C. Support Clamps for PVC Raceways: Click-type clamp system.

D. Selection of Supports: Comply with manufacturer's written instructions.

E. Strength of Supports: Adequate to carry present and future loads, times a safety factor of at least three or 90-kg concentrated load, whichever is more stringent.

330.030 SUPPORT INSTALLATION

A. Install support devices to securely and permanently fasten and support electrical components.

B. Install individual and multiple raceway hangers and riser clamps to support raceways. Provide U-bolts, clamps, attachments and other hardware necessary for hanger assemblies and for securing hanger rods and conduits.

C. Support parallel runs of horizontal raceways together on trapeze- or bracket-type hangers.

D. Size supports for multiple raceway installations so capacity can be increased by a 25 percent minimum in the future.

E. Support individual horizontal raceways with separate, malleable-iron pipe hangers or clamps.

F. Install 6-mm- diameter or larger threaded steel hanger rods, unless otherwise indicated.

© Copyright protected

G. Arrange supports in vertical runs so the weight of raceways and enclosed conductors is carried entirely by raceway supports, with no weight load on raceway terminals.

H. Simultaneously install vertical conductor supports with conductors.

I. Separately support cast boxes that are threaded to raceways and used for fixture support. Support sheet-metal boxes directly from the building structure or by bar hangers. If bar hangers are used, attach bar to raceways on opposite sides of the box and support the raceway with an approved fastener not more than 600 mm from the box.

J. Install metal channel racks for mounting cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices unless components are mounted directly to structural elements of adequate strength.

K. Install sleeves for cable and raceway penetrations of concrete slabs and walls unless core-drilled holes are used. Install sleeves for cable and raceway penetrations of masonry and fire-rated gypsum walls and of all other fire-rated floor and wall assemblies. Install sleeves during erection of concrete and masonry walls.

L. Securely fasten electrical items and their supports to the building structure, unless otherwise indicated. Perform fastening according to the following unless other fastening methods are indicated:

1. Wood: Fasten with wood screws or screw-type nails.
2. Masonry: Toggle bolts on hollow masonry units and expansion bolts on solid masonry units.
3. New Concrete: Concrete inserts with machine screws and bolts.
4. Existing Concrete: Expansion bolts.
5. Instead of expansion bolts, threaded studs driven by a powder charge and provided with lock washers may be used in existing concrete.
6. Steel: Welded threaded studs or spring-tension clamps on steel.
7. Welding to steel structure may be used only for threaded studs, not for conduits, pipe straps, or other items.
8. Light Steel: Sheet-metal screws.
9. Fasteners: Select so the load applied to each fastener does not exceed 25 percent of its proof-test load.

330.040 IDENTIFICATION MATERIALS AND DEVICES

A. Comply with BS 822 and IEC 60034-8.

B. Install at locations for most convenient viewing without interference with operation and maintenance of equipment.

C. Coordinate names, abbreviations, colors, and other designations used for electrical identification with corresponding designations indicated in the Contract Documents or required by codes and standards. Use consistent designations throughout Project.

D. Self-Adhesive Identification Products: Clean surfaces before applying.

E. Identify raceways and cables with color banding as follows:

F. Bands: Pre-tensioned, snap-around, colored plastic sleeves or colored adhesive marking tape. Make each color band 50-mm wide, completely encircling conduit, and place adjacent bands of two-color markings in contact, side by side.

G. Band Locations: At changes in direction, at penetrations of walls and floors, at 15-m maximum intervals in straight runs, and at 8-m maximum intervals in congested areas.

H. Colors: As follows:

1. Fire Alarm System: Red.
2. Security System: Blue and yellow.
3. Telecommunication System: Green and yellow.

I. Tag and label circuits designated to be extended in the future. Identify source and circuit numbers in each cabinet, pull and junction box, and outlet box. Color-coding may be used for voltage and phase identification.

© Copyright protected

J. Install continuous underground plastic markers during trench backfilling, for exterior underground power, control, signal, and communication lines located directly above power and communication lines. Locate 150 to 200 mm below finished grade. If width of multiple lines installed in a common trench or concrete envelope does not exceed 400 mm, overall, use a single line marker.

K. Install warning, caution, and instruction signs where needed to ensure safe operation and maintenance of electrical systems and of items to which they connect. Install engraved plastic-laminated instruction signs with approved legend where instructions are needed for system or equipment operation. Install metal-backed butyrate signs for outdoor items.

L. Install engraved-laminated emergency-operating signs with white letters on red background with minimum 9-mm- high lettering for emergency instructions on power transfer, load shedding, and other emergency operations.

M. Labels: Labels shall be provided inside the boxes or cubicles to describe the functions of the various items of equipment. Where the cubicle is divided into compartments each door shall have an external label to identify the compartment.

330.050 FIRE STOPPING

A. Apply fire stopping to cable and raceway penetrations of fire-rated floor and wall assemblies to achieve fire-resistance rating of the assembly. Fire stopping materials and installation requirements are specified in Division P Section "Fire Stopping Systems."

330.060 CABLE SEGREGATION AND FIRE RISK

A. All cables shall be routed and connections designed to reduce fire risk, outage and damage to other plant and buildings.

B. Cables shall be segregated to reduce damage if fire occurs and avoid faulty operation of equipment due to induced voltages as follows:

1. Control and protection cables shall be separated from power cables to avoid damage in the event of a power cable fault.
2. Telephone, communication, analogue and digital system cables shall not be at any point less than 300 mm away from power cables, unless otherwise required by relevant Standards and Regulations.
3. All cable holes through walls and floors shall be sealed with approved silicone foam fire seals or other approved materials after the cables have been installed and the cost thereof is deemed to be included in the Contract.

C. Each cable shall be run in one continuous length, straight through joints will not be permitted unless specifically authorized by the Engineer in writing.

D. Wherever cables/wires are routed with a likelihood of these being exposed to high temperature, they shall be provided with additional “heat resistant” sleeves to Engineer’s approval.

330.070 CONCRETE BASES

A. Construct concrete bases of dimensions indicated or otherwise required, but not less than 100 mm larger, in both directions, than supported unit. Follow supported equipment manufacturer's anchorage recommendations and setting templates for anchor-bolt and tie locations, unless otherwise indicated. For concrete and reinforcement characteristics, refer to Division E Section " Accessories Cast Into In Situ Concrete."

330.080 SUPPORT FRAMES FOR SWITCHGEAR

A. Support frames for switchgear located over cable trenches, where shown on the Drawings or required by equipment design, shall be installed prior to pouring concrete.

330.090 HOLES AND ANCHORS

A. Drilling for anchor bolts shall be carried out using appropriate electric drills and in approved positions.

© Copyright protected

B. Holes and chases in in situ concrete shall be cast in. Do not cut hardened concrete or drill holes larger than 10-mm diameter without prior approval.

C. Holes and Chases in Pre-cast Concrete: do not cut or drill pre-cast concrete without prior approval.

D. Holes in Structural Steelwork: Do not cut or drill structural steelwork without prior approval.

E. Holes and chases in masonry must not exceed:

1. Size of holes: 300-mm square.
2. Depth of vertical chases: 1/3 wall thickness or, in cavity walls, 1/3 leaf thickness.
3. Depth of horizontal chases: 1/6 wall or leaf thickness.

F. Cutting Masonry:

1. Ensure mortar is fully set before commencing.
2. Cut carefully and neatly, avoiding spalling, cracking or other damage to surrounding structure.
3. Keep holes to smallest practicable size and do not exceed specified dimensions.
4. Cut chases in straight lines and horizontally and vertically only; do not set back to back; offset by a distance not less than wall thickness.

G. Preformed Holes in Masonry: Submit proposals for bridging over holes for ducts etc. which exceed 450-mm width.

330.100 CUTTING AND PATCHING

A. Cut, channel, chase, and drill floors, walls, partitions, ceilings, and other surfaces required to permit electrical installations. Before start of work, re-confirm from existing “As-builts” the locations of existing services in the area and obtain approval for work notification. Perform cutting by skilled mechanics of trades involved.

B. Repair and refinish disturbed finish materials and other surfaces to match adjacent undisturbed surfaces. Install new fireproofing where existing fire stopping has been disturbed. Repair and refinish materials and other surfaces by skilled mechanics of trades involved.

330.110 FIELD QUALITY CONTROL

A. Inspect installed components for damage and faulty work, including the following:

1. Supporting devices for electrical components.
2. Electrical identification.
3. Electricity-metering components.
4. Concrete bases.
5. Cutting and patching for electrical construction.
6. Touchup painting.

B. Test Employer's electricity-metering installation for proper operation, accuracy, and usability of output data.

1. Connect a load of known kW rating, 1.5 kW minimum, to a circuit supplied by the metered feeder.
2. Turn off circuits supplied by the metered feeder and secure them in the "off" condition.
3. Run the test load continuously for eight hours, minimum, or longer to obtain a measurable meter indication. Use a test load placement and setting that ensure continuous, safe operation.
4. Check and record meter reading at end of test period and compare with actual electricity used based on test load rating, duration of test, and sample measurements of supply voltage at the test load connection. Record test results.
5. Repair or replace malfunctioning metering equipment or correct test setup; then retest. Repeat for each meter in installation until proper operation of entire system is verified.

C. Ensure that all warning signs and signages as dictated by the regulations are in place and the room doors locked, once equipment is energized.

D. Field tests shall, in addition to those specified by regulation, specifically include the following:

© Copyright protected

1. Insulation resistance tests for all parts of the electrical system, irrespective of voltage class and shall include individual measurement between the various live conductors as also between the individual live conductors and ground.
2. Earthing resistance at each equipment.
3. Loop impedance of each circuit.
4. Earth leakage protection device test.

330.120 REFINISHING AND TOUCHUP PAINTING

A. Refinish and touch up paint. Paint materials and application requirements are specified in Division M Section "Painting and Clear Finishing."

1. Clean damaged and disturbed areas and apply primer, intermediate, and finish coats to suit the degree of damage at each location.
2. Follow paint manufacturer's written instructions for surface preparation and for timing and application of successive coats.
3. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
4. Repair damage to PVC or paint finishes with matching touchup coating recommended by manufacturer.

330.130 CLEANING

A. On completion of installation, including outlets, fittings, and devices, inspect exposed finish. Remove burrs, dirt, paint spots, and construction debris.

B. Protect equipment and installations and maintain conditions to ensure that coatings, finishes, and cabinets are without damage or deterioration at time of Substantial Completion.

© Copyright protected

V10A - PACKAGED ENGINE GENERATORS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes emergency power plant installation comprising the following:

1. Diesel generating set(s), with associated control panel with decentralized synchronization functionality, auxiliaries, exhaust system, start-up system, cooling system, fuel system, batteries and charger etc.
2. Fuel storage and transfer system
3. Instrumentation, protection and control equipment
4. Outdoor enclosure
5. Manually operated overhead hoist
6. Soot Filter
7. Inter-plant cabling and wiring
8. Earthing.
9. Connection to BMS system, including interface elements such as relays, transducers, etc. as detailed in Division 23 Specification Sections BMS schedules and /or shown on the Drawings.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Equipment and component parts shall comply with the following standards:

1. ISO 3046.
2. ISO 8528.
3. IEC 60034.
4. IEC 60085.
5. CISPR.

Equivalent NEMA, ANSI and IEEE standards where such standards meet with or exceed the ISO and IEC Standards.

120.000 SYSTEM DESCRIPTION

120.010 PLANT DESCRIPTION

A. Performance Class: Diesel generator set shall be class G2 (20% voltage drop / free drop at 100% loading) to ISO 8528-1.

B. Generator Set Assembly: Compact package type, with all equipment mounted on one rigid steel bed frame suitable for skidding. Radiator shall be mounted on the set or remotely as shown on the Drawings. Design shall permit easy operation, maintenance and repair.

C. Vibration reduction shall be achieved by appropriate design and careful balancing at factory. Compact set shall have approved anti-vibration isolators of steel spring or resilient neoprene between rotating equipment and bed-frame, limiting transmission of vibration to building to a maximum of 0.04 mm amplitude throughout the operating vibration frequency range.

D. Noise reduction shall be achieved by approved methods at source of noise, including all necessary acoustic louvers, inlet and outlet air attenuators, residential exhaust silencer(s), acoustic treatment of the room walls, floors, doors and ceiling, etc. with sound level measured at 1 m in any direction outside the room limited to 80 dBA in accordance with ISO standards for residential areas. Generator supplier to coordinate with the main contractor for the required installations.

© Copyright protected

E. Sand trap louvers: generator room louvers shall be of approved sand trap type if required on the drawings or recommended by the Manufacturer. Contractor to coordinate with the building works for the required installations.

F. Cold Starting: Engine shall be fully equipped to start and pick up initial load specified at specified minimum ambient temperature. Provide coolant heater.

1. Cold starting aids, such as engine jacket water heater, lubricating oil heater, intake-air heater, battery and all devices, accessories, connections, thermostatic switches and off-duty disconnects with pilot lights and necessary protection, shall be supplemented as recommended by the manufacturer and approved.

G. Equipment ratings shall be as shown on the Drawings or the next higher standard ratings provided by the manufacturer. Ratings shall be net prime power (PRP) to ISO 8528-1 with varying load for unlimited number of hours per year and with 10% overload capability for 1 hour every 12 hours to ISO 3046-1, excluding fan and any auxiliaries, auxiliary drives and losses, delivered at specified frequency, voltage and power factor and under worst climatic conditions on site.

120.020 DIESEL GENERATOR SET

A. Components: Set shall basically consist of diesel engine, brushless synchronous generator with direct flexible coupling to engine and single or parallel control cubicle as required and shown on the Drawings.

B. Governing shall conform with ISO 3046-4, electronic type governor with limits of speed control as specified below.

C. Starting and Stopping: When in the automatic mode the set shall start and stop automatically by a signal sensed through an auxiliary contact in the load transfer switchgear. The set shall stop, after an adjustable cool- down period (2 - 30 minutes).

D. Duty: Generator shall reach full speed within 10 seconds from start impulse and accept immediately the first step load to ISO 8528-5 (load being mixed, steady and inductive, with motor starting loads as shown on the Drawings). Transient voltage variation shall not exceed 20% under any step-load application for which the system is intended, up to full rated load, recovering to within +/-2% within a few cycles. For parallel synchronized generators, life safety / life support loads shall be energized once the first generator starts within 10 seconds total time from receiving the impulse start signal without waiting for the other generators to synchronize and connect to bus.

E. Failure To Start: Should engine fail to start following a start impulse, the system shall come to rest for a few seconds. Two further starting attempts shall be automatically made with intermediate 20-second maximum periods of rest. Should the set fail to start after three attempts, an alarm shall sound and a 'start failure' signal illuminate.

F. Hand operation shall be possible for testing or normal operation through a test/manual/off/auto selector switch.

G. Regular Exercising: While on 'auto', the set shall start regularly and automatically every week and shall operate for 30 minutes before stopping.

120.030 DIESEL ENGINE AND AUXILIARIES

A. Design: Diesel engine shall be designed for type of load and application required. Engine and governor shall be selected to meet operating requirements and response specified.

B. Engine Type: Compression-ignition type, with direct solid-injection, turbo-charged after-cooled, for ratings over 100 kW, water cooled, with air-cooled radiator inline or V-type cylinder arrangement suitable for direct coupling to driven machine.

C. Engine Cycle: 4-stroke cycle.

D. Engine Speed: 1500 rpm.

E. Type of Fuel: Light fuel diesel oil.

© Copyright protected

F. Fuel System: Engine shall be designed for operating with locally available diesel fuel and have documentation to verify this.

G. Engine rating shall be such that alternator can deliver net specified rated output as specified earlier, with temperature rise not exceeding rise allowed by the Standards.

H. Accessibility: It shall be possible to:

1. Remove rocker-box covers without disturbing fuel injection pipes or other components.
2. Remove and replace pistons and piston rods, liners, big and small end shells and caps without dismounting engine.
3. Bar engine over by hand for spill timing check and adjustment.

I. Measuring Instruments: Engine mounted instruments shall include, at least, water temperature gauge, lubricating oil temperature gauge and pressure gauge, speedometer and running time meter. It shall be possible to measure, with extra instrumentation, coolant temperature at lower end of radiator, air depression after air filter, air boost and temperature using methods recommended by manufacturer. Instrument accesses shall be normally sealed by threaded blanking caps. Speed shall be sensed via a magnetic.

J. Cooling System: Engine shall be water cooled with gear- driven water pumps. System shall be pressurized, with heavy-duty tropical radiator cooled by reverse flow fan. Radiator shall be set mounted or remote as shown on drawings. Remote radiators, if used, can be horizontal or vertical as recommended by the Manufacturer or shown on the drawings. Fan cowl and hand protection guards shall be fitted. Coolant temperature shall be controlled by one or more thermostats as determined by design of system. Radiator shall be sized for continuous performance at 110% rated load at worst operating ambient conditions with a 10 deg. C temperature differential. Radiator shall be non-ferrous metal, incorporating pressure valve, radiator cap and drain cock and with integral expansion tank. Direct acting modulating thermostatic diversion valve shall control engine cooling water temperature. Under normal operation, by-pass shall not be fully closed. Treated or fresh cooling water and anti-corrosion and anti-freeze additives shall be used as recommended by Manufacturer for Specific Conditions of Installation. Coordinate with the plumbing works for the provisions/piping needed for coolant drain.

K. Cooling Airflow: Obstructions in path of cooling air flow (openings, louvers, attenuators, grilles, mesh, ducts, bends etc.) shall not reduce air flow below that needed at full rated output. Fan and radiator characteristics shall be selected accordingly. Advise if additional booster fans are required and provide necessary control gear for automatic operation. Submit static pressure calculation vs. fan capacity to substantiate the Selection.

L. Cylinders shall have removable liners. Wet type liners shall have witness hole between liner sealing rings of each cylinder for early detection of coolant or oil leakage. Each cylinder shall have drilled and tapped hole and valve for connections of pressure indicator, unless other wise recommended by the manufacturer and approved by the Engineer.

M. Lubricating Oil System: Pressurized circulating type, using two engine-driven, gear type lubricating oil pumps with full flow filters and replaceable elements and lubricating oil heat exchanger. Filter system shall have spring loaded by-pass valve to permit oil circulation if filters become clogged. Audible and visual alarms shall cut-in when valve starts opening. Lubricating oil cooler shall be shell and tube heat exchanger with water from engine radiator as the cooling medium. Direct acting thermostatic diversion valve shall control oil temperature. Under normal operation by-pass shall not be fully closed. Coordinate with the plumbing works for the provisions/piping needed for proper and neat oil change.

N. Fuel system shall have injection pump and injectors that are easily removable and replaceable for servicing. Engine shall have integral, gear type, engine driven transfer pump to lift fuel against a head of 2.5 m and supply it through filters to injection pump at constant pressure. Fuel filter elements shall be easily replaceable.

O. Exhaust system shall be complete with flanged, bolted, black steel pipe sections, long sweep elbows, flexible steel expansion sections, clean-outs, silencer, wall thimbles and supporting steelwork. Silencer shall be independently supported. Indoor hot exhaust parts shall be insulated with mineral rock wool material, not less than 50 mm thick, retained by wire ties and cladded with sheet metal

© Copyright protected

aluminum (22 - SWG) covers to protect insulation. Exhaust piping shall be fitted with rain cap, drain measures (condensate traps, drain plugs/valves, etc.) to avoid rain ingress and internal corrosion. Exhaust system shall be designed to reduce back-pressure to below maximum specified by the manufacturer, in relation to exhaust pipe length shown on the Drawings. Manufacturer's calculations for exhaust pipe sizing shall be submitted for approval including back pressure temperature and necessary measures to be applied against corrosion and to ensure efficient operation.

P. Electric Starting System: Engine starting shall be manual by push-button or automatic through control system at control panel. System shall consist of heavy-duty 24 V D.C. starter motor, heavy-duty battery and battery charger. Cranking motor and battery shall be rated for cranking the engine when cold and at lowest temperature recorded. Starting pinion shall automatically disengage when engine fires.

Q. Storage Battery: Lead-acid, sealed-in-plastic type, complete with battery rack and inter-cell connectors. Battery shall have sufficient capacity to provide minimum four cranking periods.

R. Battery Charger: 25% over-rated, solid state, full-wave rectifier type, adequate to fully recharge depleted battery in not more than 8 hours and to automatically control rate of charge (providing a high-charge rate to a depleted battery and reducing to a trickle-charge rate when battery is fully charged). Ammeter shall be provided to indicate charging rate, which shall be adjustable. Battery charger shall be mounted in control cubicle, unless otherwise approved.

S. Electronic Governor shall provide isochronous governing, (and paralleling and load sharing of generator sets in the case of paralleled generators). Governor shall have zero percent (isochronous) setting and adjustable droop from zero percent to 10% droop. System shall include power supply unit, magnetic speed pick-up, control module and actuator using fast response D.C. motor drive or equally approved alternative. Governor shall be designed for fast-response and high precision of speed (frequency) control, automatic paralleling and load sharing and shall include speed adjustment to +/-5% of normal, while running, and with remote control interface.

T. Governor over-speed trip shall automatically close fuel pump racks in event of engine over-speed. Device shall be separate and independent from governing mechanism.

U. Protective system shall comprise automatic engine shut- down and generator trip with visual and audible alarms in event of over-speed, low lubricating oil pressure, high cooling water temperature and over cranking.

V. Exhaust system shall be equipped with a soot filter to remove the Diesel particulate matter.

W. The soot filter shall be made of high grade 304 stainless steel and shall have high performance including the following:

Low pressure drop in the exhaust system.

High resistance to mechanical shock due to rough handling and engine vibration.

High resistance to thermal shock startup, shutdown and engine cycling.

120.040 GENERATOR (ALTERNATOR)

A. Type: Synchronous, low reactance, high efficiency, revolving field type, with brushless exciter and flexible coupling, sized to pick up effective load without exceeding transient and steady-state voltage deviation limits specified up to its full nominal rating and designed for the performance stipulated in the Specification. It shall be one bearing construction with bearings of the sleeve or sealed ball type.

B. Leads and Cables: Phase leads shall be brought out fully insulated to a terminal cable box of heavy gauge sheet steel, protection IP 44. Control and protection cables shall be brought out to a separate terminal box.

C. Maximum voltage difference between the three phases at 100%-balanced load shall not exceed 1%. With unbalanced load up to 30% on one phase at unity power factor and zero load on other phases, the line-to-neutral voltages shall not differ by more than 5%.

© Copyright protected

D. Characteristics:

1. Number of Phases: 3 phases, 4-wires.
2. Rated Voltage, Frequency, and Net Rated Output: As shown on the Drawings
3. Rated power factor: 0.8.
4. Winding Connection: Re-connectable with ends brought out and fully insulated.
5. Maximum Unbalanced Load Current, (negative sequence component of current) with None of the Phase Currents Exceeding Rated Current: 8% of the rated current.
6. Overload: 10% nameplate rating for 1 hour every 12 hours
7. Rotor: Salient pole type, incorporating damping grid.
8. Excitation: Brushless, with rotating armature rectifiers and discharge resistors.
9. Voltage Regulator: Automatic, with readily accessible controls for voltage level.
10. Insulation: Class H for stator and class H for rotor & exciter, with class F temperature rise, unless otherwise indicated on the drawings.
11. Enclosure: Drip proof and screen protected (IP 21 to IEC 60529).
12. Cooling: Built-in centrifugal fans.
13. Maintained Short Circuit: 250% for 3 seconds.
14. Over-speed: 120% (minimum) for 2 minutes.

E. Voltage Regulation: Overall voltage deviation within normal speed variations shall be within limits specified from no-load to full-load, from hot to cold and with load power factor from 0.8 lagging to unity. Regulator shall automatically reduce voltage if load exceeds capacity of generator. Voltage build-up shall be positive and rapid even when full load is suddenly applied. Line-to-line voltage waveform deviation factor shall not exceed +/-5%. Total harmonic content shall not exceed 5% and that of one harmonic not to exceed 3%. Radio interference suppression shall be within the limits set by the Standards, grade (N).

F. Exciter: Armature shall be 3-phase, directly mounted to generator shaft and connected to generator field windings through six solid state, hermetically sealed, silicon rectifiers, accessible for maintenance or repair. Exciter shall have field suppression system to eliminate any source of diode failure resulting from high inductive loads and surges. Exciter field windings shall be stationary. Exciter-regulator combination shall maintain output voltage within limits specified for any load up to 110% generator rating and under any sudden load changes specified.

G. Voltage Regulator: Solid state, volts/Hz type, utilizing silicon semi-conductor devices in control and power stages, with built-in Electro-magnetic interference suppression and designed for single or parallel operation. Manual adjustment to +/-5% of regulated voltage level shall be possible by a potentiometer at control panel. All components shall be sealed, moisture and heat resistant, with a suitable environmentally protected enclosure. Voltage regulator shall automatically reduce voltage if load exceeds capacity of generator and shall sustain a 3-phase short- circuit current at the generator terminals for the period for which the short-circuit protection operates and at least for 3 seconds. Voltage regulator power shall be supported by generator voltage and current to maintain excitation field power.

H. Two-position switch shall be provided for selection of manual or automatic mode of regulated voltage control.

I. Sets Operating In Parallel: Cross-current compensation and necessary paralleling modules shall be provided to effect sharing of active and reactive loads equally between generators.

120.050 INSTRUMENTATION, PROTECTION AND CONTROL EQUIPMENT

A. Generating Set Instruments, Protection And Controls: Control relays, sensing equipment, switchgear protective relays and devices and start, stop and shutdown controls shall be provided as necessary for operation specified. Generating set, instruments, protection and controls shall be mounted preferably in one control cubicle.

B. Generator controls, metering, monitoring and protection shall be carried out via modular solid state, microprocessor based units, with digital display facility

C. Instruments and controls for a non-paralleled set shall include at least the following:

1. Line and phase voltage metering on the 3 phases.

© Copyright protected

2. Current metering on the 3 phases.
3. Frequency meter.
4. Off/test/manual/auto duty switch.
5. Manual-start and stop push buttons.
6. Kilowatt-hour meter.
7. Power factor meter.
8. Service-hour running counter.
9. Plant exerciser.
10. Potentiometer for voltage level control.
11. Speed raise/lower device.
12. Cool-down time setting controls.
13. Over cranking monitoring and alarm
14. Illuminated indicator panel with LEDs at least for low oil pressure, high water temperature, over-speed, fail-to-start, generator overload, reverse-power, generator on load, battery low charge state
15. Lamp test push-button.
16. Indicating gauge and low level fuel alarm.
17. Battery charger, on/off switch, pilot lights.
18. D.C. ammeter.
19. Alarm sounder and reset controls.
20. Anti-condensation heater.

D. Protective gear shall ensure orderly engine stop or shutdown with reset relays, as required for safety and operational reliability, and shall include the following:

1. Output air circuit breaker (ACB) with solid state trip unit, in accordance with Division Y Section "Switchboards", (electrically operated and electrically tripped by shunt release) for over-current and external earth fault protection.
2. Over-voltage protection with voltage and time lag adjustment.
3. Loss-of-field protection.
4. Negative phase sequence protection.
5. Restricted earth-fault protection, with current adjustable settings between 0 and 20% of rated current, and time adjustable settings 0 to 3 seconds.
6. Reverse power relay (for sets operating in parallel).

E. Control and Protective Gear Cubicles: Generator set mounted instrument and/or control cubicles shall be resiliently mounted, preventing transmission of vibration to the components. Separately mounted instrument and control cubicles shall be self-supporting, floor mounted and free- standing. Cubicles shall be sheet steel construction, ventilated indoor type, vermin and dust-proof, (IP 42 to IEC 60529), with lockable hinged doors and instrument panels, separate compartments for control devices, protective relays, circuit breaker(s) and neutral earthing device. Inner and outer surfaces of steel enclosures shall be cleaned, phosphatized, primed with heavy-duty rust inhibiting primer and finished with two coats of enamel. Wiring shall be 600/1000 V, modularly arranged, with connections made at front terminal blocks with no live conductors exposed. Wires shall have approved numbered ferrules at each terminal. Printed circuit plug-in boards, where applicable, shall be of industry standards, accessible and withdrawable, mounted in standard racks.

F. Load Shedding: An automatic microprocessor based load shedding system shall be provided for load connection / disconnection according to load priorities and generator power availability as described on the drawings.

G. Step Loading : An automatic step loading system shall be provided for sequential application of emergency loads with an adjustable (0- 30 sec) time delay between each two steps as described on the drawings. The system shall comprise all necessary control equipment including under over/ voltage sensing relays, time delay relays, interface devices and wiring with respective circuit breakers.

H. Parallel operation of generator sets shall be achieved through generators' control panel in decentralized topology. Contractor shall provide the following

© Copyright protected

1. Generator control panel with synchronizing functionality, , automatic switching and automatic active and reactive load-sharing modules, as required for paralleling as specified here below, together with sequential starting system based on demand load sensing, to allow automatic starting and transfer of load from one set to another without break in supply.
2. One neutral earthing switch per set, interlocked in cascade, such that switch of the first generator to start and be connected to the bus, is closed. The switches shall be make-before-break-type so that the neutral switch never floats in case the generator with the neutral closed fails or is shut off the system.

I. For Short-Break Set: Provide complete control package with necessary relays, contactors, clutch control system, control rectifier and D.C. supply, automatic load application system, load transfer switches and load sensing components for activating the sequences of operation described.

J. For no-break set provide programmable controller, with fault-indicating and logic cards, automatic starting system, coupling controls and synchronizing systems, main contactor and other functional contactors, frequency and voltage sensing devices, independent regulated and controlled D.C. power supply equipment for control of induction coupler and Electro-magnetic clutch etc. to activate the sequences of operation described.

K. Relays: electronic, microprocessor based front settable / programmable, sealed type, with dust-tight enclosures, removable covers, test terminal blocks and plugs for testing relay without removal from case. Removal from casing shall automatically short-circuit respective current transformer secondary windings.

L. Instruments shall be housed in enameled metal cases for switchboard flush installation and shall be grounded in accordance with the approved standards.

M. Current Transformers: Class 2 for measuring and protection. Refer to switchgear sections for particulars.

N. Voltage Transformers: Single phase, dry type, 0.5 accuracy class. Refer to switchgear sections for particulars.

O. KWH Meter: digital (part of microprocessor unit) for unbalanced 3-phase, 4- wire loads.

120.060 SYNCHRONIZING AND CONTROL PANEL

A. Synchronization shall be performed through generator set mounted control panels. System shall be of the decentralized, automatic random access system type with automatic load pickup, load sharing, and load demand paralleling and shall be fully featured for unattended operation and expansion for future load and integration with generator addition(s).

B. Control panels shall accommodate metering / monitoring, control and protection units / instruments, synchronizing equipment and all necessary associated components (as described below) for the parallel generating sets. Control panels shall be micro-processor based of the fully computerized type. Control panels shall be equipped with the necessary interfaces for connection to and control of the generator circuit breakers and outgoing feeder circuit breakers of the emergency distribution board.

C. Synchronizing switch panel shall include:

1. 3-bus AC voltmeter, 90 mm, 90 att-. volt scale.
2. 2 synchronizing lamps.
    a) One frequency meter for station bus and generator units, dial type, 45-55 Hz scale.
3. Fail circuitry including:

a)	Overload/Load Shed:	Alarm and immediate shed only.
b)	Over Voltage:	Alarm only.
c)	Under Voltage:	Alarm only.
d)	Over/Under Frequency:	Alarm only.
e)	Station Battery Failure:	Alarm only.

© Copyright protected

4. Master control delay with heavy-duty control relays including, synchronizer, etc. mounted on a plate to facilitate removal and testing. All failure and synchronizing relays shall be provided with glass enclosures and plug-in bases to facilitate removal and testing.
5. Sequence Of Operation: For two or more generator sets to be paralleled via the synchronizing board, the sequence of operation shall be as follows:

    a) Auto-Mode:

        1) On receipt of a start signal indicating the loss of power, all generator sets shall automatically and independently start, accelerate to rated frequency and build up to rated voltage. The first unit to reach the preset level closes to the bus with the other units disabled in doing so. The first priority load is then switched to the emergency system bus. The priority controls prevents the overloading of the system bus by inhibiting the operation of the lower priority load switching until additional generator-sets are closed to the bus.
        2) The control of the remaining generator-sets is reverted to the synchronizing system for each paralleling operation in sequence. Each generator-set then synchronized with the system bus and closed will assume its proportional share of the load. Also, as each generator-set close to the bus lower priority loads will be switched on automatically and shared by the system proportionally.
        3) If a generator fails to start, or the bus overloads or a generator fails, the corresponding breaker shall open (or remain open), the alarm will sound and the lowest priority loads shall be shedded.
        4) The microprocessor of the system shall continually monitor the total load on the bus, and should the system be able to carry the entire load safely with fewer generators, the controller will shut off some of the generator units.
        5) Upon the return of normal power and after an adjustable preset time all the generator breakers shall open and the generator-sets shall run unloaded for a cool down period, then shut off and be ready for another automatic operation.

D. Each generator paralleling control panel shall include the following functions:

1. Line and phase voltage metering on the 3 phases, current metering on the 3 phases, frequency metering and kilo watt metering, 2% accuracy.
2. Running time metering.
3. Synchronization and load sharing functionalities.
4. Programmable controller to manage the load demand, priority control and load shedding.
5. Synchronization check.
6. Monitoring of bus voltage, current and frequency.
7. Alarm and status indication for:

a)	Generator Running:	Status indication.
b)	Automatic Mode:	Status indication.
c)	Demand Mode Standby:	Status indication.
d)	Cool-down Mode:	Status indication.
e)	Fail To Synchronize:	Trouble alarm indication.
f)	System Test:	Status indication
g)	Utility Power Failure:	Status indication
h)	High Engine Temperature:	Alarm - shutdown.
i)	Low Oil Pressure:	Alarm - shutdown.
j)	Low Engine Temperature:	Trouble alarm indication.
k)	Low Day-tank Level:	Trouble alarm indication.
l)	Not In Auto:	Trouble alarm indication.
m)	Generator Over-Current:	Alarm - shutdown.
n)	Loss Of Field:	Alarm - shutdown.
o)	Reverse Power:	Alarm - shutdown.
p)	High Temperature Shutdown:	Alarm - shutdown.
q)	Low Oil Pressure Shutdown:	Alarm - shutdown.
r)	Over-crank:	Alarm - shutdown.
s)	Over-voltage:	Alarm - shutdown.

© Copyright protected

t) Over-speed: Alarm - shutdown.
u) Control Locked Out: Alarm - shutdown.
v) Low Coolant Level: Alarm - shutdown.
w) Low Fuel Main Tank: Trouble indication

8. Audible and Visual alarms.
9. Alarm silence push-button to shutoff sound but maintain visual on.
10. Auto-Off-Manual selector switch.
11. Control reset push-button.
12. Breaker control push-buttons/ switch for circuit breaker on/off switching.
13. Locking voltage and frequency adjustment potentiometers.
14. Complete engine control including DC gauges.
15. Reverse power relay test switch.
16. Ground fault alarm to generator main breaker.
17. Automatic Control Components:

a) Electronic governor control and load sharing module for isochronous load sharing and control of the generator set's electronic governors.
b) First start sensor for monitoring the voltage and frequency of the generator-set as it is starting.
c) Electronic reverse power relay.
d) Synchronizer to adjust phase angle and frequency before paralleling.
e) Pulse alarm system to sound alarm at first fault and each additional fault.
f) Permissive paralleling relays to prevent out of phase paralleling in automatic and manual modes.
g) DC Voltage sensor with time delay monitor for starting battery system.
h) System starting controls.
i) Bus under-relay.
j) Master first start sensor.
k) Time delay start relay.

120.070 FUEL STORAGE AND TRANSFER

A. Day-tank Construction: Closed cylindrical steel, inclined at least 3 degrees from horizontal and fitted with drain plug, inlet and outlet pipe connectors and breather pipe or as shown on drawing (Sub-base fuel tank).

B. Day-tank breather pipe shall have replaceable paper air filter or breather caps with air filters.

C. Day-tank instruments shall include float switch, solenoid valve and dial-type level indicator to give alarm on over-fill and low-level.

D. Pipes and valves: between day tank and generator (within Electrical scope) shall be as per Mechanical specifications.

E. Day-tank Filling Pumps: Electrically operated, automatically started and stopped, duplex pumps and standby manual pump, installed on piping system between storage tank and one or more day-tanks for fuel transfer. Motor shall be totally enclosed, fan-cooled, squirrel-cage induction type, with integrally coupled pump-rotor contained on one base. Pump shall be self-priming type against the specific head shown on the Drawings. Priming plug, sealed and protected bearings and combination starter with thermal overload protection and circuit breaker for short-circuit protection shall be provided. Operation shall be interlocked with float switches in day-tank. All necessary check valves, by- pass valves, float valves and maintenance valves on piping system shall be provided as shown on the Drawings.

F. Day-tank Connections: Female threaded, black forged steel pipe couplings, fitted through holes in top of tank and welded all around inside and outside. Connections, except vent connection, shall extend inside tank to within 150 mm of bottom and shall be seamless black steel pipes of same size as connection and braced to tank walls. Vent connection shall not extend inside tank more than 20 mm. A manual valve shall be provided on the fuel supply line to the genset.

© Copyright protected

G. Fuel Lines: Heavy gauge, black seamless steel, to ISO/65 or equal, treated internally with corrosion resistant paint and with joints sealed with PTEE tape. Plumber's twine or gasket sealing compound shall not be used. Changes in direction and branching and jointing shall be with regular pipefitting. Field fabricated and bent fittings shall not be used.

H. Fuel Lines: Fuel feed line to day-tank shall have by- pass with stopcock. Size of fuel return line from day-tank to main fuel tank shall be to manufacturer's recommendations.

I. Valves Generally: 827.4 kPa (steam working pressure rating and 1380 kPa cold water non-shock pressure rating and type that can be repacked under pressure.

J. Pipe Hangers and Supports: Galvanized steel.

120.080 MISCELLANEOUS REQUIREMENTS

A. Manually Operated Overhead Hoist: Chain operated, self aligning, low headroom type, comprising trolley with gear mechanism combined into a compact unit, designed to run on lower flanges of I-beam runway. Hoist shall have shock resistant suspension, positive action Western type local brake; lifetime lubricated sealed bearings and load safety hook. Trolley shall have four alloy cast iron wheels. Safety factor shall be minimum of 5. Capacity of hoist shall be as indicated on the Drawings, and shall be tested to 1.5 times rated capacity.

B. Power And Control Cables: Comply with Division Y Section "Low Voltage Electrical Power Conductors and Cables", and Section " Control/Signal Transmission Media" of the Specification and as shown on the Drawings.

C. Earthing Equipment: Comply with Division Y Section "Earthing And Bonding" of the Specification.

PART 1 REFERENCES

100.000 RELATED DOCUMENTS

PART 2 PRODUCTS AND WORKMANSHIP

200.000 MATERIALS

200.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

© Copyright protected

1. Caterpillar
2. Cummins (Onan)
3. Deutz
4. Kohler
5. M.T.U.
6. MAN-B&W
7. Volvo
8. Wartsila
9. Perkins
10. Pet bow

200.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

210.000 QUALITY MANAGEMENT

210.010 QUALITY ASSURANCE

A. Local Representative: Provide evidence that proposed equipment manufacturer has a locally established and authorized organization which can be called upon for professional advice and maintenance as may be required, and which can immediately supply spare parts to support day to day and emergency maintenance requirements. Failure to satisfy Engineer may disqualify a manufacturer.

B. MAINTENANCE CONTRACT: obtain an undertaking by the equipment manufacturer and his authorized local representative to provide an annual maintenance contract, available after substantial completion of the work, covering routine service and emergency service by trained employees, and to ensure supply of necessary standard spare parts.

210.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle generator set and system components as per Manufacturer's instructions.

210.030 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

210.040 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance service by skilled, competent employees of the generator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper generator operation at rated speed and capacity. Use parts and supplies as used in the manufacture and installation of original equipment.

1. Include 24-hour-per-day, 7-day-per-week emergency callback service.

a) Response Time: 1 hour or less.

© Copyright protected

210.050 SPARE PARTS AND EXTRA MATERIAL

A. Spare Parts: Provide manufacturer's recommended spare parts for 1000 hours operation of the plant. Provide list of manufacturer's spare parts for 2000 hours operation together with current prices. Pack with protective covering for storage and identify with labels describing contents.

B. Tools and Instruments: Provide tools and instruments required for normal routine inspection, testing, operation and general maintenance, as recommended by the manufacturer.

220.000 SUBMITTALS

A. Product Data: Submit full technical data of equipment for approval including, but not limited to, the following:

1. General description and characteristics of engine- generating sets, standards with which components comply, site rating and overload capability, overall efficiency, and fuel and lubricant consumption at 100%, 75%, 50% and 25% of rated load.
2. Description and operating criteria of engine; type, model, manufacturer, fuel and lubricating oil types and specific consumption, starting conditions and starting periods from cold to full-load pick-up, governor and response characteristics due to sudden load changes, super-charger, fuel injection system, cooling system and radiator, air filters, fuel filters, oil filters and pumps.
3. Description and operating criteria of generator, exciter and voltage regulator, with loading response and short-circuit characteristics, insulation, cooling and accessories.
4. Dimensioned outline plan and elevation drawings of engine generator set and other components specified, weights and forces, mounting methods, vibration protection etc.
5. Battery type, make, charge/discharge characteristics, capacity and constructional features.
6. Battery charger, method of charging, equalizing and trickle charging.
7. Daily fuel tanks, pipes and accessories; materials and construction.
8. Exhaust system and silencers; materials and construction.
9. Control instruments, protection, alarms, cut-outs, indicating lamps, indicating instruments and all other devices or components.
10. Time-current characteristic curves for generator protective device.
11. Synchronization system where specified for two or more sets are in parallel, including technical data, instruments, governor and voltage regulation, with characteristic curves etc.
12. Calculation of noise levels in dBA at typical points within engine room and at various locations inside and outside.
13. Calculation of static pressure on radiator fan including indication of Manufacturer’s required C.F.M. and fan static pressure.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Certified manufacturers' dimensional drawings, templates and installation instructions for equipment and accessories, showing weights and distribution of forces, location and size of cabling (power and control), piping connections to equipment, and other pertinent data.
2. Plans and elevations of all equipment.
3. Separate unit wiring diagrams, schematics and interconnecting wiring diagrams.
4. Constructional details of daily service fuel tank, including outline drawings showing piping arrangements, connections and dimensions.
5. Complete execution drawings of associated auxiliaries.
6. Overall Single Line Diagram of the plant, indicating ratings of different equipment and metering & protection devices.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer’s authorized representative and the contractor.

D. Qualification Data: For firms and persons specified in "Quality Assurance" Article.

E. Routine Tests and Factory Test Reports: Fully assembled plant or equipment shall be tested at the factory, before shipping. Complete performance tests shall be carried out under site simulated conditions, in accordance with the Standards and as described in the Specification, showing evidence of compliance with specified requirements.

© Copyright protected

F. Field Test and Observation Reports: Indicate and interpret test results and inspection records relative to compliance with performance requirements.

G. Certified Summary of Performance Tests: Demonstrate compliance with specified requirement to meet performance criteria for sensitive loads.

H. Sound measurement test report.

I. Field test report of tests specified in Part 3.

J. Maintenance Data: For each packaged engine generator and accessories to include in maintenance manuals specified in Division 1. Include the following:

1. List of tools and replacement items recommended to be stored at the Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.
2. Detail operating instructions for both normal and abnormal conditions.

230.000 EXECUTION

230.010 EXAMINATION

A. Examine areas, equipment foundations, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine generator performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Examine roughing-in of cooling-system piping systems and electrical connections. Verify actual locations of connections before packaged engine generator installation.

230.020 CONCRETE BASES

A. Install concrete bases of dimensions indicated or otherwise required for packaged engine generators. Refer to Division E Section " Accessories Cast Into In Situ Concrete " and Division V Section "Basic Electrical Materials and Methods."

230.030 INSTALLATION

A. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and manufacturers' equipment drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.

B. Install packaged engine generator to provide access for periodic maintenance, including removal of drivers and accessories.

C. Built-In Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which shall be built into concrete foundations, bases or building structure are provided as and when required and that they are properly installed.

D. Tools: Use only tools recommended by equipment manufacturers for installations, particularly in making connections and adjustments.

E. Supervision: Carry out equipment installation under the direct supervision of a qualified technician, licensed by and trained at the factory. Final adjustments and putting into satisfactory operation shall be made by a specialist delegated by the factory.

F. Generating Set: Install to maintain alignment and minimize engine and generator stresses. Protect instrumentation and control equipment including engine mounted instruments from machine vibration. Mountings and method of mounting shall be as recommended by the manufacturer and approved by Engineer.

G. Engine exhaust piping shall be slightly sloped away from engine to avoid condensation returning to engine and shall have drain plugs or clean-out at lower end as required.

H. Engine Hot-Air Exhaust Duct: Install approved canvas duct with metal frames between radiator and louvered opening in wall for radiator exhaust air.

© Copyright protected

I. Tank Vent Pipe: Extend to nearest outside wall of building and carry up to at least 2 m above ground level with end at least 1 m away from any building opening. Slope vent pipe back to tank without traps and support securely. Provide replaceable dust filter and gooseneck bend or approved weatherproof vent cap at top of pipe.

J. Pipe Hangers And Supports: Fasten securely to building structure with approved masonry expansion bolts, minimum 20 mm diameter and install in accordance with manufacturers' instructions.

K. Earthing: Install earthing system in accordance with Division Y Section " Earthing And Bonding " of the Specification.

230.040 CONNECTIONS

A. Piping installation requirements are specified in Division 22 and 23 Sections. Drawings indicate general arrangement of piping and specialties. The following are specific connection requirements:

1. Install piping adjacent to packaged engine generator to allow service and maintenance.
2. Connect water supply to cooling system.
3. Connect cooling-system water supply and drain piping to diesel engine heat exchangers. Install flexible connectors at connections to engine generator and remote radiator.
4. Connect exhaust-system piping to diesel engines.

B. Electrical wiring and connections are specified in Division V Sections.

C. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

230.050 IDENTIFICATION

A. Identify system components according to Division V Section "Basic Electrical Materials and Methods."

230.060 INSPECTION AND TESTS ON SITE

A. Supervised Adjusting and Pretesting: under supervision of factory-authorized service representative, pretest all system functions, operations, and protective features. Provide all instruments and equipment required for tests. Adjust to ensure operation is according to Specifications. Load system using a variable resistive and reactive load bank to be provided during testing only simulating kW, and power factor of loads for which unit is rated.

B. Tests: provide the services of a qualified independent testing agency to perform the tests listed below according to manufacturer's recommendations upon completion of installation of system. Use instruments bearing records of calibration within the last 12 months, traceable to approved standards, and adequate for making positive observation of test results. Include the following tests:

1. Insulation Tests: test generator windings using 500 V d.c. for units rated up to 250 volts and 1000 V d.c. for units rated between 250 and 600 volts. Verify minimum insulation resistance is 25 megaohms for units up to 250 volts, and 100 megaohms for units 251 to 600 volts. Verify by dielectric absorption test that polarization index levels are according to manufacturer's industry standards approved.
2. Battery Tests: measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions. Test for contact integrity of all connectors. Perform an integrity load test and a capacity load test for the battery. Verify acceptance of charge for each element of battery after discharge. Verify measurements are within manufacturer's specifications.
3. Battery Charger Tests: verify specified rates of charge for both equalizing and float-charging conditions.
4. System Integrity Tests: methodically verify proper installation, connection, and integrity of each element of engine generator system before and during system operation. Check for air, exhaust, and fluid leaks.

© Copyright protected

5. Simulation of malfunctions to verify proper operation of local and remote protective, alarm, and monitoring devices.
6. Load Test: use variable load bank capable of simulating kVA, kW, and power factor of load for which unit is rated. Run unit at 25, 50, and 75 percent of rated capacity for 30 minutes each, and at 100 percent for 3 hours immediately followed (in case of prime generators) by 10 % overload test for 30 minutes. Make the 100-percent load run at 80 percent power factor. Record voltage, frequency, load current, battery-charging current, power output, oil pressure, and coolant temperature periodically during the test.
7. Vibration Baseline Test: measure amplitude for nominal frequency and for frequencies 5, 10, 15, and 20 percent above and below nominal at each main bearing cap. Vibration levels not exceeding those specified in NEMA MG1, "Motors and Generators," are acceptable.
8. Exhaust System Back-Pressure Test: use a manometer with a scale exceeding 40 inches of water. Connect to the exhaust line close to the engine exhaust manifold. Verify that back pressure at full-rated load is within manufacturer's published allowable limits for the engine.
9. Exhaust Emissions Test: conform to applicable government test criteria.
10. Voltage and Frequency Transient Stability Tests: use recording oscilloscope to measure voltage and frequency transients for 50-percent and 100-percent step-load increases and decreases and verify that performance is as specified.
11. Harmonic Content Tests: measure harmonic content of input and output current under 25 percent and at 100 percent of rated linear load. Verify that harmonic content is within specified limits.
12. Efficiency Tests: perform at 50 percent, 75 percent, and 100 percent of rated load.

C. Retest: correct deficiencies identified by tests and observations and retest until specified requirements are met.

D. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation resistances, time delays, and other values and observations. Attach a label or tag to each tested component indicating satisfactory completion of tests.

E. Test instruments shall have been calibrated within the last 12 months, traceable to applicable standards, and adequate for making positive observation of test results. Make calibration records available for examination on request.

230.070 COMMISSIONING

A. Battery Equalization: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.

230.080 CLEANING

A. On completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

230.090 DEMONSTRATION

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

V11B - MEDIUM-VOLTAGE TRANSFORMERS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes distribution step down transformers with medium-voltage and/or low voltage primaries and secondaries as specified.

B. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division Y Section "Enclosed Bus Assemblies" for busway connections between transformers and secondary distribution equipment.
3. Division Y Section "Medium-Voltage Cables" for cable terminations at transformers.
4. Division W Section "Central Control / Building Management ".

C. Necessary interfaces for connection to BMS system, including interface elements such as relays, transducers, etc. as specified and /or shown on the Drawings.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Equipment and component parts shall comply with the following Standards:

1. Common clauses for HV switchgear and control gear standards: IEC 62271-1.
2. Power transformers: IEC 60076.
3. Insulated bushings for alternating voltages above 1000 V: IEC 60137.
4. Material thermal class insulation: IEC 60085.
5. For transformer characteristics: BS EN 50708-2-1 for dry type transformers.
6. Neutral Earthing Resistor: IEEE standard C57.32.

120.000 SYSTEM DESCRIPTION

120.010 DRY TYPE CAST RESIN POWER TRANSFORMER

A. Type:

1. 3-phase, indoor type.
2. Step down, two winding.
3. MV windings shall be cast epoxy resin under vacuum.
4. LV windings shall be insulated with insulating foil impregnated / pre-impregnated with epoxy resin and heat cured afterwards.
5. Insulation for both LV and MV windings shall be class F as a minimum, rated for continuous operation under worst site ambient conditions at full load, and complying with IEC 60076-11.
6. Windings temperature rise shall not exceed 80 deg. C.
7. Transformer core shall be constructed from high grade, non-aging “Cold Rolled Grain Oriented” silicon steel laminations with suitable grade to fulfill the losses and noise levels specified below.

B. Transformers shall be suitable for continuous operation at cooling air temperature of 50/40/30 deg. C at any time, monthly average of hottest month and yearly average respectively.

C. Transformer no load and load losses shall not exceed BS EN 50708-2-1 values for class Tier 2.

D. Transformer’s emergency overloading capability shall comply with IEC 60076-12.

E. Noise Level: A weighted sound power (LWA) level calculated in accordance with IEC 60076-10 (with fans off) shall not exceed BS EN 50708-2-1 values for the specified classes in paragraph 120.010 C above.

© Copyright protected

F. Noise level for transformers with fans: the sound power level with all fans in operation shall not exceed 6 dB additional to the specified limits.

G. Insulation and Encapsulation: Humidity resistant, explosion and fire-resistant, self-extinguishing, tropicalized, giving non-toxic gases in the event of fire. To fulfill environmental, climate and fire classes of E2, C2 and F1 respectively to IEC 60076-11 / BS EN 50708-2-1.

H. Windings: Medium voltage winding shall be Copper strip conductor, and low voltage winding shall be Copper conductor foil, unless otherwise approved.

I. Winding current densities at rated normal and short circuit conditions shall be submitted for approval. Normal densities shall not exceed 1.8 A/mm2 for Copper winding, unless otherwise submitted by manufacturer and approved by engineer.

J. Tapping shall be provided on MV side by means of re-connectable links (off-circuit), giving +/- 2.5% and +/-5% tapping on transformers for each primary voltage rating.

K. Rubber sound isolation pads shall be provided between core and coil assemblies, and between base and housing.

L. Mounting and Handling: Transformer base and structure shall have lifting hooks or lugs, towing and lashing eyes or lugs and provision for roller wheels.

M. Terminals: Arranged as described in paragraph 120.010 Q hereof and/or as shown on the Drawings, and shall be compatible for copper or aluminum cable termination.

N. Enclosure's earthing bolt(s) or copper pad(s) shall be provided on main frame of transformer for earthing of transformer's housing and core.

O. LV star neutral point shall be connected to a separate earthing terminal fixed to but insulated from the enclosure and shall be labeled with the same.

P. Housing: Sheet steel construction, IP 31 with provision of fans for indoor installation.

Q. Characteristics:

1. Rated Power (net site rating): as shown on drawings.
2. Winding Connections: Dyn 5 with neutral fully insulated and brought out.
3. Frequency: 50 Hz.
4. Highest Voltage Um (rms):

   a) MV Side 24 kV.
   b) LV Side 1.1 kV.

5. Rated Voltage (no load):

   a) MV Side 15 kV.
   b) LV Side 420 V.

6. Impedance Voltage at Rated Current: 6 %.
7. Tap-Changer Positions: +/- 2.5% and +/- 5% on primary.
8. Rated Power Frequency Withstand-Voltage: 50 kV.
9. Rated Lightning Impulse Withstand-Voltage: 125 kV.
10. Short-Circuit Apparent Power of the System at Location: 500 MVA for 15 kV systems and 1000 MVA for 30 kV systems as a minimum.
11. Duration of Short-Circuit-Withstand: 2 seconds.
12. Terminal Connection System:

    1) MV Side: open bolted terminals / bushings with cable sealing ends (epoxy joints). Cable entry shall be from bottom.
    2) LV Side: open bolted terminals / bushings with cable sealing ends (epoxy joints) or as shown on drawings. Cable entry shall be from bottom.

R. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

S. Accessories shall include the following:

© Copyright protected

1. Digital protective unit for transformer monitoring and protection against winding temperature and contacts for fan controller operation with display for indication of winding temperature values and alarm / trip status, 2 N.O. contacts for winding temperature alarm and trip the upstream medium voltage switchgear circuit breaker flag relays, with data link interface port for connection to BMS, along with necessary winding temperature sensors (at least one 3-wire PT100 / RTD 200 or equivalent per phase) and interface with fan control and protection system.
2. Fans and fans digital control unit for extra rating of transformer. Controller shall have input dry contacts interface for remote control enable and output alarm/fault relay. Controller shall comply with IEC 61000-6-2 for EMC immunity and with IEC 61000-6-4 for EMC emission. Controller shall be similar to VRT200 or approved equal. Supplier shall coordinate with contractor for necessary power supply for fans and controller.
3. Four re-orientable roller rim wheels and attachment accessories.

T. Surge arresters: Provide surge arresters as specified under Division V Section "Medium Voltage Switchgear", on MV side of transformers, unless surge arrestors are located on the switchgear in the Drawings or it is agreed with the Engineer to provide the arresters on the outgoing MV circuit breaker cubicle of transformer for the cases where the distance between medium voltage switchgear and transformer is not exceeding 15m. The contractor is responsible for the coordination between the medium voltage switchgear and transformer suppliers.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers of Distribution Transformers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. A.B.B.
2. Schneider Electric / France Transfo
3. Schneider Electric / Areva
4. Schneider Electric / Square D.
5. G.E.
6. Eaton / Cutler Hammer Corp.
7. SGB
8. Pauwels/Crompton Greaves Ltd.
9. Siemens

B. Locally assembled dry type transformers by one of the above approved manufacturers are acceptable subject to compliance with design requirements and adequacy of reference list and quality control of the local factory.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

© Copyright protected

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Manufacturer Qualifications: Engage a firm experienced in manufacturing transformers similar to those indicated for this Project and with a record of successful in-service performance.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle transformers as per Manufacturer's instructions.

310.030 COORDINATION

A. Coordinate layout and installation of transformers with other construction.

B. Coordinate size and location of concrete or mounting bases. Concrete, reinforcement, and formwork requirements are specified in Division E Section " Accessories Cast Into In Situ Concrete."

310.040 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of substantial completion.

310.050 FACTORY ACCEPTANCE TEST

A. Factory testing units for one unit of each rating of the dry type transformers to be supplied shall be witnessed by the Engineer for locally assembled transformers. Selection of transformers for witness test shall be randomly carried out by the Engineer and shall cover all ratings to be delivered. Witness test shall include complete routine and function testing in addition to the special tests specified above. Test procedure and program shall be submitted for approval prior to test conduction, by at least 14 days.

310.060 SPARE PARTS AND EXTRA MATERIAL

A. Spare parts: provide spare parts as recommended by the manufacturer including but not limited to the items below, for one year maintenance, as expected under local conditions, and to allow for emergency replacement due to accidental breakage or failure. Spare parts shall include but not limited to the following:

1. Spare parts for dry type transformers with quantity greater than two shall include but not limited to fan, fan controller and temperature monitoring unit with a quantity of two percent of total number of transformers, with minimum one unit each.

B. Tools and Instruments: provide tools instruments required for normal routine inspection, testing, operation and maintenance as recommended by the manufacturer.

C. Provide complete price list of spare parts adequate for five years operation as expected under local conditions.

320.000 SUBMITTALS

A. Product Data: Include full technical data on features, components, ratings, and performance for each type of transformer specified. Include core material, grade, lamination thickness, flux density, winding material, and current density. Additionally, include dimensioned plans, sections, and elevation views. Show minimum clearances and installed devices and features. Submit Manufacturers' catalogues.

© Copyright protected

B. Wiring Diagrams: Detail wiring and identify terminals for tap changing and connecting field-installed wiring.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

D. Product Certificates: Signed by manufacturers of transformers certifying that the products furnished comply with requirements.

E. Type Test Certificates: Submit to verify compliance of main equipment with the relevant IEC Standards.

F. Routine Tests: Each transformer unit shall undergo routine tests at the manufacturer's works in accordance with the relevant standards. Submit routine test reports, prior to shipping equipment, indicating ambient test conditions and guaranteed rating of equipment under site conditions.

G. Special / Type Tests: Factory special and type tests shall include noise level, temperature rise, impulse withstand on one transformer of each rating to be delivered. In addition, dissipation factor test (tan-delta) shall be performed for oil type transformers.

H. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Plans and elevations, with dimensions and weights.
2. Arrangement of equipment and general layouts.
3. One-line diagram of power system.
4. Schematic diagram indicating the secondary wiring of transformer mechanical protection and the control circuit of cooling fans (if any).
5. General arrangement and drive mechanism details for off-circuit tap changer.
6. Foundation details, grouting holes and installation details.

I. Sound-Level Test Reports: Certified copies of manufacturer's sound-level tests applicable to equipment for this Project.

J. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

K. Maintenance Data: For transformers to include in the maintenance manuals specified in Division 01.

330.000 EXECUTION

330.010 INSTALLATION

A. Locations and Layout: Exact locations and physical layout of equipment and components may be varied as required to suit manufacturer's design and as approved, provided the required functions and operations are accomplished; follow the identification of the units indicated on Drawings exactly to ease checking and building maintenance procedures.

B. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and equipment manufacturers' drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.

C. Cable Trenches: Ensure that trench construction and covers provided for installation of power and control cables are in accordance with approved shop and construction drawings.

D. Built-In Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which shall be built into concrete foundations, bases, cable trenches or building structure are provided as and when required and that they are properly installed.

E. Equipment: Install on concrete bases etc., and assemble completely plumb and level, before grouting in holding-down bolts.

F. Supports and Terminations: Install all incoming and outgoing cable supports, cable ends and termination fittings required for MV, LV and control cables.

© Copyright protected

G. Relays: Set in accordance with manufacturer's instructions and the Local Power Authorities requirements.

H. Earthing: Ensure that earthing installation is as described in Division Y Section " Earthing And Bonding " of the Specification and/or as shown on the Drawings.

I. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, brackets, and temporary blocking of moving parts from switchgear units and components.

330.020 IDENTIFICATION

A. Identify transformers and install warning signs according to Division V Section "Basic Electrical Materials and Methods."

330.030 CONNECTIONS

A. Tighten bus joint, connector, and terminal bolts according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

330.040 FIELD QUALITY CONTROL

A. Equipment: Inspect equipment upon delivery to site and report any damage to Engineer.

B. Components: Check component ratings, types, sizes and wiring connections, including current and voltage transformers, fuses, switches, instruments and relays.

C. Manufacturer's instructions shall be followed under all circumstances. Carry out and record measurement and tests recommended by the manufacturer.

D. Test Objectives: To ensure transformer is operational within industry and manufacturer's tolerances, is installed according to the Contract Documents, and is suitable for energizing.

E. Test Labeling: On satisfactory completion of tests for each transformer, attach a dated and signed "Satisfactory Test" label to tested component.

F. Schedule tests and provide notification at least 7 days in advance of test commencement.

G. Report: Submit a written report of observations and tests. Report defective materials and installation.

H. Tests: Include the following minimum inspections and tests according to manufacturer's written instructions.

1. Inspect accessible components for cleanliness, mechanical and electrical integrity, and damage or deterioration. Verify that temporary shipping bracing has been removed. Include internal inspection through access panels and covers for dry-type transformers.
2. Inspect bolted electrical connections for tightness according to manufacturer's published torque values.
3. Insulation Resistance: Perform meg-ohmmeter tests of primary and secondary winding to winding and winding to ground.
4. Duration of Each Test: 10 minutes.
5. Temperature Correction: Correct results for test temperature deviation from 20 deg C standard.
6. Turns Ratio: Measure between windings at each tap setting. Measured ratios deviating more than 0.5 percent from calculated or measured ratio for an adjacent coil is not acceptable.
7. Winding Resistance: Measure for windings at nominal tap setting. Measured resistance, deviating more than 1 percent, from that of adjacent windings, is not acceptable.
8. Verification of the operation of the cooling system.
9. Liquid-Filled Transformer, Insulation Power-Factor Test: Determine overall dielectric loss and power factor for windings' insulation. Limit test voltage to line-to-ground voltage of windings being tested.
10. Functional test of all protective devices.

I. Test Failures: Compare test results with specified performance or manufacturer's data. Correct deficiencies identified by tests and retest. Verify that transformers meet specified requirements.

© Copyright protected

330.050 GROUNDING

A. Comply with Division V Section "Earthing and Bonding" for materials and installation requirements.

330.060 CLEANING

A. On completion of installation, inspect components. Remove paint splatters and other spots, dirt, and debris. Repair scratches and mars on finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

330.070 ADJUSTING

A. After installing and cleaning, touch up scratches and mars on finish to match original finish.

B. Adjust transformer taps to provide optimum voltage conditions at utilization equipment throughout normal operating cycle of facility. Record primary and secondary voltages and tap settings and submit with test results.

330.080 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

V11C - MEDIUM-VOLTAGE SWITCHGEAR

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes medium-voltage switchgear and associated auxiliary equipment.

B. Description Of Work: medium voltage (MV) switchgear installations comprise the following:

1. Indoor metal-enclosed (LSC2A) MV switchgear.
2. Control power supply.
3. Equipment supports.
4. Earthing of switchgear.
5. Ancillary work.

a) Connection to BMS system of electrical power supply network, including interface elements such as relays, transducers, etc. as necessary and /or as shown on Drawings.

110.000 DESIGN PARAMETERS

110.010 PROJECT/SITE CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Employer or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer not less than two days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.

110.020 REFERENCE STANDARDS

A. Standards: Equipment and component parts shall comply with the following Standards:

1. Common Clauses for HV Switchgear and Control Gear Standards: IEC 62271-1.
2. A.C. Metal-Enclosed Switchgear and Control Gear for Rated Voltages above 1 kV and up to and including 52 kV: IEC 62271-200.
3. HV A.C. Circuit Breakers: IEC 62271-100.
4. Insulation Coordination: IEC 60071.
5. HV A.C. switch-fuse combinations: IEC 62271-105.
6. A.C. Disconnectors (isolators) and Earthing Switches: IEC 62271-102.
7. HV Switches for rated voltages above 1 kV and less than 52 kV: IEC 62271-103.
8. Surge Arrestors: IEC 60099.
9. Metering and Protective Current Transformers (CTs): IEC 61869-2.
10. Metering and Protective voltage Transformers (VTs): IEC 61869-3.
11. Relays: IEC 60255.
12. Reading Instruments: IEC 60051.
13. Watt-Hour Meters: IEC 62052-11, 62053-11, 62053-22 & 60051.
14. Power Transformers: IEC 60076.
15. Sulfur Hexa-Fluoride: IEC 60376.
16. Fuses: IEC 60282-1.
17. Climate Conditions: IEC 60721-3-3 & 60721-3-4.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REQUIREMENTS

1. Busbars: high conductivity, electrolytic copper, modular, designed to withstand worst short-circuit conditions without allowing permissible temperature rise at ambient conditions to be

© Copyright protected

exceeded, in accordance with the Standards. Busbar connection from one unit of switchgear to another shall be expansion/contraction compensated, plated and bolted. Bolted or clamped contact surfaces shall be properly tin or electro-silver plated as necessary. Busbar supports shall be flame-retardant, track-resistant, glass polyester, porcelain or equally reliable fiberglass reinforced epoxy to approved standards.

2. Busbars: shall be tin-plated and insulated either with epoxy insulation applied by the fluid-dip process or heat shrinkable insulating sleeves. Busbar connections shall be insulated with easily installed, performed vinyl boots, secured by nylon hardware.
3. Earth Bus: Copper of not less than minimum size required by the Standards, designed to withstand worst earth- fault current of power system without showing any signs of thermal or mechanical damage or degradation. Earth bus shall extend full length of switchgear.
4. Power Cable Terminations: Fixed bolted type, unless otherwise specified, complete with standard fittings and accessories for connection of incoming and outgoing cables. Cable compartment shall be designed to permit cables to enter enclosure and connect at respective terminals from below. Terminations are to include appropriate sealing ends, fittings, earthing straps and accessories for types of cables used, including stress cones or other stress relieving accessories, heat shrinkable sleeving, end boxes or end bushings and fittings of any kind necessary to support and protect specified cable.
5. Where single core cables are used, top / bottom cable entry plates shall be made of Aluminum with adequate thickness and rigidity to support cables.
6. All switchgear shall be provided with Local/Remote selector switch for controlling the switchgear either from local or remotely via BMS system.
7. Potential Indicators: Neon indicators shall be provided at front of each switchgear unit, one per phase, using capacitive potential divider to indicate voltage state on cable terminals.
8. Short circuit indicator: neon indicators are to be provided at front of each switchgear unit, one per phase, to indicate damaged section due to existence of short circuit.
9. The primary windings of VTs shall be protected by a HRC fuses.
10. The secondary windings of VTs shall be protected by MCBs located at the LV compartment. Each MCB shall be equipped with necessary auxiliary contacts for alarm, interlock, BMS interface, etc. applications.
11. All secondary circuits shall be wire with PVC insulated flexible 750V copper wires, with a minimum cross section of 1.5mm2 for control, alarms, signaling etc, and 2.5mm2 and 4mm2 for voltage and current circuits respectively.
12. The secondary circuits of the current transformers shall be connected to terminal blocks located inside the LV compartment. These terminal blocks shall be equipped with suitable built-in make before break shorting facilities.
13. DC supplies to each cubicle shall be protected by suitable MCBs equipped with necessary auxiliary contacts to give alarms in case of MCB trips.
14. Interlocks shall be provided on switchgear so that:

    a) Circuit breaker cannot be isolated, earthed or put into service position when closed.
    b) Access to cable compartments cannot be made unless earthing switch is closed.
    c) Earthing switch cannot be opened unless cable compartment is closed.

15. Keys and padlocks shall be provided for manually interlocking two or more units if required. Electrical and mechanical interlocks shall be provided for automatic safe and functional operation of the system as specified or shown on the Drawings/Schedules.
16. Earthing facilities shall be provided for earthing and/or short-circuiting the feeder at its terminals through built-in, safety-interlocked, quick-make earthing switch, without use of loose attachments.
17. Metal cases of instruments and control devices shall be connected by PVC insulated copper conductors of not less than 2.5mm2 cross-section to nearest earth bar.
18. Ferrules: Cable and wire ends shall be fitted with numbered ferrules of approved type at each termination. Colour coding shall be as required by the Regulations and the applicable Section of the Specification.
19. Test terminal blocks shall be provided inside insulating covered bases for instruments, instrument transformers, relays etc. in LV compartments.
20. Components shall be interchangeable when of same rating and function.
21. Finish: Inner and outer surfaces of steel enclosures and structure shall be cleaned, phosphatized, primed with rust inhibiting primer and finished with two coats of baked enamel, color standard

© Copyright protected

gray (RAL 7033) unless otherwise approved. Finish shall be vermin and fungus proof and suitable for worst climatic conditions on site.

22. MV Switchgear Ratings:

    a) Rated Voltage: 24 kV.
    b) Nominal Service Voltage : 15 kV.
    c) Rated Frequency: 50 Hz.
    d) Rated One Minute Power Frequency Withstand Voltage (rms) to Earth and Between Phases: 50 kV.
    e) Rated Impulse Withstand-Voltage (1.2/50 micro-sec) (peak): 125 kV.
    f) Rated Normal Current of Busbars: (630/1250/1600/2000/2500 A) as shown on Drawings.
    g) Rated Short Time Withstand-Current: 20 kA for 1 second for metal enclosed LSC2A-PI or PM switchgear).
    h) Rated Peak Withstand-Current: 50 kA (for metal enclosed LSC2A switchgear).
    i) Passive internal arc classification for metal enclosed LSC2A switchgear or extandable ring main units (LSC2B or LSC2A) is designated as follows:

Classification IAC	AFL
Internal arc	20 kA 1 s

23. Auxiliary Power Supply Rating:

    a) Rated Supply Voltage of Closing and Opening Devices and Auxiliary Circuits: 110 or 125 D.C. V, as recommended by manufacturer.

120.020 INDOOR METAL-ENCLOSED SWITCHGEAR

A. Type: Air insulated type for installation indoor categorized (LSC2A-PI or PM), having a minimum of two high voltage compartments with insulated or metallic partitions in between and one point of disconnection per functional unit, comprising single busbar, floor mounted, free standing switchgear of modular construction, forming a continuous integral structure extendable at either end, with withdrawable mounted circuit breakers and three position switch disconnector per feeder or fixed breaker and three position switch disconnector per feeder, isolating disconnectors, and/or switch – disconnector-fuse combination, motorized switch disconnector, as specified or shown on the Drawings.

B. Switchgear shall have a degree of protection, against contact with live parts and against external effects, of IP 3X for enclosures and IP 2XC for partitions according to IEC 62271-1 and IEC 60529, when in the connected position.

C. Circuit Breakers: Frame mounted and bolted into position. Frame shall have wheels for handling during installation or maintenance.

D. Single air-break/SF6 isolator shall be provided, on busbar side of circuit breaker, interlocked with circuit breaker operation such that isolation or connection of the isolator is not possible while circuit breaker is closed. Isolators shall be pad lockable in the off and earth positions.

E. Compartmentation shall be provided by earthed metallic or insulated partitions between switching devices, busbars, cable terminations and LV equipment.

F. Mechanical interlock between the door and the switch disconnector's "Earth Position" shall be provided.

G. Control and monitoring of each unit shall be provided on front panel and shall include mimic diagram, operating handles of main device and earthing switches, position indicators, close and trip push buttons, potential indicators, identification and instruction plates, protective devices, metering and indicating instruments, key and padlockable devices, as specified and shown on the Drawings.

H. Access to LV wiring shall be from front of cubicle for control, protection, test terminal blocks and associated LV power connections. Multi-pin, disconnectable, lock-in type plug and socket arrangement shall be provided between circuit breaker and stationary part of cubicle.

I. Anti-condensation heaters with hygrostat, switch and pilot lamp and of rating recommended by manufacturer shall be provided in each section of switchgear assembly.

© Copyright protected

J. Wiring diagram, suitably protected and located inside LV compartment of each unit, shall indicate all data and components related to the particular unit and its external circuitry.

120.030 MV CIRCUIT BREAKERS

A. Type: vacuum break circuit breaker or SF6 circuit breaker, with closed gas circuit, and with pressure detector to prevent operation of circuit breaker in case of loss of gas pressure within the sealed enclosure**.**

B. Circuit breakers used in ring main units shall be of class M1-E2 for mechanical and electrical endurances respectively to IEC 62271-100.

C. Circuit breakers used in metal enclosed (LSC2A) switchgears shall be of class M2-E2 for mechanical and electrical endurances respectively to IEC 62271-100.

D. Circuit breakers used in metal clad (LSC2B) switchgears shall be of class M2-E2-C2 for mechanical and electrical endurances and for restrike probability during capacitive current breaking respectively to IEC 62271-100.

E. SF6 breakers shall be provided with pressure switches, one per pole, to initiate alarm in case the pressure of the SF6 gas drops below manufacturer set values. Gas filling valves shall be provided unless sealed type circuit breakers are used. Gas status indicator shall be provided on circuit breaker front.

F. Particulars: In addition to the ratings specified in paragraph 120.010 22 "MV Switchgear Ratings" of Article 2.2**Error! Reference source not found.** "General Requirements" hereof, circuit breakers shall have the following ratings:

1. Rated Normal Current: As shown on Drawings.
2. Rated Short-Circuit Breaking Current at Nominal Service Voltage and 30 % Percentage D.C. Component in Accordance with IEC 62271-100: 20 kA (metal enclosed LSC2A switchgear).
3. Rated Short-Circuit Making Current (peak): 50 kA (metal enclosed LSC2A).
4. Rated Duty Operating Sequence: O - 3 min – CO - 3 min - CO.
5. Rated Transient Recovery Voltage (TRV) for Terminal Faults (peak) not exceeding: 30 kV otherwise, surge arrester shall be used on each main and outgoing feeder.
6. Rated Cable Charging Breaking Current: 30.5 kA.
7. Rated (single) Capacitor Breaking Current: 400 A minimum.

G. Operating Mechanism: Mechanically and electrically trip- free, stored energy, spring loaded, manually charged by lever or hand-crank, electrically charged by suitably rated universal motor, and capable of one complete off-on-off cycle in case of loss of control power. The operating mechanism shall include anti-pumping device and incorporate manual trip facility fitted with a guard. It shall be possible to manually discharge the springs. Circuit breaker shall have electrical close solenoid and one trip coil, mechanical on and off status indicator, mechanical and electrical on/off push buttons, mechanical indication of spring charged, non-resettable operation counter and auxiliary contacts to satisfy all functions specified or shown on the Drawings. Five N.C. and five N.O. spare auxiliary contacts for future use shall be provided in addition to those required different applications. All spare auxiliary contacts shall be wired to terminal blocks inside the LV compartment marked as spare. Auxiliary relays shall be provided where insufficient auxiliary contacts are available. Insertion of manual spring charging lever or hand- crank shall automatically disconnect the motor.

H. The tripping, closing and auxiliary functions shall be capable of operating at control voltages between 85 per cent and 110 per cent of the rated values.

I. Interchangeability: Circuit breakers of different current ratings shall not be interchangeable. Circuit breakers of same current rating shall be wired alike and interchangeable.

J. Mechanical endurances of circuit breakers shall be class M2 according to IEC 62271-100.

120.040 MV SWITCH-DISCONNECTORS AND SWITCH-FUSE COMBINATIONS (FOR INSTALLATION IN FIXED METAL-ENCLOSED SWITCHGEAR)

A. Switch-Disconnector: General purpose, 3-pole, load- break, short-circuit make, SF6 interrupter or vacuum interrupter type, equipped with gas pressure indicator with alarm contacts, class M1-E3 for

© Copyright protected

mechanical and electrical endurances respectively to IEC 62271-103, providing positive break indication, as defined in IEC 62271-102, with contact position indicating device and reliable method of preventing any earth leakage currents passing from terminals of one side to terminals of other side of the switch-disconnector when in the open position.

B. Switch-disconnector operation shall be electrically and manually through handles at front of unit. Switching mechanism shall be manual, motor operated, spring charged, quick-make and quick-break, with speed of switching independent of operator. On/off control push buttons shall be provided for controlling the switch. Switch-disconnector shall have on and off positions, lockable in either position. Reliable mechanical indicator shall be provided for indicating the two positions.

C. Switch-disconnector earthing switch of the quick-make type, front operated (operation being independent of operator), class E2 for electrical endurance to IEC 62271-102, shall close onto cable terminals and be interlocked such that it will close only after load-break switch- disconnector and associated breaker are open. Earth blades shall be visible through an inspection window. Access to cable compartment shall be prevented unless earthing switch is closed.

D. Switch-Disconnector Ratings:

1. Rated Normal Current: 630 A.
2. Rated Short-Circuit Making Current (peak): 50 kA.
3. Rated Short Time Current: 20 kA for 1 sec.

E. Switch-Fuse Combination: 3-pole, trip-free, of similar construction to switch-disconnector, with set of three air- insulated fuses, in accordance with IEC 62271-105. Automatic trip switching shall be by fuse striker pins which actuate common trip-bar in switch mechanism. Once operated, striker pins remain in ejected position, preventing re-closure of switch until fuse has been replaced. Single phasing shall not be possible. Switch-Fuse combination shall have two earthing switches to earth both sides of fuses simultaneously by means of quick-make earthing switches, interlocked to operate after main switch is opened.

F. MV Fuses: High-breaking capacity, totally enclosed, cartridge type fuse-links, current limiting, with striker pins to cause switch to open. Fuses shall comprise fuse links and fuse bases insulated to respective standards. Fuses shall comply with IEC 60282-1.

G. Switch-Fuse Combination Ratings:

1. Rated Normal Current: 200 A.
2. Rated Short-Circuit Breaking Capacity: 20 kA.
3. Rated Short-Circuit Making Current (peak) to IEC 62271-105: 50 kA.
4. Rated Current of Fuse Link: as shown on drawings.

H. Switch-Fuse combination additional devices, where specified or shown on the Drawings, shall be provided as follows:

1. Shunt trip relay, operated by push buttons or relay as shown, using auxiliary power.
2. Under-voltage relay, operated by auxiliary power electrical closing device, geared motor connected to switch spring charging mechanism, with closing release, operated from auxiliary power supply.

I. Mechanical endurance shall be class M1 according to IEC 62271-103.

120.050 PROTECTIVE RELAYS, DEVICES AND AUXILIARIES

A. Protective Relays: Digital, programmable, solid state, static, sealed type, having high immunity to electric field, with modular design, suitable for operation at 55 deg. C ambient temperature, mounted in dust-tight steel enclosures with cover, with self supervision system test buttons for testing without removing from case, and built in self regulated power supply unit and installed where shown on the Drawings. Adjustments and settings shall be accessible and visible from front of relay. Performance shall be in compliance with IEC 60255-151, -8, -1 and IEC 60255-22 (Sections 1-4) and as applicable elsewhere in this specification.

B. Protective Relay: shall be supplied with DC power from the switchgear power supply, and to be provided with a pilot LED which shall be lit under healthy operating conditions. Relay shall be provided with a self supervision system which upon power supply interruption or a fault condition

© Copyright protected

shall switch off the LED and to initiate an alarm. The rated current and voltage for current & voltage sensing relays shall match that of the corresponding current and voltage transformers of the switchgear respectively. The continuous rating of the output contacts shall not be less than 5A.

C. Interference and test voltages of the solid state relays shall be as follows:

1. Insulation test voltage, terminal groups between themselves and the relay frame work as per IEC 60255-5: 2 kV, 50 Hz, 1 min.
2. Impulse test voltage, terminal groups between themselves and the relay frame work as per IEC 60255-151: 5 kV, 1.2/50 micro sec.
3. High frequency test voltage, terminal groups between themselves and the relay framework as per IEC 60255-1: 2.5 kV, 1MHZ.

D. Over Current Relay: 3 phase, non-directional, solid state type with two setting stages as follows:

1. Low setting stage for overload protection with current setting range of 50 % to 250 % of rated current in steps of 5%, and adjustable definite time and inverse time operation modes as per IEC 60255-151.
2. High setting stage (instantaneous) for short circuit protection with current setting range up to 4000% of rated current.
3. For transformer protection the time and instantaneous units shall not operate on inrush or due to harmonic currents during transformer energization or on system faults. Separate additional harmonic restraint relays may have to be provided, if required based on the transformer manufacturer's data.

E. Directional Over Current Relay: 3 phase, directional, solid state type for overload protection with current setting range of 50 % to 250 % of rated current in steps of 5%, and adjustable definite time and inverse time operation modes as per IEC 60255-151.

F. Earth fault relay, non-directional, solid state type with two setting stages as follows:

1. Low setting stage of 10 % to 80 % of rated current and adjustable definite time and inverse time operation modes as per IEC 60255-151.
2. High setting stage (instantaneous) with current setting range up to 1000% of rated current.

G. Restricted earth fault relay, on secondaries of distribution transformers and generators having a solidly grounded neutral, where specified or indicated on the Drawings, shall be high impedance, instantaneous differential type, current calibrated from 1% - 20% of phase current.

H. Under-Voltage and Over Voltage Relays: three phase or three single phase, solid state definite time type with the following setting ranges:

1. Under Voltage Relay: 60 % to 90 % of rated voltage and 0.2 to 6 sec time delay.
2. Over Voltage Relay: 80 % to 130 % of rated voltage and 0.2 to 6 sec time delay.

I. Under-Voltage and Phase-Sequence Relays: Under-voltage relay shall be time-delay type, with selectable time/voltage characteristics 0.1 - 1.0 seconds for settings between 60% and 90% of normal voltage, sensed at VT secondaries. Combined under-voltage and phase-sequence relays shall be provided where specified or shown on the Drawings. Phase- sequence relay shall prevent operation (closing) of respective circuit breaker in case of non-conformance of phase rotation.

J. Each relay shall be provided with an interface data link (IEC 61850 or equivalent) and adequate number of contacts for tripping annunciation, and interface with BMS functions.

K. Auxiliary Relay: Suitably rated with sufficient number of N.O. and N.C. contacts for operation in conjunction with protective relays or control/interlocking requirements. Relay shall have two N.O. and two N.C. spare contacts.

L. Surge Arresters on Main Incoming Feeders: Gap-less, metal oxide, heavy duty type, silicon polymer housing with the following characteristics:

1. Arrester Rated Voltage: 15 kV.
2. Maximum Continuous Operating Voltage (Uc): 12.7 kV.
3. Nominal Discharge Current (8/20 micro-sec peak): 10 kA.
4. Energy Input Capacity**:** 3.5 kJ/kV.

© Copyright protected

Surge arresters shall be vertical, free standing, explosion-proof type. Submit complete data and characteristics in accordance with IEC 60099 testing requirements and procedures.

M. Surge Arresters on Outgoing Circuit Breakers: Where specified or shown on the Drawings, surge arresters shall be gap-less, metal oxide, heavy duty type, silicon polymer housing with the following characteristics:

1. Arrester Rated Voltage: 12 kV.
2. Maximum Continuous Operating Voltage (Uc): 10.2 kV.
3. Nominal Discharge Current (8/20 micro-sec peak): 10 kA.
4. Energy Input Capacity: 3.5 kJ/kV.

Surge arresters shall be vertical, free standing, explosion-proof type. Submit complete data and characteristics in accordance with IEC 60099 testing requirements and procedures.

N. Control power supply shall be a complete system, including main LV switch, battery charger, batteries, racks and connectors, factory assembled and completely pre-wired to minimize field installation.

O. Batteries: Nickel cadmium type, of capacity sufficient to supply all MV switchgear auxiliary loads, relays, coils, lamps, alarms etc. for 8 hours, to close all circuit breakers in rapid succession, and trip all circuit breakers simultaneously with the charger off. Battery shall be heavy-duty type with transparent containers, maximum and minimum electrolyte level indicators and alarm initiating relay in case of D.C. output failure. Battery calculation shall be submitted according to IEEE 1115 based on simultaneous trip of all circuit breakers in T1 (1 minute) period, continuous load in T2 (478 minutes) period, and successive close of all circuit breakers in T3 (1 minute) period. Batteries shall be sized for nominal system voltage +10% -15%. Calculation shall consider the following factors:

1. 1.15 design margin.
2. 1.25 aging factor.

P. Battery Racks: Generously dimensioned termite resistant hardware with electrolyte resistant paint finish, or square sectioned steel tubes treated with electrolyte resistant extruded coating. Fittings and connectors shall be approved and certified electrolyte resisting and corrosion proof materials.

Q. Battery Charger: Automatic voltage controlled, solid state type, suitable for float and boost charging, returning batteries to 90% full charge within 4 hours after full discharge, plus full duty cycle required of batteries. Charger shall operate from 230 V supply, 50 Hz, three or single- phase, giving specified DC output and having minimum range of adjustment of 100% - 125% float voltage and 110% - 135% boost voltage. Ripple shall not exceed 1% of nominal output voltage. Output voltage regulation tolerance shall be +/- 1%. Output transient response shall be +/- 5% maximum of the DC voltage setting for 100% step load changes with recovery time of 500 m sec to steady state. Charger shall be rated 125% of its nominal full load and shall have its own automatic control against overcharging and overload protection. Charger shall have AC voltmeter, DC voltmeter, DC ammeter, main incoming circuit breaker, pilot lights on AC input and DC output, and earth fault detector with alarm indication. Battery charger sizing calculations shall consider the following:

1. 1.1 design margin.
2. 1.4 battery inefficiency factor.

R. Battery Charger Type: Dual charger-type, parallel redundant, with each module capable of carrying the full load requirements of the system.

120.060 METERING INSTRUMENTS - INSTRUMENT TRANSFORMERS

A. Provide metering Instruments and instrument transformers as specified and/or shown on the drawings.

B. Instruments Generally: Housed in enameled, square steel cases for switchboard flush installation, size 96 x 96 mm with 5 mm frontal, protected and sealed white background dials with black pointers (in general) and anti- parallax shadow-proof glass covers. Accuracy of instruments shall be class 1.5 unless otherwise specified. Moving parts shall be damped, revolving on hard-stone bases, with zero adjustment screw.

© Copyright protected

C. AC Voltmeters: Moving iron type, operating from VT secondaries, and with the following characteristics:

1. Measuring Range: 1.25 x system nominal voltage in kV with red line marked on nominal voltage, 250 degrees decimal scale.
2. Overload Factor: 1.2 times rated voltage continuous and twice rated voltage for 1 minute.

D. DC Voltmeters: Moving coil type, with the following characteristics:

1. Measuring Range: 1.25 x D.C. aux. power voltage V.
2. Overload Factor: 1.2 times rated voltage continuous and twice rated voltage for 1 minute.

E. Voltmeter Selector Switch: 7-position, rotary type, with cam-operated contacts, permitting line-to-line and line- to-neutral voltage readings, and with off position.

F. AC Ammeters: Moving iron type, operating from CT secondary, and with the following characteristics:

1. Measuring Range :1.25 CT primary amps, 250 degrees decimal scale
2. Overload Capacity: 1.2 times measuring range continuous, twice measuring range for 2 minutes, and fifty times measuring range for 1 second.

G. DC Ammeters: Moving coil type, with the following characteristics:

1. Measuring Range: 2 x normal D.C. range A.
2. Overload Capacity: Ten times measuring range for 5 seconds.

H. Power Factor Meters: Totally enclosed, 3-phase, electro- dynamic type, with cross-coil meter movement and accuracy of 1% from at least 20% - 100% rated current at rated voltage.

1. Measuring Range: 0.1 conductive-unity-0.1 capacitive

I. Watt-meters: Totally enclosed, 3-phase, electro-dynamic type, with overload factor of 1.2 times continuous.

1. Measuring Range: 1.25 x rated kW.

J. Watt-Hour Meters: 3-phase, to IEC 62052-11, 62053-11, 62053-22 and IEC 60051, unless otherwise required by the Local Power Authority, for operation from 5 A CT secondaries.

K. Frequency Meters: Vibration (reed) type, rated frequency 50Hz, class 1, rated frequency range 45-55Hz, and unaffected by voltage variations of +/-20%.

L. Current Transformers (CTs): Indoor dry type (cast- resin), with the following characteristics:

1. Metering (general): Class 0.5, 5 A secondary.
2. Protection: Class 5P20, 5 A secondary.
3. Continuous rating Factor: 1.2.
4. Troid current transformer enclosing the three phase conductors shall be provided for zero sequence earth fault protection where required on drawings.
5. Tariff Kilowatt-Hour-Metering: Class 0.2 A secondary.
6. Current transformers for all types of differential and restricted earth fault protection shall be class PX to IEC 61869-2.
7. Characteristic of CT including knee point voltage (V_k), maximum magnetizing / exciting current (I_{mag} @ V_k) and CT secondary resistance (R_{ct}) shall be submitted for Engineer's approval by the Contractor as part of his CT calculation.

Rated primary current, core size and accuracy limit factors shall be determined in accordance with nominal current of plant protected, short-circuit level and burden. CT shall perform under specified conditions without exceeding accuracy limit. Submit error curves for approval. Thermal short-circuit rating shall be the same as specified for the MV switchgear with dynamic short-circuit rating of 2.5 times thermal rating.

M. Voltage Transformers (VTs): Magnetic, single-phase, indoor, dry type (cast-resin), with the following characteristics:

1. Rated Voltage:

© Copyright protected

a) Primary: 15/√3 kV.
b) Star Secondary / Secondaries: 110/√3 V.
c) Open Delta Secondary: 110/3 V.

2. Accuracy Class: 0.5 for metering and 3P for protection.
3. Rated Voltage Factor: 1.2 continuous, 1.9 for 30 seconds.

Check associated burden and ensure VT can perform satisfactorily under specified conditions. Submit error curves for approval.

120.070 MICROPROCESSOR BASED METERING AND MONITORING UNIT

A. General: A microprocessor based metering unit shall be provided on the incoming and/or outgoing feeder panels of the MV switchgear as shown on the drawings. Unit shall be capable of monitoring and displaying the functions listed below and the capability to communicate data. Unit shall be similar to Cutler Hammer / Eaton Corp (UK) type IQ DP-4000 or other equal and approved.

B. Direct reading metered values shall be displayed by the unit as follows:

1. AC amperes in each phase, +/-0.5% accuracy
2. AC voltage, phase to phase, phase to neutral, +/-0.5% accuracy
3. Megawatts, +/-1% accuracy
4. Megavars, +/-1% accuracy
5. Megavoltamperes, +/-1% accuracy
6. Power factor, +/-2% accuracy
7. Frequency, +/-0.1 Hz accuracy
8. Megawatt demand (5,10,15,30 minute interval field programmable), +/-1% accuracy
9. Megawatt , megavars and VA hours, +/-1% accuracy
10. %THD , +/- 1%

C. Unit shall be provided with an interface data link (IEC 61850 or equivalent) for connection with BMS systems.

D. Control power shall be drawn from the monitored incoming AC line terminal connections. Device shall have non-volatile memory and does not require battery backup. In the event of a power failure, the device shall retain preset parameters.

E. Unit shall allow user to disable undesired values or functions and to later reactivate them if required. In the event of trip or alarm condition, a built-in reset button shall allow a manual reset of the unit. Unit is also to be capable of being remotely reset via its communication port.

F. Addressable communication card shall be provided for interfacing with BMS system, for transmission of all data, including trip data.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division Y Section "Earthing and Bonding ".
3. Division Y Section "Medium-Voltage Cables" for cable terminations at switchgear.
4. Division W Section "Central Control / Building Management ".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. ABB
2. G.E.
3. Schneider Electric
4. Siemens
5. Cuttler Hammer/Eaton corp.

B. Locally assembled products by one of the above approved manufacturers are acceptable subject to compliance with design requirements and adequacy of reference list and quality control of the local factory.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Manufacturer Qualifications: Engage a firm experienced in manufacturing switchgear similar to those indicated for this Project and with a record of successful in-service performance.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.

B. Deliver, store, and handle materials, components, and equipment as per Manufacturer’s instructions.

310.030 COORDINATION

A. Coordinate layout and installation of switchgear with other construction and room dimensions. Advise the Engineer in case of conflict.

B. Coordinate size and location of concrete or mounting bases. Concrete, reinforcement, and formwork requirements are specified in Division E Section "Accessories Cast Into In Situ Concrete."

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division H Sections.

310.040 WARRANTY

A. Manufacturer’s Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period Warranty Period: 1 year from date of Substantial Completion

310.050 FACTORY ACCEPTANCE TEST

A. Factory acceptance tests of equipment under this Contract are subject to be witnessed by the Engineer for locally assembled equipment. Witness test shall include complete routine and function testing on all units to be witnessed. Test procedure and program shall be submitted for approval prior to test conduction. Allow for test expenses including business class transportation and hotel accommodation as necessary for two persons from the Engineer’s/ Employer’s side.

© Copyright protected

310.060 SPARE PARTS AND EXTRA MATERIAL

A. Spare Parts: Provide spare parts, as recommended by the manufacturer, for one year maintenance as expected under local conditions, and to allow for emergency replacement due to accidental breakage or failure. Spare parts shall include, but are not limited to, the following:

1. Two sets of each type of lamp, fuse, auxiliary switch, trip coil, control switch, selector switch, neon indicator and the like.
2. Complete set of main contacts of each rating.
3. Complete set of breaker/switch auxiliary contacts.
4. Complete mechanism of breaker/switch of each type.
5. Drive motor of each type.

B. Tools and Instruments: Provide tools and instruments required for normal routine inspection, testing, operation and maintenance including levering crank, manual charging handle, manual shutter operator, testing jumpers and HV test bushings, set of rail extensions, digital micro ohm-meter, set of mobile lifting and handling equipment etc. as necessary for the type of switchgear.

320.000 SUBMITTALS

A. Product Data: Submit full technical data of equipment for approval including, but not limited to, the following:

1. Manufacturers' catalogues, detailed description of construction, provisions for extension, compliance with the Standards, dimensions and weights, operating characteristics, operating curves and error curves (VT, CT) for all switchgear, control gear, protective gear, metering gear etc.
2. Details of miscellaneous items including pilot lights, cabling or wiring, incoming and outgoing feeder terminal fittings, supports, labels, interlocks, bracing etc.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Plans and elevations, with indication of switchgear mounted components, dimensions and weights.
2. Arrangement of equipment and general layouts.
3. One-line diagram of power system showing current ratings of switchgear and busbars and types and locations of protective gear (relays, metering instruments, CTs, VTs) etc.
4. Schematic and elementary diagrams of control circuits.
5. Block diagrams for BMS interface points.
6. Foundation details, grouting holes and installation details.
7. Physical arrangement of incoming and outgoing feeders, instrument transformers, busbars, connections etc.
8. Dimensions and weights of control power supply and other auxiliary equipment or components.
9. Calculation of current and voltage transformers characteristics to verify their suitability for proper unsaturated operation under site fault condition and their adequacy for relay/wires/metering requirements.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer’s authorized representative and the contractor.

D. Technical Literature: Submit the following for approval prior to equipment manufacture:

E. Schedule of selected circuit breakers, relays and control gear, with complete identification of each component and its characteristics.

F. Type Test Certificates: Submit to verify compliance of main equipment with the relevant IEC Standards, including the following:

1. Impulse withstand-voltage tests
2. Power frequency withstand-voltage tests.
3. Temperature-rise tests.
4. Short time current tests.
5. Verification of making and breaking capacity.
6. Mechanical endurance/operation tests.

© Copyright protected

7. Verification of degrees of protection for persons against contact with live and moving parts.
8. Internal arc tests.
9. Protection degree test to IEC 60529.

G. Routine Tests: Each complete switchgear unit shall undergo routine tests at the manufacturer's works in accordance with the relevant standards.

H. Qualification Data: For firms and persons specified in "Quality Assurance" Article.

I. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

J. Maintenance Data: For switchgear to include in the maintenance manuals as specified in Division 01 and to the satisfaction of the Employer's requirements.

K. Submit a list of spare parts and tools required for 5 years of operation as expected under local conditions. Include part and drawing numbers, current unit prices, and source of supply.

L. Coordination Study: Submit protection coordination study, including pick-up settings and time-grading, together with time-current curves, equipment damage curves and range of adjustments etc. as required to coordinate with upstream and downstream protective devices of the complete system based on coordination curves of protective devices used and specific calculated prospective short circuit currents at various points.

330.000 EXECUTION

330.010 INSTALLATION

A. Locations and Layout: Exact locations and physical layout of equipment and components may be varied as required to suit manufacturer's design and as approved, provided the required functions and operations are accomplished; follow the identification of the units indicated on Drawings exactly to ease checking and building maintenance procedures.

B. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and equipment manufacturers' drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.

C. Cable Trenches: Ensure that trench construction and covers provided for installation of power and control cables are in accordance with approved shop and construction drawings.

D. Built-In Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which shall be built into concrete foundations, bases, cable trenches or building structure are provided as and when required and that they are properly installed.

E. Equipment: Install on concrete bases etc., and assemble completely plumb and level, before grouting in holding-down bolts.

F. Supports and Terminations: Install all incoming and outgoing cable supports, cable ends and termination fittings required for MV, LV and control cables.

G. Relays: Set in accordance with manufacturer's instructions and in compliance with local Utility requirements.

H. Earthing: Ensure that earthing installation is as described in Division 26 Section "Grounding and Bonding for Electrical Systems" of the Specification and/or as shown on the Drawings.

I. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, brackets, and temporary blocking of moving parts from switchgear units and components.

330.020 IDENTIFICATION

A. Identify field-installed wiring and components and provide warning signs as specified in Division V Section "Basic Electrical Materials and Methods."

B. Diagram and Instructions: Frame under clear acrylic plastic on the front of switchgear.

© Copyright protected

1. Operating Instructions: Printed basic instructions for switchgear, including control and key-interlock sequences and emergency procedures.
2. Storage for Manual: Include a rack or holder, near the operating instructions, for a copy of the maintenance manual.
3. System Power Riser Diagrams: Depict power sources, feeders, distribution components, and major loads.

330.030 CONNECTIONS

A. Tighten bus joint, connector, and terminal bolts according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

330.040 FIELD QUALITY CONTROL

A. Equipment: Inspect equipment upon delivery to site and report any damage to the Engineer.

B. Switchgear: Inspect and check switchgear for completeness and as recommended by the manufacturer and check phasing of buses, contact alignment and clearances.

C. Components: Check component ratings, types, sizes and wiring connections, including current and voltage transformers, fuses, switches, instruments and relays.

D. Before energization carry out at least the following tests:

1. Insulation resistance on busbars (with circuit breakers in disconnected position), circuit breakers, bushings and insulators, feeder terminals etc., using at least a 5 kV megger for MV circuits and a 1000 V megger on all control and protection circuits, with relays, lamps and the like components disconnected, to ensure satisfactory insulation resistance as recommended by the Standards and approved practices.
2. High voltage tests on busbars, while circuit breakers, switches and VTs are in disconnect position by applying HV AC test voltage between phases and phase to earth at 80% of the IEC voltage withstand test for 1- minute.
3. Resistance across closed contacts of circuit breakers using appropriate micro-ohm meter.
4. Functional test of circuit breakers, switches, earth switches, interlocking, protection, alarms, interface with BMS system, etc.
5. Polarity check and ratio tests for CTs.
6. CT transformation ratio.
7. VT polarity test.
8. VT transformation ratio.
9. Calibration checks and adjustment for ammeters and voltmeters.
10. Primary and/or secondary injection tests to check relay operation, using appropriate test sets, followed by tripping of circuit-breaker once only, through its protective relay circuit.

E. Cables: With circuit breaker in disconnected position, ensure that HV testing of feeder cable and respective termination is carried out as required under cable tests.

F. After energization carry out inspection and checking as follows:

1. Breakers shall be closed, one at a time, with as little load on the feeder as possible; check meters as load is increased and any indication of overheating detected by appropriate instruments or sensors.
2. Open and withdraw circuit breaker after a prolonged test run, inspect and check circuit breaker conditions, isolating contacts, contacts on all instruments and control switches, connections at terminal blocks etc., busbar connections and busbars for any indication of overheating; check for loose connections and bolts etc. and finally re-apply megger tests to ensure same quality of insulation as before energization.
3. Close circuit breaker slowly, while in the disconnected position and inspect contacts and/or contact movement and compare with design figures.

G. Manufacturer's instructions shall be followed under all circumstances. Carry out and record measurement and tests recommended by the manufacturer.

© Copyright protected

330.050 CLEANING

A. Inspect interior and exterior of installed switchgear. Remove paint-splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish.

330.060 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation.

© Copyright protected

V21A - INTERIOR LIGHTING

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes interior lighting fixtures, lighting fixtures mounted on exterior building surfaces, lamps, ballasts, emergency lighting units, mounting provisions and connection to circuit wiring and to corresponding lighting control equipment.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Comply with the following Standards:

1. LED Fixtures:

a) IEC 60598 “Luminaires”.
b) IES LM-79-08 “Approved Method: Electrical and Photometric Measurements of Solid-State Lighting Products”.
c) IES LM-80-08 “Approved Method: Measuring Lumen Maintenance of LED Light Sources”.
d) IES TM-21-11 “Projecting Long Term Maintenance of LED Light Sources”.
e) EN 55015 “Limits and Methods of Measurement of Radio Disturbance Characteristics of Electrical Lighting and Similar Equipment”.
f) IEC 62471 “Photobiological Safety of Lamps and Lamp Systems”.

2. LED Drivers:

a) IEC 61347-1 “Lamp Controlgear - Part 1: General and Safety Requirements”.
b) IEC 61347-2-13 “Lamp Controlgear - Part 2-13: Particular Requirements for D.C. or A.C. Supplied Electronic Controlgear for LED Modules”.
c) IEC 62384 “DC or AC Supplied Electronic Control Gear for LED Modules - Performance Requirements”.
d) IEC 61000-3-2 “Electromagnetic Compatibility (EMC) - Part 3-2: Limits - Limits for Harmonic Current Emissions (Equipment Input Current ≤ 16 A per Phase)”.
e) EN 55015 “Limits and Methods of Measurement of Radio Disturbance Characteristics of Electrical Lighting and Similar Equipment”.
f) IEC 61547 “Equipment for General Lighting Purposes - EMC Immunity Requirements”.
g) IEC 62031 “LED Modules for General Lighting – Safety Specifications”.

120.000 SYSTEM DESCRIPTION

120.010 LIGHTING FIXTURE CONSTRUCTION - GENERAL

A. Generally: Construction and wiring of fixtures shall comply with the Regulations and Standards. Fixtures shall be fabricated, assembled and wired entirely at factory. Manufacturer's name, factory inspection stamp and official quality label shall be fixed to each fixture supplied.

B. Lighting Fixtures (Luminaires): Manufacturer's standard, as given in Lighting Fixture Schedules shown on the Drawings, or equal.

C. Sheet Steel Housings: Not less than 0.6 mm thick, and thicker when required by the Specification or the Standards.

D. Sheet Steel Reflectors: Not less than 0.5 mm thick.

E. Aluminum Reflectors: Not less than 99.5 % purity and not less than 0.7 mm thick, unless otherwise approved.

© Copyright protected

F. Fabrication: Metalwork shall be mitred, welded and ground smooth without tool marks or burrs. Flat metal parts shall be stiffened by forming grooves and edges during fabrication. Metal parts shall have finish free from irregularities.

G. Rust-proof Ferrous Base: Ferrous metal parts shall be bonderized (treated with corrosion resistant phosphate solution) and given an approved rust-inhibiting prime coat before application of final finish.

H. Finish for Non-Reflecting Metal Surfaces: Approved baked enamel paint. Paint color on fixture frames and trims shall be as specified or as selected by the Engineer.

I. Finish for Light Reflecting Surfaces: White baked enamel paint having reflection factor not less than 85%. Mirror reflectors, where specified, shall be highly polished, anodized aluminum with reflection factors not less than 97%.

J. Mechanical Resistance of Finish: After finish has been applied on steel surfaces and cured, it shall withstand a 6 mm radius bend without showing signs of cracking, peeling or loosening from base metal.

K. Resistance of Finish to Ultra-Violet: Finish shall withstand 72 hours exposure to an ultra-violet RS lamp placed 100 mm from surface without discoloring, hardening or warping, and shall retain the same reflection factor after exposure.

L. Heat Resistance: Finishes, wires and components inside fixtures shall be certified materials to resist the temperatures or other conditions encountered in the fixtures.

M. Lamp Cap Temperature Rise Test: Comply with IEC 60360 when testing incandescent or discharge lamps for compliance with the limits for each type of lamp.

N. Wiring Inside Fixtures: Not less than 0.5 mm2, and insulated for 240 V application. Insulation shall have acceptable characteristics to resist maximum temperatures inside fixtures. Wiring shall be terminated on screw type, fixed, insulating, terminal blocks.

O. Hinges: Fixtures with visible frames and hinged diffusers shall have concealed hinges and catches, and stain-less steel retaining clips. Other alternative equally durable products may be submitted for approval.

P. Suspension Aligners: Provide for pendant fixtures for axial, vertical and horizontal alignment. Vertical adjustment shall be minimum 25 mm.

Q. Recessed Fixtures: Construct to fit into suspended ceilings without distorting fixture or ceiling. Plaster rings shall be provided for plaster or concrete ceilings.

R. Recessed down light fixtures shall be provided with “trims” to architectural approval and shall not have visible fixing screws or clips.

S. Outdoor Fixtures: UV resistant, non-ferrous metal or specially molded material for outdoor use.

T. Removal of parts for maintenance shall be possible without removing fixture housing.

120.020 LIGHT EMITTING DIODE (LED) LIGHTING FIXTURES - GENERAL

1. Light emitting diode shall be a solid state device embodying a p-n junction, emitting optical radiation when excited by an electric current. It shall be part of the LED module which is supplied as a light source. Output color consistency shall be guaranteed and have a Color Rendering Index (CRI) greater than 80 measured in accordance with IES LM-79-08, unless otherwise indicated on drawings.
2. LED luminaires shall comply with IEC 60598.
3. LED luminaires shall be protected against electric shock by means of basic insulation along with either of the following additional safety precautions:
    a) Earthing accessible conductive parts such that these parts cannot become live in case of basic insulation failure (Class I to IEC 60598).
    b) Providing double insulation or reinforced insulation with no provisions for protective earthing (Class II to IEC 60598).

© Copyright protected

4. LED luminaires' efficacy shall be as shown on Drawings or 75 lumen per watt whichever is more stringent.
5. Guaranteed rated life (L80B50) shall not be less than 50,000 hours at 25 deg. C, as per IES LM-80-08, Approved Method: Measuring Lumen Maintenance of LED Light Sources and IES TM-21-11, Projecting Long Term Maintenance of LED Light Sources.
6. Luminaires guaranteed lifetime shall cover all fixtures components including lamp, fixture and drivers.
7. LED luminaires shall be suitable for 24/7 continuous operation at 50 deg. C with no negative effect on the specified luminaire life time at 50 deg. C and / or performance in terms of color temperature shifting and lumen output.
8. LEDs shall comply with Photo-biological Safety of lamps and lamp systems in accordance with the requirements of IEC 62471. Provide a test report to prove the fixture is classed as "Exempt" or "Risk Group 1".
9. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires, unless more stringent requirements are indicated on Drawings.
10. EMI/RFI shall meet EN 55015 requirements.
11. The maximum percentage of direct up-light from the outdoor luminaires shall be as CIE 126-1997.
12. Housing, for non-linear luminaires, shall incorporate an adequate heat sink, the design of the heat sinks shall be such that there is a direct thermal path from the LED junctions to the atmosphere thus providing a thermal transfer effect throughout the life of the luminaire which ensures the overall fittings and the LEDs are kept relatively cool and any heat generated throughout the life of the fixture at the specified ambient temperature doesn't affect the guaranteed life time and / or luminaire performance.
13. Linear LED lighting strips shall comply with the following in addition to the general requirements listed above:

    a) Linear LED strips shall be provided in flexible lengths as required by the installation conditions.
    b) Linear LED lighting strips characteristics in terms of IP rating shall suit the area of installation and as shown on Drawings.
    c) Linear LED lighting strips characteristics in terms of flexibility shall suit the method of installation (curved or linear) and as shown on Drawings.
    d) Linear LED construction shall be properly designed to ensure adequate heat dissipation from the LED junctions to the atmosphere to ensure that the overall strip is kept relatively cool and any heat generated throughout the life of the strip at the specified ambient temperature doesn't affect the guaranteed life time and / or luminaire performance.
    e) Linear LED strip channels/profiles degree of protection shall match the specified IP rating and shall ensure proper heat dissipation throughout the life of the strip such that the guaranteed life time is not affected.
    f) Linear LED strip power rating (W/m) shall be within 10% of the specified value.
    g) Maximum strip length connected to each LED driver shall be as per manufacturer's recommendation considering the distance from fixture, power and wire cross section.

14. Electronic LED Drivers: high efficiency, high power factor, suitable for operation at the ambient conditions specified for the project. Driver shall have constant output current or constant output voltage over the whole wattage range independent of mains supply fluctuations as shown on drawings and sufficient for operating the number and wattage of LEDs connected. Guaranteed rated life of the driver shall be 50,000 hours as a minimum.
15. LED drivers shall have electrical insulation between primary and secondary sides. Secondary cables from the driver to LED modules shall be provided by the LED supplier. Maximum length between driver and LED module shall be as per manufacturer's recommendations.
16. LED driver shall be protected against electric shock, accidental contact with live parts, short circuit, overload, over temperature where the output current is reduced if the temperature limit is exceeded.
17. In case LED luminaire internal temperature monitoring is required then the LED driver shall be provided with the possibility to connect a temperature sensor to monitor the LED temperature and protect the LED modules against thermal damage.
18. Dimmable driver, where required, shall be compatible with the dimming system used.

© Copyright protected

19. Drivers shall be compatible with the lighting control system used such as; 1-10V, DALI, DMX, etc...
20. LED driver shall be provided with constant light output function, where required on Drawings, in order to maintain the light output of the LED by increasing the LED driving current over the lifetime.
21. LED driver shall comply with IEC 61347-1, IEC 61347-2-13 and IEC 62384 and shall meet the limits of main harmonic content as defined in IEC 61000-3-2 and comply with radio interference suppression limits defined in BS EN 55015 and immunity requirements of IEC 61547.

310.010 QUALITY ASSURANCE

A. Fixture Design and Standards: The Specification and the Drawings are a guide to the selection of lighting characteristics and lighting fixtures, giving general features of construction, materials, method of installation and conditions of operation. Unless otherwise specified, fixtures shall be manufacturer's standard series, designed and manufactured for the purpose and application required, generally in accordance with the Schedule of Lighting Fixtures and complying with IEC 60598 and BS EN 55015.

B. Lighting fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard.

C. All fixtures and accessories selection shall be in accordance of MINEA general specifications.

310.020 COORDINATION

A. Design Layout: Fixture layout has been determined from photometric data of specified fixtures to achieve desired level and uniformity of illumination. Reflected ceiling plans shall be checked to ensure exact positions of fixtures with respect to structural members, ducts, pipes, other installations and ceiling panels/tiles, where required. Certain fixtures are shown in provisional positions, pending preparation of final equipment layout drawings. Such fixtures shall be located in coordination with final equipment layout so that illumination is as intended by the design.

© Copyright protected

B. Fixtures, Mounting Hardware, and Trim: Coordinate layout and installation of lighting fixtures with ceiling system and other construction.

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match product installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fully Equipped Lighting Fixtures: 1% of each type and rating installed. Furnish at least one of each type.
2. Control Gears: 1% of each type and rating installed. Furnish at least one of each type.

320.000 SUBMITTALS

A. Equipment Data: Submit data for approval including, but not limited to, the following:

1. Detailed literature on each fixture, lamp and control gear including manufacturer's name, catalogue number, rating, material specification, overall dimensions, operating characteristics and principles
2. Details of changes to standard fixtures for adaptation to condition of installation and to the Specification
3. Photometric data for lighting calculations provided as IES or LDT format including polar light distribution curves, coefficient of utilization, glare classification, efficiency, depreciation factors etc.
4. Dimensions of fixtures.
5. Certified results of accredited manufacturers' laboratory tests for fixtures and lamps for photometric performance.
6. For LEDs: Photometric test reports from accredited manufacturer's laboratories shall be submitted verifying the luminaire photometric characteristic; the testing shall conform to LM-79-08 or similar and approved international equivalent standard. Report shall include laboratory name, report number, date, luminaire catalogue number, luminaire, light source specifications, etc…
7. Battery and Charger Data: For self-contained emergency lighting fixtures.
8. Fluorescent and high-intensity-discharge ballasts.
9. Cold cathode and LEDs drivers.
10. Energy-efficiency data.
11. Life, output (lumens, Color temperature, and CRI) and energy efficiency data for lamps. Lifetime for LED fixtures shall be indicated at an ambient temperature of 25 and 50 deg. C.
12. Photo biological risk assessment for LED fixtures.
13. Types of lamps.

B. Shop and Construction Drawings: Submit Drawings for approval including, but not limited to, the following:

1. Exact position of each fixture on reflected ceiling plans, with indication of ceiling features, structural members, ducts, pipes and other fittings, as applicable and pertinent to the installation.
2. Installation details including suspension and mounting provisions.
3. Purpose made fixtures or lighting assemblies with full details.
4. Wiring details, circuit and panelboard references, special lighting control arrangements etc.

C. Samples: Submit fully equipped sample of each fixture type, modified if required, together with color and texture samples of each fixture.

D. Installation instructions.

E. Coordination Drawings: Reflected ceiling plans and sections drawn to scale and coordinating fixture installation with ceiling grid, ceiling-mounted items, and other components in the vicinity. Include work of all trades that shall be installed near lighting equipment.

F. Product Certificates: Signed by manufacturers of lighting fixtures certifying that products comply with requirements.

G. Test Certificates: Submit certificates demonstrating LED fixtures compliance with the referenced standards. Include the following as a minimum:

© Copyright protected

1. Degree of Protection to IEC 60529.
2. Humidity Proof to IEC 60598.
3. Insulation resistance and electric strength to IEC 60598.
4. Color rendering for LED fixtures to IES LM 79-08.
5. LED fixtures lifetime to IES LM-80-08 and IES TM-21-11.
6. Efficacy to IES LM-79-08.

H. Dimming Ballast Compatibility Certificates: Signed by manufacturer of ballast certifying that ballasts are compatible with dimming systems and equipment with which they are used.

I. Addressable Ballast Compatibility Certificates: Signed by manufacturer of ballast certifying that ballasts are compatible with the central battery systems and equipment with which they are used.

J. Maintenance Data: For lighting fixtures to include in maintenance manuals specified in Division 1.

330.000 EXECUTION

330.010 INSTALLATION

A. Generally: Install fixtures level, aligned and parallel or square to building lines and at uniform heights as shown on the Drawings or as approved by Engineer. Make final height adjustment after installation.

B. Fixture Support: Provide fixture and/or fixture outlet boxes with hangers, brackets and flanged bolted fittings, as necessary, to support weight of fixture. Submit details of hangers etc. and method of fastening for approval. Rigidly secure fixtures mounted on outlet boxes to fixture studs. Install hooks or extension pieces, when required, for proper installation. Provide one point of support in addition to the outlet box fixture stud for individually mounted fixtures longer than 600 mm.

C. Remote Mounting of Ballasts: Distance between the ballast and fixture shall not exceed that recommended by ballast manufacturer. Verify, with ballast manufacturers, maximum distance between ballast and luminaire.

D. Stem Hangers: Provide two stem hangers for individually mounted pendant fixtures. Stems shall have suspension aligners and shall be of suitable length for suspending fixtures at required height.

E. Suspended Ceilings: If ceiling construction is unable to support weight of fixtures without strain or deformation, suspend fixtures directly from building structure.

F. Solid Ceilings: Coordinate dimensions of recesses in ceilings with exact fixture dimensions and structural elements.

G. Continuous Rows: Arrange fixtures so that individual fixture can be removed without dismantling remaining fixtures. Provide minimum spacing between fixtures.

H. Cover Plates: Install cover plates over fixture outlet box or opening in ceiling or structure when left unused.

I. Flush Recessed Fixtures: Install to completely eliminate light leakage within fixture and between fixture and adjacent finished surface.

J. Ventilation: Keep ventilation channels free after fixture is installed, if required by the design of the fixture. Ensure that the final circuit connection is adequately protected against heat transfer from fixtures.

K. Earth metal frames as described in Division Y Section " Earthing And Bonding ".

L. Tightness: Ensure that enclosed fixtures are reasonably insect/dust tight when installed, and completely weather- proof for installations subject to weather conditions. Installation of fitting and termination of circuit wiring should not invalidate the ingress protection rating.

M. Lamps for Permanent Installation: Place new lamps in fixtures immediately prior to hand-over and when instructed by Engineer. Lamps used for temporary service shall not be used for final lamping of fixtures.

N. Fixtures: Set level, plumb, and square with ceiling and walls, and secure according to manufacturer's written instructions and approved submittal materials. Install lamps in each fixture.

© Copyright protected

O. Support for Fixtures in or on Grid-Type Suspended Ceilings: Use grid for support.

1. Install a minimum of four ceiling support system rods or wires for each fixture. Locate not more than 150 mm from fixture corners.
2. Support Clips: Fasten to fixtures and to ceiling grid members at or near each fixture corner.

330.020 INSPECTION AND TESTS ON SITE

A. Visual Inspection: Check neatness of installation, uniformity of equipment and nameplates etc.

B. Illumination Measurements: Taken at selected locations, to determine level and uniformity.

C. Operation: Check lighting installations for operation including control and regulation equipment.

D. Electrical Data: Measure power factor, current and voltage at start for installations with discharge lamps.

E. Inspect each installed fixture for damage. Replace damaged fixtures and components.

F. Advance Notice: Give dates and times for field tests.

G. Provide instruments to make and record test results.

H. Tests: As follows:

1. Verify normal operation of each fixture after installation.
2. Emergency Lighting: Interrupt electrical supply to demonstrate proper operation.
3. Verify normal transfer to battery source and retransfer to normal.
4. Report results in writing.

I. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

J. Corrosive Fixtures: Replace during warranty period.

330.030 CLEANING

A. Clean fixtures internally and externally after installation. Use methods and materials recommended by manufacturer.

330.040 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting aimable fixtures to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.

1. Adjust aimable fixtures to provide required light intensities.

© Copyright protected

V23 - LIGHTING CONTROL DEVICES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.

110.000 SYSTEM DESCRIPTION

110.010 GENERAL LIGHTING CONTROL DEVICE REQUIREMENTS

A. Line-Voltage Surge Protection: Include in all line voltage solid-state equipment.

110.020 TIME SWITCHES

A. Description: Solid-state programmable units with alphanumeric display.

B. Description: Electromechanical-dial type.

1. Astronomic dial.
2. Two contacts, rated 30-A unless otherwise indicated.
3. Two pilot-duty contacts, rated 2-A unless otherwise indicated.
4. Eight-day program uniquely programmable for each weekday and holidays.
5. Skip-day mode.

110.030 PHOTOELECTRIC RELAYS

A. Description: Solid state, with single-pole, double-throw dry contacts rated to operate connected relay or contactor coils or microprocessor input.

B. Light-Level Monitoring Range: 0 to 37 673 lx, with an adjustment for turn-on/turn-off levels.

C. Time Delay: Prevents false operation.

D. Indoor Ceiling- or Wall-Mounting Units: Adjustable for turn-on/turn-off levels, semiflush, calibrated to detect adequacy of daylighting in perimeter locations, and arranged to turn artificial illumination on and off to suit varying intensities of available daylighting.

E. Indoor Skylight Units: Housed in a threaded plastic fitting for mounting under skylight.

F. Outdoor Sealed Units: Weathertight housing, resistant to high temperatures and equipped with sun-glare shield and ice preventer.

110.040 OCCUPANCY SENSORS

A. Ceiling-Mounting Units: Unit receives control power from a separately mounted auxiliary power and control unit, and operates power-switching contacts in that unit.

B. Ceiling-Mounting Units: Unit receives 24-V dc power from a remote source and, on sensing occupancy, closes contacts that provide signal input to a remote microprocessor-based lighting control system.

C. Switch-Box-Mounting Units: Unit receives power directly from switch leg of the live ac circuit it controls and operates integral power switching contacts rated 1000 W at ac, minimum.

D. Operation: Turns lights on when room or covered area is occupied and off when unoccupied, unless otherwise indicated.

1. Time Delay for Turning Lights Off: Adjustable over a range from 1 to 15 minutes, minimum.
2. Manual Override Switch: Turns lights off manually regardless of elapsed time delay.

© Copyright protected

3. Ambient-Light-Level Control: Adjustable for setting a level of ambient illumination above which sensor will not turn lights on when occupancy is sensed.
4. Isolated Relay Contact: Operates on detection of occupancy or vacancy, as indicated, to activate an independent function.

E. Auxiliary Power and Control Units: As follows:

1. Relays rated for a minimum of 20-A normal ballast load.
2. Sensor Power Supply: Rated to supply the number of connected sensors.

F. Passive-Infrared Type: Detects occupancy by a combination of heat and movement in zone of coverage. Each sensor detects occupancy anywhere in an area of 93 sq. m by detecting occurrence of 150-mm minimum movement of any portion of a human body that presents a minimum target of 232 sq. cm to the sensor.

G. Ultrasonic Type: Emits a beam of ultrasonic energy and detects occupancy through use of Doppler's principle in discerning movement in zone of coverage by sensing a change in pattern of reflected ultrasonic energy.

H. Dual-Technology Type: Uses a combination of passive-infrared and ultrasonic detection methods to distinguish between occupied and unoccupied conditions for area covered. Particular technology or combination of technologies that controls each function (on or off) is selectable in the field by operating controls on unit.

110.050 MULTIPOLE CONTACTORS AND RELAYS

A. Description: Electrically operated and mechanically held.

1. Current Rating for Switching: Consistent with type of load served.
2. Control Coil Voltage: Match control power source.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 1 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

1. Division V Section "Basic Electrical Materials and Methods".
2. Division V Section "Lighting Control Devices" for low-voltage, manual and programmable lighting control systems.
3. Division V Section "Wiring Devices" for wall-box dimmers and manual light switches.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Contactors and Relays:

a) Automatic Switch Co. (ASCO)/Emerson Electric
b) Challenger Electrical Equipment Corp.
c) Cutler-Hammer /Eaton Corporation
d) Siemens-Furnas Controls
e) GE Lighting Controls
f) Hubbell Lighting, Inc.

g) Siemens Energy and Automation, Inc.
h) Schneider Electric
i) Schneider Electric / Square D
j) GE/Zenith Controls, Inc.
k) ABB

2. Time Switches:

a) Diversified Electronics, Inc.
b) Grasslin Controls Corp.
c) Intermatic, Inc.
d) Leviton Manufacturing.
e) Paragon Electric Co., Inc.
f) Tork, Inc.
g) GE/Zenith Controls, Inc.

3. Photoelectric Relays:

a) Allen-Bradley/Rockwell Automation.
b) Area Lighting Research, Inc./Tyco Inc.
c) Fisher Pierce.
d) Grasslin Controls, Corp.
e) Intermatic, Inc.
f) Paragon Electric Co., Inc.
g) M H Rhodes/Cranes Co.
h) SSAC, Inc.
i) Tork, Inc.

4. Occupancy Sensors:

a) Arrow Hart Wiring Devices.
b) BRK Electronics.
c) Bryant Electric.
d) Honeywell, Inc.; Home and Building Controls.
e) Hubbell Lighting, Inc.
f) Lightolier.
g) Lithonia Control Systems.
h) MyTech Corporation.
i) Novitas, Inc.
j) RAB Electric Manufacturing Co., Inc.
k) SenTec, Inc.
l) Sterner Lighting Systems, Inc.
m) Tork, Inc.
n) Touch-plate Lighting Inc..
o) Unenco Electronics (A Hubbell Co.).
p) Watt Stopper, Inc. / Legrand.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Source Limitations: Obtain lighting control devices from a single source with total responsibility for compatibility of lighting control system components specified in this Section, in Division V Section "Lighting Controls Devices,".

© Copyright protected

310.020 COORDINATION

A. Coordinate features of devices specified in this Section with systems and components specified in other Sections to form an integrated system of compatible components. Match components and interconnections for optimum performance of specified functions. Include coordination with the following:

1. Division V Section "Network Lighting Controls."
2. Division Y Section "Panelboards."

320.000 SUBMITTALS

A. Product Data: Include dimensions and data on features, components, and ratings for lighting control devices.

B. Samples: Occupancy sensors for color selection and evaluation of technical features.

C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

D. Maintenance Data: For lighting control devices to include in maintenance manuals specified in Division 1.

330.000 EXECUTION

330.010 INSTALLATION

A. Install equipment level and plumb and according to manufacturer's written instructions.

B. Mount lighting control devices according to manufacturer's written instructions and requirements in Division V Section "Basic Electrical Materials and Methods."

C. Mounting heights indicated are to bottom of unit for suspended devices and to center of unit for wall-mounting devices.

330.020 CONTROL WIRING INSTALLATION

A. Install wiring between sensing and control devices according to manufacturer's written instructions and as specified in Division Y Section "Low Voltage Electrical Power Conductors And Cables" for low-voltage connections and Division 27 Sections related to digital circuits.

B. Wiring Method: Install all wiring in raceway as specified in Division Y Section "Raceways And Boxes For Electrical Systems."

C. Wiring Method: Install all wiring in raceway as specified in Division 26 Section " Raceways And Boxes For Electrical Systems," unless run in accessible ceiling space and gypsum board partitions.

D. Bundle, train, and support wiring in enclosures.

E. Ground equipment.

F. Connections: Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values.

330.030 IDENTIFICATION

A. Identify components and power and control wiring according to Division V Section "Basic Electrical Materials and Methods."

330.040 FIELD QUALITY CONTROL

A. Schedule visual and mechanical inspections and electrical tests with at least seven days' advance notice.

B. Inspect control components for defects and physical damage, testing laboratory labeling, and nameplate compliance with the Contract Documents.

C. Verify settings of photoelectric devices with photometer calibrated within previous six months.

© Copyright protected

D. Electrical Tests: Use particular caution when testing devices containing solid-state components. Perform the following according to manufacturer's written instructions:

1. Continuity tests of circuits.
2. Operational Tests: Set and operate devices to demonstrate their functions and capabilities in a methodical sequence that cues and reproduces actual operating functions.

a) Include testing of devices under conditions that simulate actual operational conditions. Record control settings, operations, cues, and functional observations.

E. Correct deficiencies, make necessary adjustments, and retest. Verify that specified requirements are met.

F. Reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

330.050 CLEANING

A. Cleaning: Clean equipment and devices internally and externally using methods and materials recommended by manufacturers, and repair damaged finishes.

330.060 DEMONSTRATION

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."
1.

330.070 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested, to adjust light levels, make program changes, and adjust sensors and controls to suit actual conditions.

© Copyright protected

V24 - DIMMING CONTROLS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes the following:

1. Integrated, multipreset, modular dimming controls.
2. Multichannel, remote-controlled dimmers.
3. Remote-controlled dimming stations.

110.000 SYSTEM DESCRIPTION

110.010 GENERAL DIMMING DEVICE REQUIREMENTS

A. Line-Voltage Surge Protection: Include in all solid-state equipment.

B. Compatibility: Dimming control components shall be compatible with other elements of interconnected lighting controls and with connected loads as to communication, signaling, and control functions.

C. Dimmers and Dimmer Modules:

1. Audible Noise and Radio-Frequency Interference Suppression: Solid-state dimmers shall operate smoothly over their operating ranges without audible lamp or dimmer noise or radio-frequency interference at any setting. Modules shall include integral or external filters to suppress audible noise and radio-frequency interference.
2. Dimmer or Dimmer-Module Rating: As indicated, but not less than 125 percent of connected load.

D. Panic Switch: Include where indicated or required by authorities having jurisdiction. Switch operation overrides dimmer settings and restores lights on connected output circuits to full brightness regardless of settings.

110.020 MANUAL, MODULAR DIMMING CONTROLS

A. Description: Factory-fabricated equipment providing one to four channels of manual dimming control. Integrate controls and dimmers for mounting in a two- or three-gang wall box under a single wall plate.

B. Module Dimming Capability: Listed for control of type of lighting unit used.

1. Fluorescent Dimmers, 230-V Circuits: Control lights smoothly over a minimum range of 100 to 5 percent of full brightness.
2. Unit Rating: 1900 W, minimum; with each dimming channel rated 600 W, minimum.
3. Wall-Plate Style and Finish: Coordinated with lighting controls specified in other Division V, X and Y Sections.

110.030 INTEGRATED, MULTIPRESET, MODULAR DIMMING CONTROLS

A. Description: Microprocessor-based, solid-state controls.

1. Operation: Automatically changes variable dimmer settings of different groups of lights (channels) simultaneously from one preset scene to another when a push button is operated.
2. Each system includes a control panel and one to four dimmer-control modules. Panels and modules are integrally flush mounted in a single wall box.

B. Control panel adjusts each dimmer channel setting for each scene and commands change from one preset scene to another. Control positions or displays at control panel indicate dimmer settings for each channel for each scene.

© Copyright protected

C. Timed cross-fade action occurs when one preset scene is switched to another.

110.040 MULTICHANNEL, REMOTE-CONTROLLED DIMMERS

A. Description: Microprocessor-based, solid-state controls and low-voltage control signals change dimmer settings of remote dimmer modules.

1. Operation: Dimmer modules change intensities of different groups of lights (channels) from one preset scene to another.
2. System includes modular dimmer cabinets and separately mounted control panels.

B. Control panels adjust dimmer channel settings for each scene and command change from one preset scene to another. Displays at control panel indicate dimmer settings for each channel for each scene. Panels are flush mounted with push button and display units and have finish colors as selected by Engineer.

C. Change from one preset scene to another is accomplished by a timed cross-fade action, adjustable over a range of at least 1 to 240 seconds, and is separately programmable for each preset.

D. Dimmer Cabinet: Factory wired and convection cooled without fans.

E. Dimmer Modules: Plug-in type, automatically disconnected by an air-gap relay when switched off or set to minimum intensity. Units withstand power-line surges of 6000 V, 3000 A.

F. Non-dim modules include relays with contacts rated to switch 15-A tungsten filament load and 15-A electronic ballast load.

G. Filtering of each dimmed circuit provides a minimum 350-microsecond current rise time at a 90-degree conduction angle at 50 percent rated dimmer capacity. At any load within rating, rate of current rise does not exceed 30 mA/microsecond, measured from 10 to 90 percent of load current waveform.

H. System Power-Failure Memory Feature: Retain programming for a minimum of 90 days after power failure. When power is restored, return intensities of dimmed lights for each scene to levels set before failure.

110.050 LOW-VOLTAGE WIRING

A. Digital and Multiplexed Signal Wire: Shielded, twisted-pair cable as specified in Division W Sections .

B. Low-Voltage Control Cable: Multiple conductor, color-coded, No. 20 AWG copper, minimum.

1. Sheath: PVC, except in plenum-type spaces use sheath listed for plenums.
2. Ordinary Switch Circuits: Three conductors, unless otherwise indicated.
3. Switch Circuits with Pilot Lights or Locator Feature: Five conductors, unless otherwise indicated.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

D. Division V Section "Lighting Control Devices" for time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.

PART 1 PRODUCTS AND WORKMANSHIP

100.000 MATERIALS

100.010 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

110.000 QUALITY MANAGEMENT

110.010 QUALITY ASSURANCE

A. Source Limitations: Obtain dimming controls from a single source with total responsibility for compatibility of lighting control system components specified in this Section, in Division V Section "Network Lighting Controls," and in Division V Section "Lighting Control Devices."

110.020 COORDINATION

A. Coordinate features of devices specified in this Section with systems and components specified in other Sections to form an integrated system of compatible components. Match components and interconnections for optimum performance of specified functions. Include coordination with the following:

1. Division V Section "Lighting Controls."
2. Division V Section "Lighting Control Devices."

110.030 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra products described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra products to Employer.

1. Dimmer Modules: 1 for every 10 of each type and rating installed. Furnish at least one of each type.

120.000 SUBMITTALS

A. Product Data: Include dimensions and data on features, components, and ratings for dimming controls. Include elevation views of front panels of control and indicating devices and control stations. Also include the following:

1. List of ballasts and lamp combinations compatible with dimmer controls, by manufacturer and catalog number.
2. Sound data, including results of operational tests of dimming controls.
3. Operational documentation for software and firmware.

B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on Project. Indicate dimensions, weights, arrangement of components, and clearance and access requirements.

1. Wiring Diagrams: Detail specific systems tailored to this Project and differentiate between manufacturer-installed and field-installed wiring.

© Copyright protected

C. Samples: Flush-mounted, dimming control station faceplates for color selection and evaluation of technical features.

D. Manufacturer Certificates: Signed by manufacturers certifying that they comply with requirements.

E. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

F. Maintenance Data: For dimming controls to include in maintenance manuals specified in Division 1. Include software operating manuals.

130.000 EXECUTION

130.010 INSTALLATION

A. Install equipment level and plumb and according to manufacturer's written instructions.

B. Mount control equipment according to manufacturer's written instructions and requirements in Division V Section "Basic Electrical Materials and Methods."

C. Mounting heights indicated are to bottom of unit for suspended items and to center of unit for wall-mounting items.

130.020 CONTROL WIRING INSTALLATION

A. Install wiring as specified in Division V Section "Low Voltage Electrical Power Conductors And Cables" for low-voltage connections and Division W Section "Data Communications" for digital circuits.

B. Wiring Method: Install all wiring in raceway as specified in Division Y Section "Raceways And Boxes For Electrical Systems."

C. Wiring Method: Install all wiring in raceway as specified in Division Y Section "Raceways And Boxes," unless run in accessible ceiling space and gypsum board partitions.

D. Bundle, train, and support wiring in enclosures.

E. Ground equipment.

F. Connections: Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in relevant standards.

130.030 IDENTIFICATION

A. Identify components and power and control wiring according to Division V Section "Basic Electrical Materials and Methods."

B. Label each system control module and each remote dimmer bank with a unique designation. Make designations on elevated components readable from floor.

130.040 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Engage a factory-authorized service representative to test, adjust, and program dimming controls.

B. Schedule visual and mechanical inspections and electrical tests with at least seven days' advance notice.

C. Inspect control components for defects and physical damage, and nameplate compliance with the Contract Documents.

© Copyright protected

D. Check tightness of electrical connections with torque wrench calibrated within previous six months. Use manufacturer's recommended torque values.

E. Verify settings of photoelectric devices with photometer calibrated within previous six months.

F. Electrical Tests: Use particular caution when testing devices containing solid-state components. Perform the following according to manufacturer's written instructions:

1. Continuity tests of circuits.
2. Operational Tests: Set and operate controls to demonstrate their functions and capabilities in a methodical sequence that cues and reproduces actual operating functions.

a) Include testing of dimming control equipment under conditions that simulate actual operational conditions. Record control settings, operations, cues, and functional observations.

G. Correct deficiencies, make necessary adjustments, and retest. Verify that specified requirements are met.

H. Test Labeling: After satisfactory completion of tests and inspections, apply a label to tested components indicating test results, date, and representative.

I. Reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

130.050 CLEANING

A. Cleaning: Clean equipment and devices internally and externally using methods and materials recommended by manufacturers, and repair damaged finishes.

130.060 DEMONSTRATION

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

130.070 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested, to adjust light levels, make preset scene changes, and adjust controls to suit actual conditions.

V25 - NETWORK LIGHTING CONTROLS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes manual, low-voltage lighting controls.

B. This Section includes manual and programmable, low-voltage lighting controls.

C. This Section includes programmable, low-voltage lighting controls.

D. Lighting control devices in compatibility with network lighting control system.

E. Connection to BMS system, including interface elements such as software protocol, relays, transducers, etc., as detailed in Division W Sections and BMS schedules, and shown on Drawings.

110.000 SYSTEM DESCRIPTION

110.010 GENERAL REQUIREMENTS

A. Expansion Capability of System: Adequate to increase the number of control functions in the future by 25 percent more than those indicated. This applies to equipment ratings, housing volumes, spare relays, terminals, and control cable conductor quantities.

B. Line-Voltage Surge Protection: Include in all line voltage solid-state equipment.

110.020 FUNCTIONAL SYSTEM DESCRIPTION

A. A control signal from a manual switch, an internal timing and control unit, or an external sensor or other control signal source is routed to the system control module. This module processes signal according to its programming and routes an "open" or "close" command to one or more relays in the power-supply circuits to groups of lighting fixtures or other loads.

110.030 SYSTEM COMPONENTS

A. Control Module Description: Microprocessor-based, solid-state, 365-day timing unit. Output circuits are switched on or off by internally programmed time signals or by program-controlled analog or digital signals from external sources. Output circuits are pilot-duty relay type capable of operating the types of power switching devices specified. An integral keypad provides local programming and control capability. Keypad use is protected by a key-locked cover and a programmed security access code. An integral alphanumeric liquid crystal or light-emitting-diode display provides menu-assisted programming and control capability. Modules and their associated control panels include the following features:

B. Control Module Description: Microprocessor-based, solid-state, 365-day timing and control unit. Unit is programmable for control of indicated number of output circuits. Output circuits are switched on or off by internally programmed time signals or by program-controlled analog or digital signals from external sources. Output circuits are pilot-duty relay type capable of operating latching-type single-pole lighting circuit relays, multipole lighting contactors, and other devices, all located in other enclosures. An integral keypad provides local programming and control capability. Keypad use is protected by a key-locked cover and a programmed security access code. Manual control and programming steps are viewed on an alphanumeric display. Modules and their associated control panels include the following features:

C. Control Module Description: Microprocessor-based control unit receives programming from hand-held programmer. Control units include a solid-state, programmable, 365-day timing unit and can receive inputs from indicated sensors and other sources. Output circuits are pilot-duty relay type capable of operating latching-type single-pole lighting circuit relays, multipole lighting contactors,

© Copyright protected

and other devices. Output circuits also include digital circuits arranged to transmit control commands to remote preset dimmers. Modules and their associated control panels include the following features:

D. Control Module Description: Panelboard mounted, microprocessor based. Panelboard uses low-voltage-controlled, electrically operated, molded-case branch circuit breakers as prime power-circuit switching devices. Circuit breakers and a limited number of digital or analog, low-voltage control circuit outputs are individually controlled by control module. Control unit includes a solid-state, programmable, 365-day timing unit and receives inputs from indicated sensors and other sources. Line-voltage components and wiring are separated from low-voltage components and wiring by barriers. Control module is locally programmable. Panelboard complies with requirements in this Section and in Division Y Section "Panelboards." Modules and their associated control panels include the following features:

E. Control Module Description: Programmable, microprocessor-based control unit mounted in preassembled modular relay panel. Low-voltage-controlled, latching-type, single-pole lighting circuit relays are prime output circuit devices. Where indicated, a limited number of digital or analog, low-voltage control circuit outputs are supported by control unit and circuit boards associated with relays. Control unit receives inputs from indicated sensors and other sources. Line-voltage components and wiring are separated from low-voltage components and wiring by barriers. Control module is locally programmable. Modules and their associated control panels include the following features:

1. System Memory: Nonvolatile. Reboots program and resets time automatically without errors after power outages up to 90 days' duration.
2. Automatic Time Adjustment: System automatically adjusts for leap year and daylight saving time and provides weekly routine and annual holiday scheduling.
3. Astronomic Control: Automatic adjustment of dawn and dusk switching.
4. Remote Communications Capability: Allows programming, data-gathering interrogation, status display, and controlled command override from an IBM-compatible microcomputer at a remote location over telephone or data lines. System includes modem, communications and control software, and remote computer compatibility verification for this purpose. Microcomputer is not in this Contract.
5. Telephone Override Capability: Overrides programmed lighting shutdown commands by telephoning computer and entering a voice-menu-guided override touch-tone code specific to the zone being controlled.
6. Local Override Capability: Manual, low-voltage control devices override programmed shutdown of lighting and override other programmed control for intervals that may be duration programmed.
7. Automatic battery backup provides power to maintain program and system clock operation for 90 days' minimum duration when power is off.
8. Daylight Balancing Dimming Control: Control module interprets variable analog signal from photoelectric sensor and routes dimming signals to dimming fluorescent ballast control circuits. Signal controls dimming of fixture so illumination level remains constant as daylight contribution varies.
9. Daylight Compensating Switch Control: Control module interprets a preset threshold illumination-level signal from a photoelectric relay and activates relays controlling power to selected groups of lighting fixtures to turn them on and off to maintain adjustable minimum illumination level as daylight contribution varies.
10. Flick Warning: Programmable momentary turnoff of lights warns that programmed shutoff will occur after a preset interval. Warning is repeated after a second preset interval before end of programmed override period.
11. Diagnostics: When system operates improperly, software initiates factory-programmed diagnosis of failure and displays messages identifying problem and possible causes.

F. Mechanically Held, Modular Single-Pole Relays: Split-coil, momentary-pulsed type.

1. Low-Voltage Leads: Five-pin plug connector.
2. Pilot Contacts: Single pole.
3. Rated Capacity (Mounted in Relay Panel): 20 A for tungsten filaments; and 20 A for ballasts.

© Copyright protected

4. Endurance: 50,000 cycles at rated capacity.
5. Mounting: Knockout in modular relay panel, unless otherwise indicated.

G. Electrically Held, Modular Single-Pole Relays: As follows:

1. Rated Capacity (Mounted in Relay Panel): 20 A for all types of fluorescent and HID ballasts; and 15 A for tungsten filaments.
2. Operating Coil: DC.
3. Mounting: Modular printed circuit board. Board is held in place in modular relay panel by quick-release spring pins, unless otherwise indicated.
4. Pilot Device: Provides positive relay position indication.

H. Modular Relay Panels: Steel cabinets, preassembled with modular single-pole relays, power supplies, and accessory components required for specified performance.

1. Barriers separate low-voltage and line-voltage components.
2. Cover: Hinged, lockable type.
3. Directory: Mounted on back of door. Identifies each relay as to bunch loads controlled, and each programmed pilot device, if any.
4. Control Power Supply: Transformer and full-wave rectifier with filtered dc output.

I. Time Switches: Solid-state programmable units with alphanumeric display and shall be compatible with the network lighting control system used.

J. Photoelectric Relays: Solid state, with single-pole, double-throw dry contacts rated to operate microprocessor input, compatible with the network lighting control system used and shall have the following features:

1. Light-Level Monitoring Range: 0 to 37 673 lx, with an adjustment for turn-on/turn-off levels.
2. Time Delay: Prevents false operation.
3. Indoor Ceiling- or Wall-Mounting Units: Adjustable for turn-on/turn-off levels, semiflush, calibrated to detect adequacy of daylighting in perimeter locations, and arranged to turn artificial illumination on and off to suit varying intensities of available daylighting.
4. Indoor Skylight Units: Housed in a threaded plastic fitting for mounting under skylight.
5. Outdoor Sealed Units: Weathertight housing, resistant to high temperatures and equipped with sun-glare shield and ice preventer.

K. Occupancy Sensors: Compatible with the lighting control system used and with the following features

1. Ceiling-Mounting Units: Unit receives 24-V dc power from a remote source and, on sensing occupancy, closes contacts that provide signal input to a remote microprocessor-based lighting control system.
2. Switch-Box-Mounting Units: Unit receives power directly from switch leg of the live ac circuit it controls and operates integral power switching contacts rated 1000 W at ac, minimum.
3. Operation: Turns lights on when room or covered area is occupied and off when unoccupied, unless otherwise indicated.

a) Time Delay for Turning Lights Off: Adjustable over a range from 1 to 15 minutes, minimum.
b) Manual Override Switch: Turns lights off manually regardless of elapsed time delay.
c) Ambient-Light-Level Control: Adjustable for setting a level of ambient illumination above which sensor will not turn lights on when occupancy is sensed.
d) Isolated Relay Contact: Operates on detection of occupancy or vacancy, as indicated, to activate an independent function.

L. Auxiliary Power and Control Units: As follows:

1. Relays rated for a minimum of 20-A normal ballast load or 13-A tungsten filament or high-inrush ballast load.
2. Sensor Power Supply: Rated to supply the number of connected sensors.

a) Passive-Infrared Type: Detects occupancy by a combination of heat and movement in zone of coverage. Each sensor detects occupancy anywhere in an area of 93 sq. m by detecting

© Copyright protected

occurrence of 150-mm minimum movement of any portion of a human body that presents a minimum target of 232 sq. cm to the sensor.

b) Ultrasonic Type: Emits a beam of ultrasonic energy and detects occupancy through use of Doppler's principle in discerning movement in zone of coverage by sensing a change in pattern of reflected ultrasonic energy.

c) Dual-Technology Type: Uses a combination of passive-infrared and ultrasonic detection methods to distinguish between occupied and unoccupied conditions for area covered. Particular technology or combination of technologies that controls each function (on or off) is selectable in the field by operating controls on unit.

3. Multipole Contactors and Relays: Electrically operated and mechanically held, compatible with the lighting control system used and shall have the following features:.

a) Current Rating for Switching: Consistent with type of load served, including tungsten filament, inductive, and high-inrush ballast (ballasts with 15 percent or less total harmonic distortion of normal load current).

b) Control Coil Voltage: Match control power source.

M. MANUAL SWITCHES AND PLATES

1. Switches: Modular, momentary push-button, low-voltage type.

a) Color: White, unless otherwise indicated.

b) Integral Pilot Light: Indicates when circuit is on.

c) Locator Light: Internal illumination helps locate switch in the dark.

d) Wall Plates: Match those specified in Division V Section "Wiring Devices" to materials, finish, and color. Use multigang plates if more than one switch is indicated at a location.

e) Legend: Engraved or permanently silk-screened on wall plate where indicated.

N. LOW-VOLTAGE WIRING

1. Digital and Multiplexed Signal Wire: Shielded, twisted-pair cable as specified in Division W Section "Data Communications."

2. Low-Voltage Control Cable: Multiple conductor, color-coded, 0.6 mm2 copper, minimum.

a) Sheath: PVC, except in plenum-type spaces use sheath listed for plenums.

b) Ordinary Switch Circuits: Three conductors, unless otherwise indicated.

c) Switch Circuits with Pilot Lights or Locator Feature: Five conductors, unless otherwise indicated.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division V Section "Wiring Devices" for wall-box dimmers and manual light switches.
3. Division V Section "Dimming Controls" for architectural dimming system equipment.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Crestron Electronics, Inc.
2. Cutler-Hammer/Eaton Corporation.
3. GE Lighting Controls.
4. Honeywell, Inc./Home and Building Controls.
5. Johnson Controls, Inc./Controls Group Div.
6. Lutron Electronics Co., Inc.
7. Schneider Electric
8. Schneider Electric / Square D Co.
9. ABB

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who is an authorized representative of the programmable lighting system manufacturer for both installation and maintenance of units required for this Project.

B. Manufacturer Qualifications: A firm experienced in manufacturing programmable lighting controls similar to those indicated for this Project and with a record of successful in-service performance.

C. Source Limitations: Obtain low-voltage lighting control system components from a single manufacturer.

1. Provide total responsibility for compatibility of system components, including those provided in this Section and in Division V Sections "Lighting Control Devices" and "Dimming Controls."

310.020 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to Employer.

1. Modular Single-Pole Relays: 1 for every 10 installed. Furnish at least one of each type.
2. Electrically Operated, Molded-Case Circuit Breakers: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

320.000 SUBMITTALS

A. Product Data: Include dimensions and data on features, components, and ratings for lighting controls.

B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on Project. Indicate dimensions, weights, arrangement of components, and clearance and access requirements.

1. Wiring Diagrams: Detail specific systems tailored to this Project and differentiate between manufacturer-installed and field-installed wiring.

C. Operational Documentation: For software and firmware.

© Copyright protected

D. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects/engineers and owners, and other information specified or required by Engineer.

E. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

F. Maintenance Data: For lighting control equipment and system components to include in maintenance manuals specified in Division A. Include software-operating manuals.

320.020 COORDINATION

A. Coordinate features of equipment and system components to form an integrated system of compatible components. Match components and interconnections for optimum performance of specified functions.

B. Coordinate lighting controls specified in this Section with work specified in other Sections, including the following:

1. Division V Section "Lighting Control Devices."
2. Division Y Section "Panelboards."
3. Division V Section "Dimming Controls."

320.030 INSTALLATION

A. Install equipment level and plumb and according to manufacturer's written instructions.

B. Mount control equipment according to manufacturer's written instructions and requirements in Division V Section "Basic Electrical Materials and Methods."

C. Mounting heights indicated are to bottom of unit for suspended items and to center of unit for wall-mounting items.

320.040 CONTROL WIRING INSTALLATION

A. Install wiring between control devices as specified in Division Y Section "Low Voltage Electrical Power Conductors and Cables" for low-voltage connections and Division W Section "Data Communications" for digital circuits.

B. Wiring Method: Install all wiring in raceway as specified in Division Y Section "Raceways and Boxes."

C. Bundle, train, and support wiring in enclosures.

D. Ground equipment.

E. Connections: Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A – UL 486 B.

320.050 IDENTIFICATION

A. Identify components and power and control wiring according to Division V Section "Basic Electrical Materials and Methods."

B. Label each system control module with a unique designation. Make designations on elevated components readable from floor.

320.060 FIELD QUALITY CONTROL

A. Schedule visual and mechanical inspections and electrical tests with at least seven days' advance notice.

B. Electrical Tests: Use particular caution when testing devices containing solid-state components. Perform the following according to manufacturer's written instructions:

© Copyright protected

1. Continuity tests of circuits.
2. Operational Tests: Set and operate controls to demonstrate their functions and capabilities in a methodical sequence that cues and reproduces actual operating functions.

    a) Where light balancing or other control involving equipment provided under other Sections is indicated, combine testing required by this Section with that required by Sections specifying other equipment. Test programmable control related to light balancing, occupancy sensing, and other controls under conditions that simulate actual operational conditions. Record control settings, operations, cues, and functional observations.

C. Correct deficiencies, make necessary adjustments, and retest. Verify that specified requirements are met.

D. Reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

320.070 CLEANING

A. Cleaning: Clean equipment and devices internally and externally using methods and materials recommended by manufacturers, and repair damaged finishes.

320.080 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested, to adjust light levels, make program changes, and adjust sensors and controls to suit actual conditions.

320.090 DEMONSTRATION

A. Explain programming and operation of system and train Employer's maintenance personnel on procedures and schedules for maintaining, programming, operating, adjusting, troubleshooting, and servicing system. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

    1. Provide a minimum of eight hours' training in operation and maintenance.

© Copyright protected

V32 – STATIC UNINTERRUPTIBLE POWER SUPPLY

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes, on-line, static-type, continuous duty, solid state, double conversion uninterruptible power supply (UPS) system installation and static transfer switch, comprising the following:

1. Complete rectifier/charger-battery-inverter system with 100% rated for continuous automatic static switch and maintenance manual by-pass switch.
2. Input harmonic filter.
3. Output isolation transformer.
4. Power conditioner.
5. Interplant power and control cabling.
6. Connection of normal AC power from assigned terminals/switch/circuit breaker, as shown on the Drawings.
7. Earthing system.
8. Connection to BMS system for full monitoring, including proper interface digital software link for remote monitoring from BMS for the points specified in this Section and as detailed in BMS schedules and /or shown on the Drawings as a minimum.

110.000 DESIGN PARAMETERS

110.010 PROJECT/SITE CONDITIONS

A. Temperature limits within which equipment shall be designed to operate are zero to +40 deg. C at 100% rated output. Equipment shall be capable of operating under up to 55 deg. C ambient conditions with derating factor of 1.25% per deg. C over 40 deg. C.

110.020 DEFINITIONS AND ABBREVIATIONS

A. EMI: Electromagnetic interference.

B. LCD: Liquid-crystal display.

C. LED: Light-emitting diode.

D. UPS: Uninterruptible power supply.

110.030 REFERENCE STANDARDS

A. Standards: Installation shall comply with the following standards:

1. IEC 62040-1,2&3 “Uninterruptible Power Systems”.
2. IEC 61000-3-4 “Electromagnetic compatibility (EMC) - Part 3-4: Limits - Limitation of emission of harmonic currents in low-voltage power supply systems for equipment with rated current greater than 16 A”.
3. IEC 61000-4 “Electromagnetic compatibility (EMC) – Testing and Measurement Techniques”.
4. IEEE 485 “IEEE Recommended Practice for Sizing Lead-Acid Batteries for Stationary Applications”.
5. IEC 62310 “Static Transfer Systems”.
6. IEC 61000-3-2 “Electromagnetic compatibility (EMC) - Part 3-4: Limits - Limitation of emission of harmonic currents in low-voltage power supply systems for equipment with rated current greater than 16 A”.
7. IEC 61000-3-3 “Electromagnetic compatibility (EMC) - Part 3-3: Limits - Limitation of voltage changes, voltage fluctuations and flicker in public low-voltage supply systems, for equipment with rated current ≤16 A per phase and not subject to conditional connection”.

© Copyright protected

8. IEC 61000-6-2 “Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments”.
9. IEC 61000-6-3 “Electromagnetic compatibility (EMC) - Part 6-3: Generic standards - Emission standard for residential, commercial and light-industrial environments”.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL SYSTEM DESCRIPTION

A. System: UPS system shall be online, continuous duty, double conversion, class VFI-SS-111 to IEC 62040-3.

B. System shall be of the programmable type, microprocessor based with CPU and memory capabilities for storage of alarms, faults, status change, etc. The UPS shall permit setting parameters for the environment and type of usage to be specified by the Engineer. UPS shall be of the self-diagnostic type, equipped with a self-test function to verify correct system operation. The self-test shall identify the parts of the UPS requiring repair in case of a fault. The system shall be provided with multi-password levels to limit access to software and data.

C. General: System shall be interposed between normal AC power supply and critical load, to secure a minimum period of continuity of no-break battery back-up for the time shown on Drawings in case of failure of normal AC supply and maintain output voltage, frequency and phase deviation within specified tolerances.

D. Redundant systems may be selected for systems 40 kVA and over, depending on criticality of the supplied load and for high reliable requirements. System shall be 100% fully rated, single, dual or “n+1” multi-unit parallel redundant for number and capacity as shown on drawings; which implies complete UPS unit(s) with two sets of battery strings operating in parallel for each unit for ratings up to 80 kVA and two to four sets of battery strings in parallel for each unit for ratings above 80 kVA unless otherwise recommended by the manufacturer and approved by the Engineer. UPS shall be maintained (continuously supplying load through the inverter), with automatic no-break transfer to or retransfer from alternate source (bypass) in case of failure or overload on rectifier- battery-inverter system. System shall employ decentralized bypass technique so that each UPS unit shall be provided with its own static bypass transfer switch. Each UPS unit shall be provided with its own master controller. Master and slave configuration is not acceptable.

E. Normal AC power supply will be available from one protected source fed from either normal AC network or from AC Characteristics of output of generator set (when provided) and UPS system shall be coordinated for best results. Study and advise on special requirements of generator characteristic output and stability.

F. Redundant Systems: have parallel units interconnected so that normal AC power feeds two or more inverters in parallel, to give required power output at critical load. Load sharing circuits shall ensure real and reactive load sharing and provide reverse power protection between parallel units. Full rated capacity of UPS, in case of failure of one of the rectifiers or one of the inverter units shall be equally shared by other healthy units without overloading these units or disturbing operation.

G. Separate filters shall be provided for each rectifier/charger unit separately to limit the THD to less than 7% this applies for all load currents from 25 to 100% of full load.

H. System overall efficiency shall not be less than [

90 % at full load and 88 % at half load (up to 5kVA system).

92 % at full load and 90 % at half load (10-40kVA system).

93 % at full load and 91 % at half load (60-500kVA system).

I. Noise level of complete assembly shall not exceed the following values at 1.0 m distance anywhere within UPS room.

50 dB(A) for ratings up to 5 kVA

60 dB(A) for ratings up to 20 kVA

65 dB(A) for ratings up to 125 kVA

© Copyright protected

70 dB(A) for ratings up to 220 kVA

70-75 dB(A) for ratings up to 500 kVA

120.020 SYSTEM OPERATION

A. Under normal conditions inverter(s) shall be synchronized and phase locked to normal AC supply. Upon loss of normal AC supply, battery shall continue supply of no-break power to inverters, which then free-run on self- generated UPS frequency reference. Upon restoration of normal AC supply, inverters shall re-synchronize to AC line, gradually (at slew rate), if frequency and voltage deviation of normal AC supply is within preset limits specified.

B. Automatic Transfer To Bypass: Static transfer switch shall automatically transfer critical (100%) load from inverter to by-pass source (which is normal AC supply) if:

1. Inverter output voltage characteristics fall outside specified limits.
2. Critical load exceeds overload rating of UPS.
3. Over-temperature is sensed.
4. Manual (push button) command is given.
5. Transfer to by-pass mode shall be inhibited, and an alarm initiated if voltage, frequency and/or phase shift of by- pass power is outside acceptable tolerances.

C. Re-Transfer To Inverter: Re-transfer of critical load from auto by-pass source to inverter (UPS mode) is only to be possible under the following conditions:

1. Inverter output voltage characteristics return to within specified tolerances.
2. Original load current reduces to within rated full load capacity of UPS.
3. Re-transfer selector switch is in automatic position.

D. Lock-out feature shall inhibit re-transfer if by-pass source conditions are outside preset tolerances or if UPS output and by-pass are not synchronized and phase locked or if UPS output is not restored to normal conditions.

E. Normal Power Restored: When normal power is restored following an outage, rectifier/charger shall initially draw no power except for transformer in-rush current and shall gradually continue providing power to the inverter and recharging the battery. After approximately 15 seconds (walk-in time), input power requirements shall rise to power level to drive critical load and recharge battery.

F. Automatic Restart: When normal power is restored to normal conditions following an outage and after a complete battery discharge, the UPS shall automatically restart and resume supplying power to the connected load via the inverter.

G. Provide maintenance disconnecting switch fully rated to carry the full load input current of the UPS.

120.030 SYSTEM CHARACTERISTICS

A. Rectifier/Charger Input:

1. Nominal Input Voltage: 400V, three phase, 4 wire, 50Hz.
2. Voltage input variation: +10%, -15% from nominal.
3. Frequency: +/-5% from nominal.
4. Transformer Exciting Current In Rush: Less than 600 % nominal current.
5. Power Factor: minimum 0.9 lagging at full load and nominal input voltage.
6. Total Feedback Current Harmonics: Maximum **7** % for UPS ratings above 20kVA and 8% for UPS ratings 20kVA and below.
7. Current Limiting: 115% max. of that required to operate inverters and charge battery at full rated load, adjustment possible between 100% and 125%.
8. Walk-in Current in Rush: 25% to 100% FLC in 15 seconds.

B. Rectifier/Charger Output:

1. Float and Equalize Operation: Adjustable, automatic, compatible with battery.
2. Regulation: +/-1% max. from 0-100% load.
3. Ripple: +/-2% rms. (0 to 100% resistive load).
4. Static Inverters:

© Copyright protected

5. Nominal net system power output rating in kVA: as shown on drawings with load power factor 0.8 lag.
6. Nominal output voltage: 400 V, three phase, 4 wire, 50 Hz, adjustable +/-5% of nominal.
7. Output voltage regulation:

    a) Balanced load: +/-2% (0 - 100% load)
    b) Unbalanced load (3-phase output only): +/-3% (at each 10% of load)

8. Phase Displacement: 120 deg. (+/-3 deg.) at 100% load unbalance.
9. Output Voltage Waveform: 5% max. total harmonic, 3% max. single harmonic.
10. Frequency Stability: Normally synchronized to input line frequency over +/-2 adjustable ranges; free running at +/-0.5. Full battery voltage variation, load and p.f. range; slew rate shall not exceed 0.1 Hz/sec.
11. Dynamic Output Voltage Tolerance Sudden Full Load Removal: +/-10% max. recovering application or to within 1% in less than 100 milliseconds.
12. Over-load Rating: 125% for 10 minutes, 150% for 60 seconds, 1000% for 5 cycles, 105% continuous.
13. Load crest factor without derating (Ipk/Irms): 3:1

C. Automatic Static Bypass Transfer Switch:

1. Transfer Time: 150 microsecond (overlapping) maximum.
2. Total Sensing and Transfer/Retransfer Time: 2 milliseconds, maximum.
3. Retransfer Mode: automatic/inhibit (selectable).
4. Retransfer Delay: 2 - 32 secs. in auto mode (selectable).
5. Transfer Point: +/-10% of nominal output voltage (adjustable).
6. Retransfer Point: +/-5% of nominal output voltage (adjustable).
7. Transfer Inhibit Point: +/-20% of nominal output voltage (adjustable).
8. Bypass circuit shall be provided with backfeed protection to IEC 62040-1 through internal backfeed contactor to prevent feedback to the mains from the inverter in case of mains failure and a fault in bypass circuit.

120.040 COMPONENTS AND ACCESSORIES

A. Materials and Parts: Electronic devices shall be solid state, hermetically sealed. Indicator lights shall be twin LED type, those denoting blown fuse conditions shall be seen by operator without removing panels or opening cabinet doors. Power connections and remote alarm and control wiring shall be accessible at terminal boards. Power semi- conductors shall be fused. Metal surfaces including copper and aluminium heat sinks and busbars shall be treated with permanent protective coating. Electro-mechanical power devices and relays shall be vacuum impregnated, insulated for maximum operating voltage conditions, and enclosed in dust-tight enclosures. Cables shall be fire resistant high temperature grade.

B. UPS shall be provided with a socket connection for a serial interface to be linked to a portable PC, to a modem or to the BMS system for communication with the UPS. It shall enable interrogation of the UPS about status, faults, data stored, reprogramming, etc.

C. Housing: Equipment shall be housed in a free-standing, well ventilated, totally enclosed modular assembly with front accessible lockable doors, giving easy access for maintenance, inspection and adjustments, and with provisions for handling and lifting during and after installation. Enclosures shall be suitable for industrial, tropical environments, protection IP 21 to IEC 60529, of galvanized sheet steel construction treated against corrosion and with light grey RAL7032 baked paint or epoxy finish to approved standard.

D. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

E. Sub-assemblies and components shall be mounted on pull- out and/or swing-out trays, of the plug-in type where possible. Where it is not possible to mount components in pull-out or swing-out trays, they shall be easily accessible inside the enclosure. Assemblies shall be replaceable without requiring any adjustments or settings in the UPS.

F. Ventilation: For units rated over 3 kVA, an integral, forced-air, cooling system shall be provided in each UPS module to remove dissipated heat efficiently, and ensure components operate within

© Copyright protected

environmental ratings. Air shall enter bottom of cabinet through replaceable filters, and exhaust through the top. At least two fans shall be provided for ventilating each enclosure. No degradation of performance shall occur in the event of a single fan failure. Temperature sensors, mounted on semi-conductor heat sinks, shall initiate alarm if maximum working temperature is exceeded.

G. Rectifier/charger unit shall be as follows:

H. Active front end (AFE) Insulated Gate Bipolar Transistor (IGBT) or 6-pulse silicon controlled rectifier (SCR) type for UPS ratings up to 40 kVA.

I. IGBT type UPS ratings 40 kVA and up to 200 kVA.

J. IGBT or 12 pulse SCR type with filter for UPS ratings above 200 kVA.

K. The unit shall have mainline circuit breaker and a rectifier input transformer for 12 pulse UPS, and shall be automatic with soft start-up (walk-in) feature, using IGBT with vector control design or silicon controlled rectifiers (SCR) with control logic circuitry to control firing angles to SCR to suit power output requirements and protect against primary power surges, lightning transients, under-voltage and over-voltage conditions. Output shall be passed through LC filters to DC bus.

L. Rectifier/charger unit shall be microprocessor based and capable of supplying full load power to inverter, and to charge the battery from a discharge condition to 90% charge within ten to twelve hours, and maintain full charge at floating voltage until next operation. The rectifier/battery charger shall employ input AC current limiting as well as battery charge current limiting for battery protection. Charger current shall be voltage regulated and current limited. The control of the optimum charging method shall be completely controlled by the charger's microprocessor.

M. Inverter shall employ IGBT technology in three leg, vector control or high frequency switching and real time control technique, and complete with output transformer and filters. Inverter start-up shall be automatic, to reach full voltage within milliseconds and deliver power to the load within 2 seconds. Inverter shall start at any load including short-circuit. Inverter shall be provided with an inverter output transformer. For UPS ratings 200kVA and below transformer-less technique may be used, subject to Engineer's approval.

N. Inverter oscillator shall operate and maintain output frequency of inverter within specified tolerances, and be capable of synchronization and phase-locking to normal power supply frequency. When inverter is phase-locked to normal power supply, and latter fails, oscillator shall automatically revert to free running state (quartz oscillator) and maintain specified limits.

O. Modular UPS system where shown on the Drawings shall consist of multiple units with equal capacities, each not exceeding 50 kVA, connected in parallel architecture and share one common frame or more according to the required number of modules, each frame shall have common input and output busses and separate battery system consisting of two parallel strings as a minimum. Modular UPS system shall be online, double conversion, IGBT rectifier, IGBT inverter with transformerless technique. The modular UPS system shall have the following features as a minimum:

    1. Each module shall be provided with fully rated static and maintenance bypass.
    2. The modular system shall be expandable by adding modules without shutting down the system (hot pluggable).
    3. Modules shall be replaceable without shutting down the system during the replacement process (hot swappable).
    4. The modular system shall not have a single point of failure. Fault on any of the modules shall not affect the whole system.
    5. Sufficient space for the number modules for future expansion shall be provided as shown on the Drawings.
    6. Redundancy, if required on the Drawings, shall be achieved by adding a number of modules with total power capacity shown on the Drawings.
    7. Battery capacity shall be expandable by adding independent battery strings to cater for the increase in the system power. Adding battery strings shall be done without shutting down the system.

P. Automatic static bybass transfer switch shall be continuously rated at full load (100% FL), hybrid type (make-before-break), solid state transfer device with logic thyristor assembly isolatable or

© Copyright protected

completely removable for maintenance. When signal to close switch is initiated, thyristors shall instantaneously conduct power to prevent deviations and breaks in load voltage outside specified tolerances.

Q. Maintenance By-Pass Switching: Manual (make-before- break) by-pass switch shall allow load to be transferred to by-pass source without interruption of output, and provide isolation of UPS and static switch during maintenance. Test position shall permit testing of static switch while load is being fed from bypass power circuit. Transfer inhibited warning circuit shall be provided to give an alarm indication in case by-pass supply is beyond acceptable tolerances.

R. Rectifier input and bypass isolating transformers shall be provided for all UPS ratings 80 kVA and above. Isolating transformer shall be installed on the UPS output if the system is transformer less (without inverter transformer) and on UPS bypass input if the UPS is equipped with inverter transformer.

S. UPS inverter output, IGBT rectifier input and bypass input transformers shall be two-winding type, while 12 pulse rectifier input transformers shall be three winding type.

T. Transformers shall be galvanically isolated dry-type, Class H insulated, with metallic electrostatic shielding, and high efficiency (98% or higher) type. Transformers shall be installed either within the UPS enclosure or in a separate enclosure as applicable and approved by engineer.

U. Protection: UPS modules shall have built-in or inherent electronic current-limiting protection against permanent self damage effective down to short-circuits. Fast acting, current limiting devices shall protect against failure of any solid state component. Internal failure in any UPS module shall cause immediate isolation from input and output by operation of static interrupters or causing shut down of faulty module. Protection shall be provided against, but is not limited to, the following:

1. Input over and under voltage and power line surges
2. Output over voltage and voltage surges
3. Sudden abnormal changes in output load conditions
4. Short-circuits at output terminals
5. Inverter and rectifier overcurrent
6. Auxiliary Control Circuit Overcurrent.

V. UPS Bypass and Output Neutral: Designed to continuously carry twice the full load phase current.

W. Input Passive Filter Disconnection: UPS control system shall not disconnect the input passive filters unless the UPS is operating at light loads (less than 25%).

X. Battery: High rate discharge, heavy duty, industrial, high impact resistant, clear plastic encased, sealed lead- acid (gas recombination) type cells with automatically re-closing explosion proof safety vents. Electrolyte specific gravity shall not exceed 1.25 when fully charged at 25 deg. C. Ampere-hour rating shall be sufficient for emergency period specified with all inverters operating at full rated output, to a discharge limit of not less than 1.75 V per cell. Cells shall be normally maintained at 2.25 V per cell. Guaranteed life shall not be less than 10 years, with a capacity drop down to not less than 80% under normal expected service.

Y. Battery Cabinet: shall be factory assembled from UPS manufacturer, of welded construction and formed from heavy gauge steel with added supports to retain cabinet squareness and integrity during harsh shipping and handling conditions, Adjustable battery rails or trays shall be provided to allow for multiple battery configurations and facilitate battery upgrades in the future, Heavy duty polyester strapping material shall be used to tie down batteries, Cabling shall be routed down the sides of the cabinet, away from the front of the batteries allowing full access for easy maintenance, series wiring shall be routed efficiently and neatly with tier to tier jumpers located at front batteries allowing for safe and easy maintenance, Cabinets shall be top coated with a hybrid epoxy-polyester powder coat and oven cured for a chip and corrosion resistant long lasting finish, All circuit breakers used on the cabinets shall be rated to 600 VDC. Each battery string shall be provided with its own circuit breaker for the individual string fault protection and disconnecting means. Battery cabinet enclosure degree of protection shall be IP 20.

Z. Battery checking system shall be provided for each UPS to check the battery continuity and improve life time through regular automatic test and measurements for battery status, voltage and current. System shall provide a predictive and automatic diagnostics of battery health, optimize the recharge

© Copyright protected

time and provide an advance warning about the end of battery life upon detection of a weak / defective battery.

AA. The battery cells age, at the time of delivery into site, shall be less than three months.

BB. Battery calculations according to IEEE 485 shall be carried out by UPS supplier and submitted for approval, based on the following:

1. Nominal active power factor of not less than 0.8 Lag.
2. Temperature factor for operation at 25 Deg C.
3. Aging factor of 1.25.
4. Design margin factor of 1.15.
5. Recharge time up to 90% of its capacity within 10 to 12 hours.

CC. Mimic Panel: UPS assembly shall include a mimic diagram with digital and LED displays, indicating instruments and control devices, in true relative positions.

DD. Local panel instruments shall include at least the following (digital readings):

1. Inverter input voltage: measuring DC bus voltage.
2. Battery current: measuring charge / discharge currents.
3. AC voltage: measuring inverter output voltage, normal supply voltage or system output.
4. UPS output measurements: for current, voltage and frequency.
5. Remaining battery backup time.
6. Input voltages.
7. Input current.
8. Total power.
9. Total harmonic distortion on input feedback current (THDi).
10. Total harmonic distortion on input voltage (THDv).

EE. Local Panel Indicators shall include at least the following:

1. System on battery supply.
2. Inverter phase locked to verify synchronization between inverter output and normal AC supply input.
3. Static switch on normal AC supply (bypass mode).
4. Static switch inhibited.
5. Over-temperature, indicating excessive temperature in heat sinks for transformers, rectifier/charger and inverter (alarm to automatically transfer load to by-pass circuit).
6. Inverter output overload, indicating inverter output beyond specified rating failure of any stage, DC bus earth fault, inverter output earth fault.

FF. Local built-in controls shall include at least the following:

1. Inverter on/off.
2. Battery input circuit breaker.
3. Auto/manual reset-test switch.
4. Manual reset switch.
5. Hybrid switch transfer test push-button.
6. Re-transfer auto/inhibit selector switch to allow automatic re-transfer of load to inverter after timed interval of normal operation and inhibit re-transfer of load to inverter until hybrid switch is in auto-mode.
7. Battery automatic/equalize recharge timer, 0 - 30 hours adjustable, with automatic/boost/equalize switch (accessible to maintenance personnel only and to be used only with manufacturer's recommendation for type of battery specified).
8. Voltage and frequency adjustment controls with locking devices (accessible to maintenance personnel only).
9. Indicator test/reset switch.
10. Control power supply isolator (accessible to maintenance personnel only).
11. Alarm test-accept-reset.

GG. Local built-in alarms causing horn to sound, with tripping command if required, shall include at least the following:

1. Fan failure: Alarm only.

© Copyright protected

2. Over Temperature: Alarm with automatic transfer of load to by-pass after a safe preset period.
3. DC Volts out of Limits: Alarm with indication.
4. Fuse Failure: Alarm.
5. Battery on Load/Disconnected: Alarm only.
6. Overloads: Alarm only with a trip command if pro- longed, for each rectifier/inverter unit.
7. Normal AC Supply Failure: Alarm only.
8. Hybrid Switch Operation to by-pass Mode: Alarm only.
9. Low and High Output Voltage: Alarm only.

HH. Input active harmonic filter shall be provided to limit input current harmonic distortion to less than 7% THD at all load currents from 0 to 100% of full load and improve power factor to not less than 0.9. The input filter shall be mounted inside the UPS cabinet or in a separate enclosure.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Eaton / Powerware
2. GE
3. APC/Schneider Electric
4. Siemens
5. Socomec
6. Emerson – Libert
7. ABB / Newave

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Manufacturer’s Certification: The manufacturer shall be specialized in manufacturing of on line, double conversion three phase UPS modules specified in this document with a minimum of twenty years documented worldwide experience and shall have a nationwide first party service organization. The manufacturer shall be ISO 9001 certified and shall design to internationally accepted standard.

© Copyright protected

B. Factory Testing: Prior to shipment the manufacturer shall complete a documented test procedure to test all functions of the UPS modules and batteries (via a discharge test), when supplied by the UPS manufacturer and guarantee compliance with the specification. The manufacturer shall provide a copy of the test report upon request. Tests shall comply to IEC 62040-3 and include but not necessarily limited to the following:

1. Light load test.
2. AC input failure test.
3. AC input return test.
4. Transfer test.
5. Full load test.
6. UPS efficiency test.
7. Unbalanced load test.
8. Balanced load test.
9. Short-circuit test.
10. Harmonic components test.

C. Materials and Assemblies: All materials and parts comprising the UPS shall be new, of current manufacture, and have not been in prior service, except as required during factory testing. All active electronic devices shall be solid state and not exceed the manufacturers recommended specified tolerances for temperature or current to ensure maximum reliability. All semiconductor devices shall be sealed. All relays shall be provided with dust covers. The manufacturer shall conduct inspection on incoming parts, modular assemblies, and final products.

D. Installer Qualifications: Experienced installer who is an authorized representative of UPS manufacturer for both installation and maintenance of units required for this Project.

E. Local Representative: Provide evidence that proposed equipment manufacturer has a locally established and authorized organization which can be called upon for professional advice and maintenance as may be required, and which can immediately supply spare parts to support day to day and emergency maintenance requirements. Failure to satisfy Engineer may disqualify a manufacturer.

F. Materials and components shall be manufacturer's latest design, and Standards used shall be approved prior to manufacture.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store, and handle materials, components, and equipment as per Manufacturer’s instructions.

B. Equipment containing batteries shall not be stored for a period exceeding 3 months without powering up the equipment for a period of 8 hours to recharge the batteries. . Relevant Certificate for the batteries production date shall be submitted to the engineer.

310.030 WARRANTY

A. Manufacturer’s Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of substantial completion.

B. Battery: The battery manufacturer’s warranty shall be passed through to the final customer and shall have a minimum period of one year.

310.040 FACTORY ACCEPTANCE TEST

A. Factory testing units of at least one UPS system of each rating to be supplied shall be witnessed by the Engineer. Selection of UPS system for witness test shall be randomly carried out by the Engineer. Witness test shall include complete routine and function testing on all units to be witnessed. Test procedure and program shall be submitted for approval prior to test conduction. Factory witness test shall include for business class air tickets, five stars Hotel full accommodation, transportation and all test expenses for two persons from the Engineer’s/ Employer’s side.

© Copyright protected

310.050 SPARE PARTS AND EXTRA MATERIAL

A. Spare Parts: Provide and deliver to client stores manufacturer's recommended spare parts for one year operation of UPS system. Spare parts shall include as a minimum complete set of fuses for all types and ratings along with cooling fans.

B. Provide list of manufacturer's spare parts for five years operation together with current prices.

C. Tools and Instruments: Provide tools and instruments required for normal routine inspection, testing, operation and general maintenance, as recommended by the manufacturer.

320.000 SUBMITTALS

A. Equipment Data: Submit full technical data of equipment for approval including, but not limited to, the following:

1. Manufacturers' catalogues, detailed description, compliance with the Standards, dimensions and weights, system operation, operating characteristics, methods of operation, protective and control provisions, heat losses, ambient conditions and limitations on electronic components, inverter cut-off voltage, battery calculation to IEEE 485, etc. beyond which such components may suffer partial or permanent damage.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Plans and front and side elevations, with indication of built-on control and indicating devices and instruments, exact dimensions and weights, cabling etc.
2. One-line diagram with ratings of each piece of equipment, cabling, grounding etc.
3. Control and elementary diagrams, wiring diagrams and the like.
4. Installation and mounting details.
5. Batteries arrangement and mounting details.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

D. Manufacturer Certificates: Signed by manufacturers certifying that they comply with requirements.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article.

F. Test Certificates: Submit type test and routine test certificates. System shall undergo a functional and load test program approved by the Engineer, and shall undergo a minimum 8 hours 'burn-in' test, under site simulated conditions, prior to shipment.

G. Field Test Reports: Indicate test results compared with specified performance requirements, and provide justification and resolution of differences if values do not agree.

H. Maintenance Data: For UPS units to include in maintenance manuals specified in Division 01. Include the following and to the satisfaction of Employer's requirements:

1. Lists of spare parts and replacement components recommended being stored at Project site for ready access.
2. Detailed operating instructions covering operation under both normal and abnormal conditions.

330.000 EXECUTION

330.010 INSTALLATION

A. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and equipment manufacturers' drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.

B. Built-In Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which shall be built into concrete foundations, bases or building structure are provided as and when required and that they are properly installed.

© Copyright protected

C. Tools: Use only tools recommended by equipment manufacturers for installations, particularly in making connections and adjustments.

D. Supervision: Carry out equipment installation under the direct supervision of a qualified technician, licensed by and trained at the factory. Final adjustments and putting into satisfactory operation shall be made by a specialist delegated by the factory.

330.020 IDENTIFICATION

A. Identify components and wiring according to Division V Section "Basic Electrical Materials and Methods."

330.030 BATTERY EQUALIZATION

A. Equalize charging of battery cells according to manufacturer's written instructions. Record individual-cell voltages.

330.040 FIELD QUALITY CONTROL

A. Electrical Tests and Inspections: Perform tests and inspections according to manufacturer's written instructions and as listed below to demonstrate condition and performance of each component of the UPS:

1. Inspect interiors of enclosures, including the following:

a) Integrity of mechanical and electrical connections.
b) Component type and labeling verification.
c) Ratings of installed components.

2. Test manual and automatic operational features and system protective and alarm functions.

a) Test communication of status and alarms to remote monitoring equipment.

B. Power Supply Output Disturbance: Provide microprocessor based instrument, and monitor and record power supply output disturbance of voltage and frequency. Instrument details shall be submitted for approval.

C. Test Periods shall be prolonged (over 24 hours) and as requested by Engineer, to verify and obtain realistic voltage and frequency profile under any loading and switching conditions within the criteria specified.

D. Data logging shall include high and low average voltage, sags and surges, spikes and spike bursts, drop-outs, high and low frequencies etc. with print-out and storage on cassette tape for subsequent re-entry into instrument's memory for display or print-out.

E. Tests shall include loads at various power factors from low-load to overload condition, and measurements of temperature, heat losses, output voltage, wave shape, and harmonic content and frequency stability.

F. Retest: Correct deficiencies and retest until specified requirements are met.

G. Record of Tests and Inspections: Maintain and submit documentation of tests and inspections, including references to manufacturers' written instructions and other test and inspection criteria. Include results of tests, inspections, and retests.

330.050 GROUNDING

A. Provide direct interference free grounding circuit in accordance with Division Y Section "Earthing and Bonding" of the Specification.

330.060 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation.

© Copyright protected

V33 - DC CENTRAL BATTERY SYSTEM FOR EMERGENCY LIGHTING

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes central battery system for emergency lighting that monitors individual luminaires, automatically sense loss of normal AC supply and transfer loads from normal AC to battery DC supply on supply power failure, and that automatically retransfer to normal supply when normal power is restored along with central monitoring and automatic testing for all system components.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: the emergency lighting system shall comply with the following standards:

1. DIN/VDE 0108-100 “Sicherheitsbeleuchtungsanlagen”.
2. EN 50171 “Central Power Supply Systems”.
3. EN 50172 “Emergency Escape Lighting Systems”.
4. EN 50272-2 “Safety Requirements for Secondary Batteries and Battery Installations – Part 2: Stationary Batteries”.
5. IEC 62034 “Automatic Test Systems for Battery Powered Emergency Escape Lighting”.
6. IEC 60896 “Stationary Lead Acid Batteries”.
7. IEEE 485 “IEEE Recommended Practice for Sizing Lead-Acid Batteries for Stationary Applications”.
8. IEC 61347-1 “Lamp Controlgear - Part 1: General and Safety Requirements”.
9. IEC 61347-2-11 “Lamp Controlgear - Part 2-11: Particular Requirements For Miscellaneous Electronic Circuits Used with Luminaires”.
10. IEC 61000-6-2 “Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments”.
11. IEC 61000-6-3 “Electromagnetic compatibility (EMC) - Part 6-3: Generic standards - Emission standard for residential, commercial and light-industrial environments”.
12. BS EN 1838 “Lighting Applications – Emergency Lighting”
13. BS 5266-1 “Emergency Lighting – Part 1: Code of Practice For the Emergency Escape Lighting of Premises”.

110.020 DEFINITIONS AND ABBREVIATIONS

A. BMS: Building management system.

B. CBS: Central battery system.

C. LED: Light-emitting diode.

D. VRLA: Valve-regulated lead acid.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REUIREMENTS

A. Emergency lighting system shall provide an average of 1 lux illumination level with a maximum to minimum illumination uniformity of 40:1, throughout the facility unless otherwise required by the local codes, whichever is more stringent.

© Copyright protected

B. Emergency lighting system shall operate for 1 hour(s) duration while achieving the illuminance level stated in paragraph 120.010A above at the end of the battery discharge period.

C. Emergency lighting system shall be able to control each individual fixture's switching mode as maintained, non-maintained or switched maintained modes connected to the same circuit without additional dataline.

D. The battery and system design shall be capable of meeting the declared performance initially, during and at the end of the stated life.

E. In general, emergency lighting shall be provided by using lamps from the luminaires used for the main normal illumination, unless otherwise shown on drawings.

F. BMS Interface: CBS shall interface to the Management Level Network through a BACnet/IP to third party gateway. The gateway shall be provided by the CBS supplier and shall be connected into the Management Level Network by the BMS contractor. The BMS contractor shall obtain a list of the BACnet object IDs/names from the CBS supplier.

120.020 SYSTEM OPERATION

A. Under normal conditions the load shall be fed from the normal AC power supply through the change-over switch and the battery is re-charged up to full charge state via the battery charger. The battery is maintained in an idle condition ready to feed the load, with continuous monitoring of its output for healthy conditions with an alarm to be initiated in case of malfunction.

B. Upon loss of normal power supply, the load shall be automatically transferred to DC battery supply through the change-over switch and power shall be supplied from the batteries until the normal supply returns, upon normal power supply restoration then the load is retransferred to the normal supply.

C. If the normal power supply failure period exceeds the rated duration of the battery, the load shall be automatically shut down to protect the battery from deep discharge. The system shall automatically reset itself upon normal power supply return.

120.030 MECHANICAL CONSTRUCTION

A. The battery housing shall be sheet steel, powder coated housing IP 21 with removable screwed front, rear and top doors to provide complete access to the batteries. The electronics section shall have IP 21 sheet steel enclosure with transparent polycarbonate window for all central systems and IP 21 sheet steel enclosure with full metal door for all substations. Doors and removable panels shall be so fastened that access to dangerous live parts is not possible without the use of a tool or key. Wireways shall be smooth and free from sharp edges, burrs, flashes, etc. which might cause damage to the insulation of the wiring parts. Metal screws shall not protrude into wireways.

B. The enclosures shall be resistant to heat and fire and tested in accordance with EN 50171 requirements.

C. The electronic compartment shall have large cabling compartments with cable entries from top via multiple undrilled removable metal flange plates. All incoming cables and looping circuits shall be connected on protected and fused terminals. All outgoing luminaire circuits shall be connected direct to relevant components via plug-in type terminals not less than 2.5 sq.m.

120.040 ELECTRICAL CONSTRUCTION

A. The system shall be built-up in a modular with all modules being plug-in-type design. The outgoing circuits shall be fed through changeover modules. 1 module shall be used for circuits with maximum load of 6 Amps as per DIN/VDE 0108. Each circuit shall be protected within the system on mains and battery side via screw-in type cartridge fuses on each module. The fuses shall be accessible via front plate of the module. The mains supply and battery mains cable shall be protected by knife edge fuses. The fuse holders shall have handles for simple removal of the fuses, 25 percent spare capacity shall be available in terms of circuits and modules.

© Copyright protected

B. The main panel incoming shall be switch disconnector provided with current limiting HRC fuse type, complying with IEC 60269-2, with rated breaking capacity 120kA and manufactured by an approved firm.

C. Each panel shall have a spare fuse carrier with at least 3 fuses for each size used in respective panel.

120.050 CONTROL MODULE

A. The control module shall be composed of a microprocessor control module with plain text 4 line displays with a minimum of 20 characters per line, to provide operative status and luminaire failures.

B. The central battery equipment shall include facilities for monitoring the system function. The following shall be measured:

1. Battery voltage.
2. Battery/charger/discharge current.

C. The following test and monitoring equipment shall be provided:

1. Devices with automatic reset e.g. push button, to simulate a normal supply failure.
2. Isolating devices to isolate the AC supply for checking the duration of the system.
3. Indication of the actual power supply source (normal supply or battery).
4. Indication of the following faults and system condition:

a) Float charge voltage out of the permissible range.
b) Interruption of the battery charging circuit.
c) Failure in charge equipment; no charge current, although normal supply is available.
d) Supply from the battery, although normal supply is available.
e) Warning to be given at least 10 min before deep discharge protection is initiated.
f) Deep discharge protection initiated.
g) Failure of a powered ventilation system for battery cabinet or battery option.

D. LEDs shall indicate as a minimum:

1. Mains operation.
2. Battery operation.
3. Fault.
4. Deep discharge.

E. Potential free indicator contacts shall be provided for:

1. Operation.
2. Battery operation.
3. Summary fault.

F. Centronic interface for the connection of standard printers shall be provided on the front of the control module. An electronically controlled 24 V output for the voltage monitoring of lighting sub distribution panels shall be provided.

G. Electronically isolated mains monitoring shall be provided for maintained and non maintained light circuits, with forced changeover in case of mains failure from mains to emergency light operation. As a standard following programming modes shall be available.

1. Manual reset.
2. Time delay of mains return.
3. Stair well light timer adjustable from 1 to 15 minutes, where shown on Drawings.
4. Acoustic alarm in case of mains failure, manual reset or summation.

H. Individual changeover shall be provided per emergency circuit with free programming for maintained, non-maintained or switched maintained light and 2 pole fusing conforming to VDE.

I. Failure recognition for each individual safety/exit luminaire in conjunction with proprietary electronic ballasts including 2 wire monitoring module without additional data line.

© Copyright protected

120.060 CHANGEOVER MODULE

A. Each changeover module shall be freely programmable to suit type of luminaires connected on outgoing circuits and switching mode of each individual luminaire i.e. maintained, non-maintained or switch maintained. The individual luminaires monitoring circuits shall be included in the changeover module. Each circuit in the changeover module shall have LED indications for circuit on and lamp failure and shall be fit to monitor 20 luminaires as a minimum. All outgoing circuit terminals shall be provided to monitor the sub distribution boards. As an alternative, modules constructed using printed circuit may be provided.

120.070 MONITORING / ADDRESS MODULE

A. Monitoring module shall be provided for luminaire with standard electronic ballast and connected to the central battery system. Monitoring module shall be compatible with electronic ballasts from any manufacturer with the following features: it must be able to operate with both AC and DC voltage, it must shut itself off in an event of a lamp failure, input current in shut off mode must be less than 10mA and must have constant power output high frequency electronic control gear / transformer. The electronic ballast shall be "CE" marked and shall comply with IEC 60929.

B. Monitoring / address modules shall comply with IEC 61347-1 and IEC 61347-2-11.

C. Monitoring modules shall be able to accept 230 V AC at 50 Hz and 220 V +25/-20 % DC. Monitoring / address modules shall be protected against reverse polarity. Monitoring / address module shall have IP 20 degree of protection to IEC 60529 and a flame retardant housing.

D. Monitoring / address modules shall have selector switches for 20 addresses as a minimum and shall have a 230 V AC control input connected to the branch circuit from a node after the switch in case of switched maintained fixtures. Fixtures fed from two sources where shown on drawings such as a dimmed general lighting or switched maintained circuits shall be provided with monitoring module with an integrated changeover or a separate switch controller such that in case of battery operation either in mains failure or testing the fixture is fed from the battery source. Emergency fixtures controlled through DALI protocol shall be provided with monitoring module with DALI control input.

120.080 ELECTRONIC ADDRESSABLE BALLASTS AND LED CONTROL GEARS FOR EXIT SIGNS

A. Safety and exit luminaires shall be provided with high frequency electronic addressable ballast without monitoring module or LED electronic gear in case of LED luminaires, with 20 addresses as a minimum for function monitoring in DC-operation without additional data line and free programmable switching mode as maintained, non-maintained or switched maintained luminaires in one circuit without additional data line. Ballasts shall able to operate with both AC and DC voltage and shall have automatic lamp detection including automatic switch-off in the event of a lamp defect and automatic restart after lamp replacement.

B. Electronic addressable ballast shall comply with IEC 60929, IEC 61347-2-3 and IEC 61347-2-4. Electronic LED control gear shall comply with IEC 61347-2-13 and IEC 62384

C. Electronic addressable ballast and LED control gear shall meet the limits of main harmonic content as defined in IEC 61000-3-2 and comply with radio interference suppression limits defined in BS EN 55015 and immunity requirements of IEC 61547. Ballasts shall have Efficiency Index EEI=A2, power factor corrected to above 0.9. The electronic ballast shall be "CE" marked and shall comply with IEC 60929. All electronic addressable ballasts and LED control gear for the exit luminaires shall be manufactured by the emergency central battery system manufacturer.

D. LED electronic control gear shall be high efficiency, high power factor, suitable for operation at the ambient conditions specified for the project. Control gear shall have constant output current or constant output voltage over the whole wattage range independent of mains supply fluctuations as shown on drawings and sufficient for operating the number and wattage of LEDs connected.

E. Control gear shall have electrical insulation between primary and secondary sides. Maximum length between control gear and LED module shall be as per manufacturer's recommendations.

© Copyright protected

F. Electronic addressable ballasts and LED control gear shall be able to accept 230 V AC at 50 Hz and 220 V +25/-20 % DC. Ballasts shall be protected against reverse polarity. Ballasts shall have IP 20 degree of protection to IEC 60529 and a flame retardant housing.

G. Whenever the main lighting fixtures are used as emergency lighting or exit signs are obtained from manufacturer different than that of the CBS, the Contractor shall ensure coordination between both manufacturers. Central battery supplier shall provide necessary addressable modules for each fixture.

120.090 LOCAL CONTROLLER / BRANCH CIRCUITS MONITORING MODULE

A. Final branch lighting circuits feeding non maintained or switched maintained emergency fixtures shall be monitored for operation through single or 3 phase voltage monitor, as the case may be, installed in the lighting sub-distribution boards or a single phase control relay shall be installed in final circuit when required. The non-maintained and switched maintained luminaires shall be lit during a local supply failure. However the emergency supply panel shall not switch to battery use as long as its own mains supply is available. The Local Controllers should comply with IEC 61347-1 and IEC 61347-2-11.

120.100 CHARGER

A. Charger module shall be micro processor controlled module with temperature controlled voltage charging to IU characteristics. Automatic boost charging facility shall be built in to the system depending on the required total battery capacity. It shall have charging and supervising method for failure indication of battery circuits as well as battery charger. Battery chargers shall be capable of automatically charging their batteries that have been discharged so that they can perform at least 80 % of their specified duration within 12 h of commencement of charge in accordance with EN 50171. The charger shall have built in deep discharge protection and shall be provided with LED indications for:

1. Operation.
2. Charger on.
3. Booster on.
4. Mains operation.
5. Battery capacity >10 percent, >50 percent, 100 percent.
6. Charging failure.
7. Insulation fault.

B. Charger shall have potential free indicator contacts for:

1. Charging failure.
2. Fast charge.
3. Insulation fault.

C. The battery charger shall be so designed that a short circuit on its output will not cause damage.

D. Charger shall have a push button to simulate earth leakage failures. Charger shall include plug-in-type terminals as well as the protection fuses for mains and battery accessible via the front plate of the charger.

120.110 BATTERIES

A. Batteries shall be maintenance free, VRLA sealed leak proof 220 V and in compliance with IEC 60896. Batteries shall have extremely low gas generation, low self discharge and have permanently sealed pressure release vents.

B. Battery ampere-hour rating shall be sufficient for emergency period specified with all luminaires operating at full luminous output, to a discharge limit of not less than 1.75 V per cell. Cells shall be normally maintained at 2.25 V per cell. Guaranteed life shall not be less than 10 years, with a capacity drop down to not less than 80% under normal expected service. At the end of the specified duration for the system, the output voltage shall be not less than 90% of the nominal voltage at the

© Copyright protected

nominal load. Battery strings shall consist of 18 blocks of 12 V batteries. Batteries shall consist of one string for ratings up to 10 kVA and of two strings for rating above 10 kVA.

C. Batteries shall be installed and provision for maintenance made in accordance with EN 50272-2 and manufacturer's recommendations.

D. Date of manufacture shall be stamped on each battery and shall be less than 3 months from the date of delivery to the site.

E. Battery calculations according to IEEE 485 shall be carried out by the CBS supplier and submitted for approval, based on the following:

1. Nominal active power factor of not less than 0.9 Lag
2. Temperature factor for operation at 25 Deg C.
3. Aging factor of 1.25.
4. Design margin factor of 1.15.
5. Recharge time not exceeding 12 hours so that the battery can perform at least 80 % of their specified duration.

120.120 CENTRAL MONITORING DEVICE

A. The central monitoring shall be via central group monitoring hardware and software, monitoring and programming unit. The unit shall operate with latest visualization software to give detailed text, address and information of all luminaires connected to system. It shall have programming/automatic testing facility for time duration test, function test, location of luminaire, manual rest and acoustic alarm. It shall have facility for software interface to the BMS to provide transmission of all data records as desired.

120.130 AUTOMATIC AND CYCLIC FUNCTION MONITORING AND LOGGING FACILITY

A. Automatic test system shall comply with IEC 62034.

B. An automatic test unit with a recording facility shall be installed with the following features as a minimum:

1. Constant monitoring of the charge, the intervals shall be less than 5 minutes where monitoring is periodic.
2. Cyclical monitoring of switching and functional capacity of the connected load for the emergency power supply. Test shall be carried at least once every week with a test duration between 10 seconds and 5 minutes provided that the total is less than 10 minutes per week.
3. Recording of any faults in the central power supply system and any fault in the test equipment or central monitoring.
4. Fault notification where there is a fault in the transmission route to the central monitoring point.
5. A facility for manual initiation of the test on the central power supply or on the central monitoring unit.

C. If a mains supply failure occurs up to four hours before a programmed functional test, the test shall be postponed and rescheduled for between 4 h and 24 h after restoration of the mains supply. In the event that a functional test is postponed, indication of the pending test shall be given on the remote panel. If a mains supply failure occurs up to 24 h before a programmed rated duration test, the start of the test shall be postponed and rescheduled within seven days after restoration of the mains supply.

D. The limited duration test shall be performed for two thirds of the rated duration. The central emergency power supply system shall be automatically checked to ensure that the battery has not discharged to a lower voltage than is required for a discharge of two thirds of the rated duration.

120.140 WIRING

A. Internal wiring used to carry AC supply and safety equipment circuits shall be separated from each other by running through separate compartments or by double insulation.

© Copyright protected

B. All wiring shall comply with the requirements of Division Y Section “Low Voltage Electrical Power Conductors and Cables”.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division V Section “Interior Lighting”.
3. Division V Section “Fuses”.
4. Division Y Section “Panelboards”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Cooper Ceag
2. Teknoware
3. Inotec

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation AS shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Manufacture’s Certification: The manufacturer shall be specialized in manufacturing of central battery system as specified in this document. The manufacturer shall be ISO 9001 certified and shall design to internationally accepted standard.

B. Factory Testing: Prior to shipment the manufacturer shall complete a documented test procedure to test all functions of the central battery system and batteries (via a discharge test), when supplied by the CBS manufacturer and guarantee compliance with the specification. The manufacturer shall submit a copy of the test report. Tests shall comply with EN 50171 for the central battery system and with IEC 62034 for the automatic test system.

© Copyright protected

C. Materials and Assemblies: All materials and parts comprising the CBS shall be new, of current manufacture, and have not been in prior service, except as required during factory testing. All active electronic devices shall be solid state and not exceed the manufacturer's recommended specified tolerances for temperature or current to ensure maximum reliability. All semiconductor devices shall be sealed. The manufacturer shall conduct inspection on incoming parts, modular assemblies, and final products. Materials and components shall be manufacturer's latest design, and Standards used shall be approved prior to manufacture.

D. Installer Qualifications: Experienced installer who is an authorized representative of CBS manufacturer for both installation and maintenance of system required for this Project.

E. Local Representative: Provide evidence that proposed equipment manufacturer has a locally established and authorized organization which can be called upon for professional advice and maintenance as may be required, and which can immediately supply spare parts to support day to day and emergency maintenance requirements. Failure to satisfy Engineer may disqualify a manufacturer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle equipment as per Manufacturer's instructions.

B. Equipment containing batteries shall not be stored for a period exceeding 3 months without powering up the equipment for a period of 8 hours to recharge the batteries. Relevant Certificate for the batteries production date shall be submitted to the Engineer.

310.030 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace central battery system and replace batteries that fail in materials or workmanship within specified warranty period.

1. Warranty Period: One year warranty from the date of substantial completion for central battery system and batteries.

310.040 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to client stores.

1. Fuses: 25 percent of each type and rating, but no fewer than 3 of each type.
2. Cabinet Ventilation Filters where applicable: One complete set.
3. Change Over Modules: 10% percent, minimum one unit of each type.
4. Circuit Board: One spare circuit board for each critical circuit.

320.000 SUBMITTALS

A. Product Data: for each type and rating of central battery equipment unit include dimensions and data on features and components for each product specified. Include data on electrical ratings, operating characteristics, operating weights, furnished options, specialties and accessories. Include a detailed description of operating modes and any load limitations that may apply.

B. Shop and Construction Drawings: For each type and rating of central battery equipment unit include plans, elevations, sections, and mounting details. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, ventilation requirements, method of field assembly, components, and location and size of each field connection. Include block diagram for BMS interface points. Include system one-line diagram, internal and interconnecting wiring; and diagrams for power, signal, and control wiring. Include elevation, details, and legends of control and indication displays. Include circuit current (withstand) rating of unit.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

© Copyright protected

D. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout, required working clearances, and required area above and around central battery equipment. Show central battery equipment layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article..

F. Product Certificates: For each type of central battery equipment.

G. Sample Warranty: For special warranty.

H. Guarantee certification for 10 years battery operation as a minimum.

I. Operation and Maintenance Data: For central battery equipment to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Division 01:

a) Manufacturer's written instructions for testing, adjusting, and reprogramming control modules.
b) Manufacturer's written instructions for selecting and setting field-adjustable controls and status and alarm points.

J. Source quality-control reports.

K. Field quality control report.

L. Records and Reporting: on completion of the work, drawings of the emergency escape lighting installation shall be provided and retained on the premises. The drawings shall be made in accordance with EN 50171 requirements. In particular, they shall identify all luminaires and the main components, and shall be regularly updated with any subsequent changes to the system. These drawings shall be signed by a competent person to verify that the design meets the requirements of this standard.

M. Log Book: a log book shall be provided for the recording of routine examinations, tests, defects and alteration. These shall be available as a hard copy automatically printed from an automatic testing device.

330.000 EXECUTION

330.010 EXAMINATION

A. Receive, inspect, handle, and store central battery equipment according to manufacturer’s recommendations.

B. Examine areas, surfaces, and substrates to receive central battery equipment, with Installer present, for compliance with requirements for installation tolerances, structural support, ventilation, temperature, humidity and other conditions affecting performance of the Work.

1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment will be installed, before installation begins.

C. Examine equipment before installation. Reject equipment that is wet, moisture damaged, or mold damaged.

D. Examine routing layout for electrical connections to verify actual locations of connections before installation.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

330.020 INSTALLATION

A. Clearance: According to manufacturer's written instructions, but not less than 900 mm in front of unit.

© Copyright protected

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

330.030 IDENTIFICATION

A. Identify equipment and components according to Division V Section "Basic Electrical Materials and Methods" and shall comply with EN 50171.

330.040 FIELD QUALITY CONTROL

A. Tests: Perform tests listed below according to manufacturer's written instructions. Test unit functions, operations, and protective features. Adjust to ensure operation complies with Specifications. Perform tests on completion of unit installation and after building circuits have been energized. Provide instruments to permit accurate observation of tests. Include the following tests:

1. Simulate Malfunctions: Verify protective device operation.
2. Demonstrate low-battery-voltage shutdowns, and transfers due to normal source failure and restoration.
3. Verify emergency-supply duration.
4. Test for Successful Supply: Operate each type of load served by the unit for this Project without symptoms of abnormal supply such as noise, vibration, or pulsation of the load or its output.

B. Retest: Correct deficiencies identified by tests and observations and retest until specified requirements are met.

330.050 CLEANING

A. On completion of installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and abrasions in finish to match original finish. Clean unit internally using methods and materials recommended by manufacturer.

330.060 PROTECTION

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until controllers are ready to be energized and placed into service.

B. Replace central battery equipment whose interiors have been exposed to water or other liquids prior to Substantial Completion.

330.070 COMMISSIONING

A. Battery Equalization: Manually equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.

330.080 DEMONSTRATION

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

V41A - EXTERIOR LIGHTING

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes exterior lighting units with luminaires, lamps, ballasts, poles/support structures, and accessories and related power distribution and control, protective earthing and related builder's work including column foundations, cable pits, cable trenches and ductwork.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Luminaires generally are to comply with IEC 60598 and the applicable CISPR recommendations. Manufacturer is to verify compliance with these standards and the applicable local regulations and design standards.

B. Standards: Comply with the following Standards:

1. LED Fixtures:

a) IEC 60598 “Luminaires”.
b) IES LM-79-08 “Approved Method: Electrical and Photometric Measurements of Solid-State Lighting Products”.
c) IES LM-80-08 “Approved Method: Measuring Lumen Maintenance of LED Light Sources”.
d) IES TM-21-11 “Projecting Long Term Maintenance of LED Light Sources”.
e) EN 55015 “Limits and Methods of Measurement of Radio Disturbance Characteristics of Electrical Lighting and Similar Equipment”.
f) IEC 62471 “Photobiological Safety of Lamps and Lamp Systems”.

2. LED Drivers:

a) IEC 61347-1 “Lamp Controlgear - Part 1: General and Safety Requirements”.
b) IEC 61347-2-13 “Lamp Controlgear - Part 2-13: Particular Requirements for D.C. or A.C. Supplied Electronic Controlgear for LED Modules”.
c) IEC 62384 “DC or AC Supplied Electronic Control Gear for LED Modules - Performance Requirements”.
d) IEC 61000-3-2 “Electromagnetic Compatibility (EMC) - Part 3-2: Limits - Limits for Harmonic Current Emissions (Equipment Input Current ≤ 16 A per Phase)”.
e) EN 55015 “Limits and Methods of Measurement of Radio Disturbance Characteristics of Electrical Lighting and Similar Equipment”.
f) IEC 61547 “Equipment for General Lighting Purposes - EMC Immunity Requirements”.
g) IEC 62031 “LED Modules for General Lighting – Safety Specifications”.

110.020 DEFINITIONS AND ABBREVIATIONS

A. Lighting Unit: A luminaire or an assembly of luminaires complete with a common support, including pole, post, or other structure, and mounting and support accessories.

B. Luminaire (Light Fixture): A complete lighting device consisting of lamp(s) and ballast(s), when applicable, together with parts designed to distribute light, to position and protect lamps, and to connect lamps to power supply.

120.000 SYSTEM DESCRIPTION

120.010 LIGHTING COLUMNS

A. Lighting columns shall comply with BS EN 40 and MINEA General Technical Specifications.

© Copyright protected

B. Construction: Columns are to be circular section, tapered, formed sheet steel, electrically welded, and of height specified. Columns up to 12-m height are to be one piece section. Columns above 12 m and up to 20-m height may be supplied in two piece sections, of the slip joint type with sufficient overlap to ensure correct vertical alignment of column after assembly. Columns wall thickness shall comply with MINEA General Technical Specifications or of 3 mm at base whichever is more stringent. Sheet steel is to have minimum rupturing resistance of 37 kg/mm2 and minimum yield strength of 24 kg/mm2.

C. Top of column is to be designed to receive single or double arm brackets or other arrangement required, supporting number of luminaires shown on the Drawings. Bracket arrangement is to be designed to ensure that failure, due to wind induced oscillations, does not occur and that rotation from desired alignment is not possible.

D. Column Design: Column cross-section, thickness of steel, joints, welds, bolts etc. are to be designed to withstand gust wind velocity of 160 km/hr blowing in the most unfavorable direction at a height 10 m above ground level, with column fully equipped. Fatigue of steel is in no case to exceed half elasticity limit, taking into account dynamic stresses due to vibrations. Steel flange plate, of adequate thickness, is to be solidly welded onto lower edge of column as shown on the Drawings, and is to have specified number of holes for holding down bolts together with central cable access hole not less than 150 mm diameter.

E. Access door of weatherproof construction is to be positioned at column base and is to be suitably sized to insert and service the supply cable terminations and protective device. Door is to be flush fitting with retaining mechanism and positive locking arrangement with removable hexagonal key. Column is to be reinforced at door opening. Opposite each door, a non-hygroscopic baseboard of suitable size to accept appropriate equipment is to be fixed to inside of column by purpose-made brackets. Stainless steel earthing stud with washers and nuts is to be welded inside the column near the access door.

F. Finish: Welds are to be smooth with spatter removed, inside and outside surfaces of column are to be cleaned by pickling or blasting and are to be free of grease. Steel components of columns to be hot-dip galvanized after fabrication. Minimum thickness of zinc coating is to be 500 g/m2 on both inside and outside surfaces of column. Galvanizing is to be to NFA 91 / 121 or BS EN ISO 1461 . Any damage to galvanizing is to be rectified during erection by wire brushing affected area and treating with approved rust converter to the satisfaction of Engineer. Flange plate and inside and outside of column base are to be coated with heavy bitumen paint prior to erection.

G. Protection and Wiring: Columns with one or two luminaires are to be connected over one phase and neutral. Columns with three or more luminaires are to be connected over 3 phases and neutral, unless otherwise shown on the Drawings. Bolted terminals and cable lugs are to be provided with 3 phases and neutral terminals, for incoming and outgoing 3 phase 4-wire cable, and of the sizes shown on Drawings. One circuit breaker, single pole 6 A is to be provided for each phase leading to a luminaire. Circuit breakers are to be compensated and rated for 50 deg. C ambient with interrupting capacity of at least 9 kA, and are to be mounted in weatherproof enclosure at baseboard. Wiring is to be PVC insulated 3 core or 4 core 85-deg. C conductor temperature. Cable is to be at least 4 mm2 copper conductor.

120.020 LIGHT EMITTING DIODE (LED) LIGHTING FIXTURES - GENERAL

A. Light emitting diode shall be a solid state device embodying a p-n junction, emitting optical radiation when excited by an electric current. It shall be part of the LED module which is supplied as a light source. Output color consistency shall be guaranteed and have a Color Rendering Index (CRI) greater than 70 measured in accordance with IES LM-79-08, unless otherwise indicated on drawings.

B. LED luminaires shall comply with IEC 60598 along with MINEA General Technical Specifications.

C. LED luminaires shall be protected against electric shock by means of basic insulation along with either of the following additional safety precautions:

1. Earthing accessible conductive parts such that these parts cannot become live in case of basic insulation failure (Class I to IEC 60598).

© Copyright protected

2. Providing double insulation or reinforced insulation with no provisions for protective earthing (Class II to IEC 60598).

D. LED luminaires' efficacy shall be as shown on Drawings or 75 lumen per watt whichever is more stringent.

E. Guaranteed rated life (L80B50) shall not be less than 50,000 hours at 40 deg. C, as per IES LM-80-08, Approved Method: Measuring Lumen Maintenance of LED Light Sources and IES TM-21-11, Projecting Long Term Maintenance of LED Light Sources.

F. Luminaires guaranteed lifetime shall cover all fixtures components including lamp, fixture and drivers.

G. LED luminaires shall be suitable for 24/7 continuous operation at 50 deg. C with no negative effect on the specified luminaire life time at 50 deg. C and / or performance in terms of color temperature shifting and lumen output.

H. LEDs shall comply with Photo-biological Safety of lamps and lamp systems in accordance with the requirements of IEC 62471. Provide a test report to prove the fixture is classed as "Exempt" or "Risk Group 1".

I. Each luminaire type shall be binned within a five-step MacAdam Ellipse to ensure color consistency among luminaires, unless more stringent requirements are indicated on Drawings.

J. EMI/RFI shall meet EN 55015 requirements.

K. The maximum percentage of direct up-light from the outdoor luminaires shall be as CIE 126-1997.

L. Housing, for non-linear luminaires, shall incorporate an adequate heat sink, the design of the heat sinks shall be such that there is a direct thermal path from the LED junctions to the atmosphere thus providing a thermal transfer effect throughout the life of the luminaire which ensures the overall fittings and the LEDs are kept relatively cool and any heat generated throughout the life of the fixture at the specified ambient temperature doesn't affect the guaranteed life time and / or luminaire performance.

M. Linear LED lighting strips shall comply with the following in addition to the general requirements listed above:

1. Linear LED strips shall be provided in flexible lengths as required by the installation conditions.
2. Linear LED lighting strips characteristics in terms of IP rating shall suit the area of installation and as shown on Drawings.
3. Linear LED lighting strips characteristics in terms of flexibility shall suit the method of installation (curved or linear) and as shown on Drawings.
4. Linear LED construction shall be properly designed to ensure adequate heat dissipation from the LED junctions to the atmosphere to ensure that the overall strip is kept relatively cool and any heat generated throughout the life of the strip at the specified ambient temperature doesn't affect the guaranteed life time and / or luminaire performance.
5. Linear LED strip channels/profiles degree of protection shall match the specified IP rating and shall ensure proper heat dissipation throughout the life of the strip such that the guaranteed life time is not affected.
6. Linear LED strip power rating (W/m) shall be within 10% of the specified value.
7. Maximum strip length connected to each LED driver shall be as per manufacturer's recommendation considering the distance from fixture, power and wire cross section.

N. Electronic LED Drivers: high efficiency, high power factor, 230 V, 50 Hz for AC operated fixtures and 12V/24V/48V for DC operated fixtures, suitable for operation at the ambient conditions specified for the project. Driver shall have constant output current or constant output voltage over the whole wattage range independent of mains supply fluctuations as shown on drawings and sufficient for operating the number and wattage of LEDs connected. Guaranteed rated life of the driver shall be 50,000 hours as a minimum.

O. LED drivers shall have electrical insulation between primary and secondary sides. Secondary cables from the driver to LED modules shall be provided by the LED supplier. Maximum length between driver and LED module shall be as per manufacturer's recommendations.

© Copyright protected

P. LED driver shall be protected against electric shock, accidental contact with live parts, short circuit, overload, over temperature where the output current is reduced if the temperature limit is exceeded.

Q. In case LED luminaire internal temperature monitoring is required then the LED driver shall be provided with the possibility to connect a temperature sensor to monitor the LED temperature and protect the LED modules against thermal damage.

R. AC supplied LED drivers shall comply with IEC 61347-1, IEC 61347-2-13 and IEC 62384 and shall meet the limits of main harmonic content as defined in IEC 61000-3-2 and comply with radio interference suppression limits defined in BS EN 55015 and immunity requirements of IEC 61547.

S. DC supplied LED drivers shall comply with IEC 61347-1, IEC 61347-2-13 and IEC 62384 and shall comply with radio interference suppression limits defined in BS EN 55015 and immunity requirements of IEC 61547.

120.030 LED ROAD LIGHTING LUMINAIRES

A. Light source for all road lighting luminaires shall be LED.

B. Construction: Totally enclosed, dust protected and splash proof, conforming to at least IP 65/66 of IEC 60529, shock resistant, U.V. resistant and specially designed to house the LED modules, LED driver and accessories. Body is to be corrosion resistant, extruded, pressure die-cast or fabricated aluminum alloy.

C. Finish: Exposed metal parts of luminaires are to be factory finished, stove enameled, with suitable corrosion resisting paint capable of resisting heat emitted by the light source during continuous operation, and under full sunlight conditions. Color is to be agreed with Engineer.

D. Reflectors shall be polished aluminum, shined and stabilized electrochemically.

E. Luminaire Protectors: Heat and shock resistant glass, mounted into suitable frame assembly fixed to body by captive screws, and secured by extra safety clamps to allow replacement of protector and reflector. Ozone resistant ethylene propylene or approved equivalent rubber is to ensure sealing of the front glass.

F. HRC fuse cartridges, suitably rated and conforming to IEC 60269 or BS 88, are to be provided, complete with base, for protection of the luminaire. Fuse is to be rated to withstand starting current and is to be preferably located in LED driver enclosure.

G. Terminal Blocks: Suitable screw-tunnel type, clearly marked with arrangement to facilitate maintenance, quick replacement and easy disconnection of individual components.

H. All internal wiring shall be with stranded, tinned, annealed, electrolytic copper, high quality heat resistant insulation to 105 deg. Celsius.

120.040 LED FLOODLIGHTS

A. Light source shall be LED.

B. Type: Totally enclosed type, weather, dust and shock resistant, IP 65 to IEC 60529 (unless otherwise shown on drawings), with aiming adjustment facility and “lock-in-place” arrangement.

C. Housing: High pressure die-cast aluminum alloy (color shall be approved by the Engineer) closed on front by hinged framed protector highly resistant to thermal and mechanical shocks, and set in position by at least eight heavy duty stainless steel spring clamps with silicon sealing gasket. Enclosure shall be in accordance with IEC 60598-2-5, and shall be suitable for operation in specified ambient conditions.

D. Reflectors: High purity (over 99% reflectance) anodized aluminum, secured in precision aligned internal tracks to provide beam distribution required.

E. Connection box shall be located at rear of floodlight body with gland connections suitable to accept the supply cables. Light source and control gear/driver to be mounted in two separate and isolated compartments within the luminaire enclosure, unless specifically stated otherwise.

© Copyright protected

F. Finish: Exposed metal parts of floodlights are to be painted with U.V. stabilized, corrosion and heat resistant paint (color shall be approved by the Engineer), resisting operating temperatures attained in direct sunlight while lamp is burning.

G. Mounting: Floodlights are to be located as shown on the Drawings and mounted on specially designed brackets to allow swiveling in any desired direction and locking firmly in final position. Protractor scale shall be provided for accurate setting.

H. Earthing Terminals: Bolted earthing terminal shall be provided in each fitting.

I. All fixtures shall be clearly labeled by manufacturer, clearly stating make, model and country of manufacture.

J. Wherever required, antiglare louvers shall be provided to avoid glare to aircrafts.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 1 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Division V Section "Basic Electrical Materials and Methods".

B. Division V Section "Interior Lighting" for interior fixtures, lamps, ballasts, emergency lighting units, and accessories; and for exterior luminaires normally mounted on buildings.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Manufacturer: Subject to compliance with requirements, select one of the approved manufacturers.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Technical Requirements: Minor deviations from the Drawings may be considered for improvement in construction details, but no changes are to be made without the written approval of the Engineer.

B. Ambient Conditions: Unless otherwise specified, equipment is to be designed and derated for continuous and trouble-free service at 50 deg. C ambient temperature and 100% relative humidity, with temperature reaching 70 deg. C in direct sunlight and with high content of ultra-violet rays. Equipment is to withstand full load operation whilst exposed to sun.

C. All lighting fixtures shall have test certification from approved, internationally accredited, photometric laboratories.

D. All luminaires shall be sourced either directly from manufacturer or from manufacturer-authorized dealer/agent within Angola, with documentation as necessary.

© Copyright protected

E. Obtain specific written confirmation from luminaire, lamp and control gear manufacturers on the inter-compatibility of the equipment/devices to each other and to the specific project conditions.

F. Luminaires and the corresponding accessories shall be compatible with MINEA requirements

310.020 DELIVERY, STORAGE AND HANDLING

A. Store poles on decay-resistant treated skids at least 300 mm above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

B. Retain factory-applied pole wrappings on poles until just before pole installation. Handle poles with web fabric straps.

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Spare Parts: Provide items necessary for maintenance, and up to 5% (or nearest whole unit) of installed quantities of each type of lamp, control gear, fuses, luminaire covers, special bolts or nuts, lamp-holders and the like which are subject to burning, breakage or failure.

B. Furnish extra materials described below that match product installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fully Equipped LED Lighting Fixtures: 1% of each type and rating installed. Furnish at least one of each type.

320.000 SUBMITTALS

A. Equipment Data: For each type of lighting unit indicated submit complete data for approval including, but not limited to, the following:

1. Detailed literature, in English and Portuguese, for each type of luminaire or fixture, lamp and control gear including manufacturer's name, catalogue number, rating, material specification, overall dimensions, operating characteristics and principles, and any modification to a standard product if applicable
2. Detailed specification and drawings for each column type including shape, base/mounting flanges, bolts, nuts etc, cross-sections, design criteria and calculations, brackets, finishes, provisions for cabling, cut-out or circuit-breaker etc.
3. Photometric data for lighting calculations including polar curves, coefficients of utilization, efficiency and depreciation factors.
4. Materials and dimensions of luminaires and poles.
5. Certified results of independent laboratory tests for fixtures and lamps for electrical ratings and photometric data, including IP rating certification.
6. Life, output (lumens, Color temperature, and CRI) and energy efficiency data for lamps. Lifetime for LED fixtures shall be indicated at an ambient temperature of 25 and 50 deg. C.
7. High-intensity-discharge luminaire ballasts.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Layout of equipment in exact positions with mounting and construction details, concrete foundation dimensions and reinforcement, routing and sections of duct-banks and trenches, backfill and packing material, earthing rods etc.
2. Cabling and wiring diagrams, single line drawings, loads, phase distribution, protection and control, earthing and the like.
3. Calculations of illumination and glare levels, based on CIE methods.
4. High mast details shall include detailed calculations and supporting data to show that the mast meets the design criteria and shall include the following as a minimum:

a) The deflection at the top of the mast at the designed wind speed.
b) The neutral frequency of the mast.
c) The critical wind speed for resonance.
d) The damping characteristics of the mast.
e) The steel stressed under resonant conditions.
f) The acceleration at the top of the mast under resonant conditions.

g) Welding procedure.
h) Procedure to ensuring that the flange plate is not laminated.
i) Details of the joints between the mast sections and between the bottom section and the flange.
j) Details of the base compartment with the method of reinforcement at the door area and means adopted for making the door weather and tamperproof.

5. Design calculations indicating the strength of foundations and soil conditions on which they are based.

C. Samples: submit fully equipped sample of luminaire or other materials or components if required by Engineer.

D. Product Certificates: Signed by manufacturers of lighting units certifying that products comply with requirements.

E. Test Certificates: Submit certificates demonstrating LED fixtures compliance with the referenced standards. Include the following as a minimum:

1. Degree of Protection to IEC 60529.
2. Humidity Proof to IEC 60598.
3. Insulation resistance and electric strength to IEC 60598.
4. Color rendering for LED fixtures to IES LM 79-08.
5. LED fixtures lifetime to IES LM-80-08 and IES TM-21-11.
6. Efficacy to IES LM-79-08.

F. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

G. Maintenance Data: For lighting units to include in maintenance manuals specified in Division 1.

H. As-Built (Record) Drawings: At Project close-out, submit Record Drawings of installed lighting, in accordance with requirements of the Specification, Division 1.

330.000 EXECUTION

330.010 INSTALLATION

A. Equipment: Install equipment to be readily accessible for operation, maintenance and repair. Minor deviations from the Drawings may be made to accomplish this but no changes are to be made without the approval of Engineer.

B. Column Bases: Install columns on concrete bases as detailed on the Drawings. Before commencement of construction, ensure that bases are suitable for column installation.

C. Holding Down and Plumb Adjusting Nuts, Washers, Locknuts or Nyloc Nuts: Stainless steel or cadmium plated.

D. Columns: Erect columns so that luminaires are located on a line parallel to theoretical profile of road. Alignment of columns, both horizontally and vertically, is to be secured to the satisfaction of Engineer. Brackets are to be set at 90 degrees to longitudinal axis of road.

E. Install poles as follows:

1. Use web fabric slings (not chain or cable) to raise and set poles.
2. Mount pole to foundation with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.
3. Secure poles level, plumb, and square.
4. Grout void between pole base and foundation. Use non-shrinking or expanding concrete grout firmly packed in entire void space.
5. Use a short piece of 13-mm diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.

F. Luminaire Attachment with Adjustable Features or Aiming: Attach luminaires and supports to allow aiming for indicated light distribution.

© Copyright protected

G. Mounting Adjustments: After demonstrating to Engineer that specified lighting requirements have been met, carry out final setting and locking in position of the floodlights.

H. Luminaire Attachment: Fasten to indicated structural supports.

I. Lamp luminaires with indicated lamps according to manufacturer's written instructions. Replace malfunctioning lamps.

J. Cabling Conduits and Ductwork: Carry out in accordance with Division Y Section " Low Voltage Electrical Power Conductors And Cables ". Cable ducts are to be directly buried except at crossings with other service work or roads.

330.020 INSPECTION AND TESTS ON SITE

A. Visual inspection is to include inspection of condition of each piece of equipment, quality of workmanship, alignment, perpendicularity, labeling and the like, all in conformance with the Specification.

B. Insulation resistance and continuity tests are to be carried out on each circuit and piece of equipment before energization, with circuit breakers in the open position and lamps not installed.

C. Operational tests are to be carried out on all circuit breakers and control gear, with lamps installed, including recording voltage at terminals of ballasts on final columns of each circuit and at distribution panel or the like.

D. Performance tests are to be carried out after 100 hours normal operation, and are to include measurement of lighting and uniformity levels on required illuminated surfaces.

E. Other tests are to be carried out as required by the Engineer to verify conformity with the Specification.

F. Earthing resistance tests are to include measurement of earth electrode resistance at final points of circuits and continuity of protective conductors.

G. Results of tests are to be recorded on site and signed by witnessing parties.

H. Provide instruments to make and record test results.

I. Tests and Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source, and as follows:

1. Measure light intensities at night if specific illumination performance is indicated. Use calibrated photometers.
2. Check intensity and uniformity of illumination.
3. Check excessively noisy ballasts.

J. Prepare a written report of tests, inspections, observations and verifications indicating and interpreting results.

K. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

330.030 CONNECTIONS

A. Ground Equipment:

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values.

B. Ground metal poles/support structures according to Division Y Section " Earthing And Bonding."

1. Nonmetallic Poles: Ground metallic components of lighting units and foundations. Connect luminaires to grounding system with conductor as shown on plans or in accordance with Regulations.

330.040 CLEANING AND ADJUSTING

A. Clean units after installation. Use methods and materials recommended by manufacturer.

© Copyright protected

B. Adjust amiable luminaires and luminaires with adjustable lamp position to provide required light distributions and intensities.

© Copyright protected

V60 - 400 HERTZ AIRCRAFT GROUND POWER

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section specifies 50 Hz to 400 Hz solid state point of use frequency converters and accessories.

B. Description of Work: Install 50 Hz to 400 Hz frequency converters as indicated on Drawings, in Schedules, and in this Section.

1. The frequency converters shall be mounted under the aircraft end of each loading bridge.
2. Supply aircraft cables with aircraft plugs. Aircraft cable hoist systems at each loading bridge are specified as part of bridge system.
3. Each converter unit shall be equipped with solid-state energy-use metering electronics arranged to accurately measure the KWH power delivered to the system during each aircraft use of the gate. Measured power consumption data will be acquired by the Gate Control Unit (GCU), and will be transmitted for processing of costs.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Institute of Electrical and Electronic Engineers (IEEE):

1. IEEE 519 – Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems.

B. American National Standards Institute (ANSI):

1. IEEE C2 National Electrical Safety Code.
2. NEMA ANSI C84.1 - Voltage Ratings for Electrical Power Systems and Equipment

C. National Electrical Manufacturers Association (NEMA):

1. ICS-1 - General Standards for Industrial Control Devices and Systems.
2. ICS-6 - Enclosures for Industrial Control Devices and Systems.
3. ST 20 - Dry Type Transformers for General Applications.

D. Underwriters Laboratory (UL): All components shall be UL listed and labeled except for components, which are not available with a UL listing or label.

E. Air Transport Association of America (ATA): ATA 101 - Ground Equipment Technical Data.

F. DFS4OO (Euro-standard, 400 Hz).

G. International Electrical Commission: IEC 60204-1 - Electrical equipment of Industrial Machines.

H. Compliance with Local Requirements: Comply with applicable local regulations/code requirements of authorities having jurisdiction. This will have precedence over other codes/standards nominated for the project, unless otherwise approved in writing.

120.000 SYSTEM DESCRIPTION

120.010 50 HERTZ TO 400 HERTZ SOLID STATE FREQUENCY CONVERTERS

A. General: Provide 400 Hertz output solid state frequency converters complete with all components, accessories, auxiliary equipment and associated equipment as specified. Provide two (2) different

© Copyright protected

sized units, nominal 90 kVA and 120 kVA continuous output as shown and scheduled on the contract drawings. All 120 kVA units shall have dual aircraft cable and plug outputs; 90 kVA units shall have single or dual output cables and plugs as indicated on the drawings or in schedules.

B. Operational Life: The frequency converter shall have a 20 year life when operated within these specifications at any load from no-load to full load.

C. Ambient Conditions: The solid state frequency converters shall operate under any combination of the following ambient conditions without any mechanical or electrical damage, degradation of operating characteristics, or loss of normal life expectancy.

1. Operating Ambient Temperature: 0 degrees C to 50 degrees C.
2. Non-operating Temperature: -40 degrees C to 70 degrees C.
3. Relative Humidity: 10 percent to 95 percent non-condensing for all temperatures within the temperature range.
4. Operating Altitude: Sea level.
5. Non-operating Altitude: 12190 m above sea level.
6. Wind: 137 km/h steady, 200 km/h gusts.

D. Input Power:

1. Voltage: Nominal voltage, 400 volts, 3 phase, 3 wire. Allowable voltage range, 380 volts to 430 volts.
2. Input Power Factor: Unit shall be rated at 0.8 power factor at 400 volts.
3. Frequency: Nominal frequency 50 hertz. Allowable frequency range 49 hertz to 51 hertz.
4. Inrush Current: Shall not exceed 100 percent of rated full load current and shall be equipped with a fully automatic soft start circuit.
5. Protection: The frequency convener shall automatically shut down if any of the following input power conditions exist:

    a) Overcurrent.
    b) Thermal Overload.
    c) Phase Loss.
    d) Phases Out of Sequence.
    e) Over/Under Voltage.

E. Harmonic Distortion: The current harmonic distortion reflected back on the input power line with the frequency converter operating at 50 percent of full load shall not exceed 20 percent maximum and when operating at full load shall not exceed 10 percent maximum. The voltage harmonic distortion shall not exceed 5 percent with the frequency converter operating between 50 percent and full load. The units shall be tested (reference: IEEE 519), in accordance with paragraph titled "Factory Testing" in Pan 3 of this Section.

F. Output Power:

1. Power Rating: Nominal ratings of units are 90 kVA and 120 kVA at 0.8 lagging power factor.
2. Voltage: Nominal voltage 200Y/115 volt, 3 phase, 4 wire, wye connected. Actual delivered single phase voltage 112.0 volts to 118.0 volts, measured at the aircraft plug.
3. Phase Rotation: Shall be ABC left to right, front to back, top to bottom.
4. Frequency: Shall be 400 Hertz ± 0.05 percent at any load.
5. Overload Capacity: After reaching stabilized temperature at full load, the frequency converter shall be capable of carrying the following overloads:

    a) 115 percent for 1 hour, 150 percent for 5 minutes, 200 percent for 10 seconds, 250 percent for 0.5 second.

6. Overload/Short Circuit: The frequency converter shall be isolated (solid state switching or output contactors) from the aircraft load by overload/short circuit protection specifically rated for 400 Hz operation. The converter shall be equipped with an instantaneous electronic overload alarm circuit designed to operate at not less than 250 percent of rated capacity.
7. Over/Under Voltage Protection: An over/under voltage output protection system shall be provided to automatically isolate the converter output power from the aircraft when it is exceeding limits.

© Copyright protected

8. Efficiency: The efficiency shall be 95 percent or better at from 51 percent full load to full load, at rated power factor.
9. Voltage Phase Balance: With frequency changer operating at any load within the rated kVA, the maximum difference in all line-to-neutral voltages shall not exceed 2 percent for balanced loads and within 2.5 percent for 25 percent unbalanced loads.
10. Phase Voltage Displacement: Shall be 120 ± 2.0 degrees for balanced loads, 120 ± 2.5 degrees for 33 percent unbalanced loads.
11. Voltage Regulation: Voltage regulation from no-load to rated load and from rated load to no-load shall be not more than 1 percent of rated voltage and shall be maintained with input line voltage variations of + 10, -15 percent.
12. Voltage Modulation: Voltage modulation shall not exceed 1.0 percent at any load from 0 to 100 percent.
13. Voltage Recovery: Transient voltage recovery shall not exceed 200 msec for 100 percent load change.
14. Harmonic Distortion: The maximum total harmonic voltage distortion at any load shall not exceed 3.0 percent when measured line-to-line or line-to-neutral. The maximum single harmonic shall not exceed 1.5 percent of the fundamental voltage at steady state.
15. Frequency Regulation: Shall be 400 Hz ± 0.05 percent and shall not be affected by load.
16. Crest Factor: Shall be 1.414 ± 0.05.
17. Voltage Trim Adjustment: The output voltage trim adjustment shall be ± 15 percent of nominal output span.
18. Line Drop Compensation: Shall be 0 to 5 percent of voltage span and shall be adjustable.

G. Frequency Converter Control: The solid state frequency converter shall have the following control functions and equipment:

1. Momentary start stop push buttons mounted on the converter front panel.

    a) Power On: The remote "power on" pushbutton shall make the 400 Hz power available to the aircraft plug. This power shall be available for only four (4) seconds unless the aircraft plug is connected to the aircraft and the 28 VDC safety circuit is complete.
    b) Power Off: The remote "power off" pushbutton shall turn power off to the aircraft plug. The 400 Hz power shall be turned off instantly if the aircraft plug is removed from the aircraft receptacles by breaking the 28 VDC safety circuit.
    c) Aircraft Interlock Circuit: The "E" and "F" interlock circuit shall instantaneously isolate the converter output in the absence of a 28 VDC signal from the aircraft. The "E" and "F" interlock circuit indicator shall be provided to display the status of "E" and "F" interlock.

2. Isolated, fused 28 volt DC power supply for indication and control devices.
3. Automatic Reset: The reset function shall be accomplished by operation of the "power off" pushbutton.
4. Automatic Restart: The automatic restart function shall restart the unit and bring "Ground Power Available" indication back to the aircraft should the aircraft be configured to overload the unit. Reconfiguring the aircraft to a lower level of power consumption allows continuation of service without manually resetting the unit with controls located on the ramp. The function shall allow three (3) automatic resets. The fourth time shall require the unit to be reset manually.
5. Aircraft Bypass Switch: For testing purposes, an aircraft bypass switch shall be provided inside the converter to allow the unit to deliver the output power without the 28 VDC power from the aircraft. An indicator shall be provided to indicate that the bypass circuit has been selected.
6. Output Voltage Adjust: A voltage adjusting potentiometer located on the back of the primary access panel shall be provided to permit adjustment of the converter output voltage.
7. Bridge Control Interlock: The converter unit and the cable hoist shall be interlocked with the bridge control circuit so that the bridge cannot be moved away from the aircraft while frequency converter is plugged to the aircraft or the load cable is not fully stowed. Provide bypass switch at passenger loading bridge control console, enabling emergency override of interlock feature.
8. Alarm Indicator Reset: A reset pushbutton shall be provided to reset all alarm signals and indications on the inside of the front cover of the converter.

© Copyright protected

9. Line Drop Compensation: The voltage regulation means shall include an electronic line drop compensation circuit for maintaining the voltage regulation at a single point distance from the converter and shall be adjustable at full load to at least 5 percent of rated output voltage.
10. Overtemperature Protection: The converter shall automatically shutdown before the inside temperature reaches the maximum temperature rating of any component inside.

H. Meters and Indicators:

1. General: Provide the metering and switching specified by either individual meters and switches or by a combination key pad and LCD/LED readout.
2. Ammeter: The output ammeter shall have a single 0 to 400 A rms scale for 90 kVA units and 0 to 600 A rms scale for 120 kVA units in order to read output phase currents. The ammeter shall be calibrated for 400 Hz and shall have an accuracy of ± 2 percent full scale.
3. Ammeter Selector Switch: A four-position selector switch shall be provided to monitor output phase line-to-neutral currents "A", "B", "C", with "OFF" position.
4. Voltmeter: The output voltmeter shall have a single 0 to 150 VAC scale in order to read line-to-neutral voltages. The voltmeter shall be calibrated for 400 Hz and shall have an accuracy of ± 2 percent full scale.
5. Voltmeter Selector Switch: Four-position selector switch with "OFF" position shall be provided to monitor line-to-neutral voltages.
6. Power Use Metering: Provide analog digital electronic metering module arranged to transmit data to the Gate Control unit (GCU) for kilowatt-hour usage, based on 400 Hz converter input power from 50 Hz system, for each gate use event.
7. Run Time Meter: Non re-settable hour meter with range from 0-99,999 hours.
8. Status Indicators: Provide the following status indicator lights in the colors indicated:

    a) Input Power On - Amber
    b) Converter On - Green
    c) Module Fault - Red
    d) Input Voltage Fault - Red
    e) Output Voltage Fault - Red

9. Lamp Test: The lamp tests pushbutton, when depressed, shall test all door-mounted light indicators and digital display segments.
10. Diagnostic System: The solid state frequency converter shall be equipped with a complete diagnostic system including alarm message system. All of the converter's vital functions shall be continuously monitored by the diagnostic system.
11. System Indicators: The frequency converter shall be equipped with a light emitting diode (LED) status package to provide monitoring of the proper system modules operation.
12. Voltage Adjustment Device: Provide a device, located on the inside of the converter front panel, which can be used to adjust the output voltage while viewing the voltmeter.
13. Status Contacts: Each converter shall be provided with dry contacts to indicate the following (contacts shall be utilized by the Data Acquisition System provided under Pre-conditioned Air system installation):

    a) Run
    b) Stop
    c) Summary Fault

I. Physical Characteristics:

1. The unit shall be so designed and constructed that parts will not work loose in service. It shall be designed to withstand the strains, jars, vibration and other conditions incident to shipping, storage, installation and service.
2. The physical size and weight of the unit shall be suitable to provide integrated loading bridge operation as indicated on the drawings and in specifications.
3. The converter section of the frequency changer shall be modularized solid state components. The standard construction shall have no moving parts and shall require minimum service or maintenance. All cards shall be equipped with vibration resistant latching mechanism.

© Copyright protected

4. Components shall be cooled by convection, natural draft cooling, use of heat sinks, or by forced draft cooling provided the overall efficiency of the unit is not reduced by the use of fans. All fans shall be equipped with permanent, washable aluminum mesh air filters.
5. The electronic compartments shall be equipped with environmentally safe vapor type corrosion inhibitors.
6. The frequency converter shall be equipped with approved weathertight fittings for all wiring that passes through the weathertight compartments to preclude the entrance of moisture and dust into electronic compartments.
7. All printed circuit boards shall be conformably coated to protect against the effects of humidity and corrosion. All integrated circuits shall be installed with soldered joints.
8. The frequency converter shall be so constructed that adjustments and repairs can be easily made by maintenance personnel.
9. All major components and sub-assemblies shall be stenciled or labeled with identification number or letter code on or near the device. The code shall be readily visible when servicing the frequency converter.
10. The cabinet enclosure shall be NEMA 3R. The cabinet shall be mounted in such manner that no damage will occur as a result of transportation. The complete frequency changer shall be designed for lifting and transporting by forklift. Means shall be provided for easy access to all components and sub-assemblies.
11. A door interlock switch shall be provided to shut down the unit and suitable warning labels or covers shall be provided where internal voltages decay slowly after shut down. There shall be a means to defeat the door interlock switch for maintenance purposes.
12. The control panel shall be an integral part of the converter cabinet. Provision shall be included for remote controls to operate the frequency converter from remote position. Remote control locations are shown on drawings. Remote control shall perform the same functions as specified on the converter unit integral control panel.
13. The converter and associated parts to meet the harmonic voltage and current criteria specified herein shall be enclosed in a single enclosure. No external parts or equipment will be allowed.
14. Converter unit shall be capable of being locked closed with all units keyed alike.

J. Finishes:

1. Steel surfaces shall be zinc coated (hot galvanized).
2. Aluminum surfaces shall be anodized.
3. All steel parts, except galvanized surfaces not to be painted (not exposed to view), shall be cleaned and a zinc-phosphate pre-treatment applied prior to paint application.
4. Color of exposed surfaces of frequency converters installed on passenger loading bridges shall be as directed by the Engineer.
5. Painting system shall be specially formulated and applied to ensure protection of surfaces from saline dust and high humidity conditions. The average thickness of the paint film shall be 0.05 mm. Paint film shall be uniform in color and free from blisters, sags, flaking and peeling.
6. Adequacy of paint finish to inhibit the buildup of rust on ferrous metal materials shall be tested and evaluated per ANSI C37.20.2. Salt spray withstand tests in accordance with ASTM D1654 and B117 shall be performed on a periodic basis to provide conformance with the corrosion resistance standard of at least 2500 hours minimum.

K. No-Break Power Transfer (NBPT) Capability: The frequency converter shall be capable of withstanding reverse power flow caused by NBPT operations of all known aircraft without damage to any components in the unit or to the aircraft auxiliary power unit (APU).

L. Workmanship: The frequency converter, including all parts and accessories, shall be fabricated and finished in a workmanlike manner. Particular attention shall be given to freedom from defects, burrs, sharp edges, quality of soldering, welding, brazing, painting, wiring, riveting, alignment of parts and tightness of assembly screws, bolts, etc.

120.020 AIRCRAFT LOAD CABLE ASSEMBLIES

A. The aircraft output cable assemblies shall be designed to carry a nominal 115/200 volt, 3 phase, 4 wire, 400 Hz supply from the frequency converter to the aircraft.

B. Each cable assembly shall consist of 1 conductor per A, B, and C phases and 1 neutral conductor.

© Copyright protected

1. There shall be one or more 3.5 mm2 (or equivalent) control leads connected to a field-replaceable AN3430 plug with jumper installed between pins E and F.
2. All conductors shall be copper and consist of Class M stranding.
3. The cable shall have a single, heavy duty, neoprene jacket eliminating the need for banding.
4. The cable assembly shall be easily removable for replacement or repair.
5. All cables shall be 20 m in length.

C. Each cable assembly shall be sized to handle the full load current of the indicated frequency converter.

D. The number of cable assemblies per frequency converter shall be as indicated by the number of 400 Hz converter outputs listed on the drawings.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section - "Basic Electrical Materials and Methods".
2. Division Y Section - "Earthing and Bonding".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. 400 Hz frequency converters shall be products of a manufacturer regularly engaged in the engineering and fabrication of 400 Hz, solid state, point of use 50 Hz to 400 Hz frequency converters.

B. The manufacturer shall provide evidence of at least 5 years of satisfactory experience in the design and fabrication of point of use solid state frequency converters serving commercial aircraft loads.

C. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Hochian (UK)

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer with minimum five years of successful installation experience on projects utilizing 400Hz aircraft ground power similar to those required for this project.

310.020 WARRANTY

A. Manufacturers Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

© Copyright protected

1. Warranty Period: 1 year from date of substantial completion.

320.000 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data, including specifications and installation instructions, for each size and type of solid state frequency converter specified. Include data substantiating that materials comply with requirements.

B. Shop Drawings: For 400Hz aircraft ground power equipment. Include plans, elevations, sections, details, and attachments to other Work.

1. Include dimensioned plan and elevation views of equipment. Show access and workspace requirements.
2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.

C. Coordination Drawings: Plans drawn to scale and coordinating locations of equipment.

D. General: Comply with all requirements of Division 01 Specifications as applicable to quality control and required submittal of inspection records, test reports, and certifications. Submit all factory and field test reports to the Engineer within 14 days of actual test.

E. Harmonic Distortion Test:

1. Submit manufacturer factory harmonic distortion testing procedures and test data with contract bid documents.
2. Submit independent laboratory testing procedures and test data within eight (8) weeks of Notice to Proceed.

F. Certification: Provide certification from each aircraft manufacturer (including Boeing and McDonnell Douglas) that frequency converter is capable of supplying the aircraft load.

G. Solid State Frequency Converter Details (edited to identify exact units to be provided). Submit the following:

1. Drawing of unit to scale with dimensions and weights.
2. Operating details, schematic layout, diagrams, sufficient to completely describe converter.
3. Wiring diagrams with all terminal points and conductors clearly identified.
4. Spare parts list.
5. List of special tools required, if any.

H. Working Procedures: Submit proposed working procedures for the installation/erection of work of this Section to the Engineer for his approval sufficiently in advance of commencing any work affected by the working procedures.

I. Qualification Data: For firms and persons specified in "Quality Assurance" Article. Provide evidence of applicable registration or certification.

J. Tests and Certificates: Submit complete certified manufacturer’s type and routine test records, in accordance with the Standards specified in "Quality assurance" Article.

K. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

L. As-Built Drawings: Submit hard and soft copies with labeling.

M. Maintenance Data: For 400Hz aircraft ground power and components to include in maintenance manuals specified in Division 01. In addition to requirements specified in Division A Section "Contract Closeout", include the following:

1. Detailed operating instructions.

© Copyright protected

2. Routine maintenance requirements for system components.
3. Lists of spare parts and replacement components recommended to be stored at the site for ready access.

N. Warranties: Special warranties specified in this Section.

330.000 EXECUTION

330.010 FACTORY ACCEPTANCE TEST

A. Factory acceptance test of equipment under this contract are subject to be witnessed by the Engineer. Witness test shall include complete routine testing. Test procedures and program shall be submitted for approval prior to test conduction. Factory witness test shall include business class air tickets, five stars hotel full accommodation, transportation and all test expenses for two persons from the Engineer's or Employer's side.

330.020 COORDINATION

A. Coordinate layout and installation of 400Hz aircraft ground power and components with other construction and electrical work, including conduit, piping, equipment, adjacent surfaces, raceways, electrical boxes and fittings, and cabling/wiring work. Maintain required workspace clearances.

330.030 START-UP

A. The manufacturer of the units shall furnish a competent factory-based engineer to assist in placing the units in operation and to instruct personnel in their proper use.

330.040 INSTALLATION

A. The units shall be installed on the loading bridge and coordinated with the loading bridge Contractor for loading bridge mounting power connection and 400 Hz cable hoist.

330.050 FACTORY TESTING

A. Harmonic Distortion: Provide independent laboratory test results of input harmonic currents and voltages for both 90 and 120 kVA typical (one unit each) frequency converters. The test shall be completed with a distortion analyzer within 1.5 m of the frequency converter's input terminals with a maximum analyzer lead length of 1 m. The test data shall include total harmonic distortion and amplitudes of individual harmonics in graphic representation for no-load, 25,50, 75, and 100 percent load factors. Submit test procedure and test results from a certified independent laboratory within eight (8) weeks of Notice to Proceed. Provide manufacturer factory testing on one (1) 90 kVA frequency converter in accordance with this section and submit testing procedures and test results with contract bid documents.

B. Provide airfare and lodging (of not less than a 3-star hotel) per diem for three engineers to be assigned by the Engineer for witnessing performance of frequency converter units in tests conducted at the factory. One fully assembled unit of each type and size of unit required for the project shall be tested at design conditions, with output to be recorded and approved by the Engineer before equipment is dispatched from the factory.

C. All frequency converters shall be load bank tested prior to shipping from the factory with test results submitted to the Engineer 20 days prior to shipping to the Work site.

1. Testing: One hour at 50 percent kW capacity and one hour at approximately 100 percent kW capacity.
2. Monitoring: At 15 minute intervals during testing monitor voltage, frequency and amperes.

330.060 FIELD TESTING

A. Prior to acceptance of the installation, seven (7) randomly selected frequency converters shall be tested to show that they are free of defects and will be operated correctly.

© Copyright protected

B. The solid state frequency converters shall be subjected to load test through the use of portable load banks supplied for this purpose at the job site by the Contractor.

C. Load bank testing shall be done in the presence of the Engineer or his appointed representative only after all converters are permanently installed in accordance with the plans and specifications.

1. Testing: One hour at 50 percent kW capacity and one hour at approximately 100 percent kW capacity.
2. Monitoring: At 15 minute intervals during testing monitor voltage, frequency and amperes.

D. Supply all material and labor for load bank testing of frequency converters on site.

E. Demonstrate the following six (6) shut down features on all units to Engineer:

1. Removal of the plug connector from aircraft receptacle.
2. Sustained load exceeding 115 percent of rated power.
3. Over or under voltage.
4. Loss of phase or phase rotation reversal.
5. Loss of input power.
6. Loss or interruption of 28 volt DC monitoring voltage.

F. Demonstrate the interlocking operation of the system.

330.070 TRAINING

A. On-site training shall be provided to the Employer's and/or tenant airlines' designated personnel in complete operation and maintenance of the units. The number and duration of training sessions shall be as approved by Engineer.

© Copyright protected

V70 - WIRING DEVICES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes wiring devices, lighting switches, socket outlets, cord outlets, automatic and manual lighting control equipment, dimmers, outlet boxes and plates, etc.

B. Components are to be standard manufactured items, uniform and modular, complying with one set of approved Standards.

110.000 SYSTEM DESCRIPTION

110.010 PLATES, GENERALLY

A. Blank Plates: Blank plates are to be installed on outlet boxes, specified under Division 26 Section "Raceways and Boxes for Electrical Systems", on which no apparatus is installed or where apparatus installed does not have suitable cover for box. Blank plates for wall outlets are to be attached by a bridge with slots for horizontal and vertical adjustment.

B. Floor outlets and plates are to be watertight and impact resistant.

110.020 PLATES AND CORD-OUTLETS

A. Design: Square, rectangular or round designed to cover outlet box and to closely fit electrical device, and with polished chromium plated recessed head fixing screws. Combination plates are to be used for grouped outlets and devices.

B. Cord extension plates are to have threaded cord grip bushings of same material and finish as plates.

C. Plastic Plates: Heavy gauge, break resistant, pressure molded plastic, White color, for general use in Back of House (BOH) Areas.

1. Man: Legrand
2. Ref: Arteor series 5752 00, or other equal and approved.

D. Brushed Stainless Steel Plates: Heavy gauge, pressed stainless steel, satin finish, minimum 1 mm thick, for use in Front of House (FOH) Areas.

1. Man: Legrand
2. Ref: Arteor series 5752 06, or other equal and approved.

E. Cable/cord outlet (flex outlet) is to be used for up to 45 A, 250 V rating for connection of power/control cable of fixed appliances, as shown on the drawings. Plate is to have threaded cord grip to anchor cable securely to cover. Box is to include fixed terminal block and cable clamp for termination of cable/cord within.

F. Electrical outlet is to consist of outlet box, coverplate, and necessary accessories ready for connection to cable of fixed appliances.

G. Lighting outlet is to consist of outlet box, coverplate, and necessary accessories ready for connection to lighting fixture.

H. Ceiling rose: similar to lighting outlet equipped with a decorative element affixed to the ceiling from which a chandelier or lighting fitting is suspended. Ceiling rose to comply with BS 67.

© Copyright protected

110.030 SWITCHES

A. Generally: Quick-make, quick-break type with silver alloy contacts in arc resisting molded base, with toggle, rocker or push-button as specified, for inductive or resistive loads up to full rated capacity, and arranged for side and/or back connection.

B. Types: Single, two-way or intermediate, single pole or double pole, as shown on the Drawings.

C. General Lighting Switch (S1): 10 A, 250 V a.c., rocker operated, grid-switch with brushed stainless steel and switch module for use in all front of house areas.

D. General Lighting Switch (S3): 10 A, 250 V a.c., rocker operated, grid-switch with Thermosetting plastic with glossy finish white Plate and switch module for use in all back-of-house areas.

E. General Lighting Switch (S4): 10 A, 250 V a.c., rocker operated, grid-switch with metal clad aluminum plate with white switch module for use in technical spaces

F. Remote Lighting Control Panel For Contactor Control: Multiple two way momentary on/off push switch assembly, with an 'on' pilot light for each circuit controlled (remote contactor). Panel and box are to be sheet steel construction, with see-through steel-framed acrylic door and trim, handle and lock. Enclosure protection IP 42 to IEC 60947-1 for indoor installation and IP 55 for outdoor installation.

G. Weatherproof Switch (S15): 10 A, 250 V, for installation outdoors, and indoor wet areas with weatherproof plate, synthetic gasket, weatherproof outlet box, on/off indication, IP 56 enclosure.

H. Double Pole Switch (S20): Rated 20 A (or as shown on the Drawings), 250 V a.c., tumbler operated, to IEC 60669-1, with stainless steel or molded plastic plate (as required in application area), marked (etched) with equipment controlled (i.e. cooker, air conditioner, water heater) and with red neon pilot light for "on" position. Switch is to be mounted to flush or surface box, as required or as shown on the Drawings, and provided with cord outlet and cord extension to equipment controlled.

I. Manual Switch (S25): 2 pole, for fractional single phase motors and appliances, to interrupt motor and induction loads, rated 30 A at 240 V a.c., and 20 A at 600 V a.c., toggle operated, with positive indication of on/off position of contacts.

110.040 SOCKET OUTLETS

A. Generally: To have injection molded plastic base with self-adjusting, non-expanding contacts to prevent permanent distortion, arranged for side and/or back connection and with screw terminals accepting at least three parallel branch-circuit wires.

B. Types: General-purpose socket outlets are to conform to standard SASO and British practice and BS standard 1363

C. Duplex sockets are to be mounted in parallel under one common plate with break-off feature for two-circuit connection.

D. Weatherproof socket outlets are to be any of the types indicated, enclosed in surface mounted cast metal box and with cover comprising spring-retained gasket hinged flap. Enclosure is to be pre-designed box and cover for type of socket outlet specified.

E. Standard British Socket Outlet - Type R01 (230 V SERVICE): To BS 1363, polarized, grounding type, with three rectangular pin-holes (two poles and earth), rated 13 A, 250 V, switched, switched, recessed, brushed stainless steel.
   1. .Location: All front-of-house, and as shown on drawings

© Copyright protected

F. Standard British Socket Outlet - Type R03 (230 V SERVICE): To BS 1363, polarized, grounding type, with three rectangular pin-holes (two poles and earth), rated 13A, 250 V, switched, with robust shutter mechanism operated by earth pin, Thermoplastic with glossy finish with white plastic cover plate and inserts.
   1. Location: All back-of-house areas and back-of-house offices, and as shown on drawings.

G. Standard British Socket Outlet - Type R04 (230 V SERVICE): To BS 1363, polarized, grounding type, with three rectangular pin-holes (two poles and earth), rated 13A, 250 V, switched, surface mounted, metal clad, aluminum finish with white insert and switch

   1. Location: Technical areas, electrical/telecom rooms, and as shown on drawings.

H. Weatherproof Socket Outlet - Type R05 (230 V SERVICE): 13A, 250 V, 2 pole plus earth, to BS 1363, switched, enclosed in surface mounted cast-metal box and with cover comprising spring-retained gasket hinged cover. IP 56.
   1. Location: Mechanical rooms, and as shown on drawings.

I. Standard British Socket Outlet - Type R06 (230 V SERVICE): Similar to R01, but with duplex.
   1. Location: All front-of-house areas, and as shown on drawings

J. Standard British Socket Outlet - Type R08 (230 V SERVICE): Similar to R03, but with duplex.
   1. Location: All back-of-house areas and back-of-house offices, and as shown on drawings.

K. Standard British Socket Outlet - Type R09 (230 V SERVICE): Similar to R04, but with duplex.
   1. Location: Technical areas, electrical/telecom rooms, and as shown on drawings.

L. Standard British Socket Outlet - Type R11 (230 V SERVICE): Similar to R01, but with red rocker, Fed from UPS.

M. Standard British Socket Outlet - Type R13 (230 V SERVICE): Similar to R03, but with red rocker, Fed from UPS.

N. Standard British Socket Outlet - Type R14 (230 V SERVICE): Similar to R04, but with red rocker, Fed from UPS

O. Standard British Socket Outlet - Type R15 (230 V SERVICE): Similar to R05, but with red rocker, Fed from UPS

P. Standard British Socket Outlet - Type R16 (230 V SERVICE): Similar to R06, but with red rocker, Fed from UPS.

Q. Standard British Socket Outlet - Type R18 (230 V SERVICE): Similar to R08, but with red rocker, Fed from UPS.

R. Standard British Socket Outlet - Type R19 (230 V SERVICE): Similar to R09, but with red rocker, Fed from UPS

S. Power Socket - Type R31: Single outlet, single phase, three wire, 16A, weatherproof (IP 44) power switched socket outlet, 16A used in Kitchen and Laundry areas, indoors.
   1. Ref: K9913 BLU or other approved equal

T. Power Socket - Type R32: Single outlet, single phase, three wire, 32A, weatherproof (IP 44) power switched socket outlet, 16A used in Kitchen and Laundry areas, indoors.
   1. Ref: K9643 BLU or other approved equal

U. Power Socket - Type R41 Single outlet, single phase, three wire, 16 A, 2P+E, 250 V, to IEC 60309, polarized with L-shaped earth contact, splash proof molded cast metal plate and matching plug. Sockets used for car charging or similar applications shall be twist-lock type.

© Copyright protected

V. Power Socket - Type R42: Single outlet, single phase, three wire, 32 A, 2P+E, 250 V, to IEC 60309, polarized with L-shaped earth contact, splash proof molded cast metal plate and matching plug. Sockets used for car charging or similar applications shall be twist-lock type.
   1. Man: Legrand
   2. Ref: 059243

W. Industrial Socket Outlet - Type R45: single outlet, 3P+E, 3 phase, polarized, earthing type, rated 32 A, 400/415 V, to IEC 60309, with splash proof cast metal box and hinged spring-return plate, and with matching plug 3P+E.

X. Shaver Socket - Type R55: Specially designed for use with electric shavers, incorporating dual voltage isolating transformer 110/230 V and voltage selector switch. Socket is to be universal type, accepting round pin (Continental) and flat pin (American) plugs with disconnecting switch to isolate transformer from supply. Transformer is to be protected by over-current, self-resetting thermal device. Socket is to be molded plastic with flush plate marked with available voltage and function of both selector and disconnecting switches.

110.050 METALLIC OUTLET BOXES

A. Recessed and Concealed Boxes: galvanized pressed steel, with knock-outs for easy field installation. Special boxes are to be punched as required on Site.

B. Exposed Surface Mounted Boxes: galvanized cast iron with threaded hubs.

C. Outdoor Surfaces or Recessed Boxes: galvanized cast iron with threaded hubs and PVC gaskets to ensure water tightness and with stainless steel or non-ferrous, corrosion resistant screws.

D. Floor Boxes - Type A: watertight, cast iron or cast metal alloy with corrosion resistant finish, adjustable mounting, standard duty, round or square, factory drilled and tapped for required conduit sizes, and with brass cover and flange with brushed finish free from markings other than required for mounting screws.

E. Floor Boxes - Type B: non-standard size, flush floor mounted, cast metal alloy, with watertight neoprene gasketed and hinged cover, and with drilled and tapped conduit entries and adjustable mounting. Metal barriers are to separate services for power and low current.

F. Flame Proof Boxes: malleable iron or cast iron, with gas threaded hubs, special covers with silicon rubber gaskets, gas tight, and water-tight. Boxes are to comply with the Regulations for explosive areas.

G. Manufacturers: obtain metallic outlet boxes from same manufacturer as conduit or other approved, and to the satisfaction of the Engineer

Floor Box Type	Electrical	Telecom	Remarks
FB1	1 UPS Duplex R18	2 Data Outlet	SELF CHECK IN KIOSK, BPV, E-GATES, FIDS-1S, XRAY HAND BAGGAGE

FO2	1 UPS Duplex R18	-	

110.060 PLUGS

A. Type: Compatible with type of socket outlet specified, break resistant, of impact resistant molded insulating material (separable construction), with solid brass pins and cord grip and of shape Providing Easy Hand-Grip For Removal.

B. Quantity: Supply number equal to 20% of total number of each type of socket outlet supplied.

110.070 SPECIAL DEVICES

A. Lighting Contactors

1. Type: Double pole for single phase and neutral circuits, and triple or four-pole for three phase circuits, mechanically held, electrically operated, rated 500 V, of current ratings shown on the Drawings, and complying with the appropriate category of IEC 60947-4-1 Table 1.
2. Contacts: Copper alloy, with silver cadmium alloy double break contacts designed for switching inductive ballast loads and switching of tungsten lamp loads.
3. Auxiliary Contacts: As required to provide specified interlocks and signals as shown on the Drawings, or required by the Specification, with one N.O. and one N.C. spare contacts.
4. Enclosure: Unless forming part of system housed in sheet steel panel, contactor is to be provided with IP 42 enclosure for indoor use or IP 65 enclosure for outdoor use.
5. Control: Each contactor whether part of a system or separately enclosed is to have on/off pilot lights and set of on/off push buttons mounted on cover.

B. Photoelectric Cells

1. Photoelectric Cells: Omnidirectional cadmium sulfide, hermetically sealed, with 2:1 on/off adjustment possible by moving light level selector, set to operate at illuminance levels shown on the Drawings. Unit is to include timer giving 3-minute delay to prevent false switching. Temperature range is to be -10 deg. C to +80 deg. C.
2. Safety: Control is to be designed such that in case of failure, unit fails in the on position.
3. Contacts are to close or open as illumination level increases to set level with respect to requirements shown on the Drawings.

© Copyright protected

4. Enclosure: Heavy duty cast metal, with translucent dome of 'Lexan' (by G.E.) or other equal and approved, to protect against high ultra violet rays, and 180 deg. swivel base and 16 mm threaded conduit mounting. Enclosure is to be weatherproof and protected against high winds and storms.

C. Time-Switch

1. Type And Rating: Clock is to be escapement mechanical type, electrically rewound, with 24 hours dial and time adjustment and rated 10 A, 250 V.
2. Spring reserve mechanism is to allow up to 12 hours operation in the event of power failure.
3. Switching is to be capable of performing two on and two off operations, adjustable, over 24 hours.
4. Manufacturers: Obtain time-switch from:

D. Remote Lighting Relay Control System

1. Remote Lighting Relay Panel (RLRP): Comprise set of heavy duty long life service relays, rated 20 A, 230 V a.c. for switching tungsten or fluorescent lighting loads, SPST maintained (mechanically latched), with 24 V a.c. split-coil (1/2-on and 1/2-off) for control by remote push button on/off switches, via 24 V control transformer.
2. Push Button Switch (LS): SPDT, momentary contact, normally open switch with pilot light and red jewel Lens, Rated 3 A, 25 V A.C.
3. Master Selector Switch Panel (MSSP): Comprise set of push button switches type (LS), assembled in one unit comprising box and cover, with individual switch per circuit controlled, and one master switch for all-circuit control.
4. System is to allow local and remote centralized switching of group of lighting circuits and from any number of individual points. System is to use low voltage (low current) control circuitry to operate relay switches on branch circuits.
5. Manufacturers: System is to be by G.E. Remote Control Products or other equal and approved.

E. Contactor Control Panels In Connection With CCMS

1. General: Control panels are to be of equivalent construction to panel boards with respect to cabinet and interior standards of manufacture, and are to be surface mounted with see-through door and lock.
2. Construction: Non-standard modular, factory assembled cabinets, designed to receive appropriate contactors, measuring devices, terminals, relays and the like as required in conformity with the Drawings for operation of system locally and remotely from central control and monitoring system (CCMS) console.
3. Control: Switching relays controlled remotely by the CCMS are to be provided with over-riding manual local individual controls. Appropriate interface components are to be provided and coordinated with the CCMS described elsewhere in the Specification.
4. Relays, switching components, pilot lights, control transformers, fuses etc. are to be neatly arranged and mounted inside dust-tight and, where necessary, water-tight cabinets. Control and indication devices are to be continuously visible and accessible for monitoring and control.
5. Equipment is to be electrically front shielded and enclosed by sheet metal barriers, readily accessible and demountable. Wiring is to be neatly arranged, clipped and terminated in pressure type terminals. Hardware is to be non-corroding and robust material, approved by the Engineer.
6. Control panels are to incorporate three ammeters, one per phase for local readings.
7. Current transformers are to have auxiliaries to enable connection to CCMS.
8. Contactors are to be of the appropriate category, Table 1 to IEC 60947-4-1 generally as described under paragraph 110.070 A hereof. Each contactor is to be protected by an equally rated circuit breaker of suitable short-circuit capacity at point of application.
9. Overcurrent relay is to be provided with all other accessories. Upon detecting fault on monitored control panel, corresponding plug-in breaker unit is to trip, and fault signal is to be sent to CCMS.
10. Instrument and instrument transformers are to be provided as required and/or as indicated on the Drawings.
11. Current Transformers: Bar primary type to IEC 60044-1 class 0.5 for metering. Current rating is to be the next higher standard value above maximum demand load current.

© Copyright protected

12. Ammeters and Voltmeters: Long scale, switchboard type, with shadow proof covers for semi-flush mounting. Meters are to be approximately 100 mm square with scale covering approximately 250 degrees.
13. Voltmeter Selector Switches: Rotary type with cam operated contacts, and having 7 positions (off, R-Y, Y-B, B- R, R-N, Y-N, B-N).
14. Test blocks and plugs are to be provided for testing all instruments and instrument transformers.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Division V Section "Basic Electrical Materials and Methods".

B. Division Y Section "Raceways and Boxes for Electrical Systems" for boxes.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Schneider Electric
2. Schneider Electric / Square D
3. MK/Honeywell
4. Legrand
5. G.E.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation AS shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Comply with related Standards.

310.020 SPARE PARTS AND EXTRA MATERIAL

A. Furnish 2 % (with minimum of one each) extra materials for all products that match those installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to Employer.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval, including catalogues, detailed literature, manufacturer's name, catalogue number, rating, specification, overall dimensions and special features, as applicable for each item.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact indication of position of each item and outlet box and fitting on layout drawings, with box and equipment types and sizes.

© Copyright protected

2. Installation details of special devices including fans etc.
3. Wiring diagrams of special items.

C. Samples: Submit samples of each type of device for approval, unless otherwise agreed in writing by the Engineer.

D. Maintenance Data: For materials and products to include in maintenance manuals specified in Division 1.

330.000 EXECUTION

330.010 INSTALLATION

A. Locations: Drawings generally show approximate locations of outlets and equipment. Exact locations are to be determined from interior finishing and detail drawings. Any condition that would place an outlet in an unsuitable location is to be referred to the Engineer. Locate switches at strike sides of doors, whether shown on the Drawings or not. In locating outlets allow for overhead pipes, ducts, variations in arrangement, thickness of finishing, window trim, paneling and other engineering features.

B. Mounting heights for outlet boxes and similar equipment are to be uniform within the same or similar areas. Mounting is to be as shown on the Drawings or as approved by Engineer. Unless otherwise shown or instructed, mount lighting switches and socket outlets generally at 1200 mm and 300 mm from finished floor level respectively. Mount switches with long dimension vertical and operating handle, if of the toggle type, up when in the on position.

C. Additional outlets to those shown on the Drawings are to be provided as required by equipment manufacturers for control or other wiring.

D. Recessed Outlet Boxes: Make neat openings, to the satisfaction of the Engineer, allowing for thickness of finishing, and use extension rings if required. Repair damaged finishing to original condition before installation of fittings or plates.

E. Appearance: Install exposed boxes and plates plumb, square and parallel to finished wall surface. Exposed plates covering recessed boxes are to rest neatly on wall surface without gaps, and fully covering the box.

F. Grouped Outlets: Arrange neatly so that use of fittings is convenient and clear.

G. Waterproof and Explosion-Proof Fittings: Follow manufacturer's instructions for installation and connection to conduit system to fully achieve required degree of protection.

H. Damaged Fittings: Reject damaged fittings or plates with damaged finish. Protect fittings and plates against damage after installation and until handed over.

330.020 IDENTIFICATION

A. Comply with Division V Section "Basic Electrical Materials and Methods."

1. Switches: Where three or more switches are ganged, and elsewhere as indicated, identify each switch with approved legend engraved on wall plate.
2. Receptacles: Identify panel board and circuit number from which served. Use machine-printed, pressure-sensitive, abrasion-resistant label tape on face of plate and durable wire markers or tags within outlet boxes.

330.030 CONNECTIONS

A. Single pole switches are to switch the phase wire. Do not run neutral wire through switches having neutral shunt or bridge.

B. Exposed Outlet Boxes: Securely fasten to wall with machine screws to permanent inserts or lead anchors.

C. Connection Of Appliances:

© Copyright protected

D. Where appliance is designed to adapt directly to outlet box, extend electrical wiring to incoming terminals inside appliance.

E. Where appliance is not designed to adapt to outlet box, install the connecting wiring in flexible conduit firmly fixed to outlet box cover plate and to terminal box on appliance.

F. Tighten electrical connectors and terminals according to manufacturers published torque-tightening values.

330.040 FIELD QUALITY CONTROL

A. Visual Inspection: Fittings and equipment are to be inspected for fixing and workmanship.

B. Megger tests are to include switch and socket outlet tests together with insulation resistance of wiring installations.

C. Operation: Devices are to be tested for operation and are to perform as intended at full load without any signs of heating.

D. Equipment is to be insulation tested and observed, under full-load for not less than 3 days operation, with respect to undue heating and performance in general.

330.050 CLEANING

A. Internally clean devices, device outlet boxes, and enclosures. Replace stained or improperly painted wall plates or devices.

© Copyright protected

V72 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes individually mounted enclosed switches and circuit breakers used for the following:

1. Service disconnecting means.
2. Motor and equipment disconnecting means.

Components are to be standard manufactured items, uniform and modular, complying with one set of approved Standards.

110.000 SYSTEM DESCRIPTION

110.010 SWITCH DISCONNECTOR (DISCONNECTING SWITCH)

A. Type: Heavy duty, non-fused, air break, single throw, 600-V AC, suitable for motor circuits or for service entrance disconnecting applications, 2, 3, 4 or 6 poles as shown on the drawings. Disconnecting switches shall comply with IEC 60947-3, with ampere rating as shown on the Drawings ensuring its suitability for equipment horsepower rating where disconnecting switch is used for switching motors or other highly inductive loads.

B. Design: Safety type, housed in separate metallic enclosure with arc quenching devices on each pole.

C. Short Circuit Withstand: Switch disconnectors shall be capable of withstanding the maximum short circuit current at the point of installation in combination with the upstream protective device.

D. Operating Handle: A suitable handle made of conducting material shall be provided for safety and convenient operation of the switch and it shall be in electrical connection with the enclosure. In case the position of the switch contacts is indicated by the position of the operating handle, then there shall be definite off and on indicated positions for the handle, and the design of the operating mechanism shall be such that the handle cannot be left readily at or near the off position when the switch is on. A handle indicating the position of the switch contacts either closed or open shall be designed such that the door cannot be closed and secured in place with the handle indicating off while the switch contacts are in the on position.

E. Operating Mechanism: Quick-make, quick-break, double contact rotary blade mechanism, independent manual operation. The design of the operating mechanism in conjunction with the contact structure shall be such that, in normal operation, the persons operating the switch cannot restrain the operations of the contacts after they have initially touched or parted when closing or opening the switch. The design and construction of the operating mechanism shall assure ample strength and rigidity. Screws and nuts serving to attach operating parts to cross bars or other movable members shall be upset or otherwise locked to prevent loosening under the jarring of continued use. Stops shall be provided as necessary to remove undue strain from switch parts. Materials shall be suited for the particular application. Contacts and terminals shall be made of tin plated copper of 99.5% purity.

F. Mechanical Interlock: the box, cover and switch operating mechanism shall be mechanically interlocked so that the door is normally prevented from being opened when the switch contacts are in the closed position and the switch contacts are normally prevented from being closed when the door is open. Switch disconnector shall be provided with a defeatable interlock by which a qualified person using the necessary tools can open the door while the switch is in the on position or close the contacts when the door is open. Interlock shall be reactivated automatically when the enclosure door is closed.

© Copyright protected

G. Padlocking: Means shall be provided for padlocking enclosures shut, they shall be provided to positively lock the switch with the contacts in the off position with a padlock and shall accommodate at least three padlocks. Any single padlock shall be capable of providing locking.

H. Switch Disconnectors for Variable Frequency Drive (VFD) Motors: Switch Disconnectors connected to VFD motors shall have an auxiliary contact that interfaces with the motor's VFD to switch off the VFD drive before disconnecting the motor.

I. Enclosure: Enclosures shall be made of steel material, properly anti-corrosion treated and electrostatic coated unless otherwise specified. Enclosures shall comply with IP 20 to IEC 60529 for indoor general use installations, IP 54 to IEC 60529 for indoor industrial / mechanical rooms installations, IP 65 to IEC 60529 with stainless grade 304 for indoor wet areas; such as kitchen, laundry and hospital's central sterile supply department (CSSD) and clean rooms, and IP65 to IEC 60529 and to be suitable for outdoor installations, unless otherwise required or shown on the Drawings. Enclosures shall be used with the appropriate conductor entry fittings; such as knockouts and bolt on hub kit in order to maintain the specified environmental capability after installation.

J. Terminals: A switch shall have suitable wiring terminals for connection of conductors having an ampacity not less than the switch's current rating for only current rated switches.

K. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

110.020 ENCLOSED CIRCUIT BREAKERS

A. Enclosed Circuit Breaker Rated up to 1250 A shall have same specification of DP as specified in Division Y Section "Panelboards".

B. Enclosed Circuit Breaker Rated above 1250 A shall have same specification of switchboards as specified in Division Y Section "Switchboards".

110.030 FACTORY FINISHES

A. Finish: Manufacturer's standard paint applied to factory-assembled and -tested enclosures before shipping.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division V Section "Wiring Devices" for attachment plugs, receptacles, and toggle switches used for disconnecting means.
3. Division Y Section "Switchboards" for circuit breakers.

© Copyright protected

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Cutler-Hammer/Eaton Corp.
2. GE
3. ABB
4. Schneider Electric / Square D

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Disconnecting switches in compliance with IEC 62626-1 and IEC 60947-3, equipped with metallic enclosure and ample space to accommodate both incoming and outgoing cables.

310.020 DELIVERY, STORAGE AND HANDLING

310.030 WARRANTY

A. Manufacturer’s Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval, including catalogues, detailed literature, manufacturer's name, catalogue number, rating, specification, overall dimensions and special features, as applicable for each type of switch, circuit breaker, accessory, and component indicated.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a) Enclosure types and details.
b) Current and voltage ratings.
c) Short-circuit current rating.
d) Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
e) Cable terminal size.

2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.

C. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
4. Samples: Submit samples of each type of equipment for approval, unless otherwise agreed in writing by the Engineer.

© Copyright protected

5. Operation and Maintenance Data: For enclosed switches and circuit breakers and for components to include in maintenance manuals specified in Division A. In addition to requirements specified in Division A Section "Closeout Procedures," include the following and to the satisfaction of Employer's requirements:

    a) Routine maintenance requirements for components.
    b) Manufacturer's written instructions for testing and adjusting switches and circuit breakers.
    c) Time-current curves, including selectable ranges for each type of circuit breaker.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance.

    1. Proceed with installation only after unsatisfactory conditions have been corrected.

330.020 INSTALLATION

A. Locations: Drawings generally show approximate locations of equipment. Exact locations are to be determined from detail drawings. Any condition that would place equipment in an unsuitable location is to be referred to the Engineer.

B. Waterproof Fittings: Follow manufacturer's instructions for installation and connection to conduit system to fully achieve required degree of protection.

C. Damaged Equipment: Reject damaged equipment. Protect equipment against damage after installation and until handed over.

D. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

E. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

330.030 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division V Section "Basic Electrical Materials and Methods."

B. Enclosure Nameplates: Label each enclosure with engraved metal or laminated-plastic nameplate mounted with corrosion-resistant screws.

330.040 CONNECTIONS

A. Install equipment grounding connections for switches and circuit breakers with ground continuity to main electrical ground bus.

B. Install power wiring. Install wiring between switches and circuit breakers, and control and indication devices.

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values.

330.050 FIELD QUALITY CONTROL

A. Visual Inspection: Equipment is to be inspected for fixing and workmanship.

B. Operation: Devices are to be tested for operation and are to perform as intended at full load without any signs of heating.

C. Prepare for acceptance tests as follows:

    1. Test insulation resistance for each enclosed switch, circuit breaker, component, and control circuit.

© Copyright protected

2. Test continuity of each line- and load-side circuit.

D. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in the relevant standards. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

E. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

330.060 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges to fulfill the coordination study requirements.

330.070 CLEANING

A. On completion of installation, inspect interior and exterior of enclosures. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

330.080 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the conditions specified in Division V Section “Basic Electrical Materials and Methods.”

330.090 COORDINATION

A. Coordinate layout and installation of switches, circuit breakers, and components with other construction, including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

© Copyright protected

W10A - IP-BASED TELEPHONY COMMUNICATIONS SYSTEM

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes a carrier grade IP-based Telephony Communications System consisting of central switching equipment and telephone instruments as such:

1. Call Processing Unit and software.
2. Gateways.
3. Signaling Servers.
4. IP terminals and client devices.
5. Applications and network management.

100.020 PERFORMANCE REQUIREMENTS

A. Refer to Division W, Section “Data Communications”.

B. Software Requirements

1. To be developed.

C. Design Considerations

1. To be developed.

D. Software Expansion Requirements

1. To be developed.

E. Hardware Expansion Requirements

1. To be developed.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W Section “Common Clauses for IT & Security Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. “OFE”: shall refer to “Owner Furnished Equipment”, which will be provided by the Owner/Employer. The Contractor shall be responsible for removing this equipment from the Owner’s premises and re-installing and integrating this equipment in good working order where required and detailed in these Specifications.
2. "Turnkey System": a complete system of hardware and software delivered to the Employer ready-to-run.

C. Abbreviations: To be developed.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W Section “Common Clauses for IT & Security Systems”.

120.020 SYSTEM DESCRIPTION

A. Overview of Current Environment and Requirements

B. General Features

1. The IP-Based Telephony System shall provide centralized communications to deliver voice and other services as defined within the scope of works.
2. The system shall be an extension of the current IP-Based Telephony System currently operational at other Airport facilities.
3. The Telephone System connectivity shall utilize the Airport Operational Network and communications cabling supporting infrastructure.

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W Section W31 “Common Clauses for IT & Security Systems”.

B. Related Sections

1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but not limited to:

1. To be developed

B. Adjunct Systems

1. Where adjunct systems are not available directly from the selected Telephony System manufacturer, adjunct manufactures must be certified or otherwise approved for use by the selected Telephony System manufacturer.

C. End Point Devices

1. Where endpoint devices are not available directly from the selected Telephony System manufacturer, end point devices must be certified or otherwise approved for use by the selected Telephony System manufacturer.

300.020 SYSTEM ARCHITECTURE

A. The Contractor shall provide a full description of the proposed system architecture.

B. The Contractor shall include diagrams explaining system architecture and shall specify the model names and version numbers of all relevant components of the system.

C. The solution shall:

D. be able to integrate with radio trunking, public access, and paging systems and any other system, e.g. DECT, GSM, WiFi, etc.

E. be centralized into Main Telecom Rooms from a call processing and signaling perspectives. All VoIP/TDM conversion devices (Media Gateways) shall be located within telecommunication spaces.

F. support multi-Manufacturer interoperability with other Manufacturer's products and across any QoS infrastructure.

G. support end-to-end QoS, including but not limited to traffic marking, enhanced queuing services, link fragmentation and interleaving, CRTP, low latency queuing, link efficiency, traffic shaping, and call admission control.

H. provide bandwidth management and call admission control to guarantee at all times that the network and LAN/WAN links are not over-subscribed.

I. be able to support open industry standard devices such as H.323, SIP, etc., including the support of analog and digital phones.

J. support remote office phones from a centralized phone system. The Contractor shall state any additional equipment that maybe required at the remote site.

K. have local survivability capabilities provided for remote sites during a WAN outage (for remote sites hosted off of a central server).

L. be able to provide easy addressing scheme of the IP phones, such as Dynamic Host Control Protocol (DHCP), without having to change the addressing scheme of the existing IP data network.

M. The Telephony system shall provide redundant server based call processing, Internet Protocol / Time Division Multiplexing (IP/TDM) media gateways, redundant server based multi-media UM, auto attendant, Automatic Call Distributor (ACD), VoIP telephones, analog telephones, wireless Local Area Network (LAN) telephones, thin client software telephones, dedicated network switches, other end devices, hardware, software, programming, configuration, wire, system patch panels, terminations, patch cords and including all accessories required for a complete and operating system.

N. The Telephony System shall include High-Availability platform with built in self diagnostics and self-healing capabilities to provide 99.999% reliability for all call processing and all call routing systems.

O. The Telephony System shall utilize redundant distributed call processors, with redundant power supplies, redundant connectivity and automatic load balancing.

P. The Telephony System shall be capable of non-blocking VoIP operation, peer-to-peer IP connectivity, with active monitoring and control for the duration of all calls.

Q. Telephony System ports, licenses and configurations shall be provided for each end device and connection as applicable.

R. Re-homing of VoIP Telephones subsequent to loss of any component shall be automatic and not impact the dial plan, features, or capabilities. All services shall be automatically restored, without intervention when the failed condition has been corrected.

S. System Administration shall be Graphical User Interface (GUI) based and integrated to allow basic telephone system Moves, Adds and Changes (MACs) including UM to be automatically configured in each other system to eliminate the need for duplicate manual updating of other systems. A scheduling feature is to be provided for telephone MACs and software backup processing.

T. The Telephony System shall be equipped with basic ACD capabilities and reporting with the following basic functions.

U. Automatic routing of calls based on caller menu choices and agent availability.

V. Interface with Interactive Voice Response (IVR) system.

W. The Telephony System shall provide capability to send immediate audio page to groupings of telephone sets by building.

X. The Telephony System shall provide encryption capability and be secured from hacking attempts and unauthorized access.

Y. The system shall support all relevant industry standards listed below.

Z. Manufacturers shall be compliant as a minimum with the following standards. Update as appropriate to conform to latest applicable standards.

AA. Class Based Weighted Fair Queuing (CBWFQ).

BB. Committed Access Rate.

CC. Compressed Real Time Protocol (CRTP).

DD. DCL.

EE. Dynamic Host Configuration Protocol (DHCP).

FF. Differentiated Services.

GG. Domain Name Service (DNS).

HH. FAX - Group 3 (ITU-T recommendation T.4 Fax group 3 is the most common type of fax machine transmitting on A4 paper. The machine scanning format is digital and operates at rates between 9.6 and 14.4 Kbps).

II. FAX - Group 4 (IUT-T recommendation T.6 and supports two-dimensional image compression, compressing the line width as well as the line length).

JJ. G.711 Pulse Code Modulation (PCM) of Voice Frequencies.

KK. G.726 Adaptive Differential Pulse Code Modulation (ADPCM).

LL. G.728 Coding of Speech at 16 Kbps using Low-Delay Algebraic Code Excited Linear Prediction (LD-ACELP).

MM. G.729 Coding of Speech at 8 Kbps using Conjugate Structure Algebraic Code Excited Linear Prediction (CS-ACELP).

NN. G.729a Annex A Reduced Complexity 8 Kbps CS-ACELP Speech Codec.

OO. H.225 Call Signaling Protocols and Media Stream Packetization for Packet based Multimedia.

PP. H.245 Control Protocol for Multimedia Communications.

QQ. H.323 Packet Based Multimedia Communication Systems.

RR. IP Precedence.

SS. Internet Protocol version 6 (IPv6).

TT. Lightweight Directory Access Protocol (LDAP).

UU. Media Gateway Control Protocol (MGCP).

VV. Policy Based Routing.

WW. Q.931 Manages Call Setup and Termination.

XX. Priority Queue Weighted fair Queuing (PQWFQ).

YY. Random Early Discard (RED).

ZZ. Resource ReSerVation setup Protocol (RSVP).

AAA. RTP Control Protocol (RTCP).

BBB. Real-time Transport Protocol (RTP).

CCC. Real-time Streaming Protocol (RTSP).

DDD. Session Initiation Protocol (SIP).

EEE. T.120 Data Protocols for Multimedia Conferencing.

FFF. Simple Network Management Protocol (SNMP).

GGG. Transmission Control Protocol / Internet Protocol (TCP/IP).

HHH. T.37.

III. T.38 IP Based Fax Service Maps.

JJJ. User Datagram Protocol / Internet Protocol (UDP/IP).

KKK. Voice Profile for Internet Mail (VPIM).

LLL. Weighted Queuing.

MMM. Weighted RED.

NNN. IEEE 802.1d Spanning Tree Protocol.

OOO. IEEE 802.1p Prioritization Technique/Layer 2 QoS.

PPP. IEEE 802.1q VLAN Tagging.

QQQ. IEEE 802.3 Ethernet (CSMA/CD).

RRR. IEEE 802.3af Power over Ethernet.

SSS. IEEE 802.1x

300.030 SYSTEM RELIABILITY, SECURITY AND AVAILABILITY

A. To be developed

B. Refer to Division W, Section "Common Clauses for IT & Security Systems"

300.040 TELEPHONY SYSTEM CAPABILITIES

A. The following performance parameters shall not be exceeded for end to end communications.

1. To be developed

B. To be developed

300.050 TELEPHONY SYSTEM CAPACITY

A. Equipment Quantity Definitions

1. Installed: The quantity or capacity of an item required to be operational at cut over.
2. Equipped: The quantity or capacity of an item required to be resident in the system at cut over for immediate activation.
3. Wired: The capability or quantity of an item that can be realized by adding plug-in components (e.g., line cards, trunk cards, and station equipment) at any time in the future without installing additional cabinets, modules, shelves, common equipment or memory.

B. Spare Capacity

1. To be developed

C. Installed Quantity Sizing for End Devices

1. To be developed

D. Installed Quantity Sizing for Service Provider Connections

1. To be developed

300.060 TELEPHONY SYSTEM CONFIGURATION

A. To be developed

300.070 TELEPHONE REQUIREMENTS

A. As a minimum, the VoIP devices/server, software and handsets shall be required to support the following industry based, standard protocols and specifications:

1. To be developed

300.080 CALL PROCESSING SYSTEM

300.090 PUBLIC MEDIA GATEWAYS

300.100 IP TERMINALS AND CLIENT DEVICES

A. Station Hardware and IP Softphone

B. Indoor telephone sets shall comply with the following unless otherwise noted:

C. Analog telephone for harsh environment shall have the following characteristics:

1. To be provided

D. Wall mounted IP telephones shall have the following additional characteristics:

1. To be provided

E. Standard IP telephones shall have the following characteristics:

1. To be provided

F. Enhanced IP telephones shall have the following characteristics:

1. To be provided

G. Wireless IP telephone shall have the following characteristics:

1. To be provided

H. Conference IP telephone shall have the following characteristics:

1. To be provided

I. Cordless IP telephone shall have the following characteristics:

1. To be provided

J. Telecommunications Devices for the Deaf (TDD) shall have the following characteristics:

1. To be provided

K. IP Payphones shall have the following characteristics:

1. To be provided

L. Dual Band Wireless IP telephone shall have the following characteristics:

1. To be provided

M. Contact Center Agent IP telephone

1. To be provided

300.110 APPLICATIONS

A. Voice Mail and Unified Messaging System

B. IP Contact Center

C. Conferencing

D. Web Collaboration Functionality

300.120 CALL ROUTING AND REPORTING SOFTWARE FUNCTIONALITY

300.130 DIAL PLAN AND ADVANCED ROUTING FEATURES

300.140 INTERACTIVE VOICE RESPONSE (IVR) AND COMPUTER TELEPHONY INTEGRATION (CTI)

300.150 DIGITAL AUDIO RECORDING

300.160 SYSTEM ADMINISTRATION REQUIREMENTS

300.170 SYSTEM MONITORING AND DIAGNOSTICS

300.180 CALL ACCOUNTING / CALL LOGGING

300.190 NETWORK MANAGEMENT SYSTEM

300.200 INTERCONNECTION AND THIRD PARTY NETWORK SERVICES

300.210 OTHER CAPABILITIES

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

1. To be provided

310.020 CONFIDENTIALITY

A. Refer to Division W Section “Common Clauses for IT & Security Systems”.

310.030 QUALITY ASSURANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Licensing Requirements

1. To be provided

310.040 DELIVERY, STORAGE AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.050 WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.060 COMMISSIONING

1. To be provided

310.070 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.080 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be provided

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1. To be provided

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be provided

330.040 DEMONSTRATION AND TRAINING

A. To be provided

W10C - IP-BASED TELEVISION SYSTEM (IPTV)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes an IP-Based Television System accessed from networked computers and from set-top boxes. The system shall be capable of providing the following services via an IP-based streaming media system over Ethernet:

1. Satellite television
2. Digital terrestrial Off-air television
3. Broadcast video /Cable Television
4. Pay-per-view
5. Internet connectivity
6. Video on Demand (VOD)
7. Interactive TV standard features.

100.020 PERFORMANCE REQUIREMENTS

A. The IPTV System shall be delivered free of engineering, manufacturing, installation and operating defects. The system shall be engineered and installed for ease of operation, maintenance and testing.

B. The IPTV system shall be designed with the greatest level of resiliency and redundancy based on functional and technical design requirements.

C. The system shall be modular to allow future expansion without the introduction of major changes.

D. To be developed.

E. The IPTV system shall support the following functional requirements.

1. Overall system consistent latency shall be less than 200ms**.**
2. Overall system jitter shall be less than 50ms.
3. Individual alphanumeric number codes shall be assigned to each IPTV set-top box.
4. Language selection shall be flagged at default, as per Employer requirements, and shall be user selectable.
5. Service access levels shall be assigned, including child lock and use of pin codes.
6. All transactions shall be logged in a secured database.
7. All defaults shall be reset and user related data shall be erased upon user subscription deletion.
8. All alarm conditions shall be reported to the server.
9. Interactive Middleware shall be capable of operating continuously in standalone mode whereby all transactions will be logged.

F. The system shall display 100 channels with the capacity to expand to 200channels in the future.

G. The following sources shall be used for the system:

1. satellite, including all Free-to-Air channels and Non-Free-to-Air packages channels.
2. Off-air [Digital Terrestrial] [UHF/VHF] Local channels
3. International News Channels CNN, Fox News, BBC-Arabic, BBC-English, Al-Arabiya, etc..
4. Video streaming of Cable TV signals or previously stored data.

H. Expansion capability:

1. 25%spare capacity is required at all levels of the system.
2. The software licensing shall be for the entire system with no limitation on the number of end-users.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

C. Antenna reception and distribution systems: "Cable networks for television signals, sound signals and interactive services":

1. EN 60728-1: Part 1: System performance of forward paths
2. EN 60728-1-1: Part 1-1: RF cabling for two way home networks
3. EN 60728-1-2: Part 1-2: Performance requirements for signals delivered at the system outlet in operation
4. EN 60728-3: Part 3: Active wideband equipment for cable networks
5. EN 60728-4: Part 4: Passive wideband equipment for coaxial cable networks
6. EN 60728-5: Part 5: Headend equipment
7. EN 60728-6: Part 6: Optical equipment
8. EN 60728-10: Part 10: System performance for return paths
9. EN 60728-11: Part 11: Safety
10. EN 50083-2: Part 2: Electromagnetic compatibility for equipment
11. CLC/TR 50083-5-1: Part 5-1: IP gateways and interfaces for headends
12. EN 50083-8: Part 8: Electromagnetic compatibility for networks
13. EN 50083-9: Part 9: Interfaces for CATV/SMATV headends and similar professional equipment for DVB/MPEG-2 transport streams

D. Safety regulations such as earthing, lightning protection, potential equalization, mechanical stability, etc.

1. EN 60728-11: Part 11: Safety.

E. Regulations pertaining to EMC interference emission/irradiation, short-circuit current, interference suppression, etc.

1. EN 50083-2: Part 2: Electromagnetic compatibility for equipment
2. EN 50083-8: Part 8: Electromagnetic compatibility for networks

F. Standard overview of "coaxial cables" for cable distribution systems to EN 50117:

1. EN 50117-1: Part 1: Generic specification
2. EN 50117-2-1: Part 2-1: Sectional specification for cables used in cabled distribution networks - Indoor drop cables for systems operating at 5 MHz - 1000 MHz
3. EN 50117-2-2: Part 2-2: Sectional specification for cables used in cabled distribution networks - Outdoor drop cables for systems operating at 5 MHz - 1000 MHz
4. EN 50117-2-3: Part 2-3: Sectional specification for cables used in cabled distribution networks - Distribution and trunk cables for systems operating at 5MHz - 1 000 MHz
5. EN 50117-2-4: Part 2-4: Sectional specification for cables used in cabled distribution networks - Indoor drop cables for systems operating at 5 MHz - 3000 MHz
6. EN 50117-2-5: Part 2-5: Sectional specification for cables used in cabled distribution networks - Outdoor drop cables for systems operating at 5 MHz - 3000 MHz
7. EN 50117-2-6: Part 2-6: Sectional specification for CATV cables up to 6 GHz used in cabled distribution networks
8. EN 60966-2-4: Part 2-4: Radio Frequency and coaxial cable assemblies - Part 2-4: Detail specification for cable assemblies for radio and TV receivers - Frequency range 0 MHz to 3000 MHz, IEC 61169-2 connectors .

G. Comply with FAA AC 70/7460-1 or ICAO ANNEX 14, VOL.1 for marking and lighting of antenna installations.

H. All Audiovisual equipment (such as TV sets) shall be "ENERGY STAR qualified" products or equivalent international certification program wherever possible. They shall carry the latest applicable version of ENERGY STAR label or equivalent.

I. The system functions in public areas such as elevators and lobbies shall comply with the most current version of the Accessibility Guidelines by Authorities Having Jurisdiction.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. Pay-Per-View: Similar to pay-per-view services of existing cable TV services. User has no control over playback and feature presentation time.
2. Near Video on Demand: Allows the viewer to choose viewing time within specified limits. Groups sessions of the same movie together in multicast sessions. Fast Forward and rewind are implemented by jumping between multicasts.
3. True Video on Demand: Full choice of viewing times with VCR type controls. Dedicates an entire session to a single user and provides individualized user control over the presentation.
4. User Interface: End point of Contractor's responsibility for Work of this Section. User interfaces are the RJ45 terminals on device plates (system outlets).
5. MPEG-4 Part 10: video compression standard, also known as MPEG-4 AVC (for Advanced Video Coding) and equivalent to H.264 of ITU-T.
6. MPEG-H Part 2: video compression standard, also known as HEVC for High Efficiency Video Coding and equivalent to H.265 of ITU-T.

C. Abbreviations

1. To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

120.020 SYSTEM DESCRIPTION

A. The IPTV system shall consist of the following main components:

1. Integrated Receiver/Decoder (IRD)
    a) To be developed
2. HD and SD Processor/Streamer
    a) To be developed
3. Audio/Video Monitor
    a) To be developed
4. Video-On-Demand Server/Multimedia Server
    a) To be developed
5. Encoding Station
    a) To be developed
6. Middleware server
    a) To be developed
7. System Controller PC: IPTV Supervision Workstation
    a) To be developed

8. IPTV configured network switches
    a) To be developed
9. Satellite dish antenna
    a) To be developed
10. DiSEqC™ Multi-switch
    a) To be developed
11. VHF/UHF Antenna
    a) To be developed
12. DVB-T Receiver
    a) To be developed
13. IPTV Set-Top Boxes
    a) To be developed
14. Equipment racks
    a) To house the head-end equipment.
15. Cables
    a) To be developed

120.030 DESIGN REQUIREMENTS

A. To be developed

120.040 INTERACTIVE TV SYSTEM FEATURES

A. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. The IPTV System shall be integrated and interfaced to the following systems. The Contractor shall coordinate with the Employer to clearly define the scope of work for system interfacing and shall identify those areas requiring interface work by third party suppliers.
    1. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General
    1. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.
B. Related Sections
    1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

210.020 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

210.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but not limited to:

1. To be developed

300.020 IPTV SYSTEM HEADEND COMPONENTS

A. Multi-format SD/HD Integrated Receiver / Decoder

1. To be developed

B. HD/SD Video Processor/Streamers

1. To be developed

C. Audio and HD Video Monitor

1. To be developed

D. Encoding station

1. To be developed

E. Video on Demand (VOD) Server/ Multimedia Server

1. To be developed

F. Middleware Application

1. To be developed

G. Minimum requirements of Supervision Workstation and associated peripherals shall be confirmed by relevant manufacturer/supplier and shall comply with:

1. Division W, Section “Computers & Related Peripherals”.

H. To be developed

300.030 SET-TOP BOX

A. The set-top box (STB) shall be the hardware and common software infrastructure component that will be employed at the end user premises to convert video, delivered as IP packets, into an uncompressed digital stream that can be directly turned into TV signal ready for display by a television set.

B. The set-top box shall be capable of supporting advanced IPTV functionality such as Digital Video Recorder (DVR), allowing the user to rewind, fast-forward, pause, slow down play, etc. by sending user commands upstream via the channel.

C. To be developed

300.040 OFF-AIR AND SATELLITE TV RECEPTION

A. Comply with the relevant requirements and recommendations of EN 50083 series and EN 60728 series “Cable Networks for Television Signals, Sound Signals and Interactive Services” for satellite and digital terrestrial TV reception at headend.

B. Coaxial cables used for satellite and digital terrestrial TV reception at headend shall comply with the relevant requirements and recommendations of EN 50117 series "Coaxial Cables”.

C. To be developed

D. Antenna Tower: To be developed

E. Off-Air, Mast-Mounted Antennas (DVB-T Terrestrial Antennas, where required): To be developed .

F. Satellite Earth-Station Antenna: To be developed

G. Universal receiving system Ku-Band: To be developed

H. Universal receiving system Ku-Band: To be developed

I. DiSEqC™ Multiswitch: To be developed

J. DVB-T Receiver: To be developed

K. Coaxial Cables: To be developed.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. Contractor shall coordinate with the Employer and his Suppliers when considering:

1. Structured communications system cabling, termination, identification and testing.
2. Provision and installation of computer hardware, racks/cabinets and related networking software and equipment.
3. Active communication and data processing equipment.
4. Fiber optic cabling infrastructure.
5. Provision and installation of a Virtualized Servers Environment.
6. Provision and installation of UPS in communications rooms.
7. Communications grounding busbars and grounding wires connecting to the main building earth electrode system.
8. Dedicated power panels, ground busbars, circuits, floor boxes and utility outlets.
9. Installation and finishing of plywood backboards.
10. Building mechanical ductwork, cooling/heating system and environmental control sensors.
11. Communications pathway devices such as cable trays, conduits, conduit sleeves, and penetrations in walls and floors.

B. To be developed

310.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for IT & Security Systems”:

1. CONFIDENTIALITY
2. QUALITY ASSURANCE
3. DELIVERY, STORAGE AND HANDLING
4. WARRANTY
5. COMMISSIONING
6. MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. To be developed

330.040 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W12A - IP-BASED PUBLIC ADDRESS SYSTEM

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes a fully IP-network based Public Address and Voice Alarm System (PA/VA), for the purpose of voice evacuation, emergency notification, paging, BGM and messaging**.**

B. The PA/VA System shall constitute a Voice Evacuation System/ Voice Alarm Communication System (EVC) which is independent of but collocated and interfaced with the Fire Detection and Alarm System.

C. The PA/VA system shall interface with the FAS and other ELV Building Services Systems. These interfaces shall be hardwired where required by code.

100.020 PERFORMANCE REQUIREMENTS

A. Basic emergency functions performance criteria.

B. Non-emergency functions performance criteria.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. Equipment and system shall comply with the following Standard:

a) BS EN 54-16, Fire detection and fire alarm systems. Components for fire alarm voice alarm systems. Voice alarm control and indicating equipment.
b) BS EN 54-24, Fire detection and fire alarm systems. Requirements for the design and construction of loudspeakers.
c) BS EN 54-4, Fire detection and fire alarm systems. Power supply equipment.
d) BS 5839 Part 8, Fire detection and fire alarm systems for buildings. Code of practice for the design, installation, commissioning and maintenance of voice alarm systems.
e) BS 6259, Code of practice for the design, planning, installation, testing and maintenance of sound systems.
f) BS EN 50849, Sound systems for emergency purposes.
g) IEC 60268 (BS 6840) (series, as applicable), Sound system equipment
h) ISO 8240-16, Fire detection and alarm systems, Part 16: Sound system control and indicating equipment
i) BS EN ISO 3382-1, Acoustics. Measurement of room acoustic parameters. Part 1 Performance spaces.
j) BS EN ISO 3382-2, Acoustics. Part 2 Measurement of room acoustic parameters. Reverberation time in ordinary rooms.
k) BS EN ISO 3382-3, Acoustics. Part 3 Measurement of room acoustic parameters. Open plan offices.

2. System Network:

a) The PA/VA System shall be based on IEEE 802.3bt PoE Ethernet Network Infrastructure. All network cabling, conventions and equipment shall be consistent with this IEEE standard.
b) Comply with the latest issue of several material and test standards, which have been developed and published by Institute of Electrical and Electronics Engineers (IEEE) for data communications industry, but not limited to:
c) IEEE 802.1 – LAN/MAN Bridging and Management,
d) IEEE 802.3 – Carrier Sense Multiple Access/Collision Detection Access Methods (Ethernet),

e) IEEE 802.11 – Carrier Sense Multiple Access/Collision Avoidance Access Methods (Wireless LAN's),
f) ISO/IEC/IEEE 24765, Systems Software Engineering Vocabulary.
g) Comply with the latest issue of several Network Equipment Building System (NEBS) material and test standards, which have been developed and published by Telcordia (Ericsson). Level 1, Level 2, and Level 3 are applicable to this Section:
h) SR-3580: NEBS™: Criteria Levels.
i) GR-63: NEBS Requirements: Physical Protection.
j) GR-1089: Electromagnetic Compatibility (EMC) and Electrical Safety - Generic Criteria for Network Telecommunications Equipment.
k) GR-3160-Core: Generic requirements for Data Centers Equipment and Spaces.

3. For interface with the Fire Alarm System, comply with the latest issue of:

a) BS 9999 and BS 5839 recommendations

4. Fire rated Cable Certified for 120 minutes

a) EN 50200, Method of test for resistance to fire of unprotected small cables for use in emergency circuits
b) UL 2196, Standard for Fire Test for Circuit Integrity of Fire-Resistive Power, Instrumentation, Control, and Data Cables
c) BS 8434-2, Methods of test for assessment of the fire integrity of electric cables. Test for unprotected small cables for use in emergency circuits. BS EN 50200 with a 930° flame and with water spray.
d) BS 7629-1, Electric cables. Specification for 300/500 V fire resistant screened cables having low emission of smoke and corrosive gases when affected by fire. Multicore and multipair cables.
e) BS 6387, Test method for resistance to fire of cables required to maintain circuit integrity under fire conditions.
f) IEC 60331-1, Tests for electric cables under fire conditions.
g) IEC 60331-2, Tests for electric cables under fire conditions.
h) IEC 60332-2-2, Tests on electric and optical fibre cables under fire conditions.
i) IEC 60332-3-10, Tests on electric and optical fibre cables under fire conditions.
j) IEC 60331-2, Tests for electric cables under fire conditions.
k) UL 1724, Outline of Investigation for Fire Tests for Electrical Circuit Protective Systems.
l) UL 1685, Standard for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.
m) UL 1666, Test for Flame Propagation Height of Electrical and Optical- Fiber Cables Installed Vertically in Shafts.

5. The system functions in public areas such as lifts (elevators), lobbies and parking areas shall comply with the Accessibility Guidelines by Authorities Having Jurisdiction.
6. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.
7. To be developed.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. Definitions

1. Channels: Separate parallel signal paths, from sources to loudspeakers or loudspeaker zones, with separate amplification and switching that permit selection between paths for speaker alternative program signals.
2. Zone: Separate group of loudspeakers and associated supply wiring that may be arranged for selective switching between different channels.

C. Abbreviations:

1. To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

120.020 SYSTEM DESCRIPTION

A. Overview

1. The PA/VA system shall be used in case of fire detection to help speed up response time and advise occupants of the safest emergency route.
2. During a fire incident, a pre-recorded message shall be broadcast providing a clear instruction of what action to take.
3. It shall be possible for the PA/VA system to provide emergency messages in incidents other than fire.
4. Retain Sub-paragraph below for multiple occupancy buildings or large buildings with a complex fire strategy.
5. The PA/VA system shall provide phased evacuation for the Project.
6. Pre-recorded messages will be specifically generated as per the requirements of each site, to assist in safe evacuation.
7. Voice alarm messages shall be in multiple languages in an accent which is familiar and intelligible to the people of UAE, which is a cosmopolitan with more than 165 nationals living in the country.

B. Basic Emergency Functions

1. The PA/VA system shall be used for:

a) Live emergency paging
b) Timed security messages
c) Coded staff alert messages

2. In case of Fire Detection, Emergency Voice Evacuation or Communication System in Positive Alarm Sequence (Delayed Alarm sequence) shall be permitted.

C. Non-Emergency Functions

1. In addition to Voice Alarm, the PA/VA system shall be used for ancillary functions such as:

a) General paging
b) Advertising announcements
c) Background music (BGM)
d) Passenger announcement systems (mass transportation hubs)
e) Call to prayer

2. These ancillary functions shall not impair the required operation of the emergency voice evacuation or communications system.

D. General Features

1. The PA/VA system shall be BS EN 54-16, ISO 7240-16 and EN/IEC 50849 certified and BS 5839 part 8 compliant, with:

a) Full system supervision
b) Loudspeaker line impedance supervision
c) A supervised emergency microphone on the front panel and
d) A supervised message manager for the pre-recorded messages and chimes.
e) The PA/VA system components shall communicate over IP.
f) The PA/VA system shall utilize an Audio over IP (AoIP) protocol that supports AES67 for audio and AES70 for control with encryption and authentication.

E. Message Priorities

1. Signals associated with life safety
2. Signals associated with property protection
3. Trouble signals associated with life and/or property protection
4. All other signals

F. System Location

1. The PA/VA system main controller and system amplifiers shall be provided next to fire alarm control panel (MFACP/FACP), at a continuously monitored location, which is attended by facility management or designated personnel at all times, such as Command Center, etc.

G. To be developed.

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed

PART 2

PART 3 REFERENCES

300.000 RELATED DOCUMENTS

A. General

1. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.

B. Related Sections

1. To be developed.

310.000 RELATED PRODUCTS

310.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.020 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

310.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.040 ARCHITECTURAL FITTINGS, FINISHES AND BRACKETS

A. To be developed.

PART 4 PRODUCTS AND WORKMANSHIP

400.000 PRODUCTS

400.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the work include, but are not limited to, the following:

1. To be developed .

400.020 GENERAL FEATURES

A. To be developed.

400.030 SYSTEM COMPONENTS

A. The PA/VA system shall consist of several integrated sub-systems that form a complete system for building announcement and message management:

1. The system shall consist of:

a) Controller
b) Amplifiers
c) Call stations
d) Sound sources
e) Loudspeakers
f) Power supply
g) Inter-cabling
h) Accessories such as end-of-line modules
i) Workstations, servers and other hardware and software requirements
j) Equipment racks, housing the system headend equipment.

400.040 GENERAL EQUIPMENT AND MATERIAL REQUIREMENTS

A. To be developed.

1.

400.050 TECHNICAL STUDY

A. Preliminary Study

1. To be developed.

B. Final Study

1. To be developed.

400.060 IP-NETWORKED CONTROLLER

400.070 IP-NETWORKED CALL STATION

400.080 IP-NETWORKED MULTI-CHANNEL AMPLIFIER

A. ETHERNET SWITCH

1. The Ethernet switch shall be a managed ten (10) -port Industrial Gigabit switch with:
2. eight (8) RJ45 ports providing PoE and
3. two (2) ports providing RJ45/SFP combo sockets for glass fiber transceivers.
4. RS-232 serial interface for console.

400.090 FIBER TRANSCEIVERS

A. LX Fiber transceiver

B. SX Fiber transceiver

400.100 IP-NETWORKED MULTI-FUNCTION POWER SUPPLY

A. The multi-function power supply shall provide a fully supervised DC-power supply with integrated fail-safe redundancy.

400.110 AUXILIARY DC POWER SUPPLIES

400.120 LOUDSPEAKERS

A. General Characteristics:

1. Voice alarm loudspeakers shall be listed and approved by UAE Civil Defence and they shall be tested as part of the voice evacuation system.

B. DSP Controlled Line Arrays

C. Loudspeaker Type 1: 20-Watt Ceiling Speaker

D. Loudspeaker Type 2: 6-Watt Ceiling Speaker

E. Loudspeaker Type 3: 6-Watt Cabinet /Wall Mounted Speaker

F. Loudspeaker Type 4: 20-Watt Wall Mounted Speaker

G. Loudspeaker Type 5: 20-Watt Ceiling Mounted Pendant Speaker

400.140 REMOTE WALL-MOUNTED VOLUME CONTROLLER

400.150 NETWORK EQUIPMENT

400.160 INTEGRATION REQUIREMENTS

400.170 UNINTERRUPTIBLE POWER SUPPLY (UPS)

400.180 SIGNAL TRANSMISSION COMPONENTS

400.190 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

400.200 ARCHITECTURAL FITTINGS, FINISHES AND BRACKETS

400.210 PROPOSED SOLUTION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

410.000 QUALITY MANAGEMENT

410.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

410.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for IT & Security Systems”:

1. CONFIDENTIALITY
2. QUALITY ASSURANCE
3. DELIVERY, STORAGE AND HANDLING
4. WARRANTY
5. COMMISSIONING
6. MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

410.030 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

420.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Samples for initial selection:

1. To be developed

C. Additional Requirements for Shop Drawings

1. To be developed

D. Calculations:

1. To be developed

E. Coordination Drawings:

1. To be developed

430.000 EXECUTION

430.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Open-Cable Installation

1. To be developed

C. Impedance and Signal Levels

1. To be developed

430.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

430.030 FIELD QUALITY CONTROL

A. To be developed

430.040 OCCUPANCY ADJUSTMENTS

A. To be developed

430.050 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W12F - IP-BASED INTERCOM SYSTEM

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes state-of-the-art, electronic Security Audio Communication system that enables IP-based intercommunications, access control, monitoring and protection of all pertinent areas of the Project facilities.

B. The terms “Security Audio Communication system”, “IP-based Intercom system” and “IP-enabled Intercom system” are equivalent and may be used interchangeably throughout this Specification.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. System peripheral components and devices shall comply with the requirements of:

1. EN 50486, Equipment for use in audio and video door-entry systems.
2. Or other approved international standard.

C. The system functions in public areas such as lifts (elevators), lobbies and parking areas shall comply with the most current version of the Accessibility Guidelines by Authorities Having Jurisdiction.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. To be developed.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

C. Other Clarifications Related to the Scope of Work:

D. The IP-based Intercom system shall utilize the Project Structured Cabling Network and Data Communications Network Installations. This connectivity shall form part of the Structured Cabling Network and Data Communications Network as applicable. It shall not form part of the Intercom system.

E. Network switches and other similar devices which are strictly dedicated and configured for the Intercom system, but installed remotely from the Intercom headend, shall form part of the work for the Intercom system.

F. Inter-wiring, conduits and related accessories, network connectivity and any other material which is specific to the Intercom central equipment and which is required to provide a complete operational system, shall form part of the Intercom system.

120.020 SYSTEM OVERVIEW

A. The IP-enabled Intercom System shall consist of a Security Audio Communication Node/Exchange and various types of intercom stations distributed at key locations throughout the Project and connected to the Project Data Communications Network.

1. Audio Servers: To be developed
2. Master Stations: To be developed
3. Control Room Station: To be developed.
4. Substations, Wall Mount: To be developed
5. Substations, Weatherproof and Vandal proof: To be developed

B. To be developed.

C. The Security Audio Communication Node shall provide seamless integration with the following systems:

1. Public address system.
2. VOIP telephone system and public telephone network.
3. Parking Control Equipment.

D. System design shall take into consideration Project requirements in terms of end users special needs, regulations, system planning, operation, changes and maintenance.

E. The Security Audio Communication system shall utilize the Project Data Communication Network and shall support:

1. Network monitoring servers
2. Network time servers
3. E-mail notification
4. Remote system programming
5. Remote system upgrade

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. The IP-based Intercom System shall be integrated and interfaced to the following systems:

1. To be developed.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.040 OCCUPANCY ADJUSTMENTS

A. To be developed

330.050 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W12H - MASTER CLOCK SYSTEM (MCS)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. A GPS and An Ethernet Synchronized master clock system using NTP and POE.
2. NTP clocks.
3. Interfaces with other systems.
4. System wire and cable.

100.020 PERFORMANCE REQUIREMENTS

A. NTP (Network Time Protocol) servers with an integrated GPS receiver located on a LAN (Local Area Network) shall provide the high accuracy of the GPS satellite system of the UTC reference time. The system shall utilize the existing Project Local Area Network to provide a synchronized clock display system.

B. Time Server Accuracy:

1. Stratum 1, NTP V2, V3, V4.

C. 1PPS output ±50 nanoseconds of UTC time reference provided by the NTP server(s), when synchronized.

D. Internal oscillator/10MHz (battery backed real-time clock circuit during GPS /Ethernet loss):

1. TCXO (temperature compensated crystal oscillator): 1x10–11 over 24 hours to GPS, 1x10-8 aging/day, 450 usec 1PPS holdover in 24 hours or,
2. OCXO (oven-controlled crystal oscillator): 2x10-12 over 24 hours to GPS, 5x10-10 aging/day, 25 usec 1PPS holdover in 24 hours.

E. Security Features

1. The system shall support the following features, as a minimum, for improved security and quality of service (QoS) for real time processing and network management: IPv6 address standard, SSL (Secure Sockets Layer) and SSH (Secure Shell).

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer’s instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

C. All equipment shall be tested, labelled and certified by an internationally recognized and approved testing laboratory to meet the following performance specifications, electromagnetic compatibility and safety requirements (European Standards):.

1. Electromagnetic Compatibility Directive: (EMC) 2014/30/EU.
2. Safety: European Low voltage directive (LVD): 2014/35/EU [**Or**] BS EN 62368-1, Audio/video, information and communication technology equipment. Safety requirements
3. European Radio Equipment Directive (RED) 2014/53/EC.
4. ITU-T Standards:

a) G.703, Physical/Electrical Characteristics of Hierarchal Digital Interfaces
b) G.704, Synchronous Frame Structures Used at 1544, 6312, 2048, 8488, and 44736kbps Hierarchical Levels

c) G.810, Definitions and Terminology For Synchronized Networks
d) G.811, Timing Characteristics of Primary Reference Sources
e) G.812, Timing Requirements for Slave Clocks for use as Node Clocks in Synchronized Networks
f) G.813, Timing Characteristics of SDH Equipment Slave Clocks
g) G.824, Control of Jitter and Wander Within Digital Networks That are Based on the 1544kbps Hierarchy

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. Definitions

1. GPS: Global Positioning System: A worldwide system that employs 24 orbiting satellites in an integrated network to determine geographic location anywhere in the world, and which employs and transmits atomic time.
2. UTC: Universal time coordinated. A time-scale that forms the basis of a coordinated distribution of standard frequencies and time signals throughout the world. It is often referred to as Greenwich Mean Time (GMT).
3. Ethernet synchronized master clock system: Provides time synchronization via SNTP (Simple Network Time Protocol) or Daytime Protocol from time server. The clock system controller receives the same time via an Ethernet connection, which is then transmitted to the network clocks. This requires a TCP/IP Network with Internet access or connection to a Network Time Server.
4. PRS: Primary Reference Source.; provides Stratum-1 quality output signal (ANSI terminology); also known as PRC: Primary Reference Clock (ITU-T terminology).

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. To be developed

C. Other Clarifications Related to the Scope of Work:

1. The master clock system shall utilize the Project Structured Cabling Network and Data Communications Network Installations. This connectivity shall form part of the Structured Cabling Network and Data Communications Network as applicable. It shall not form part of the Clock System.
2. Network switches and other similar devices which are strictly dedicated and configured for the Master Clock System, but installed remotely from the system controller, shall form part of the works for the Clock System.
3. Inter-wiring, conduits and related accessories, network connectivity and any other material which is specific to the central equipment and which is required to provide a complete operational system, shall form part of the Clock System.

120.020 SYSTEM DESCRIPTION

A. This Section specifies a wired clock system that relies on a connection with the Global Positioning Satellite (GPS) system and Ethernet for synchronizing the time provided to clocks and network devices using the Network Time Protocol (NTP).

B. Data and low voltage DC power shall be distributed over the same network cable using Power over Ethernet (PoE) technology.

C. To be developed

D. NTP (Network Time Protocol) servers shall allow clients which may be supplied by different manufacturers to synchronize clocks, computer clocks, other computer timing devices and other kinds of network equipment using the standard reference of time accepted worldwide, known as UTC (Universal Time Coordinated).

E. The clock system shall be operated within the parameters of a standard network configuration, and shall utilize standard industry network equipment and distribution methods, including standardized PoE distribution technology.

F. The clock system shall operate autonomously and shall provide software configuration options for time zone offsets, automatic daylight saving time corrections without scheduled operator intervention or maintenance. The clock system shall be configured via software control and shall allow for remote monitoring and configuration changes while providing password protection.

G. Configuration Software

1. The network clock system shall be fully configurable and managed remotely through IP via software.

H. GUI Interface – Windows configuration

1. The network clock system shall include a GUI (Graphical User Interface) based network software application, operating under the Windows OS, for configuration and maintenance of the network time server and all network clocks.
2. The GUI application shall include password protection of the clock configuration, encrypted communication, and the ability to enable or disable options that might reduce security.
3. A status display to remotely monitor the time displayed on the clock, the internal UTC time, synchronization status, and any error condition regarding the clocks network status shall be provided and for quickly configuring groups of clocks with the ability to save and load configurations.

I. Console interface – Unix/Linux, non-Windows platform configuration:

1. A separate menu driven Telnet or SSH (Secure Shell) console interface shall be provided for configuration, of the network time server and network clocks on a non-Windows OS such as UNIX, Linux.

210.020 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

210.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but not limited to:

1. To be developed

300.020 SYSTEM FUNCTIONS AND FEATURES

A. To be developed.

300.030 MASTER CLOCK

A. Description: Microprocessor-based, software-controlled unit.

1. Programming and control switches.
2. Informational Display: LED or backlit LCD type.

a) Normally shows current time, display.

b) Provides programming cues when system is being programmed.
c) Provides all international time zones.

3. Data Output Port for interface with the Internet and the Local Area Network.
4. Power Supplies: To be developed.
5. Enclosure: To be developed.
6. Housing: To be developed.
7. Electrostatic Discharge Resistance: To be developed.

300.040 NTP CLOCKS

A. To be developed

B. NTP Clock Characteristics – Analog Type:

1. To be developed

C. NTP Clock Characteristics – Digital Type:

1. To be developed

300.050 BACK BOXES FOR NTP CLOCKS

A. To be developed

300.060 GUARDS

A. To be developed

300.070 GPS ANTENNA

A. To be developed

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 CONFIDENTIALITY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.030 QUALITY ASSURANCE

A. To be developed

310.040 DELIVERY, STORAGE AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.050 WARRANTY

A. To be developed

310.060 COMMISSIONING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.070 MAINTENANCE AND SUPPORT DURING WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.080 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Additional Requirements for Submittals:

1. Product data: To be developed
2. Shop Drawings: To be developed
3. Samples for Initial Selection: To be developed
4. Operating License for the GPS transmitter (if required by local regulations and Authorities Having Jurisdiction): To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.040 ADJUSTING

A. Program system according to Employer's requirements.

B. To be developed

330.050 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W12J - DISTRIBUTED ANTENNA SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Particular Conditions apply to this Section.

B. This specification is to be used as a basis for the system design which includes installation and performance criteria. The Contractor shall finalize the system design according to the proposed approved products that shall be used to validate the design. The Contractor shall present in his shop drawings the final solution based on the selected and approved materials, in compliance with the standards, rules, and regulations stipulated in these specifications. The scope shall also include verification and coordination of the final solution to the satisfaction of the Employer and the Engineer.

1.2 SUMMARY

A. The below specification section is performance based.

B. Final specifications and GSM related products selection shall be as per the mobile operator requirements and recommendations.

C. The specified Distributed antenna system (DAS) shall provide complete coverage throughout the project scope. Two separate systems shall be provided:
   1. The cellular system shall be provided by mobile operators.
   2. The Tetra system shall be provided by the contractor and shall allow communication between staff that are constantly moving throughout the building for operation, maintenance, security and safety purposes.

D. The system components of the TETRA system include, but are not limited to, the following:
   1. Optical Master Unit,
   2. Optical Remote Unit,
   3. Coaxial cables, splitters, couplers, amplifiers, and ancillary distribution components,
   4. Indoor antennas,
   5. Terminations, connectors, and ancillary components,
   6. Wireways and cable containment system,

E. Single mode fiber optic cabling to support connectivity between the headend master equipment, any intermediate fiber optic distribution units, and to remote antenna unit equipment..

F. Related Sections
   1. To be developed

1.3 REFERENCE STANDARDS

A. Compliance with Local Requirements: Comply with applicable building code, local ordinances and regulations, and requirements of authorities having jurisdiction.

B. The BTSs for the cellular system shall be provided by mobile operators and should follow the below standards:
   1. 2G standards governed by European Telecommunications Standards Institute (ETSI).

2. 4G LTE standards
3. 3GPP
4. ITU-T Telecommunication Standardization Sector of the International Telecommunications Union

C. All materials, installation and workmanship shall comply with the following organization guidance and/ or standards:
1. TRA Regulatory Policy: Private Mobile Radio Service - Version 1.0, Issue Date: 30 December 2009
2. EN 300 296: Land Mobile Service; Radio equipment using integral antennas intended primarily for analog speech;
3. EN 300 471-2: Land Mobile Service
4. EN 50174-1 + A2: Information Technology – Cabling Installation, Part 1 Installation specification and quality assurance and all introduced contextual relationships with relevant standards in the EN50173 and EN50174 series.
5. EN50383, EN50384, EN50385: Specific Absorption Rate
6. ETSI EG-200-053: EMC compatibility, and radio site/system engineering
7. ETS 300 019: Environmental Engineering (EE)
8. ICNIRP Guidelines: Guidelines for limiting exposure to time-varying electric, magnetic, and electromagnetic fields.
9. IEC 61196-4: Coaxial communication cables - Part 4: Sectional specification for radiating cables – performance and test methods
10. ETSI TR 102: Designer's Guide
11. NFPA-1221 : Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems

D. Comply with the latest issue of:
1. NFPA 72, "National Fire Alarm Code".

E. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

1.4 DEFINITIONS AND ABBREVIATIONS

A. To be developed

1.5 SCOPE OF WORK

A. Refer to Division W, Section "Common Clauses for IT & Security Systems" for requirements.

B. System design & Implementation must be done by certified company.

C. To be developed

1.6 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of the Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

1.7 SYSTEM DESCRIPTION AND PERFORMANCE

A. All specified components shall meet at minimum the performance specifications of this article.

B. The Contractor shall submit shop drawings showing system layout and link budget calculations based on the equipment selected to meet performance criteria in this specification.

C. Radio signals shall be combined, amplified and transported from the head-end location to in-building distributed antenna locations using a combination of active equipment, fiber optic cable and coaxial cable.

D. Distributed antennas shall be located to minimize interference and intermodulation other antennas and other wireless systems. The design shall include minimum separation between various antenna types.

E. To be developed

1.8 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer / Employer has approved the respective submittal.

B. Samples for initial selection:

C. Operating License for the System as required by local regulations and Authorities Having Jurisdiction:

D. Product Certificates:

E. Manufacturer’s Endorsement

F. Signed Warranty: as specified.

G. Testing Plan:

H. Test Equipment

I. Product data: For each type of product.

J. Shop Drawings

K. Qualifications

L. Closeout Submittals (Record Documents):

M. Operations and Maintenance Manuals

1.9 QUALITY ASSURANCE

1. To be provided

1.10 DELIVERY, STORAGE, AND HANDLING

A. Comply with Division, Section “Product Requirements”.

1.11 PROJECT/SITE CONDITIONS

A. Environmental Conditions: to be developed

B. Operational Constraints: The system will run 24 hours per day, all the days of the year.

C. Power Supply

1.12 COORDINATION

A. To be provided

1.13 LICENSING REQUIREMENTS

A. To be provided

1.14 WARRANTY AND MAINTENANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements. Manufacturers shall meet all specifications requirements and shall be approved by the Engineer.

2.2 SYSTEM REQUIREMENTS

A. To be provided

2.3 SYSTEM COMPONENTS

A. Active Equipment :
1. Optical Remote Unit (ORU)
2. Optical Master Unit (OMU)

B. PASSIVE EQUIPMENT: Capable of operating in the 66-2700 MHz frequency range, and shall include:
1. Antennas
2. Splitters
3. Couplers
4. Low Loss (Coaxial RF) Cable
5. Radiating Cables (RF Leaky Cable)
6. Terminators/Dummy Loads

7. Connectors
8. Fiber Optic Cables
9. Fiber Optic Patch Panels
10. Cable Containment System

2.4 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division 27 Section “Common Clauses for IT, Security & Special Airport Systems”.

2.5 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division 27 Section “Common Clauses for IT, Security & Special Airport Systems”.

2.6 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. Refer to Division 27 Section “Common Clauses for IT, Security & Special Airport Systems”.

PART 3 - EXECUTION

3.1 INSTALLATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

3.2 FIRE-STOPPING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. to be developed

3.3 GROUNDING

A. To be developed

3.4 FIELD QUALITY CONTROL

A. To be developed

3.5 OCCUPANCY ADJUSTMENTS

A. To be developed

3.6 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation.

W24 - GENERAL CONDITIONS FOR INTEGRATED AUDIOVISUAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes general design requirements, administration topics and installation for audiovisual systems.

100.020 PERFORMANCE STANDARDS

A. Unless required by the specifications of a particular equipment or system, the following performance standards shall be met by each system:

1. Analog Audio

a) Frequency Response

1) Within plus or minus 0.5dB, 20 Hz to 20,000 Hz.

b) Signal to Noise Ratio

1) greater than 90dB (including crosstalk and hum at all input/output levels)

c) Total Harmonic Distortion

1) 0.05% maximum from 20 Hz to 20,000 Hz.

d) Input Levels

1) Microphone (Nominal): -50dBu
2) Overload (Minimum gain) : -5dBu
3) Maximum Gain: -26dBu
4) Line (Nominal): +4dBu
5) Overload (Minimum gain):+24dBu
6) Maximum Gain: +9dBu
7) Input Common Mode Rejection: >100dB

e) Output Levels

1) Line (Nominal): +4dBu
2) Maximum: +24dBu
3) Output Impedance: <15 Ohms

B. Performance Test Signal Paths

1. The signal paths for the above Performance Standards shall be as follows:

a) Audio:

1) From all source inputs (for microphones, audio units, video units, etc.) through all mixers, switchers, etc., to all signal destinations.

b) Video:

1) From all sources of the above signal paths. This shall not exempt the Contractor from the responsibility of checking all paths and outlets for appropriate compliance with the Performance Standards listed herein.

C. Optical Performance Standards

1. System design shall be based "ANSI/Infocomm 3M: 2011, Projected Image System Contrast Ratio", with the following performance criteria:

a) Viewing Requirement Categories Rationale: Basic Decision Making.
b) Contrast ratio between the ambient light and the projected image (assuming perfect black level for the projector): 15:1.

c) Minimum overlapping (for projection mapping): 10%.
d) Uniformity: Shall conform to "ANSI/Infocomm 3M: 2011, Projected Image System Contrast Ratio" standard "Partially Conforms" verification criteria; "The contrast ratio of one but no more than four measurement (viewing) locations falls below the required contrast ratio for the identified viewing category by no more than 10%."

D. Control System User Interface

1. Control system user interfaces pages shall be designed for this project exclusively. While there are a great number of design approaches to designing the user interface, the following guidelines shall be adhered to:

a) All panels shall have the time and date as icons, in the same position on every page.
b) All panels shall have a title, indicating the piece of equipment and/or functionality being controlled.
c) User interface design, shall, to the greatest extent possible maintain continuity throughout the Project, taking into account the variations in system functionality from room type to room type.
d) Comply with the recommendations of "InfoComm, Dashboard for Controls Design Guide" or similar approved design guide.

2. Final programming shall include capability to remotely control all functions of the Audiovisual system. Individual device controls shall provide full manufacturer's functionality.
3. Devices similar in nature shall be programmed to operate with a common format.
4. Functions used during a general presentation shall be accessible with a minimal amount of button presses/page flips.
5. Where feasible, multi-level access to controls should be implemented.
6. During performance testing, all equipment shall be operated under standard conditions as recommended by the manufacturer.

E. Acoustics

1. System design shall be based on the following performance criteria (for meeting rooms and conference rooms):

a) Average sound pressure level: 75 to 80 dB
b) Amplifiers shall have a dynamic headroom of +40% over the required power.
c) Intelligibility index: STI: better than 0.60
d) Sound diffusion level: 15 dB (A) above ambient noise level.
e) Total harmonic distortion: maximum 0.05% at specified output level.
f) Frequency response: +/- 3 dB over 100 Hz to 20 kHz.
g) Performance coverage envelope: 3 dB (0.25, 0.5, 1, 2, 4 and 8 kHz).

F. A/V Equipment - General

1. A/V equipment shall be compliant with the transport of combined digital audio and video signals in the High-Definition Multimedia Interface (HDMI) or DisplayPort format. HDMI components shall support HDMI 2.0b or latest version providing a minimum of 18 Gbps data rate supporting 4K video signals (3840x2160 at up to 60 fps), 3D, and high-definition audio formats.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

C. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

D. Conflicts

1. Should an instance occur in this Specification or on the Drawings in which material or construction methods called for is less than minimum requirement of the reference standards, immediately inform the Engineer in writing. Consequent to Engineer's approval, supply the materials and perform the work as though called for to minimum code standards.

E. Referenced Standards

1. International British (BS), European (EN) and IEC Standards which are in relationship with each other, tackle the same topic and carry the same number, can be used interchangeably in this specification since they are assumed to have the same intent and target the same level of quality and safety. For example: BS EN 60529 and IEC 60529. This shall be applicable to all subjects except for life safety related materials and systems (such as the Fire Alarm System) whereby BS / BS EN shall remain mandatory.

F. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references.

1. UL: Underwriters Laboratories.
2. EIA: Electronic Industries Alliance.
3. ECIA: Electronic Components Industry Association.
4. TIA: Telecommunications Industry Association.
5. ISO: International Standards Organization.
6. IEC 60268-16, Sound system equipment - Part 16: Objective rating of speech intelligibility by speech transmission index.
7. AVIXA (Formerly INFOCOMM International).
    a) ANSI/INFOCOMM A102.01:2017, Audio Coverage Uniformity Standard in Listener Areas.
    b) ANSI/INFOCOMM 2M – 2010, Standard Guide for Audiovisual Systems Design and Coordination.
    c) ANSI/INFOCOMM 3M – 2011, Projected Image System Contrast Ratio.
    d) AVIXA F501.01:2015 (Formerly INFOCOMM F501.01:2015), Cable Labeling for Audiovisual Systems.
    e) AVIXA V202.01:2016 (Formerly ANSI/INFOCOMM V202.01:2016), Display Image Size for 2D Content in Audiovisual Systems.
    f) ANSI/INFOCOMM 10:2013, Audiovisual Systems Performance Verification
    g) InfoComm, Dashboard for Controls Design Guide
8. ANSI X3T12: for FDDI and CDDI.
9. IEEE 802.3 – Carrier Sense Multiple Access/Collision Detection Access Methods (Ethernet).
10. Society of Motion Picture and Television Engineers (SMPTE).
11. Electrical equipment, devices and components shall comply with the appropriate Class for project environment as per requirements of EMC:
    a) EN 61000-6-1, Electromagnetic compatibility (EMC). Generic standards. Immunity for residential, commercial and light-industrial environments.
    b) EN 61000-6-3, Electromagnetic compatibility (EMC). Generic standards. Emission for residential, commercial and light-industrial environments.
    c) EN 61000-6-2, Electromagnetic compatibility (EMC). Generic standards. Immunity for industrial environments.
    d) EN 61000-6-4, Electromagnetic compatibility (EMC). Generic standards. Emission for industrial environments.
12. European Directives:
    a) European Low Voltage Directive (LVD) 2014/35/EU.
    b) European Radio Equipment Directive (RED) 2014/53/EC.
    c) Directive on Waste Electrical and Electronic Equipment (WEEE) 2012/19/EU.
13. Power Quality

a) EN 61000-3-2: Electromagnetic compatibility (EMC) - Part 3-2: Limits - Limits for harmonic current emissions (equipment input current ≤ 16 A per phase).
b) EN 61000-3-3: Electromagnetic compatibility (EMC) - part 3-3: limits - limitation of voltage changes, voltage fluctuations and flicker in public low-voltage supply systems, for equipment with rated current ≤ 16 A per phase and not subject to conditional connection.

14. Information Technology equipment, devices and components shall comply with the appropriate Class for project environment as per requirements of EMC:

    a) EN 55035, Electromagnetic compatibility of multimedia equipment. Immunity requirements
    b) EN 55032, Electromagnetic compatibility of multimedia equipment. Emission Requirements.

15. For interface with the Fire Alarm System, comply with the latest issue of:

    a) NFPA recommendations

16. All electrical works shall comply with applicable local regulations and code requirements of Authorities Having Jurisdiction. Refer also to Division V Section "Basic Electrical Materials and Methods".

G. All A/V systems designed and installed shall meet the most current version of the Accessibility Guidelines by Authorities Having Jurisdiction, including assisted listening systems, visual access and accommodations.

H. All A/V equipment (such as display units) shall be "ENERGY STAR qualified" products or equivalent international certification program wherever possible. They shall carry the latest applicable version of ENERGY STAR label or equivalent.

I. Local regulations and codes. These are to have precedence over the Standards where enforced and relevant.

110.020 PROJECT/SITE CONDITIONS

A. Environmental Conditions: Equipment shall be capable of withstanding the project environmental conditions specified under Division V Section "Basic Electrical Materials and Methods" encountered at the installed location without mechanical or electrical damage or degradation of operating capability as applicable to:

1. Interior, Controlled Environments.

B. To be developed

110.030 DEFINITIONS AND ABBREVIATIONS

A. Definitions

1. Gain is a measure of a screen's reflectivity – i.e. how much light the screen reflects, and ultimately how well the screen redirects light from the projected image to the audience. It is measured from the viewing angle where the screen reflects the most light, which is directly in front and at a 90 degree angle to the screen. Gain is measured relative to a block of magnesium carbonate which is a very white chemical coating that serves as the standard for 1.0 gain. A number higher than 1.0 indicates greater brightness. Gain shall be determined in accordance with SMPTE RP 94-2000.
2. Viewing angle: Angle from perpendicular of screen center at which the brightness of the image is half of its maximum potential.
3. Keystone: Distortion of projected image when the projector is not aligned perpendicularly to the projection screen.
4. Reference to "U.L. (Materials Construction) Standards" shall mean the "Standards for Safety" published by Underwriters Laboratories, Inc.
5. SYSTEM: The Audio-Visual System to which these Specifications apply.
6. Scaler: A device that converts video signals from one resolution or frame rate to another; usually up-scaling or up-converting a video signal from a low resolution to one of higher resolution.

7. Line driver: A signal amplifier used to extend an audio or video signal over extended distances. Similar in function to a distribution amplifier, but with one input and one output
8. Extender: similar to the line driver but operates in transmitter and receiver pairs to allow long distance transmission of digital signals via twisted pair or fiber optic cable
9. Matrix Switcher: Routes multiple audio/video sources to multiple audio/video destinations. It receives A/V signals from a range of input sources - computers, cameras, Disc players, etc. - and routes the output to different destinations, such as projectors and flat panel displays.
10. Phantom Power: Phantom power is a means of distributing a DC current through audio cables to operate microphones and other equipment that contain active electronic circuitry. The supplied voltage is usually between 12 and 48 Volts, with 48V being the most common.

B. Abbreviations

1. Alcons: Articulation loss of consonant
2. A/V: Audiovisual
3. CDDI: Copper Distributed Data Interface.
4. EDID: Extended display identification data
5. FDDI: Fiber Distributed Data Interface.
6. HDCP: High-bandwidth Digital Content Protection
7. HDMI: High-Definition Multimedia Interface
8. HID Human Interface Device
9. IWB: Interactive WhiteBoard
10. KVM Keyboard, Video and Mouse
11. SMTP: Simple Mail Transport Protocol.
12. SNPP: Simple Network Paging Protocol
13. STB: Set-Top Box (IPTV)
14. STI: Speech Transmission Index
15. TFT: Thin-Film-Transistor
16. TMDS: Transition-Minimized Differential Signalling
17. VCSS: Video Communications Server

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. General: Provide audiovisual systems design, engineering, and installation within designated spaces of the Project **.** Systems shall include all devices, equipment, installation, programming and commissioning in accordance with requirements of the contract documents and drawings.

B. Works Included:

1. Refer to the following Sections for scope of work and system description for each Room Type:

a) Section W24A - Integrated Audiovisual Systems and Equipment – For Meeting Rooms.
b) Section W25 – Digital Media Displays.

C. To be developed.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Drawings and general provisions of the Contract, including Project "Preliminaries and General Requirements", apply to this Section.
2. All the requirements presented in this Specification "General Conditions for Integrated Audiovisual Systems" shall be complimentary to and shall apply to the following A/V Systems except where a particular A/V System Specification document calls for otherwise. In this case, the individual A/V System Specification shall have precedence:

a) Section W24A - Integrated Audiovisual Systems and Equipment – For Meeting Rooms.

b) Section W25 – Digital Media Displays.

B. Related Sections:

1. To be developed

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but not limited to:

B. Audio Systems

1. To be developed

C. Displays

1. To be developed

D. Presentation Source Equipment

1. To be developed

E. Control Systems

1. To be developed

F. Equipment Racks/Cabinets

1. To be developed

G. Cables

1. To be developed

H. TV Broadcasting Network Products

1. To be developed

300.020 MATERIALS - GENERAL

A. Refer to the following Specification Sections for Equipment Specifications and schedules by individual Room type:

1. Section W24A, “Integrated Audiovisual Systems and Equipment – For Meeting Rooms”.

B. Refer to the following Specification Section for Equipment Specifications and schedules by System type:

1. Section W25, “Digital Media Displays”.

300.030 TECHNICAL PANELS, BOXES AND COVER PLATES

A. General

1. Refer to:

a) Division V Section “Wiring Devices” for device boxes, cover plates and floor-box service fittings.
b) Division Y Section “Raceways and Boxes for Electrical Systems” for boxes.

B. Configuration:

1. To be developed
2. Submit manufacturer’s detailed assembly drawing indicating configuration and details related to material, finish and tagging.

300.040 EQUIPMENT RACKS/CABINETS

A. Equipment Rack/Cabinet

1. Comply with Division W, Section “Communications Equipment Room Fittings ” for equipment racks and cabinets.

B. Configuration

1. To be developed
2. Comply with EIA/ECA-310-E.

C. Power Management

1. To be developed

D. Rack/Cabinet Accessories:

1. To be developed
2. Contractor to determine ventilation requirements to maintain 30 Deg. C maximum temperatures. Provide:

a) One or two quiet fans in top knockouts of each rack, as required.
b) Vent blockers to facilitate proper air movement.
c) Thermostatic fan control
d) Other measures as proposed by Contractor for guaranteed proper thermal management.

300.050 A/V CREDENZA

A. General

1. Comply with Division W, Section “Communications Equipment Room Fittings” for equipment racks and cabinets.

B. Configuration

1. Modular, consisting of multiple bays.
2. To be developed

C. Power Management

1. To be developed

D. Rack/Cabinet Accessories:

1. To be developed
2. Wire Duct: wide slot wiring duct, size as required.
3. Contractor to determine ventilation requirements to maintain 30 Deg. C maximum temperatures. Provide:

a) Quiet fans in top knockouts of each rack, as required.
b) The overall fan noise at full load capacity shall not exceed 35dBA measured at 1m from the credenza.
c) Vent blockers to facilitate proper air movement.
d) Thermostatic fan control
e) Other measures as proposed by Contractor for guaranteed thermal and acoustical management.

300.060 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. To be developed

B. Remote field-mounted components shall be fed from the nearest UPS source.

C. Coordinate UPS voltage, circuit size, and connection requirements with the Project Electrical design.

D. Coordinate UPS configuration - whether centralized or decentralized, redundant or non-redundant with the Project Electrical design.

E. Ensure that the allocated space and environmental conditions are adequate for the adopted configuration.

F. Comply with Division V, Section “Uninterruptible Power Supply”.

300.070 WIRE AND CABLE

A. General Cable Requirements: Size and type as recommended in writing by system manufacturer unless otherwise indicated.

B. Comply with the following Specification Sections – as applicable to power, control, data and video signal transmission cables:

1. To be developed

C. Low Smoke Zero Halogen (LSZH/LS0H) cables: for plenum installation as per adopted Standards for the Project.

1. Low Smoke Zero Halogen (LSZH/LS0H) cables shall comply with the following European Standards:

a) Flame retardant: IEC 60332-1.
b) Halogen-free according to:

1) IEC 60754-1 for amount of halogen acid gas.
2) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).

c) Low smoke density according to IEC 61034-2.

D. Fire Resistant Cables: For life safety installations interface. Refer to Division Y Section "Low-Voltage Electrical Power Conductors and Cables".

1. Use Fire-resistant cables Type FR4

E. Grounding Components: To be developed.

F. Cable Types

1. To be developed

G. Connectors

1. To be developed

300.080 MEDIA BROADCASTING NETWORK PRODUCTS

A. Description

1. Media Broadcasting cables and their connecting hardware shall provide the means of transporting signals between the media broadcast outlet/connector and the horizontal cross-connect .

B. To be developed

300.090 CONDUITS, TRUNKING, ENCLOSURES AND FI TTINGS

A. Where rack, cabinet, or console mounting is indicated, equipment shall be designed to mount in a 19-inch (483-mm) housing complying with EIA/ECA-310-E and Division W, Section “Communications Equipment Room Fittings**”.**

B. To be developed

300.100 SPECIAL TOOLS AND KITS

A. The Contractor shall furnish any special installation equipment, tools, or kits necessary to properly complete the telecommunications system installation. This may include, but is not limited to, tools for pulling, splicing, terminating, and testing the cables, communication devices, stands for cable reels, cable wenches, assembly and adjustment devices, etc.

B. To be developed

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

310.030 QUALITY ASSURANCE

A. Project Management

1. To be developed

B. Contractor's Qualifications

1. To be developed

C. Materials and Equipment

1. To be developed

D. Administrative Requirements

1. To be developed

310.040 DELIVERY, STORAGE AND HANDLING

A. Comply with Project "Preliminaries and General Requirements".

310.050 WARRANTY AND MAINTENANCE

A. Contractor shall provide a two years warranty for the works, Systems, and subsystems specified herein, including all materials, software and labor, to be free from defects in design, workmanship, and materials.

B. System Availability

1. At any given time, the overall A/V shall be considered unavailable if the system is not available, not fully or accurately functional, or does not meet performance criteria for the given connection.
2. All A/V components shall execute, without degradation, at the scheduled periods and response times for the systems to be considered available.
3. The systems shall operate as specified under Article "PROJECT/SITE CONDITIONS", Paragraph "Operational Constraints".
4. Availability of the overall A/V shall be at least 99.999% within the specified "Operational Constraints".

C. Warranty period shall commence from date of Taking Over of the SYSTEM

D. Experimental Period

1. After the on-site tests are satisfactorily completed in accordance with the technical specifications and approved procedures, and before Taking Over, assume a one-month experimental period during which the SYSTEM performance will be fully demonstrated under actual operation conditions. This demonstration is to confirm, to the satisfaction of the Employer / Engineer that the SYSTEM is free of remarks and is ready for taking-over.
2. Contractor shall supervise and take responsibility for the operation of the system during the experimental period. After the satisfactory completion of this period, the system shall be taken over by the Employer, as per Contract conditions, whereby the warranty period shall commence.

E. Software Service

1. Technical Support: Provide software support for two years, beginning at Project Completion.
2. To be developed

310.060 SPARE PARTS AND EXTRA MATERIAL

A. The manufacturer shall guarantee the flow and availability of the spare parts without a major design change for at least ten years' period from date of System Acceptance by Employer.

B. To be developed

320.000 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer and/or Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:

1. Product data: For each type of product.
2. Shop Drawings.
3. Wiring diagrams to show typical wiring schematics.
4. System Operation: Include:

a) System Architecture and performance requirements.
b) Inter-connectivity patching of all network devices
c) Human Machine Interface (HMI) design for all categories of users.
d) Software Architecture and justification (e.g.: off-the-shelf and specific software, etc.).

B. Submittals shall comply with Project "Preliminaries and General Requirements".

C. Samples for initial selection:

1. To be developed

D. Prefabrication Submittals

1. To be developed

E. Product Certificates: signed by manufacturers of equipment and /or software certifying that furnished products comply with contract requirements.

F. Manufacturer's Endorsement

1. Contractor shall submit Manufacturer's technical validation and endorsement of the design documentation and implementation.

G. Calculations

1. To be developed

H. Coordination Drawings:

1. To be developed

I. Shop Drawings shall include the following:

1. To be developed

J. Qualifications

1. The Contractor shall provide the appropriate documentation to comply with the requirements described in Article "QUALITY ASSURANCE", included with, and at the time of, bid submission.

K. Closeout Submittals (Record Documents):

1. To be developed

L. Operations and Maintenance Manuals

1. To be developed

M. To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. To be developed

B. Workmanship: To be developed

C. Cables: To be developed

D. Equipment Modification: To be developed

E. Firestopping: To be developed

F. Grounding and Bonding: To be developed

G. Equipment: To be developed

H. Motorized Projector Lifts: To be developed

I. Mounting Heights: To be developed

J. Cable Separation: To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. The Factory Acceptance Tests shall be carried out in a hardware and software environment, which simulates the final configuration of the SYSTEM.

B. To be developed

330.030 FIELD QUALITY CONTROL

A. Contractor System Checkout

1. To be developed

B. System Acceptance Tests

1. To be developed

C. Experimental Period: To be developed

330.040 DEMONSTRATION AND TRAINING

A. To be developed

W24A - INTEGRATED AUDIOVISUAL SYSTEMS AND EQUIPMENT - FOR MEETING ROOMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. The audiovisual systems within the Meeting Room shall provide the audiovisual capabilities required for effective instruction and learning, including the following:

1. Audio program presentation
2. Speech audio reinforcement
3. Audio-conference communication
4. Video program presentation
5. Wireless presentation

100.020 PERFORMANCE STANDARDS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

120.020 SYSTEM DESCRIPTION

A. The A/V system shall consist of the following sub-systems:

1. Audio program reinforcement system
2. Speech and Audio-conference reinforcement system
3. Video presentation display system. Front projection
4. Video presentation display system. Flat panel display
5. Wireless presentation system
6. Control system with a touch-screen control panel to allow system operator to control the following functions:

B. All systems shall be dedicated and permanently installed.

C. The systems shall utilize the building local area network for audio and video input and output, system control and maintenance and monitoring functions.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W Section W24 “General Conditions for Integrated Audiovisual Systems”.

B. Related Sections:

1. To be developed

210.000 RELATED PRODUCTS

210.010 MISCELLANEOUS PRODUCTS AND SYSTEMS

A. For the following miscellaneous products and systems, refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”:

1. TECHNICAL PANELS, BOXES AND COVER PLATES
2. EQUIPMENT RACKS/CABINETS
3. A/V CREDENZA
4. UNINTERRUPTIBLE POWER SUPPLY (UPS)
5. WIRE AND CABLE
6. CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS
7. SPECIAL TOOLS AND KITS

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

300.020 AUDIO SYSTEMS

A. Audio Digital Signal Processors: Networked

1. To be developed

B. Power Amplifiers: Networked

1. To be developed

C. Loudspeakers

1. Ceiling speaker
    a) To be developed
2. Program speaker, wall mounted
    a) To be developed

D. Microphones and Accessories

1. Lectern/Table Mounted Gooseneck Cardioid Microphone
    a) To be developed
2. In-Table "button type" Microphone
    a) To be developed
3. Ceiling-mounted Networked Microphone Array

a) To be developed

4. Table-mounted Networked Microphone Array
    a) To be developed

300.030 DISPLAYS

A. Flat Panel Displays
    1. To be developed
B. Display Mount
    1. To be developed
C. Video Projectors - Small Venue
    1. To be developed
D. Front Projection Screens
    1. To be developed

300.040 PRESENTATION SOURCE EQUIPMENT

A. Analog Audio Signal Interfaces/Line-Drivers
    1. To be developed
B. Blu-Ray Disk Player
    1. To be developed
C. Digital Extender Transmitter / Receiver
    1. To be developed
D. Digital Audio-Video Matrix Switcher
    1. To be developed
E. HDMI Audio De-Embedder
    1. To be developed
F. Wireless Presentation System
    1. To be developed
G. A/V Connection Plate (Media Hub) (Input Plate)
    1. To be developed
H. IPTV Set-Top Box
    1. To be developed

300.050 CONTROL SYSTEMS

A. System Controller – Large
    1. To be developed
B. System Controller - Small
    1. To be developed
C. Wired Wall Mount Touch Panel
    1. To be developed
D. Wireless Touch Panel
    1. To be developed

E. Keypad Controller

1. To be developed

F. Room Scheduling Panel

1. To be developed

G. Room Scheduling, Management and Asset Management System

1. To be developed

310.000 QUALITY MANAGEMENT

310.010 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section "General Conditions for Integrated Audiovisual Systems":

1. PRODUCTS AND WORK BY OTHERS / COORDINATION
2. CONFIDENTIALITY
3. QUALITY ASSURANCE
4. DELIVERY, STORAGE AND HANDLING
5. WARRANTY AND MAINTENANCE

310.020 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section "General Conditions for Integrated Audiovisual Systems".

B. To be developed

320.000 SUBMITTALS

A. Provide in accordance with Division W, Section "General Conditions for Integrated Audiovisual Systems".

330.000 EXECUTION

330.010 MISCELLANEOUS FIELD AND INSTALLATION WORK TOPICS

A. For the following topics, refer to Division W, Section "General Conditions for Integrated Audiovisual Systems":

1. INSTALLATION
2. FACTORY ACCEPTANCE TESTS
3. FIELD QUALITY CONTROL
4. DEMONSTRATION AND TRAINING

W25 - DIGITAL MEDIA DISPLAYS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes Digital Media Displays used to provide advertisements, TV content and branding information throughout the Project public areas.

1. The technology shall be the latest technology, for example: TFT-LCD Displays with edge LED back light, and Full Matrix LED.
2. The information to be displayed on the Digital Media Displays shall be generated, hosted and distributed by various Systems including but not limited to IP–Based Television System (IPTV)
3. Data shall be transported along the Project Data Network which generates graphical output to the Screen.

100.020 PERFORMANCE STANDARDS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

B. General Requirements for Displays

1. The Contractor shall use well-proven and market available product and technologies (e.g. propose display panels with LED backlight or better).
2. The proposed displays shall be slim and light weight, suitable for public displays.
3. The proposed display shall be already available on other projects of comparable size.
4. The display panels shall be capable of working continuously 24/7 under public commercial environment conditions without any degradation or limitation of their performance and without developing any visually apparent effects deemed undesirable by the Employer.
5. The life span of the equipment and their associated peripherals shall be at least 5 years, based on a continuous 24-hours operational schedule.
6. All displays shall perform 24/7 operations without preventive maintenance
7. All displays shall be capable of displaying information in both landscape and portrait orientation.
8. The Contractor shall provide the enclosures of the display and shall ensure that all connectors and controllers are accessible while the display is mounted.
9. The Contractor shall ensure that the provided structure and screen enclosures will have sufficient ventilation to meet the displays’ operating temperature.
10. The displays shall have relevant self-diagnostic functions to support trouble-shooting and preventive maintenance. These relevant self-tests shall be initiated each time the equipment is powered up.
11. The display shall comply with the latest industry standards for high operational reliability and availability.
12. The Contractor shall provide the necessary display frame size, color and finishes to meet the architectural requirements at the installation area.
13. Displays shall be provided with mounting brackets with adjustable 0-15 degree tilt angle.
14. Mounting brackets shall be coordinated with the Architectural design.
15. The Contractor shall be fully responsible for the mechanical interface of the proposed bracket with the supporting structure (wall, column, etc.) and in coordination with the Building Contractor in charge of the supporting structure.
16. There shall be no panel or switch accessible from the front or the side of the frame of the display. Manipulation by unauthorized people shall be made as difficult as possible. All manual controls on the outer side of the display, allowing access to the display system, shall be deactivated by software, if required, for security reasons.
17. The display shall have a built-in power supply compatible with Project mains power supply characteristics.
18. A 3m power cord with plug shall be provided for the display panel and associated controller. The plug shall conform to the Project socket outlets standard.

19. The display panel and associated controller shall have adequate built-in protection against over-voltage and over-current.
20. LCD Displays shall have full motion video display capability with support for multiple formats, so that if not actively used for signage functions, they can be used for public awareness information by commercial video advertising bodies.
21. To be developed.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

B. Definitions

1. Digital Media Display shows dynamic digital content such as pictures slide shows, video clips, animations, video streaming, television
2. LCD: Liquid Crystal Display.
3. TFT-LCD: Thin-Film Transistor Liquid Crystal Display
4. LED: Light Emitting Diode display with dot matrix mode of LED’s
5. Digital media Controller: Windows or Linux based media player which can connect to the network and any video source provided.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “General Conditions for Integrated Audiovisual Systems”.

120.020 SYSTEM DESCRIPTION

A. The A/V system shall consist of video presentation 16:9 HD display systems consisting of:

1. Flat Panel Displays – configured into arrays
2. Video Walls and associated video wall controllers

B. The video presentation signals shall be sourced from:

1. A local or portable computer and/or laptop.
2. Blu-Ray disk player or other video sources.

C. All systems shall be dedicated and permanently installed.

W31 - COMMON CLAUSES FOR IT & SECURITY SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes common requirements for IT & Security Systems.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

C. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

D. Conflicts
   1. Should an instance occur in this Specification or on the Drawings in which material or construction methods called for is less than minimum requirement of the reference standards, immediately inform the Engineer in writing. Consequent to Engineer's approval, supply the materials and perform the work as though called for to minimum code standards.

E. Referenced Standards
   1. International British (BS), European (EN) and IEC Standards which are in relationship with each other, tackle the same topic and carry the same number, can be used interchangeably in this specification since they are assumed to have the same intent and target the same level of quality and safety. For example: BS EN 60529 and IEC 60529. This shall be applicable to all subjects except for life safety related materials and systems (such as the Fire Alarm System) whereby BS EN shall remain mandatory.

F. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
   1. Comply with the latest issue of several material and test standards, which have been developed and published by Institute of Electrical and Electronics Engineers (IEEE) for data communications industry, but not limited to:
      a) 802.1 – LAN/MAN Bridging and Management,
      b) 802.3 – Carrier Sense Multiple Access/Collision Detection Access Methods (Ethernet),
      c) 802.11 – Carrier Sense Multiple Access/Collision Avoidance Access Methods (Wireless LAN's),
   2. ISO/IEC/IEEE 24765, Systems Software Engineering - Vocabulary.
   3. Comply with the latest issue of several material and test standards, which have been developed and published by Network Equipment Building System (NEBS). Level 1, Level 2, and Level 3 are applicable to this Section:
      a) SR-3580: NEBS: Criteria Levels.
      b) GR-63-Core: NEBS: Physical Protection.
      c) GR-1089-Core: NEBS: EMC and Electronic Safety.
      d) GR-3160: Data Centers.
   4. Internet Engineering Task Force (IETF).
   5. International Organization for Standardization (ISO).
   6. European Directives:
      a) European Low Voltage Directive (LVD): 2014/35/EU.
      b) European Radio Equipment Directive (RED) 2014/53/EU.

c) Directive on Waste Electrical and Electronic Equipment (WEEE) 2012/19/EU.

7. Electrical equipment, devices and components shall comply with the appropriate Class for project environment as per requirements of EMC:
   a) EN 61000-6-1, Electromagnetic compatibility (EMC). Generic standards. Immunity for residential, commercial and light-industrial environments.
   b) EN 61000-6-3, Electromagnetic compatibility (EMC). Generic standards. Emission for residential, commercial and light-industrial environments.
   c) EN 61000-6-2, Electromagnetic compatibility (EMC). Generic standards. Immunity for industrial environments.
   d) EN 61000-6-4, Electromagnetic compatibility (EMC). Generic standards. Emission for industrial environments.
8. Power Quality
   a) EN 61000-3-2: Electromagnetic compatibility (EMC) - Part 3-2: Limits - Limits for harmonic current emissions (equipment input current ≤ 16 A per phase).
   b) EN 61000-3-3: Electromagnetic compatibility (EMC) - part 3-3: limits - limitation of voltage changes, voltage fluctuations and flicker in public low-voltage supply systems, for equipment with rated current ≤ 16 A per phase and not subject to conditional connection.
9. Information Technology equipment, devices and components shall comply with the appropriate Class for project environment as per requirements of EMC:
   a) EN 55035, Electromagnetic compatibility of multimedia equipment. Immunity requirements
   b) EN 55032, Electromagnetic compatibility of multimedia equipment. Emission Requirements.
10. And / Or Electrical and Information Technology equipment, devices and components shall comply with the appropriate Class for project environment as per requirements of EMC:
    a) Code of Federal Regulations: 47 CFR - Telecommunication, Chapter I - Federal Communications Commission, Part 15 - "Radio Frequency Devices."
11. Safety
    a) IEC 62368-1, Audio / video, information and communication technology equipment. Safety requirements.
    b) IEC 62368-3, Audio / video, information and communication technology equipment. Safety aspects for DC power transfer through communication cables and ports.
    c) IEC 60950-1, Information technology equipment. Safety. General Requirements.
    d) IEC 60950-22, Information technology equipment. Safety. Equipment to be installed outdoors.
12. All electrical works shall comply with the local Electricity Regulations. Refer also to Division V, Section “Basic Electrical Materials and Methods”.

G. System software, terminology, and modeling of Integration Systems shall be compliant with ANSI/ISA-95 (S95).

H. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

110.020 PROJECT/SITE CONDITIONS

A. Environmental Conditions: to be developed

B. Operational Constraints: The SYSTEM will run 24 hours per day, all the days of the year.

C. Unless otherwise indicated**,** 25%spare capacity shall be required at all levels of the SYSTEM.

D. Power Supply
   1. Power supply for all products shall be supplied or derived from the voltage system described below, as shown on the Drawings, or as otherwise specified.
   2. Nominal characteristics of power supply and distribution system (AC voltage / No. of Phases / Frequency / Earthing system) shall be as per local country standard. For details, refer to Division V, Section “Basic Electrical Materials and Methods”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Definitions
   1. SYSTEM: The IT or Security System to which these Specifications apply.
   2. Virtual Server Environment (VSE): An environment that runs multiple independent operating systems on a single physical computer. In a VSE, a single physical server may be divided into multiple logical servers.

B. Abbreviations: to be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. The Contractor shall provide, based on these specifications and design drawings, the final design and construction documents and all equipment, software, material, labor and services required to construct and install the SYSTEM infrastructure including, but not limited to:
   1. All design services, drawings and specifications, equipment, software, materials, labor and services, not specifically mentioned or shown, which may be necessary to complete the design and installation of the SYSTEM.
   2. Proposal to upgrade the specified systems to the latest technology available, so as to bring the specified items to the prevailing technology at the time of construction as detailed in Article "Quality Assurance" of this Specification Section.
   3. Hardware as specified for the system and any hardware that is specific to the Contractor's proposed system.
   4. Software application and any other software that may be required to make the system fully operational as specified including the provision of network management software, IP addresses, setup and configuration and any other required configuration.
   5. Installation and setup of the system hardware and software as specified.
   6. Coordination with the Service Providers of interfaced systems.
   7. Integration of the SYSTEM with other systems and in coordination with the Employer.
   8. Risk analysis of system design showing advantages and drawbacks.
   9. Post deployment auditing.
   10. Delivery of the "Interface Control Document - ICD".
   11. Final connection of hardware to power, infrastructure termination and patch cords connecting system equipment to the data outlets and other network communication equipment.
   12. Documentation: Licenses, Shop drawings, Specifications, As-built drawings, user's manual, operation and maintenance manuals, test reports, etc.
   13. Handover manufacturer's recommended spare parts (along with current unit prices) for all major components in the system for two (2) years fault-free operation.
   14. Handover manufacturer's recommended test equipment and tools (along with current unit prices) required for system maintenance.
   15. Test plan.
   16. System testing and commissioning.
   17. System roll-out.
   18. System warranty as specified herein.
   19. Training as specified herein.
   20. Maintenance and support as specified herein.
   21. Supply the licenses for all software, programs and modules provided for the works including those developed and modified by the Contractor. The appropriate licenses supplied by the Contractor shall enable the Employer to use, modify, and develop the software, programs and modules for the works supplied under this Contract.

B. Systems Integration

   a) To be developed.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General
   1. Drawings and general provisions of the Contract, including Project "Preliminaries and General Requirements", apply to this Section.
   2. All the requirements presented in this Specification "Common Clauses for IT & Security Systems" shall be complimentary to and shall apply to the following SYSTEMS except where a particular SYSTEM Specification calls for otherwise. In this case, the individual SYSTEM Specification shall have precedence.

      a) IT Systems
      b) Security Systems
      c) Other Communications Systems

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. To be developed as per design requirements

210.020 SIGNAL TRANSMISSION COMPONENTS

A. To be developed as per design requirements

210.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS
   1. To be developed as per design requirements

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFCATURERS

A. To be developed

300.020 PROPOSED SOLUTION

A. The Contractor shall use well-proven technologies with a demonstrated history of operation in a live airport environment.

B. The proposed solution shall be already available in use on other Projects of similar application and comparable size.

C. System and applications software shall be controlled and configured by working parameters stored in tables and easy to change without programming.

D. The system shall be easy to deploy throughout the whole Project.

E. The system shall be able to accept multiple devices of different types, technologies and manufacturers.

F. The proposed solution shall conform to each SYSTEM specification.

G. The Contractor shall ensure that the system does not cause any interference to other systems.

300.030 NETWORK EQUIPMENT

A. General
   1. System Architecture shall be based on a "Client-Server" configuration.
   2. System software shall be controlled and configured by working parameters stored in tables and easy to change without programming.

B. Servers
   1. The Contractor shall design Servers architecture to fulfil, as a minimum, the following requirements:

      a) Separation of database and application servers.
      b) Dual-redundant servers in clusters for high availability.
      c) Servers located in separate rooms for disaster recovery.
   2. Servers Configuration:

      a) The servers shall consist of dual, redundant servers. The intent is to prevent a single system point of failure.
      b) The servers shall be identical, with one server acting as the primary and the second server acting as a hot stand-by server with automatic fail over capabilities.
      c) The two servers shall maintain synchronized databases automatically. Upon loss of communication of the system with the primary host, the secondary server shall automatically assume the control of the system and become the primary server. Upon the re-establishment of communication with the server, the two servers shall automatically re-synchronize without requiring re-booting of the servers.
   3. The Contractor shall design servers that are able to cope with the foreseen workload:

      a) The Contractor shall indicate the percentage increase of workload that the servers will be able to cope with.
   4. The Contractor shall **[deliver and]** configure the required servers.

      a) Requirements for servers shall be given (in terms of operating system, memory, CPU, storage, associated peripheral I/O devices, etc.)

      b) The Contractor shall include servers under the Project Virtual Servers Environment.

      c) Requirements for servers shall be coordinated with the Virtual Servers Environment Contractor. Refer to Division W, Section “Virtual Servers Environment (VSE)”.

C. End Users' Clients
   1. The Contractor shall provide workstations on which the client will be able to operate.
   2. Main characteristics shall be given in terms of Memory, CPU, Screen size, resolution, etc.
   3. The Contractor shall deliver and configure required workstations.
   4. The following peripheral I/O devices shall be provided at the workstations and terminal/data servers:

      a) Keyboard and mouse
      b) Flat panel LCD video display unit.
   5. All PC’s shall be the latest model at the time of purchase and shall be sourced from a recognized manufacturer. Purchase of the PC’s shall be delayed until the latest time possible without causing a delay in the construction schedule to ensure that they will be state-of-the-art, based on the latest proven technology.

D. Equipment Mounting: to be developed

E. Specifications of servers, workstations, printers and associated peripherals shall be confirmed by the relevant SYSTEM manufacturer/supplier.

F. To be developed.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. Refer to SYSTEM Specifications Sections listed under Article “Related Documents” of this Specification Section for requirements.

310.020 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of the Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

310.030 QUALITY ASSURANCE

A. Materials and Equipment
   1. To be developed

B. Manufacturer Qualifications
   1. To be developed

C. Contractor's Qualifications
   1. To be developed

310.040 DELIVERY, STORAGE AND HANDLING

A. Comply with Project "Preliminaries and General Requirements".

310.050 WARRANTY

A. Special Warranty
   1. The SYSTEM (comprising any associated hardware and software) shall be warranted by the Manufacturer to be free from defects in equipment, software and workmanship for a period defined below in paragraph "Warranty Period".
   2. Manufacturer's Warranty: Provide written warranty, signed by the Manufacturer and the Installer agreeing to replace system devices and equipment that fail in materials or workmanship and to provide software patch support and updates within specified warranty period.
   3. To maintain the manufacturer's warranties, equipment shall be installed, commissioned and serviced by those installers authorized by said manufacturer to perform those duties. If the Contractor is not authorized, by the said manufacturer, it is his sole responsibility to make the appropriate arrangements and bear all cost and consequences thereof.
   4. All manufacturers' equipment warranties shall be activated in the Employer's name and shall commence on the date indicated in paragraph "Warranty Period" below.

B. Experimental Period
   1. There shall be an Experimental Period during which the Contractor shall undertake supervision and responsibility for operation of the SYSTEM under actual site conditions. If any malfunction or degradation in the performance is noted on the system during this period, it shall be attended to immediately.
   2. During this period, the Contractor shall fully demonstrate the system performance under actual operation conditions. This demonstration is to confirm, to the satisfaction of the Employer / Engineer that the SYSTEM is free of remarks and is ready for taking over.
   3. The Experimental Period shall extend over three months and shall start following the certification by the Engineer of the successful testing and commissioning of the system. The Experimental Period shall, each time a malfunction is detected, be extended by three months starting from the certification by the Engineer of the successful testing of the system following the rectification of the malfunction.

C. Taking Over of the System
   1. The system shall be considered ready for taking over by the Employer following:
      a) The expiry, with no malfunctions being detected during the last three months, of the Experimental Period (as may be extended), and
      b) The submission by the Contractor, and approval by the Engineer, of the documents and information required from the Contractor for the use, occupation and maintenance of the system in accordance with the Contract (updated as necessary to reflect any rectification(s) introduced during the Experimental Period).

D. Warranty Period
   1. The Contractor shall include a statement of warranty on the entire system and on the individual pieces of equipment for two years from the date of taking over of the system.
   2. During the Warranty Period, the Contractor shall undertake Maintenance actions as defined in the “Maintenance And Support During Warranty Period” Article of this Specification Section.
   3. During the Warranty Period, the Contractor shall provide all equipment, material, software and labor needed to replace or repair defective products without any additional cost to the Contract.
   4. Warranty period shall be revised in accordance with Project “Preliminaries and General Requirements” depending on Equipment Country of Origin.

310.060 COMMISSIONING

A. Generally accepted industry standards, as well as manufacturer's written installation instructions, will be used as a basis for quality control and final acceptance of the works.

B. In-System Commissioning
   1. Equipment commissioning shall be done through demonstration of product capability and compliance with requirements after being wired and configured in the system.
   2. Test system and power supply redundancies by unplugging redundant links.
   3. Check recovery times.

C. The Contractor shall be required to perform a range of Site Acceptance Tests on site for each individual sub-system to demonstrate that all items have been correctly installed and adjusted on a location by location basis and that the sub-system operates in every respect in accordance with the Specifications.
   1. During this commissioning phase, the equipment is powered and the automation and networking are gradually integrated layer by layer.
   2. Any defects, which may become apparent during the course of these tests, shall be immediately rectified by the Contractor at his expense.
   3. The Site Acceptance Test Specifications shall be prepared by the Contractor and submitted for Approval by the Engineer and Employer.
   4. All Site Acceptance Tests shall be carried out in the presence of the Employer who shall sign off the testing documentation on satisfactory completion of the tests.
   5. The Site Acceptance Test Specifications shall at every level, be subjected to configuration management and change control by the Contractor.
   6. If modification or reprogramming is required as a result of the tests, all affected parts of the Site Acceptance Tests, as determined by the Employer, shall be re-tested.
   7. The results of the Site Acceptance Tests, version of software and hardware tested, together with any re-testing as a result of failure, shall be recorded and signed by the authorized personnel of the Contractor and the Employer.

D. Those tests shall be carried out over two phases.
   1. Preliminary Testing:
      a) Mechanical:
         1) Mechanical tests,
         2) Calibration of the components.
      b) Automatism / Electrical:
         1) Powering Tests with electricity,
         2) Control of Input/Output,
         3) Control of the safety measure either personal or material,
         4) Test of local mode operation.
      c) Network / Software Tests:
         1) Test of the Network,
         2) Test of the Supervision Workstation user interface,
         3) Test of the portable Terminal user interface.
   2. System Testing
      a) The tests performed during this phase are performed with and without loading conditions.

1) Testing the crippled mode (Safe shut down consecutive to loss of energy, etc.).

310.070 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Support
   1. The Contractor shall offer a comprehensive explanation of its Service Level Agreement (SLA) policy. The SLA should cover at least the following performance terms:
      a) 99.999% availability. GTI and GTR should be guaranteed accordingly.
      b) Emergency level 24/24, 7/7 phone support shall be available. Distant intervention on system shall be offered.
      c) High-level problem investigation support shall be offered 5/7 during working hours.
      d) Maintenance stocks shall be properly sized by the Contractor in order to match operational quantities replacement needs based on Manufacturers MTBFs for each component within the network.
      e) The MTTR shall not exceed 30minutes. The MTTR shall include the diagnostic time, active repair/replacement time and the adjustment/testing time on site, but shall exclude the response time.
   2. Maintenance service shall include:
      a) Contract lifetime software patching for revealed problems during operations.
      b) Contract lifetime hardware replacements on established malfunctions or weaknesses generating repetitive loss of service quality.
      c) Following receipt of a defective product, Manufacturer shall make reasonable efforts to repair or replace equipment with new ones and return the equipment within a reasonable time not exceeding four working days.

B. Maintenance Service
   1. During the Warranty Period, Manufacturer or factory-authorized agency shall maintain a service center capable of providing spare parts and emergency maintenance and repairs for the overall system at Project site 7 days a week and 24 hours a day. Competent personnel shall be dispatched to rectify stoppages at any time during the day or night when being called on by the Employer.
   2. The Contractor shall submit a Service-Call Report to be sent to the Employer immediately following every call out, indicating the time of call out visit, cause, remedial action taken and the time that the service was restored.
   3. A Maintenance Manpower Plan shall demonstrate the Contractor's committed resource level available for all types of activities to be carried out within the Warranty Period. Such a plan shall be submitted for Approval six months before commencement of the Warranty Period.
   4. The Contractor's response time, during the Warranty Period, shall not exceed 1 hour. The response time is defined as the time that elapses between the reporting of a fault and the maintenance personnel arriving at where the faulty equipment is located.
   5. During the Warranty Period, the MTTR shall not exceed **[30]** minutes. The MTTR shall include the diagnostic time, active repair/replacement time and the adjustment/testing time on site, but shall exclude the response time.
   6. During the Warranty Period, the monthly average of the Repair Time shall be lower than or equal to 6 minutes for each device. This performance will be monitored.
   7. The Contractor shall provide at least four inspection visits at six-month interval during the Warranty Period.
   8. The Contractor shall submit a Service-Call Report to be sent to the Employer immediately following every inspection visit, indicating the time of call out visit, cause, remedial action taken – if any - and the time that the service was restored.
   9. The Contractor shall be responsible for clearing away from the Site all surplus materials, rubbish, temporary works of every kind and leaving Project Site and installation clean and in a workmanlike condition to the satisfaction of the Employer /Engineer, upon completion of repair, and maintenance works.

C. Maintenance Performance Data
   1. Updates

a) The SYSTEM will have to be conceived to facilitate the updates that will take place throughout its life. Software update process must be easy, rapid and without risk, and must be reversible.
b) Update shall be transparent to the user and shall be done without interruption of the service.

2. Corrections

a) In the event of error, the SYSTEM shall have, as soon as possible, to store in a file a certain amount of information allowing the correction of this error, e.g. entries in the transactions, faulty operations of the statistics, etc.

3. The Contractor commits himself to the three (3) main sizing data of maintenance:

a) Annual number hours of preventive maintenance.
b) Annual number hours of corrective maintenance.
c) Average Annual cost of spare parts (Average based on ten years).

D. Preventive Maintenance
1. The Contractor shall describe the selected operations for preventive maintenance as planned during daily operation.

E. Curative Maintenance
1. The selected operations shall be chosen to correspond to a significant fraction of the forecasted time devoted to curative maintenance.
2. For each defect incidence, the Contractor shall record:

a) Equipment identification.
b) The object of the Maintenance activity.
c) The type of Maintenance activity (planned or not).
d) The total man-hours spent for the activity.
e) The total down-time duration ascribable to the Maintenance activity (transportation time, diagnosis time, repair time, restart time).

310.080 SPARE PARTS AND EXTRA MATERIAL

A. The manufacturer shall guarantee the flow and availability of the spare parts without a major design change for at least ten years' period from date of System Acceptance by Employer.

320.000 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer / Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:
1. Product data: For each type of product.
2. Shop Drawings.
3. Wiring diagrams to show typical wiring schematics.
4. System Operation: Include:

a) System Architecture and performance requirements.
b) Inter-connectivity patching of all network devices
c) Human Machine Interface (HMI) design for all categories of users.
d) Software Architecture and justification (e.g.: off-the-shelf and specific software, etc.).

B. Submittals shall comply with Project "Preliminaries and General Requirements".

C. Submittals shall include:
1. Product Certificates:
2. Manufacturer's Endorsement
3. signed Warranty.
4. Testing Plan:
5. Field Test Reports
6. Product data: For each type of product.
7. Shop Drawings
8. Qualifications
9. Closeout Submittals (Record Documents):
10. Operations and Maintenance Manuals

11. To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. General
   1. All equipment shall be firmly secured in place unless requirements of portability dictate otherwise.
   2. Equipment is to be laid out properly in communication rooms in a way to reserve relevant space for maintenance activities. This space shall also account for any future expansion of the system.
   3. Installation shall be performed in accordance with the applicable standards, requirements, manufacturers' guidelines and any authorities having jurisdiction.
   4. All boxes, equipment, etc. shall be plumb and square.
   5. The Contractor shall take such precautions that are necessary to prevent and guard against electromagnetic interference.
   6. After the proper layout of all equipment is accomplished, all components are to be labeled, and marked
   7. During installation, consideration shall be given to operational efficiency as well as the overall aesthetic factors.
   8. The Contractor shall supply and install all fittings and accessories, whether or not specified, required for proper, safe, and reliable operation of the system.
   9. The Contractor shall ensure that safe ingress and egress from all work areas are maintained during movement and installation of equipment/materials.

B. Examination
   1. To be developed.

C. Rack Mounted Equipment
   1. To be developed.

D. Wiring Methods
   1. To be developed

E. Cleaning

F. To be developed Connections

G. To be developed Weatherproof Equipment
   1. To be developed.

H. Impedance and Signal Levels
   1. To be developed.

I. Labeling and Marking
   1. To be developed.

J. Firestopping
   1. To be developed .

K. Grounding
   1. To be developed.

L. Boxes and enclosures
   1. To be developed.

M. Push Buttons

330.020 TO BE DEVELOPED FACTORY ACCEPTANCE TESTS

A. The Factory Acceptance Tests shall be carried out in a hardware and software environment, which simulates the final configuration of the SYSTEM.

B. The Contractor shall carry out any Factory Acceptances Tests, in Manufacturer's factory itself, before any site delivery, in order to make sure that the SYSTEM of both hardware and software and

the SYSTEM after integration of various sub-systems is able to satisfy site technical requirements of the equipment specifications.

C. Test Plan
   1. All tests are to be carried out, according to the methodology presented in the Test Plan which has been submitted by the Contractor and approved by the Employer.
   2. The tests are to cover every aspect related to the specification of the SYSTEM and its operation; including, but not limited to, visual inspections, measurements, and operation.
   3. Some of the functional or performance tests, which cannot be conducted in a simulated environment, due to their nature and complications, may, subject to the Engineer's approval, be combined with the Site Acceptance Tests.

D. All Factory Acceptance Test Specifications shall be subject to configuration management and change control by the Contractor at every level.

E. The results of the Factory Acceptance Tests, together with any re-testing as a result of failure, shall be recorded and signed by the authorized personnel of the Contractor.

F. Witnessed Factory Acceptance Tests:
   1. FAT's for the following SYSTEMS shall be carried out in the presence of the Engineerand Employer unless otherwise agreed by the Engineer. The Engineer will sign off the testing document on satisfactory completion of the tests.

330.030 FIELD QUALITY CONTROL

A. Pretesting: After installation, align, adjust, and balance system and perform complete pretesting to determine compliance of system with requirements in the Contract Documents. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new ones and retest until satisfactory performance and conditions are achieved. Prepare forms for systematic recording of acceptance test results.
   1. Report of Pretesting: After pretesting is complete, provide a letter certifying that installation is complete and fully operable; include names and titles of witnesses to preliminary tests.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

E. Tests and Inspections:
   1. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.
   2. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
   3. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.

F. Record test results.

G. Retest: Correct deficiencies identified by tests and observations and retest until performance requirements are met.

H. Integrated Tests with Other Contractors
   1. to be developed

I. The SYSTEM will be considered defective if it does not pass tests and inspections.

J. Tag all equipment, stations, and other components at which tests have been satisfactorily completed.

K. Prepare test and inspection reports.

L. Experimental Period: As described under “Warranty” Article of this Specification Section. Demonstrate successful operation to confirm, to the satisfaction of the Engineer /Employer that the system is free of remarks and is ready for taking-over.

330.040 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to configure, program, adjust, operate, and maintain SYSTEM equipment. Refer to Project “Preliminaries and General Requirements”.

B. In order to provide a reliable training, Employer’s maintenance personnel who are involved in the training program of this system, could be involved in the follow up of system installation as well. The Contractor shall provide an installation agenda to the Employer and confirm with him any coordination with assigned trainees.

C. Training Program
   1. Scope: Training shall be in sufficient scope to ensure that all trainees who complete the program will be certified as capable to operate and/or maintain the equipment, systems, and facilities provided and installed under this Contract, and to ensure a smooth transition between construction and operations activities.
   2. Language: to be developed
   3. Training Aids shall include:
      a) to be developed
   4. Training Manuals
      a) To be developed
   5. Training shall be performed in accordance with an approved training program. All training aids shall be available and approved prior to start of training.
   6. Course Contents
      a) To be developed

D. The Contractor shall provide training for SYSTEM operational, maintenance and administration staff:
   1. Operators shall be provided with a thorough training in all aspects of system/sub-system operation under both normal and abnormal conditions. This training shall include, but not be limited to:
      a) Orientation to provide overview of system/sub-system purpose, configuration, and operations,
      b) Terminology,
      c) Operations theory and interface,
      d) Equipment appearance, functions, concepts and operations,
      e) Operating mode, practices, and procedures under normal and emergency conditions,
      f) Safety precautions,
      g) On-the-job operating experience covering all system/sub-system operating functions, activities, and tasks including those associated with degraded operating modes, failure recognition, and recovery processes,
      h) Familiarity with content and use of O & M manuals and related reference publications.
   2. Maintenance Training
      1) To be developed
   3. Administrator Training
      1) To be developed.

W31B - WIRELESS DATA NETWORK

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes Wireless Data Network active infrastructure and associated services consisting of:

1. Wireless Radio Access Points and Antennas.
2. Wireless Data Network System Administration Software.
3. Access and Security Control Software.

100.020 PERFORMANCE REQUIREMENTS

A. To be developed.

B. Provide pervasive wireless coverage across all designated airport zones. This includes terminals, gates, lounges, retail, staff areas, baggage zones and airside operational zones. Ensures seamless connectivity for passengers, staff and airport systems.

C. The Contractor shall deploy a centralized Wireless LAN Controller (WLC) based architecture. It shall support access points across the project. Centralized control allows consistent policy enforcement and scalable RF management.

D. Adopt latest Wi-Fi technology standards Wi-Fi 7. Ensure high throughput, low latency, improved spectral efficiency and support for high-density environments. The system shall be capable to meet current and future demands for passenger and IoT device connectivity.

E. Install high-performance indoor and outdoor access points to provide dual-band (2.4GHz and 5GHz) and tri-band (6GHz) coverage with dynamic channel selection and automatic RF tuning. Shall provide optimized coverage, reduced interference and higher client concurrency.

F. Provide mounting hardware required for access point installation. Align with Architecture.

G. Implement enterprise wireless security. This includes WPA3 encryption, 802.1X authentication, dynamic VLAN assignment, and integration with Network admission control systems. This ensures role-based access, secure onboarding and compliance with cybersecurity policies.

H. Implement with a centralized orchestration tool for real-time visibility, troubleshooting, and lifecycle management of the WLAN system.

I. Design with cluster of wireless LAN controllers and dual uplinks for access points where applicable. Ensuring failover and minimal downtime.

J. Plan for peak density usage. Ensure the sufficient access point placement and backhaul capacity to support high client loads. It includes passengers, staff devices and IoT sensors. Design shall meet the reliable performance during high-traffic conditions or events.

K. Follow guidelines from the Radio Systems Approvals Board for spectrum usage, RF power limits, and access point placement coordination. Shall prevent interference and ensures regulatory compliance across the project.

L. Shall provide detailed design documentation, including high-level and low-level design documents, access point heatmaps and signal coverage maps, equipment layout and termination plans, equipment schedules and bill of quantities.

M. Provide a WLAN system that is capable of large-scale IoT onboarding, and AI/ML-driven optimization features.

N. Perform complete wireless validation surveys, load testing, and system commissioning during deployment. Ensure that wireless coverage and performance meet the design intent and operational requirements.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Comply with: PCI DSS, The Payment Card Industry Data Security Standard.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. “OFE”: shall refer to “Owner Furnished Equipment”, which will be provided by the Owner/Employer. The Contractor shall be responsible for removing this equipment from the Owner’s premises, and re-installing and integrating this equipment in good working order where required and detailed in these Specifications.
2. Wireless Radio Access Point: equipment interfacing over the air between the data network fixed network and the mobile end users.
3. Wireless Terminal Client: equipment integrated or connected to the end user terminal equipment that enables data transmission over the air to the Wireless Data Network. This terminal client can be a Wi-Fi enabled PC, PDA or specialized handset (e.g. scanner, customized PDA), etc.
4. Antenna: equipment attached to the Radio Access Points in order to amplify the RF signal to/from the Access Point, and to point the RF signals to specific coverage areas. These antennas can be omni-directional or directional.
5. Wireless Data Network System Administration Software: software installed on a dedicated platform and enabling the operation and maintenance of the Radio Access Points.
6. Access Control Function Software: software installed on a dedicated platform and enabling:

    a) The control of the users authorized on the Wireless Data Network.
    b) The centralized management of the rights of the Wireless Data Network users.
    c) The configuration of the security components of the network (authentication, encryption, VLANs).

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

120.020 SYSTEM DESCRIPTION

A. Overview of Project Environment and Requirements

B. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. Network Interfaces

1. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.

B. Related Sections

1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. To be developed

300.020 SYSTEM ARCHITECTURE AND REQUIREMENTS

A. To be developed

B. The purpose of the Wireless Data Network is to provide users with a complete high-performance radio system that enables secure access to information systems within the Project premises. Users of the system are authorized individuals who will access internet, enterprise resources and applications through the Wireless Data Network. The infrastructure shall support various user communities. Dedicated VLANs dynamically or statically assigned to each community as per security and QoS policy.

C. The Wireless Access Point shall include integrated IoT radios with onboard Bluetooth Low Energy (BLE) 5.1 or higher and Ultra-Wide Band (IEEE 802.15.4ab). These radios shall support the deployment and centralized management of IoT-based services, including location-based services, asset tracking, environmental sensors, and physical security applications.

D. The Access Point shall function as a converged IoT gateway, supporting modular wireless expansion through an onboard USB 3.0 port, enabling seamless integration of emerging technologies.

E. The system shall be fully compatible with IEEE 802.11 standards. It shall include a/b/g/n/ac/ax and be. It shall be backward compatible with legacy clients while offering enhanced features for next-generation devices.

F. The system shall include support for enhanced protocol extensions. It shall include IEEE 802.11d (regulatory domain awareness), IEEE 802.11e (Quality of Service) and IEEE 802.11i (WPA2/WPA3 security framework).

G. The system shall support simultaneous operation across all bands for IEEE 802.11a/b/g/n/ac/ax clients. It shall ensure universal connectivity across device generations.

H. The system shall support the IEEE 802.11be (Wi-Fi 7) standard. Ensure to provide following minimum feature support

1. Tri-band operation (2.4 GHz, 5 GHz, 6 GHz)
2. 320 MHz channel bandwidth
3. Multi-Link Operation (MLO) for concurrent multiband communication
4. 4096-QAM modulation
5. 16 spatial streams (where supported)
6. Extremely low latency and high reliability for mission-critical applications

I. The system shall be PCI DSS compliant. It shall support robust encryption standards (WPA3-Enterprise, 256-bit AES-GCMP) and secure management protocols. And ensure regulatory and data protection compliance.

J. The Wireless LAN infrastructure shall provide seamless wireless coverage across the entire Campus. The systems shall provide full functionality for high-density and low-latency services such as data access, voice over WLAN, video streaming, IoT telemetry and augmented reality applications.

K. 25% spare capacity is required at all levels of the system, unless indicated otherwise.

L. The software licensing shall be for the entire network with no limitation on the number of workstations or standard end-users plus an allowance of 25% additional licenses to accommodate future growth.

M. The system shall serve the Passenger and Asset tracking through RTLS.

N. Data Network Performance and Software Requirements of the Project: Refer to Division W, Section "Data Communications for Campus Network" and Section "Data Communications for Data Center".

300.030 SYSTEM COMPONENTS

A. Wireless Data Network Controllers:

1. To be developed

B. Wireless Radio Access Points

1. To be developed

C. Antennas

1. To be developed

D. Wireless Data Network Administration Software System

1. To be developed

E. Enclosures

1. To be developed

F. Access and Security Control Software System

1. To be developed

300.040 SOFTWARE ARCHITECTURE

A. The network shall be partitioned among the different user populations and applications using multiple VLAN (Virtual Local Area Network).

B. The user authentication process shall rely on IEEE 802.11i and 802.1X standard and shall follow the Employer requirements, taking into account the expected security level of each network and data package.

300.050 FREQUENCY PLANNING

A. Multi-cellular radio architecture shall be adapted to the local standards regulation with proper frequency planning.

300.060 TECHNICAL STUDY

A. Preliminary Study

1. To be developed

B. Final Study

1. To be developed

C. Refer to Division W, Section “Common Clauses for IT & Security Systems”, Articles “Proposed Solution” and “Network Equipment”.

300.070 GENERAL SOFTWARE REQUIREMENTS

A. Levels and Features to be developed

B. Refer to Division W, Section “Common Clauses for IT & Security Systems”, Articles “Proposed Solution” and “Network Equipment”.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 CONFIDENTIALITY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.030 QUALITY ASSURANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.040 DELIVERY, STORAGE AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.050 WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.060 COMMISSIONING

A. Generally accepted industry standards, as well as manufacturer's written installation instructions, will be used as a basis for quality control and final acceptance of the work.

B. To be developed

310.070 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.080 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Installation of Wireless Access Points

1. To be developed

C. Installation of Antennas

1. To be developed

D. Installation of the Wireless Data Network System Administration Software

1. To be developed

E. Installation of the Wireless Data Network Access and Security Control Software

1. To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.040 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W31C - VIRTUAL SERVERS ENVIRONMENT (VSE)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes performance requirements and system architecture for a Virtualized Servers Environment to be deployed.

B. The Virtual Servers Environment (VSE) shall support the following applications:

1. Security Systems
    a) To be developed
2. Miscellaneous Electrical and Telecom Systems
    a) To be developed.
3. Horizontal and Vertical Transportation Systems
    a) To be developed.

100.020 PERFORMANCE REQUIREMENTS

A. Virtual Servers Environment infrastructure architecture shall be designed to ensure that the following performance criteria are consistently met or exceeded.

1. Operating Systems
    a) To be developed.
2. Availability
    a) To be developed.
3. Fault Tolerance
    a) To be developed.
4. Scalability
    a) To be developed.
5. Disaster Recovery
    a) To be developed.
6. Backup And Recovery
    a) To be developed.
7. Storage
    a) To be developed.
8. Capacity
    a) To be developed.
9. Security
    a) To be developed.

B. General Software Requirements

1. To be developed.

C. General Design Considerations

1. To be developed.

D. Software Expansion Requirements

1. To be developed.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. Virtualization is a method of running multiple independent virtual operating systems on a single physical computer. It is a way of fully utilizing physical resources available in modern powerful servers.
2. To be developed.

C. Abbreviations

1. LDAP: Lightweight Directory Access Protocol
2. TOE: TCP Offload Engine

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

120.020 SYSTEM ARCHITECTURE

A. Virtual Servers Environment system architecture shall consist of the following components:

1. Host computers.
2. Virtual Machines.
3. Virtualization host computers.

B. Contractor’s detailed design shall:

1. Accommodate the constraints and demands of the virtual machines, virtualization host computers, networking, and storage.
2. Meet all technical criteria for the specified server farm in a production environment.
3. Consider operations support, ongoing maintenance activities and future upgrades.
4. Support the immediate and long-term business Project requirements to accommodate future changes.

C. As a starting point, and to successfully plan for a virtual environment, Contractor may apply the requirements for a physical environment to the virtual environment. This includes elements such as farm topology, capacity and performance requirements, availability and disaster recovery to preserve business continuity.

D. Contractor may use a number of database servers, front end web servers, and application servers, including specific application server roles, to determine the number of virtual machines and virtualization host server computers that a virtualized farm requires.

E. The optimum number and capacity of system components will help maintain better load balancing and provide more availability for the particular farm role

F. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.

B. Related Sections

1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but not limited to:

1. To be developed

300.020 VIRTUALIZATION TECHNOLOGY

A. Licensing: To be developed

B. Virtualization Environment The virtualization solution shall be capable of virtualizing, aggregating and allocating servers, storage and network resources precisely on demand and business priority

C. Server Virtualization: To be developed

D. Centralized Management: To be developed

E. Thin Provisioning: To be developed

F. Data Recovery: To be developed

300.030 SERVERS AND CONNECTIVITY

A. Objectives

1. The Contractor shall implement a robust and versatile blade and rack mount architecture that will enable and provide performance optimization, smaller power footprint, integration with and enhance virtualization among other things. To this effect, Contractor shall comply with the following minimum requirements:

B. Blade Servers

1. To be developed

C. SAN Switches

1. To be developed

D. Rack Mount Server: the servers shall support

1. To be developed

E. Blade Management Integration

1. To be developed

300.040 DESIGN PROCESS

1. To be developed

300.050 GENERAL HARDWARE REQUIREMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”

B. To be developed

300.060 GENERAL SOFTWARE REQUIREMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”

B. To be developed

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for IT & Security Systems”:

1. CONFIDENTIALITY
2. QUALITY ASSURANCE
3. DELIVERY, STORAGE AND HANDLING
4. WARRANTY

310.030 COMMISSIONING

A. To be developed

310.040 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.050 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Coordination

1. To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. To be developed

330.040 DEMONSTRATION AND TRAINING

A. To be developed

W31D - COMPUTERS & RELATED PERIPHERALS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Computers and related peripherals including but not limited to computer workstations, laptop computers and printers.
2. Servers and related ancillaries.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. PUE: Power Usage Effectiveness is a metric used to determine the energy efficiency of a data center. PUE is determined by dividing the amount of power entering a data center by the power used to run the computer infrastructure within it.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.

B. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. To be developed

300.020 GENERAL HARDWARE REQUIREMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”

B. To be developed

300.030 WORKSTATION EQUIPMENT

A. Computer Workstation – Type 1

1. To be developed

B. Computer Workstation - Type 2

1. To be developed

C. Computer Workstation - Type 3

1. To be developed

300.040 LED DISPLAYS

A. Workstation LED Display wide-screen Type 1

1. To be developed as per design requirements

B. LED Display Screen Type 2

1. To be developed as per design requirements

C. Video Wall- Type 1 for Control Rooms

1. To be developed as per design requirements

300.050 PORTABLE (LAPTOP) WORKSTATION EQUIPMENT

A. Laptop Computer Workstation

1. To be developed

300.060 PRINTERS/SCANNERS

A. Small office Black and White Laser Printer

1. To be developed

B. Small office Color Laser Printer

1. To be developed

C. Large workspace Color Laser Printer/Scanner

1. To be developed

300.070 SERVERS

A. To be developed

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for IT & Security Systems”:

1. CONFIDENTIALITY
2. QUALITY ASSURANCE
3. DELIVERY, STORAGE AND HANDLING
4. WARRANTY
5. COMMISSIONING
6. MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Coordination: To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.040 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W31F - DATA COMMUNICATIONS FOR CAMPUS NETWORK

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Data Communications for "Campus Network" equipment and software required to implement a fully operational data network:

a) Core Equipment: To be developed
b) Distribution (Border node) Equipment: To be developed
c) Access (Edge node) Switches: To be developed
d) Routers: To connect the LAN to external services and Wide-Area Network (WAN).
e) Firewalls: To be developed
f) Intrusion Detection: To monitor and alert on illegal access and sabotage attempts to the networks.
g) Intrusion Prevention: To monitor and thwart illegal access and sabotage attempts to the networks before they gain access to the network.
h) Network Management: To be developed
i) Out of Band and Field Devices Network Equipment: To be developed

2. The LAN shall include software and hardware components such as network equipment, network management software and hardware, network services and shall interface to electronic systems.
3. The proposed Wired and Wireless equipment shall support a Software-Defined Network Architecture.
4. The LAN system shall be designed to meet the initial operation requirements with the ultimate designed expansion capability to meet the requirements of future operational growth (in terms of number of ports and offered services) at project completion.
5. The LAN system final design and construction shall comply with the design intent as well as design specifications listed herein and associated drawings.
6. To be developed

100.020 PERFORMANCE REQUIREMENTS

A. Network Redundancy, Reliability and Availability

1. To be developed

B. Network design should be made to assure real time failure recovery. This is the reason why redundancy, reliability, and availability are required throughout the network using load balancing mechanisms and clustering techniques.

C. Since most Manufacturers have implemented proprietary optimizations for such purposes, detailed information on system performance shall be given by the Contractor.

D. Network Performance and Quality Of Service

1. To be developed

E. Network Security

1. To be developed

F. Network Scalability

1. To be developed

G. Equipment Connection

1. To be developed

H. To be developed

I. Software Requirements

1. To be developed

J. Design Considerations

1. To be developed

K. System Expansion Capacity

1. To be developed

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. “OFE”: shall refer to “Owner Furnished Equipment”, which will be provided by the Owner/Employer. The Contractor shall be responsible for removing this equipment from the Owner’s premises and re-installing and integrating this equipment in good working order where required and detailed in these Specifications.
2. "Turnkey System": a complete system of hardware and software delivered to the Employer ready-to-run.
3. PUE: Power Usage Effectiveness is a metric used to determine the energy efficiency of a Telecom Room/Servers Room. PUE is determined by dividing the amount of power entering a Telecom Room/Servers Room by the power used to run the computer infrastructure within it.

C. Abbreviations

1. Unicast RPF: Unicast Reverse Path Forwarding.
2. BYOD: Bring Your Own Device.
3. SDN: Software Defined Network.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

120.020 SYSTEM DESCRIPTION

A. Overview of Current Environment and Requirements

B. The system architecture shall support multi-manufacturer interoperability with other manufacturer’s products and across any QoS infrastructure.

C. Each network shall be a multi-layer, fault tolerant, Layer-3 campus-wide TCP/IP network. The LAN hierarchy shall be based on three-tier architecture: access, distribution, and core. A high-bandwidth, Ethernet shall be utilized for core and distribution layer interconnectivity.

D. The Data Network active infrastructure shall be highly scalable, growing from a small amount of users up to the ultimate designed expansion capability to meet the requirements of future operational growth (in terms of number of ports and offered services) - at project completion. Although

implemented mainly for voice and data communications, the infrastructure shall be capable of multiple means of real time communication (voice, video, instant messaging, collaboration, etc.). The infrastructure shall provide high availability, redundancy, and contingency. The infrastructure shall be able to integrate with many other devices and applications, from existing voice infrastructure to new endpoints and applications.

E. To be developed

F. The system architecture shall provide bandwidth management and call admission control to guarantee at all times that the network and LAN/WAN links are not oversubscribed.

G. The system architecture shall support end-to-end QoS. This shall include, but not limited to, traffic marking, enhanced queuing services, link fragmentation and interleaving, CRTP, low latency queuing, link efficiency, traffic shaping, and call admission control.

H. Congestion management and multicast control, shall be implemented to manage real-time voice and video traffic as well as priority network data traffic. Other LAN/WAN services such as VLANs/VXLANs, Sub-netting, DNS, Proxies, Access Control Lists, DHCP and Routing Protocols shall be configured and implemented as part of the LAN solution. WAN connectivity to the internet and external services shall be secured using Firewalls and intrusion detection system.

I. The LAN shall be resilient and redundant with automatic fail-over to ensure that performance and high-availability objectives are met without manual intervention. Recovery mechanisms must be deployed as part of the network implementation and must be tuned to achieve sub-second recovery time. All switches shall be inter-connected and configured so that there is not any single point of failure causing disruptions to LAN operations. Technologies to minimize packet loss during Supervisor failure (such as Non Stop forwarding (NSF) and Stateful Switchover (SSO)) and in-service software upgrades (ISSU) shall be part of the devices specifications.

J. All network equipment shall be both IPV4 and IPV6 capable. While the specifications are based on IPV4, the Contractor , if directed by the Employer, shall implement IPV6 with backward compatibility to IPV4. Notwithstanding, the Contractor shall define all IP addresses static ranges and dynamic ranges as well as subnets and subnet masks.

K. [Connectivity to external services shall be accomplished using either asynchronous or synchronous services (e.g. E1, E3, OC-3 or OC-12) utilizing interfaces to external Service Provider SDH network in addition to SIP-trunk with all the required components (e.g. Session Border Controller).]

L. Network routing protocols shall be used as recommended including OSPF for internal networks and BGP for external networks.

M. A Network Management System (NMS) shall be provided as part of each Network to support around the clock 24/7 operation monitoring and management of all network devices and operations.

120.030 TECHNICAL STUDY

A. Preliminary study

1. To be developed

B. Final study

1. To be developed

120.040 GENERAL HARDWARE REQUIREMENTS

A. To be developed

B. Refer to Division W, Section “Common Clauses for IT & Security Systems”

120.050 GENERAL SOFTWARE REQUIREMENTS

A. To be developed

B. Refer to Division W, Section “Common Clauses for IT & Security Systems”

120.060 DESIGN RECOMMENDATIONS

A. To be developed

B. The network topology to be recommended should be a hierarchical one. A hierarchical network design has three (3) layers. Each layer provides necessary functionality to the network. Some of the main functionalities are described below:

1. The Core Layer provides optimal transport and high speed switching.
2. The Distribution Layer provides area aggregation as well as policy-based connectivity.
3. The Access or Edge Layer provides workgroup/user access to the network.
4. Other Considerations:

a) To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed

W31G - DATA COMMUNICATIONS FOR DATA CENTER

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Data Communications for "Data Center" equipment and software required to implement a fully operational data network:

a) Spine Equipment: Unified fabric spine layer to interconnect leaf layer switches

1) To be developed

b) Leaf Equipment: Unified fabric aggregate layer to aggregate and route traffic using:

1) To be developed

c) Distribution (Border node) Equipment: Unified fabric aggregate layer to aggregate and route traffic using:

1) To be developed

d) Out of Band and Field Devices Network Equipment: this Layer shall provide alternative means of connectivity to manage devices. Switches of this layer shall consolidate all site building Switches and field equipment within the Data Center.

e) Routers: To connect the LAN to external services and Wide-Area Network (WAN)

f) Firewalls:

1) To be developed

g) Intrusion Detection: To monitor and alert on illegal access and sabotage attempts to the networks.

h) Intrusion Prevention: To monitor and thwart illegal access and sabotage attempts to the networks before they gain access to the network.

i) Network Management: To be developed

2. To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

120.020 SYSTEM DESCRIPTION

A. Overview of Current Environment and Requirements

B. General Features

1. The Data Network active infrastructure shall be used to provide:

a) data connection of the systems/users plugged in Data Hall within Project premises.
b) The Data Hall shall be treated as an independent network meeting all the requirements of these Specifications and is to be managed independently.
c) data communications between these systems/users and the associated applications servers.
d) data connection of these systems/users to the external network (World Wide Web WWW).
e) secure data communications.

2. The Data Network shall provide redundancy at designated levels thus eliminating the presence of any single point of failure at these designated levels.
3. Coordinate the features of material and equipment so they form an integrated system. Match components and interconnections for optimum future performance.

4. The software licensing shall be for the entire network with no limitation on the number of workstations or standard end-users. In addition, the duration of licenses shall be coordinated with the client early on in the project.
5. Comply with Division W, Section "Common Clauses for IT & Security Systems"

C. To be developed

120.030 SYSTEM ARCHITECTURE

A. The system architecture shall support multi-manufacturer interoperability with other manufacturer's products and across any QoS infrastructure.

B. Each network shall be a multi-layer, fault tolerant, TCP/IP network. The LAN hierarchy shall be based on a Spine and Leaf Architecture in the Server Room/Data Hall.

C. Unified fabric switches shall be utilized in the Server Room/Data Hall to connect servers, Fiber Channel and Fiber Channel over Ethernet over common links.

D. The Data Network active infrastructure shall be highly scalable, growing from a small amount of users, up to the ultimate designed expansion capability to meet the requirements of future operational growth (in terms of number of ports and offered services) - at project completion. Although implemented mainly for voice and data communications, the infrastructure shall be capable of multiple means of real time communication (voice, video, instant messaging, collaboration, etc.). The infrastructure shall provide high availability, redundancy, and contingency. The infrastructure shall be able to integrate with many other devices and applications, from existing voice infrastructure to new endpoints and applications.

E. The system architecture shall provide bandwidth management and call admission control to guarantee at all times that the network and LAN/WAN links are not oversubscribed.

310.030 QUALITY ASSURANCE

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

310.040 DELIVERY, STORAGE AND HANDLING

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

310.050 WARRANTY

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

310.060 COMMISSIONING

A. To be developed

310.070 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

310.080 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. To be developed

330.040 DEMONSTRATION AND TRAINING

A. To be developed

W40A - ACCESS CONTROL

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes state-of-the-art, electronic Access Control system that enables access control, monitoring and protection of all pertinent areas of the Project facilities, consisting of:

1. Security access central-control station.
2. One or more security access networked workstations.
3. Security access operating system and application software.
4. Security access controllers connected to high-speed electronic-data transmission network.

B. Access Control System shall interface with the Fire Alarm System and other Security and Building Services Systems. These interfaces shall be hardwired where required by code.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Regulations and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. IEC Standards

a) IEC 60839-5-1: Alarm and electronic security systems - Part 5-1: Alarm transmission systems - General requirements
b) IEC 60839-5-2: Alarm and electronic security systems - Part 5-2: Alarm transmission systems - Requirements for supervised premises transceiver (SPT)
c) IEC 60839-5-3: Alarm and electronic security systems - Part 5-3: Alarm transmission systems - Requirements for receiving centre transceiver (RCT)
d) IEC 60839-11-1: Alarm and electronic security systems - Part 11-1: Electronic access control systems - System and components requirements
e) IEC 60839-11-2: Alarm and electronic security systems - Part 11-2: Electronic access control systems - Application guidelines

2. EN Standards

a) EN 50130-4: Alarm systems - Part 4: Electromagnetic compatibility - Product family standard: Immunity requirements for components of fire, intruder, hold up, CCTV, access control and social alarm systems

C. Identification Cards shall conform to the following standards:

1. International Organization for Standardization /International Electro-technical Commission (ISO/IEC)

a) ISO/IEC 7810: Identification Cards - Physical Characteristics
b) ISO/IEC 7811-1: Identification Cards - Recording Technique Part 1: Embossing
c) ISO/IEC 7811-2: Identification Cards - Recording Technique Part 2: Magnetic Stripe - Low Coercivity
d) ISO/IEC 7811-6: Identification Cards - Recording Technique Part 6: Magnetic Stripe - High Coercivity
e) ISO/IEC 7811-7: Identification Cards - Recording Technique Part 7: Magnetic Stripe - High Coercivity, High Density
f) ISO/IEC 7816: (Parts 1 through 15): Identification Cards - Integrated Circuit Cards
g) ISO/IEC 14443: (Parts 1 through 4): Identification cards - Contactless integrated circuit cards - Proximity cards.

h) ISO/IEC 15693: (Parts 1 through 3): Identification cards - Contactless integrated circuit cards - Vicinity cards.

D. American National Standards Institute / Telecommunications Industry Association / Electronic Industries Alliance (ANSI/TIA/EIA)

1. TIA-232-F: Interface between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange
2. TIA-485-A: Electrical Characteristics of Generators and Receivers for Use in Balanced Digital Multipoint Systems

E. The system functions in public areas such as elevators, lobbies and parking areas shall comply with the Accessibility Guidelines by Authorities Having Jurisdiction.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Other Clarifications Related to The Scope of Work

C. The Access Control shall utilize the project Security Network.

D. To be developed

120.020 FUNCTIONAL DESCRIPTION OF SYSTEM

A. Security Access System: Workstation-based central station, one or more networked Workstation-based workstations, and field-installed controllers, connected by a high-speed electronic-data transmission network.

B. System Software:

1. To be developed

C. To be developed

D. Network(s) connecting workstations and controllers shall consist of one or more of the following:

1. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W, Section W31 “Common Clauses for IT & Security Systems”.

B. Related Sections

1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

210.020 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

210.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers of Access Control System: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. To be developed

300.020 OPERATION

A. Security access system shall use a single database for access-control and credential-creation functions.

B. Distributed Processing: A fully distributed processing system.

1. To be developed

C. Number of Locations:

1. To be developed

D. Data Capacity:

1. To be developed

E. Location Capacity:

1. To be developed

F. System Network Requirements:

1. To be developed

G. To be developed

300.030 APPLICATION SOFTWARE

A. To be developed

300.040 SYSTEM DATABASE

A. To be developed

300.050 CENTRAL-STATION HARDWARE

A. Central-Station Computer Workstations

1. To be developed

B. To be developed

300.060 FIXED MAP DISPLAY

A. To be developed

300.070 CONTROLLERS

A. To be developed

300.080 SECONDARY ALARM ANNUNCIATOR

A. To be developed

300.090 CARD READERS, CREDENTIAL CARDS, PANIC ALARM AND KEYPADS

A. To be developed

300.100 BIOMETRIC IDENTITY-VERIFICATION EQUIPMENT

A. To be developed

300.110 ENROLLMENT CENTER

A. To be developed

300.120 FIELD-PROCESSING SOFTWARE

A. To be developed

300.130 FIELD-PROCESSING HARDWARE

A. To be developed

300.140 TIA-232-F ASCII INTERFACE SPECIFICATIONS

A. To be developed

300.150 FLOOR-SELECT ELEVATOR CONTROL

A. To be developed

300.160 REAL-TIME GUARD TOUR

A. To be developed

300.170 VIDEO AND CAMERA CONTROL

A. To be developed

300.180 CAR PLATE NUMBER IDENTIFICATION SYSTEM

A. To be developed

300.190 ACCESS HARDWARE SPECIFICATIONS

A. To be developed

300.200 SURGE AND TAMPER PROTECTION

A. To be developed

300.210 PUSH-BUTTON SWITCHES

A. To be developed

300.220 DOOR AND GATE HARDWARE INTERFACE

A. To be developed

300.230 PROPOSED SOLUTION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Data Transmission:

1. The data transmission rate between the workstations and the servers shall be bi-directional using TCP/IP VLAN Network.
2. Coordinate IP addressing, Ethernet switch port counts and assignments, long-term storage requirements and bandwidth utilization with the Contractor providing and configuring the dedicated security VLAN.

300.240 NETWORK EQUIPMENT

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

300.250 TRANSFORMERS

A. Control transformers listed for security access-control systems: shall not be shared with any other system.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

310.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for IT & Security Systems”:

1. CONFIDENTIALITY
2. QUALITY ASSURANCE
3. DELIVERY, STORAGE AND HANDLING
4. WARRANTY
5. COMMISSIONING
6. MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.000 EXECUTION

330.010 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.020 FACTORY ACCEPTANCE TESTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.040 OCCUPANCY ADJUSTMENTS

A. To be developed

330.050 PROTECTION

A. To be developed

330.060 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W40B - PARKING CONTROL EQUIPMENT

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Automatic barrier gates.
2. Vehicle detectors.
3. Traffic controllers.
4. Entry terminals.
5. Exit terminals.
6. Pay stations.
7. Fee computers.
8. Miscellaneous parking control equipment.
9. Parking facility management software.
10. Access control units.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

C. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

D. Conflicts

1. Should an instance occur in this Specification or on the Drawings in which material or construction methods called for is less than minimum requirement of the reference standards, immediately inform the Engineer in writing. Consequent to Engineer's approval, supply the materials and perform the work as though called for to minimum code standards.

E. Referenced Standards

1. International British (BS), European (EN) and IEC Standards which are in relationship with each other, tackle the same topic and carry the same number, can be used interchangeably in this specification since they are assumed to have the same intent and target the same level of quality and safety. For example: BS EN 60529 and IEC 60529. This shall be applicable to all subjects except for life safety related materials and systems (such as the Fire Alarm System) whereby BS / BS EN shall remain mandatory.

F. Compliance with Local Requirements: Comply with applicable building code, local ordinances and regulations, and requirements of authorities having jurisdiction.

G. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the references:

1. The European Machinery Directive (2006/42/EC) regarding health and safety requirements and shall carry CE mark and be accompanied with a declaration of conformity. All relevant standards are to be mentioned – as appropriate.
2. EN 13241-1, Industrial, commercial and garage doors and gates — Product standard — Part 1: Products without fire resistance or smoke control characteristics
3. EN 12453, Industrial, commercial and garage doors and gates. Safety in use of power operated doors. Requirements.

4. EN 12445, Industrial, commercial and garage doors and gates. Safety in use of power operated doors. Test methods.
5. EN 12635, Industrial, commercial and garage doors and gates. Installation and use.
6. EN 12978, Industrial, commercial and garage doors and gates. Safety devices for power operated doors and gates. Requirements and test methods.
7. EN 12604, Industrial, commercial and garage doors and gates. Mechanical aspects. Requirements.
8. EN 12605, Industrial, commercial and garage doors and gates. Mechanical aspects. Test Methods.
9. EN 13849-1, Safety of machinery. Safety-related parts of control systems. General principles for design.
10. EN 60204-1, Safety of machinery. Electrical equipment of machines.

H. General requirements: All electrical works shall comply with the local Electricity Regulations.

1. To be developed

I. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

110.020 PROJECT/SITE CONDITIONS

A. Environmental Conditions: Equipment shall be capable of withstanding the project environmental conditions specified under Division V, Section “Basic Electrical Materials and Methods” encountered at the installed location without mechanical or electrical damage or degradation of operating capability as applicable to.

1. Interior, Controlled Environments.
2. Interior, Uncontrolled Environments.
3. Exterior Environments.

B. Thermal Movements: To be developed

C. Waterproof Equipment: Listed and labeled for duty outdoors or in damp locations, with a minimum Ingress Protection rating of IP65.

D. Barriers and gates shall be designed to withstand adverse local environmental conditions.

1. To be developed

E. Expansion Capability: To be developed

F. Power Supply: To be developed

110.030 DEFINITIONS AND ABBREVIATIONS

A. Not Applicable.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. The Contractor shall provide, based on these specifications and design drawings, the final design and construction documents and all equipment, software, material, labor and services required to construct and install the Parking Control Equipment including, but not limited to:

1. To be developed

B. Parking Control Equipment shall include all wiring, control cabling, conduit, boxes, weather- proof enclosures, contactors and accessories and ancillary work, whether described in the Specification or not, required for a complete and fully operational system.

C. The Parking Control Equipment shall interface with the Access Control System, Intercom System and other Building Services Systems. Monitoring and Control information shall be output to the Building Management System (BMS).

1. To be developed

D. To be developed

120.020 SYSTEM DESCRIPTION

A. Parking Control System: For the following types of parking management:

1. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. The Parking Control Equipment shall be integrated and interfaced to the following systems:

1. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. To be developed

210.000 RELATED PRODUCTS

210.010 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. To be developed

210.020 SIGNAL TRANSMISSION COMPONENTS

A. General Cable Requirements: Size and type as recommended in writing by system manufacturer unless otherwise indicated.

B. To be developed

210.030 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

A. To be developed

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. Available Manufacturers of Parking Control Equipment: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. To be developed

300.020 AUTOMATIC BARRIER GATES

A. General: Provide parking control device consisting of operator and controller housed in a weather-tight, tamper-resistant cabinet enclosure with gate arm. Device shall be activated by a signal from access or revenue control device.

B. Standards: comply with EN 12453, EN 12445, EN 12635, EN 12978 and EN 12604. .

C. To be developed

300.030 VEHICLE DETECTORS

A. General: Provide detection devices that sense presence or transit of vehicles and emit signals activating gate-arm operators.

B. Vehicle Loop Detector System: Self-tuning electronic presence detector with adjustable detection patterns, adjustable sensitivity and frequency settings, and panel indicator light.

   1. To be developed

C. Active Infrared Vehicle Detector or Camera Analytics

   1. To be developed

300.040 TRAFFIC CONTROLLERS

A. General: Provide directional enforcement system that allows passage of vehicle in only one direction.

B. Penetrating Type: System consisting of multiple raised teeth that allow vehicular traffic in one direction and that puncture tires of vehicular traffic in the other direction. Fabricate system from steel plate contained in welded steel frame.

   1. To be developed

C. Non-penetrating Type: System consisting of steel curb that allows traffic in only one direction. Fabricate system from steel plate contained in welded steel frame.

   1. To be developed

D. Road Blockers - Bollards

   1. To be developed

300.050 ENTRY TERMINALS

A. Use manufacturers' catalogs or product data to insert series, type, model, and designations of other characteristics.

B. To be developed

300.060 EXIT TERMINALS

A. General: Provide exit terminals with controllers, components housed in cabinet enclosures.

A. To be developed

300.070 PAY STATIONS

A. General: Provide self-contained, cashiering pay stations designed for self-service operation; with mechanisms, components, controllers, and fee computers housed in a combined enclosure.

B. To be developed.

300.080 FEE COMPUTERS

A. General: Provide modular PC-based system. Register permanent record of each transaction in computer's memory.

B. To be developed

300.090 MISCELLANEOUS PARKING CONTROL EQUIPMENT

A. To be developed

B. Traffic Lights

   1. To be developed.

C. Parking Guidance System

1. To be developed.

300.100 PARKING FACILITY MANAGEMENT SOFTWARE

A. General: Manufacturer's standard software that is compatible with security-access control system and that provides automatic facility monitoring, supervision, and remote control of parking control equipment from one or more locations.

B. To be developed

300.110 ACCESS CONTROL UNITS

A. General: Provide access control unit that activates barrier gates.

B. Unit Housing: To be developed.

C. Card Reader Controlled Unit: Functions only when authorized card is presented.

1. To be developed

D. Digital Keypad Controlled Unit: Functions only when authorized code is entered on

1. To be developed

E. Radio-Controlled System: Digital access control system consisting of code-compatible universal coaxial receiver

1. To be developed

300.120 ANCHORAGES

A. Anchor Bolts:

1. To be developed

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be provided.

B. Parking Control Equipment shall be fully coordinated with the traffic flow requirements, the Security and Access Control system, the Intercom System and License Plate Recognition (LPR) System (forming part of Access Control System) of the Project

310.020 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of the Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

310.030 QUALITY ASSURANCE

A. To be developed

310.040 DELIVERY, STORAGE AND HANDLING

A. Comply with Project “Preliminaries and General Requirements”.

310.050 WARRANTY AND MAINTENANCE

A. To be developed

310.060 SPARE PARTS AND EXTRA MATERIAL

A. To be developed

320.000 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer / Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:

1. Product data: For each type of product.
2. Shop Drawings.
3. Wiring diagrams to show typical wiring schematics.
4. System Operation: Include system architecture and performance requirements.

B. Submittals shall comply with Project “Preliminaries and General Requirements”.

A. To be developed

B. Testing Plan: To be developed

C. Test Equipment

1. To be developed

D. Contractor shall submit the required Field Test Reports in the format and media specified, upon completion of testing the installed system.

1. To be developed

E. Product data: For each type of product.

1. To be developed

F. Shop Drawings

1. To be developed

G. Qualifications

1. To be developed

H. Closeout Submittals (Record Documents):

1. To be developed

I. Operations and Maintenance Manuals to include:

1. To be developed

330.000 EXECUTION

330.010 EXAMINATION

A. To be developed

330.020 PREPARATION

A. To be developed

330.030 INSTALLATION

A. General: Install parking control equipment as required for a complete and integrated installation.

B. To be developed

330.040 FACTORY ACCEPTANCE TESTS

A. The Factory Acceptance Tests shall be carried out in a hardware and software environment, which simulates the final configuration of the system.

B. To be developed

330.050 FIELD QUALITY CONTROL

A. To be developed

330.060 ADJUSTING

A. Adjust parking control equipment to function smoothly and lubricate as recommended by manufacturer.

B. Confirm that locks engage accurately and securely without forcing or binding.

C. To be developed

330.070 PROTECTION

A. To be developed

330.080 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain parking control equipment. Refer to Refer to Project “Preliminaries and General Requirements”.

B. To be developed

W42A - VIDEO SURVEILLANCE

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes an IP Video Surveillance System consisting of but not limited to:

1. IP CCTV Cameras,
2. Software,
3. Servers and Workstations.
4. Data Storage System.
5. Ancillary equipment.

B. This system shall provide for:

1. The transport of video signals to the video recorders via the Project Data Communications Network.
2. The display of live camera video.
3. The archiving of all camera video onto a long-term storage facility located at the Security Control Room**.**

C. The Video Surveillance System (VSS) shall interface with Access Control System, Perimeter Security Systems, Intrusion Detection Systems, the Fire Alarm System and other Building Services Systems.

100.020 GENERAL FEATURES

A. The IP surveillance system shall provide digital video capture, transportation, management, recording, live viewing, playback, and storage for the video surveillance system.

B. To be developed

C. 25% spare capacity shall be required at all levels of the system.

D. The software licensing shall be provided for the entire network with no limitation on the number of workstations or standard end-users.

E. The Video Surveillance System shall be used by agents mainly for operation management and for access control of staff and passengers, inside the Project.

F. The Video Surveillance system shall be used for:

1. Operation purposes at the Project.
2. The monitoring of all vital areas in the Project.
3. Surveillance to help enforce safety and security.
4. General surveillance general traffic areas.
5. Facial Recognition.

G. The functions of the CCTV shall consist of:

1. Facilitating the coordination of the operations.
2. Supplying staff with video information.
3. Managing the flow of passengers and access for maintenance staff.
4. Monitoring of gates for the access control system and Security Audio Communication system (Intercom).
5. Monitoring of zones for Fire Alarm System at the Fire Command Center/Main Fire Station (FCC/MFS).
6. Recording and storage images.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Regulations and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

C. IEC Standards

1. To be developed.

D. EN Standards

1. To be developed

E. Comply with the latest issues of the ONVIF Specifications.

F. Control Room Design:

1. To be developed

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Environmental Conditions: To be developed

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. “OFE”: shall refer to “Owner Furnished Equipment”, which will be provided by the Owner/Employer. The Contractor shall be responsible for removing this equipment from the Owner’s premises, and re-installing and integrating this equipment in good working order where required and detailed in these Specifications.
2. "Turnkey System": a complete system of hardware and software delivered to the customer ready-to-run.
3. ONVIF™: Open Network Video Interface Forum , an open standard developed to allow the management of IP cameras and other network video devices via a unified, open platform standard. ONVIF is an organization started in 2008 by Axis Communications, Bosch Security and Sony. The aim of the ONVIF™ standards is to achieve interoperability between IP cameras and other network video devices regardless of manufacturer.
4. Frame rate, is the measurement of how quickly a camera produces unique, consecutive images called frames. Frame rate is most often expressed in frames per second (fps). Depending on how a given scene is captured in terms of motion, typical frame rates are 4, 12 and 25 fps for PAL-based systems and 5, 15 and 30 fps for NTSC-based systems respectively.
5. Camera Functionalities: Defined functional purpose of a camera – as per IEC 62676-4:

    a) Inspect: to enable the operator to obtain information from objects.
    b) Identify: to enable identification of an individual beyond reasonable doubt.
    c) Recognise: to enable the Operator to obtain recognition of an individual.
    d) Observe: enabling characteristic details of an individual, such as distinctive clothing to be seen, whilst allowing a view of activity surrounding an incident.
    e) Detect: to enable the Operator to reliably and easily determine whether or not any target, such as a person, is present.
    f) Monitor: to enable viewing of the number, direction and speed of movement of people across a wide area, providing their presence is known to the Operator.

6. NETD: Noise Equivalent Temperature Difference. It is a measure for how well a thermal imaging detector is able to distinguish between very small differences in thermal radiation in the image. NETD is expressed in milli-Kelvin (mK). It specifies the smallest temperature difference that can be detected and.is also sometimes referred to as “Thermal Contrast”.
7. To be developed

C. Abbreviations

1. To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

120.020 SYSTEM DESCRIPTION

A. The Video Surveillance System (VSS) shall provide digital video capture, transportation, management, recording, live viewing, playback, and storage of the video. The VSS shall be based on capturing and processing Ethernet transmission of video signals from cameras. The entire VSS system shall be capable of being partitioned and allow sharing of selected video signals between Security personnel and other operational personnel as required.

B. The Video Surveillance IP/Ethernet based system shall consist of video management and archiving software, Power over Ethernet (PoE) IP fixed cameras and IP cameras with pan, tilt zoom (PTZ) features, camera housings and mounting hardware, and power supplies required to form a fully functional and operational network based virtual matrix surveillance system and network based digital video recording system.

C. The system shall operate on a digital IP/Ethernet network, the Security Network of the project. The Contractor shall coordinate for the provision of network switches as part of this Project as required to accommodate the VSS.

D. The system shall have the capability to allow live video monitoring via web browsers or wireless devices. Access shall be restricted by two-factor authentication and encryption as directed by Employer. The cameras and video accessible via web browser or wireless devices shall be limited based upon user and shall be configurable by the System Administrator to limit access by person and by device or by access method.

E. The system shall include a combination of fixed and pan tilt zoom cameras, video recording and archiving servers The camera management and recording servers shall be connected to the network.

F. The VSS shall include an Intelligent Video Analysis System (IVAS). The IVAS shall apply automatic, persistent artificial intelligence to video signals in an effort to improve the efficiency of Operators by directing them immediately to events that need attention and provide them an easy way to determine the appropriate action.

G. The Contractor shall provide data cables copper or fiber optic between the IP Surveillance System and the horizontal Floor Telecom Room FTR.

H. All Indoor cameras shall be wired through Category 6A cabling to the nearest FTR.

I. All Outdoor cameras attached to building boundary and located within the Copper cabling range, shall be wired through Category 6Acabling to the nearest FTR.

J. All Outdoor Cameras that are not within any FTR copper cabling range shall be wired to the Main Telecom Room and FTR rooms/closets using fiber optic cables with proper media converters for the purpose. All wiring, Patching and needed active and passive components shall form part of the Contract.

K. The Contractor shall provide for the necessary IP cameras, data network switches, local workstations, patch panels, fiber optic cables, copper cables, accessories and ancillary, etc. for the complete operation and full integration of the above.

L. The Contractor shall fully coordinate with the Employer for the exact location and positioning of the different equipment and materials.

M. To be developed

120.030 SYSTEM ARCHITECTURE AND COMPONENTS

A. The VSS shall consist of IP compatible cameras, both fixed and PTZ, connections to the LAN via Cat 6Acabling or fiber, LAN switches, Video and Archiving Servers, system workstations, and all associated software and hardware required for a complete and operational system.

B. Provide all software licenses required for the specified monitoring and control.

C. To be developed

130.000 CONTROL REQUIREMENTS

130.010 INTEGRATION REQUIREMENTS

A. The IP Surveillance System shall be integrated and interfaced to the following systems:

1. To be developed

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

W43 – SECURITY SCREENING SYSTEMS (SSS)

1.1 RELATED DOCUMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.2 SUMMARY

A. Section includes state-of-the-art, electronic Security Screening Systems (SSS) requirements for the Project.

B. The SSS shall screen all passengers, staff, passenger baggage and goods entering the airport as well as Customs screening of all baggage and goods arriving at the airport from other countries.

1.3 REFERENCES

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. Baggage: Such articles, effects and other personal properties of a passenger as are necessary for wear, use, comfort or convenience in connection with his trip. Unless otherwise specified it includes both checked-in and unchecked baggage.
2. Baggage Handling System: Automated System handling hold baggage from the check-in desk to the Unit Load Device (ULD) for departing baggage and from the ULD to the reclaim carousel for arrival baggage.
3. Carry-on baggage: Baggage that the passenger carries onto an aircraft that is screened at the security screening checkpoint. By extension, for staff, carry-on belongings that staff can bring on site that is screened at security screening checkpoints.
4. Hold Baggage: Baggage that the passenger does not carry in the cabin. The Hold bag is traveling in the aircraft hold. The Hold baggage is checked-in at the departure and is reclaimed by the passenger at the arrival.
5. Hold Baggage Screening: Hold Baggage is security screened in the departure airport via the BHS, security screened at transfer airports (as required), and is Customs screened at the arrival airport.
6. Third Party: The Third Party is a company independent from the Master Systems Contractor, to be appointed at Master Systems Contractor expenses to provide Technical Certifications as necessary (structure, electrical items, emergency stop system, Health & Safety, etc.).
7. Operator: The Operator is the entity in charge to operate the Passenger Terminal Building, particularly to perform ground handling, security operation etc.
8. Security/Customs Authority: The Security/Customs Authority or appropriate Authority having legal competency to provide agreement related to Security, Customs and more generally all issues related to International or National Rules and Laws.

1.4 SYSTEM DESCRIPTION

A. Security Screening shall consist of different types of Security Screening Systems distributed at key locations throughout the Terminals and other project facilities and connected to the Project Security Network.

B. System design shall take into consideration Project requirements in terms of end users special needs, regulations, system planning, operation, changes and maintenance.

De
Te

C. The Security Screening Systems shall consist of Ethernet based, redundant, real-time host processors/servers, multiple workstations and terminals. The workstations will include supervisory workstations, On-Screen Resolution workstations, and viewing workstations for search and resolution stations. The system shall be capable of routing individual alarms or On-Screen Resolution (OSR) images to specific workstations.

D. To be developed.

1.5 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To Be Developed

1.6 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B.

C. To Be Developed

1.7 QUALITY ASSURANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.8 WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.9 PRODUCTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.10 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers shall meet all specifications requirements and shall be approved by the Engineer.

1.11 GENERAL OVERVIEW

A. Four types of Check and Inspection Points types are identified, plus additional screening types:
   1. SCP Screening Checkpoint
   2. SSCP Staff Screening Checkpoint
   3. GWSCP Goods and Waste Screening Checkpoint
   4. CSCP Customs Screening Check Point

B. Screening Check Point (SCP)

C. Staff Screening Check Point (SSCP)

D. Goods and Waste Screening Check Point

De
Te

E. Customs Screening Checkpoint (CSCP)

1.12 WALK-THROUGH METAL DETECTOR

1.13 HAND-HELD METAL-DETECTOR

1.14 EXPLOSIVE TRACE DETECTION UNITS

1.15 CONVENTIONAL X-RAY SCANNERS

1.16 EXPLOSIVE DETECTION SYSTEM MACHINE

1.17 FURNITURE AND ACCESSORIES

1.18 FINISHES: CORROSION PROTECTION

1.19 DELIVERY, STORAGE, AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.20 SOFTWARE LICENSING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.21 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Protection and Cleaning

1. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured with an activated burglar alarm and access-control system reporting to a central station complying with UL 1610, "Central-Station Burglar-Alarm Units," during periods when a qualified operator in the employment of the CONTRACTOR is not present.
2. Repair exposed surfaces to match original finish.
3. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, which guarantee storage of control equipment is without damage or deterioration at the time of Final Acceptance.

1.22 EXAMINATION AND FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To Be Developed

De
Te

1.23 TESTING AND COMMISSIONING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.24 TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.25 CLOSEOUT SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.26 COMPLETION AND SYSTEM ACCEPTANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W44 – EMERGENCY ASSIST ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Particular Conditions, Employer's Design Standards, Procedures, Manuals and Specifications, including without limitation Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes an Emergency Assist Alarm System to be provided at disabled toilets designed for persons with restricted mobility (PRM) within the Project.

1. Remote indication shall be provided at a central control or monitoring point provided at the security office.

B. Related Sections

1. To be developed

1.3 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

C. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following reference(s):

1. BS 8300-2, Design of an accessible and inclusive built environment. Buildings. Code of practice.

D. Compliance with Local Requirements:

1. The system functions in public areas shall comply with the most current version of the Accessibility Guidelines by Authorities Having Jurisdiction.
2. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

E. Sustainability Requirements: Comply with indicated Codes and sustainability targets and requirements specified in Division 01 Sustainability Sections:

F. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Definitions

1. Emergency Voice/Alarm Communications System (EVACS): Dedicated manual or automatic equipment for originating and distributing voice instructions, as well as alert and evacuation signals pertaining to a fire emergency, to the occupants of a building.
2. Emergency Communication System (ECS): A system for the protection of life by indicating the existence of an emergency and communicating information necessary to facilitate an appropriate response and action, such as evacuation.

B. Abbreviations

1. EVACS: Emergency Voice/Alarm Communications System.
2. PRM: Persons with Restricted Mobility.

1.5 SCOPE OF WORK

A. The Contractor shall provide, the final design and construction documents and all equipment, software, material, labor and services required to construct and install the Emergency Assist Alarm System infrastructure including, but not limited to:

1. All design services, drawings and specifications, equipment, software, materials, labor and services, not specifically mentioned or shown, which may be necessary to complete the design and installation of the system.
2. Installation and setup of the system hardware and software as specified.
3. Coordination with the Service Providers of interfaced systems.
4. Integration of the system with other systems and in coordination with the Employer.
5. Delivery of the “Interface Control Document - ICD”.
6. Final connection of hardware to power, infrastructure termination and patch cords connecting system equipment to the data outlets and other network communication equipment.
7. Documentation: Licenses, Shop drawings, Specifications, As-built drawings, user’s manual, operation and maintenance manuals, test reports, etc.
8. Handover manufacturer’s recommended spare parts (along with current unit prices) for all major components in the system for two (2) years fault-free operation.
9. Handover manufacturer’s recommended test equipment and tools (along with current unit prices) required for system maintenance.
10. Test plan.
11. System testing and commissioning.
12. System roll-out.
13. System warranty as specified herein.
14. Training as specified herein.
15. Maintenance and support as specified herein.
16. Supply the licenses for all software, programs and modules provided for the works including those developed and modified by the Contractor. The appropriate licenses supplied by the Contractor shall enable the Employer to use, modify, and develop the software, programs and modules for the works supplied under this Contract.

1.6 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. To be developed

1.7 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of the Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

1.8 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Employer's Representative / Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:

1. Product data: For each type of product.
2. Shop Drawings.
3. Wiring diagrams to show typical wiring schematics.
4. System Operation: Include system architecture and performance requirements.

B. Samples for initial selection:

C. Product Certificates:

D. Manufacturer's Endorsement

E. Signed Warranty: as specified.

F. Testing Plan:

G. Test Equipment

H. Contractor shall submit the required Field Test Reports in the format and media specified, upon completion of testing the installed system.

I. Product data: For each type of product.

J. Calculations:

K. Environmental Requirements.

L. Shop Drawings

M. Coordination Drawings:

N. Qualifications

O. Closeout Submittals (Record Documents):

P. Operations and Maintenance Manuals to include:\

1.9 QUALITY ASSURANCE

A. Qualifications:To be developed

B. Standard Products

1. Identical Items: All items of the same classification shall be identical. This requirement includes equipment, assemblies, parts, and components.

C. Electromagnetic Compatibility (EMC)

1. Ensure all equipment and systems are installed to provide electromagnetic compatibility within the system and with any other systems installed in the same location.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Comply with Division 01, Section “Product Requirements”.

1.11 PROJECT/SITE CONDITIONS

A. Environmental Conditions:

B. Operational Constraints: The system will run 24 hours per day, all the days of the year.

C. Unless otherwise indicated, 25% spare capacity shall be required at all levels of the system.

D. Power Supply

1.12 WARRANTY AND MAINTENANCE

A. Contractor shall provide a three years warranty for the works specified herein, including all materials, software and labor, to be free from defects in design, workmanship, and materials.

B. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.13 SPARE PARTS AND EXTRA MATERIAL

A. The manufacturer shall guarantee the flow and availability of the spare parts without a major design change for at least ten years’ period from date of System Acceptance by Employer.

B. Refer to Division W, Section “Common Clauses for IT & Security Systems”..

PART 2 - PRODUCTS

2.1 GENERAL EQUIPMENT AND MATERIAL REQUIREMENTS

A. The Emergency Assist Alarm system shall provide a BS 8300 - Code compliant solution suitable for stand-alone toilet alarms as well as multiple toilet alarms with central remote monitoring.

B. Each system controller shall be capable of monitoring up to 16 stand-alone toilets. The system shall be integrated into the fire alarm Emergency Voice /Alarm System (EVACS) or the BMS.

C. The controller and individual toilet controllers shall be IP based and shall communicate through the data network of the Project.

D. The system shall be supplied from power supply units which are backed up with battery supply to ensure continuous operation in the case of mains failure.

E. Visual and audible feedback shall be provided to indicate that, when the alarm has been activated, the emergency assistance call has been acknowledged and is being attended to.

F. The system shall be designed such that it is not confused visually or audibly with a fire alarm.

2.2 SYSTEM COMPONENTS

A. The system shall consist of the following components:

1. Controller
2. Ceiling Pull Cord Unit
3. Call Point
4. Reset Point / Cancel button
5. Overdoor Indicator
6. Network interface module
7. Power Supply Unit and Backup Battery.

B. System components including: pull cord units, call points, cancel buttons and overdoor indicators shall fit into single gang back boxes with approximate dimensions of 86 mm x 86 mm (Width x Height) and finish inline with the requirements of the Interior Designer.

1. Controller

    a. Controllers shall be installed in the security office, in coordination with the Employer's Representative/end user
    b. To be developed

2. Ceiling Pull Cord Unit

    a. The Pull Cord Units shall be used to activate disabled toilets alarms.
    b. To be developed

3. Call Point

    a. Emergency call points shall be used to activate emergency assist alarms.
    b. To be developed

4. Reset Point / Cancel button

a. The cancel button shall be used to reset activated emergency assist alarms.
b. To be developed

5. Overdoor Indicator (Beacon/Sounder)

a. The overdoor indicator shall be combined beacon-sounder unit similar to the "Beacon" specified in Sub-paragraph above but with an integral sounder.
b. To be developed

6. Network interface module:

a. This module shall enable remote monitoring of alarm status and muting of alarm sounders using a standard serial communications protocol.
b. To be developed

7. Power Supply Unit with an integrated battery charger and dedicated backup batteries

C. Additional Provisions

1. Panic Bar

a. A panic bar shall be located on one of the walls of the disabled toilet such that the user can press or grab to it in case of falling to the floor, to initiate a call for help.
b. To be developed

2.3 INTEGRATION REQUIREMENTS
2.4 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. The UPS shall be provided by the Electrical Contractor to cater for the load of all system components as described herein and as recommended by the Supplier considering a maximum of 80% loading and 20% spare capacity for future expansion.

B. Comply with Electrical Section "Static Uninterruptible Power Supply".

2.5 SIGNAL TRANSMISSION COMPONENTS
2.6 CONDUITS, TRUNKING, ENCLOSURES AND FITTINGS

PART 3 - EXECUTION

3.1 WIRING METHODS
3.2 INSTALLATION
3.3 FIRESTOPPING
3.4 GROUNDING
3.5 FIELD QUALITY CONTROL
3.6 OCCUPANCY ADJUSTMENTS
3.7 DEMONSTRATION AND TRAINING

W50A- ADDRESSABLE FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Particular Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes a microprocessor based, non-coded, addressable fire alarm system with manual and automatic alarm initiation; automatic sensitivity control of certain smoke detectors and multiplexed signal transmission dedicated to fire alarm service only including but not limited to:

1. Fire-alarm control panels.
2. Manual fire-alarm stations.
3. System smoke detectors.
4. Air-sampling smoke detectors.
5. Non-system detectors.
6. Heat detectors.
7. Notification appliances.
8. Device guards.
9. Emergency Voice/Alarm Communications System (EVACS)
10. Firefighters' two-way telephone communication service.
11. Firefighters' smoke-control station.
12. Magnetic door holders.
13. Remote annunciators.
14. Graphic annunciators (panels/workstations).
15. Addressable interface devices.
16. Digital alarm communicator transmitter (DACT).
17. Radio alarm transmitter.
18. Network communications.
19. System printer.

B. Section includes Fire Alarm System interface with the following building services systems:

1. To be developed

C. To be developed

D. Related Sections:

1. To be developed

1.3 REFERENCE STANDARDS

A. To be developed

B. Codes and Standards: System design, operation, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. Local regulations and codes.
2. NFPA 72, National Fire Alarm and Signaling Code.
3. NFPA 101, Life Safety Code.

4. NFPA 1221: Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems
5. NFPA 415, Airport Terminal Buildings, Fuelling Ramp Drainage and Loading Walkways.

C. Codes and Standards: System components shall comply with the applicable requirements and standards addressed within the following references:

1. UL 38: Standard for Manual Signaling Boxes for Fire Alarm Systems
2. UL 217: Standard for Smoke Alarms
3. UL 228: Standard for Door Closers-Holders, With or Without Integral Smoke Detectors.
4. UL 268: Smoke Detectors for Fire Alarm Systems
5. UL 268A: Standard for Smoke Detectors for Duct Application
6. UL 464: Audible Signaling Devices for Fire Alarm and Signaling Systems, Including Accessories
7. UL 521: Standard for Heat Detectors for Fire Protective Signaling Systems
8. UL 864: Standard for Control Units and Accessories for Fire Alarm Systems
9. UL 1480: Speakers for Fire Alarm and Signaling Systems, Including Accessories
10. UL 1481: Standard for Power Supplies for Fire Protective Signaling Systems
11. UL 1711: Standard for Amplifiers for Fire Protective Signaling Systems
12. UL 1887: Standard for Safety Fire Test of Plastic Sprinkler Pipe for Visible Flame and Smoke Characteristics
13. UL 1971: Standard for Signaling Devices for the Hearing Impaired

D. System components, design, operation, installation and workmanship shall comply with the applicable local regulations and code requirements of Authorities Having Jurisdiction. These shall have precedence over other codes and standards indicated, unless otherwise approved by the Employer, in writing.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Definitions

1. Alarm Verification Feature: A feature of automatic fire detection and alarm systems to reduce unwanted alarms wherein smoke detectors report alarm conditions for a minimum period of time, or confirm alarm conditions within a given time period after being reset, in order to be accepted as a valid alarm initiation signal.
2. A " / " used throughout the text between two consecutive words is equivalent to and shall be used interchangeably with " and ".
3. Alarm: A warning of fire danger.
4. Signal: A status indication communicated by electrical or other means.
    a. Alarm Signal: A signal indicating an emergency that requires immediate action, such as a signal indicative of fire.
    b. Evacuation Signal: A distinctive signal intended to be recognized by the occupants as requiring evacuation of the building.
    c. Fire Alarm Signal: A signal initiated by a fire alarm-initiating device such as a manual fire alarm box, automatic fire detector, water-flow switch, or other device in which activation is indicative of the presence of a fire.
    d. Supervisory Signal: A signal indicating the need for action in connection with the supervision of the fire suppression systems or equipment, or the maintenance features of related systems.
    e. Trouble Signal: A signal initiated by the fire alarm system or device indicative of a fault in a monitored circuit or component.
5. Conveying systems: include horizontal and vertical transportation systems (HVTS) such as elevators, moving walks, escalators and dumbwaiters.
6. Positive Alarm Sequence. An automatic sequence that results in an alarm signal, even when manually delayed for investigation, unless the system is reset. It provides a timed delay of a

general alarm signal in a building and at a supervising station. This gives a trained responder up to 3 minutes to investigate the cause of an alarm signal. The time limits to acknowledge the alarm signal and reset the system are designed to assure all alarm system functions are actuated in the event personnel are not available to acknowledge, investigate and reset the alarm. A positive alarm sequence feature can only be used with the specific approval of the Authority Having Jurisdiction.

7. Signaling Line Circuit (SLC): A circuit path between any combination of addressable appliances or devices, circuit interfaces, control units, or transmitters over which multiple system input signals or output signals or both are carried.
8. Soft-Addressing (Auto-Addressing): An intelligent technology which allows the Fire Alarm Control Panel to automatically scan the detection loops and allocate each device with an address number corresponding with its position on the loop.
9. Manual-Addressing: Addressing which is dependent on the user to select the device or location and assign it an address through:
    a. Hard-addressing: by setting numerical binary code tag or switch.
    b. Electronic-addressing: by programming the EEPROM in the device using hand-held field programmer.
10. Notification Appliance Circuit (NAC): A circuit or path directly connected to notification appliances.
11. Emergency Voice/Alarm Communications System (EVACS): Dedicated manual or automatic facilities for originating and distributing voice instructions, as well as alert and evacuation signals pertaining to a fire emergency, to the occupants of a building.

B. Abbreviations

1. To be developed

1.5 SCOPE OF WORK

A. The system shall include all required hardware, raceways, interconnecting wiring, end of line and other necessary circuit elements and software to accomplish the requirements of this Specification and the contract drawings, whether or not specifically mentioned herein.

B. Provide the following:

1. MFACP/FACP, manual stations, automatic fire detectors, notification appliances, wiring, wire-ways and all accessories to form a complete system.
2. Remote annunciator(s).
3. Graphic annunciator(s).
4. Networking of MFACP and FACP.
5. Firefighters telephone communication service.
6. Firefighters' smoke-control station
7. Digital alarm communicator transmitter.
8. Emergency Voice/Alarm Communications System (EVACS).
9. System printer.
10. Interface with the Public Address System.
11. Interface with other building services systems and with the BMS.

C. To be developed

1.6 COORDINATION

A. To be developed

1.7 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer / Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:

1. Product data: For each type of product.
2. Shop Drawings.
3. Wiring diagrams to show typical wiring schematics.
4. System Operation: Include system architecture and performance requirements.

B. To be developed

C. Product Certificates: signed by manufacturers of equipment and /or software certifying that furnished products comply with contract requirements (Declaration of Conformity) and performance.

D. Seismic Qualification Certificates: To be developed

E. Manufacturer's Endorsement: To be developed

F. General Submittal Requirements: To be developed

G. Contractor shall deliver signed Warranty.

H. Testing Plan: To be developed

I. Product Data: To be developed

J. Sound Levels: To be developed

K. System Graphics: To be developed

L. Prepare a risk assessment plan: To be developed

M. Shop Drawings: For fire alarm system: To be developed

N. Qualifications: To be developed

O. Closeout Submittals (Record Documents): To be developed

P. Operation and Maintenance Data: For fire alarm systems and components to include in operation, and maintenance manuals: To be developed

1.8 QUALITY ASSURANCE

A. To be developed

B. Installer Qualifications To be developed

C. Manufacturer Qualifications: To be developed

D. Source Limitations: To be developed

E. Certification

1. All components of the fire alarm system including system hardware and software shall be:

a. UL listed

b. Listed, Approved and Registered by the Civil Defense Material Approval Department

2. The entire fire alarm system including integration arrangement with the BMS, the Access Control, PAS and other Building Services Systems shall be UL listed and suitable for life safety and fire alarm applications.

3. Obtain certification according to NFPA 72 by: To be developed

F. Equipment Country of Origin: To be developed

G. Installer Qualifications: Installation shall be by personnel certified to operate as a fire alarm system installer in the region.

1.9 DELIVERY, STORAGE AND HANDLING

A. Comply with Division 01, Section “Product Requirements”.

1.10 PROJECT/SITE CONDITIONS

A. To be developed.

1.11 WARRANTY

A. Special Warranty

1. To be developed

B. Experimental Period

1. To be developed

C. Taking Over of the System

1. To be developed

D. Warranty Period

1. The Contractor shall include a statement of warranty on the entire system and on the individual pieces of equipment for two years from the date of taking over of the system.
2. To be developed

1.12 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. To be developed

1.13 SPARE PARTS AND EXTRA MATERIAL

A. Contractor shall handover manufacturer’s recommended spare parts for all major components in the system for two years fault-free operation.

B. To be developed

PART 2 - PRODUCTS

2.1 STANDARD COMMERCIAL PRODUCTS

A. Refer to Division 01 Section "Product Requirements".

2.2 SEISMIC PERFORMANCE REQUIREMENTS

A. Seismic Performance: Fire alarm control panel and raceways shall withstand the effects of earthquake motions determined according to ASCE/SEI 7

2.3 SYSTEM DESCRIPTION

A. To be developed

B. Control of System: By the MFACP/MFS/FACP.

C. System Supervision: To be developed.

D. Priority of Signals: To be developed.

E. Noninterference: To be developed.

F. System Reset: To be developed.

G. All operations shall be according to the approved Cause & Effect Matrix.

H. The Fire Command Center (FCC): To be developed

I. Source Limitations for Fire alarm System and Components: To be developed.

J. Fire alarm signal initiation shall be by one or more of the following devices and systems: To be developed

K. Supervisory signal initiation shall be by one or more of the following devices and systems: To be developed

L. System Trouble signal initiation shall be by one or more of the following devices and actions: To be developed

M. System Trouble and Supervisory Signal Actions: To be developed

N. Alarm Silencing, System Reset and Indication: Controlled by switches in the MFACP/MFS/FACP: To be developed

O. Stairwell and Elevator Shaft Pressurization: To be developed

P. Smoke-Alarm Verification: To be developed

Q. Notification-Appliance Circuit: To be developed

R. Elevators: To be developed

S. Door Controls: To be developed

T. Voice/Alarm Signaling Service: To be developed

U. Printout of Events: To be developed

V. Power Supply: To be developed

W. Communication of Events:

X. FACP Alphanumeric Display: To be developed

2.4 MAIN FIRE ALARM CONTROL PANEL (MFACP)

A. The MFACP shall be field-programmable, microprocessor-based, modular, power-limited design with electronic modules:

1. To be developed

2.5 FIRE ALARM CONTROL PANELS (FACP)

A. Description: FACPs shall be identical to and compatible with the MFACP in all respect, capable of operating the system on a stand-alone basis. Each panel maintains the status and control of its own dedicated circuit points.

1. Comply with UL 864.

B. The FACP shall serve as the interface between initiating fire devices, controlled signalling devices, and each fire alarm node. The supervised multiplex communication port shall be an integral part of the FACP.

C. Each FACP shall be powered from a local power supply, and shall provide all power necessary for its own operation and related components, including standby power. Contractor shall verify by calculations that the voltage drop limits on the lines feeding the different components do not exceed the limits recommended by manufacturer, and shall rectify wherever needed.

D. FACPs shall be used to house amplifiers, batteries, and power supplies to allow true distributed processing and amplification.

2.6 ADDRESSING MECHANISM

A. To be developed

2.7 MANUAL FIRE ALARM STATIONS

A. To be developed

2.8 SYSTEM SMOKE DETECTORS

A. General Requirements:

1. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire alarm control panel.
2. Base Mounting, Self-Restoring, Integral Visual-Indicating Light, Remote Control from the fire alarm control panel for calibration, sensitivity, and alarm condition
3. To be developed

B. Photoelectric Smoke Detectors:

1. Detector address shall be accessible from fire alarm control panel and shall be able to identify the detector's location within the system and its sensitivity setting.
2. To be developed

C. Duct Smoke Detectors: Photoelectric type.

1. To be developed

2.9 PROJECTED BEAM SMOKE DETECTORS

A. To be developed

2.10 CARBON MONOXIDE DETECTORS

A. To be developed

2.11 MULTI-CRITERIA DETECTORS

A. To be developed

2.12 NON-SYSTEM DETECTORS

A. To be developed

2.13 HEAT DETECTORS

A. To be developed

B. Heat Detector, Combination Type/ Fixed-Temperature Type/ Continuous Linear Heat-Detector

2.14 VERY EARLY WARNING FIRE DETECTION (VEWFD) SYSTEM – SPOT TYPE DETECTOR

A. Very Early Warning Fire Detection (VEWFD) Systems shall utilize very high sensitivity spot type smoke detectors that are specifically designed and tested to detect low-energy fires before the fire conditions threaten data processing and/or telecommunications service (Telecom Rooms, Control Rooms, …).

B. To be developed

2.15 AIR-SAMPLING SMOKE DETECTOR

A. To be developed

2.16 NOTIFICATION APPLIANCES

A. To be developed

B. Bells/Horns

C. Visible Notification Appliances

2.17 FIREFIGHTERS' TWO-WAY TELEPHONE COMMUNICATION SERVICE

A. Dedicated, two-way, supervised, telephone voice communication links between fire alarm control panel, the fire command center, and remote firefighters' telephone stations.

B. To be developed

2.18 FIREFIGHTERS' SMOKE-CONTROL STATION

A. To be developed

2.19 MAGNETIC DOOR HOLDERS

A. To be developed

2.20 REMOTE INDICATING LAMP

A. To be developed

2.21 GRAPHIC ANNUNCIATOR

A. To be developed

2.22 REMOTE ANNUNCIATOR

A. To be developed

2.23 FIRE ALARM NETWORK

A. To be developed

2.24 SYSTEM POWER SUPPLY

A. To be developed

2.25 ADDRESSABLE INTERFACE DEVICE

A. Monitor Module/Relay Module/ Control Module:

B. To be developed

2.26 DIGITAL ALARM COMMUNICATOR TRANSMITTER (DACT)

A. To be developed

2.27 RADIO ALARM TRANSMITTER

A. To be developed

2.28 SYSTEM PRINTER

A. To be developed

2.29 DEVICE GUARDS

A. To be developed

2.30 WIRE AND CABLE

A. To be developed

B. Fire Resistant Cables

C. Grounding Components

2.31 CONDUITS, TRUNKING AND FITTINGS

A. To be developed

PART 3 - EXECUTION

3.1 EQUIPMENT INSTALLATION

3.2 WIRING INSTALLATION

W52A - LIGHTNING PROTECTION FOR STRUCTURES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes lightning protection for buildings and associated structures and includes requirements for lightning protection systems components including, but not limited to, the following:
   1. Air Termination Network.
   2. Down Conductors.
   3. Earth Termination Network.
   4. Bonding.
   5. Accessories.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Comply with the following standards:

   1. IEC 62305 "Protection Against Lightning".
   2. IEC 62561 "Lightning Protection System Components".

110.020 DEFINITIONS AND ABBREVIATIONS

110.030 TERMS USED

A. The following terms used on Drawings and in the Specification are synonymous and may be used interchangeably:

   1. "Earth" and "Ground".
   2. "Earthing" and "Grounding".

120.000 SYSTEM DESCRIPTION

120.010 LIGHTNING PROTECTION SYSTEM COMPONENTS

A. Provide lightning protection system materials and components that comply with IEC 62561 and with approved manufacturer's standard design, in accordance with published product information and the Standards specified in this Section.

B. Provide air terminals, bonding plates, conductors, connectors, conductor straps, fasteners, earthing plates, earthing rods, rod clamps, splicers and other components required for a complete system that meets the Standards specified in this Section.

C. Roof Conductors: 70 mm^2 soft drawn stranded copper cable covered with PVC of approved color or bare, high conductivity, annealed copper strip, 25 x 3 mm.

D. Earth Rod: 16 mm diameter high strength, low carbon steel core of high tensile strength (600 N/mm2), with 99.99% pure electrolytic copper molecularly bonded into steel core, 0.25 mm minimum thickness.

   1. Driving Head: High strength steel.
   2. Couplings: Long length silicon bronze, internally threaded.
   3. Threads: Rolled onto rod to ensure uniform layers of copper and strength.
   4. Minimum Length of Rod: 2.4 m.

© Copyright protected

E. Inspection (Earth) Pit: Precast concrete construction of dimensions shown on Drawings, with heavy duty cover and brass plate engraved 'Earth Pit Below' inset in cover.

1. Provide one pit for each earth rod.

F. Bonding Conductors: High conductivity, bare annealed copper tape, 20 x 3 mm minimum dimensions, or 50 mm2 soft drawn stranded copper cable covered with PVC of approved color.

G. Accessories: Supports, joints, fasteners, clamps, bonds, test links, etc., shall be copper or copper alloy and specially manufactured for the purpose. Clamps and connectors shall be specifically designed and sized for clamping and connecting to the various shapes and surfaces of bonded metalwork. Provide bimetallic connectors between different materials. Galvanized or plated steel nails, screws and bolts will not be accepted on copper installations.

H. Flexible Bonding Straps: Flexible annealed copper braid, 20 x 3 mm, suitable for bonding flat surfaces, cut to length required and with drilled flat terminals for bolted connections. Provide special bimetallic alloy terminals for joining to aluminum conductive parts.

I. Down Conductors: High conductivity, copper tape 25 x 3 mm or 70 mm2 soft drawn stranded copper cable, bare or covered with PVC of approved color as shown on drawings.

J. Test Links: Two-bolt split-coupling, copper alloy, made to join two ends of down conductor specified. Plate indicating position and number of electrodes shall be fitted above each test link.

120.020 TECHNICAL REQUIREMENTS

A. Flat Concrete Roofed Buildings Air Termination Network: Provide horizontal conductors around periphery (or parapet), and along inner edges of roofs that are higher than adjacent parts, unless they fall in zone of protection of a higher conductor. Install horizontal conductors in a mesh of proper size for the protection level required, as shown on drawings. Join all elements of lightning protective system together. Additionally, provide air termination horizontal loops around building façade for structures above 60m and 120m as per the standard requirement or as shown on Drawings; bonded to steel reinforcement and exposed metal parts as specified and required by the standard.

B. Use Air Rods (Finials/Terminals) in the air termination network, dimensions as per the code requirements; as necessary and/or shown on drawings.

C. Peripheral/External Down Conductors: Spaced at 10m. Every down conductor shall:

1. Have test link above earth for testing earth termination network.
2. Be protected against corrosion.
3. Terminate in an earth electrode (horizontal or vertical as per design requirements).
4. Be insulated and installed in PVC conduit from test link to electrode connection point (to reduce potential gradient at earth level which otherwise would be lethal to humans or animals).

D. Have lateral connection of down conductors (intermediate level ring conductors) at earth level and at proper intervals on building façade as per standard requirements or shown on drawings.

E. Add extra internal down conductors every 40m in large and flat structures with dimensions exceeding four times the spacing between down conductors.

F. Copper Earth Electrode: Provide type A, B or a combination of both as necessary or shown on drawings to achieve a maximum resistance to earth of 10 Ohm.

G. Isolation of earth electrode for testing shall be possible.

H. Bonding of ground electrodes of all services: Provide bonding between the earth termination network of the lightning protection system and earth networks of all other services to ensure a common earthing system. The resistance to ground should, in this case be the lowest value needed for any of the individual services. Combined resistance to ground of whole network is not to exceed 10 Ohm.

I. Joints and interconnections in earth termination network shall be exothermic welds except that down conductor shall be connected by a single or multi-conductor bolted U- connector clamp at earth pits.

© Copyright protected

J. Bonding: Bond all metalwork in or on outside of structure to the lightning protection system at points above the test joint (test link) to avoid side flashing. Metalwork includes but is not necessarily limited to: water pipes, tanks, sign structures, communication supports, metal sheaths and exposed parts of electrical installations, vents, exterior metal staircases, metal window frames, vent pipes, steel doors or door frames, main earthing terminal or bar of electrical installation and reinforcing bars of concrete structures if these are in continuous electrical contact.

K. Bond metal leaving or entering a structure (having system continuity such as water piping, etc.), as follows:

1. As directly as possible to the earth termination.
2. Near point at which service enters or leaves the structure.
3. At nearest earth point or at nearest main earthing terminal or bar of protective earthing system.

If direct bonding is not acceptable by authorities and/or parties concerned, SPDs shall be used.

L. Test Links: provide a test joint on each down conductor at the connection of the earth termination, (except when reinforced steel inside columns is used as natural down conductor).

M. Surge Protection Devices where specified or required by drawings shall be as follows:

1. SPD's test requirements shall be compliant with

a) IEC 61643-11 for power systems,
b) IEC 61643-21 for telecommunication and signaling systems.

2. Selection and installation of a coordinated SPD protection shall comply with

a) IEC 61643-12 and IEC 60364-5-53 for protection of power systems,
b) IEC 61643-22 for protection of telecommunications and signaling systems.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division Y Section "Earthing and Bonding".
3. Division W Section "Surge Protective Devices ".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Furse, W.J. and Co.
2. Harger Lightning Protection, Inc.
3. Independent Protection Company, Inc.
4. Wallis
5. DEHN
6. Helita

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has specialized in installing lightning protection systems similar in material, design and extent to those indicated for this Project and whose work has resulted in installations with a record of successful in-service performance.

320.000 SUBMITTALS

A. Product Data: Submit data for air terminals, fasteners, test links earth point and rods, connectors, wall inserts and bolts and any accessories forming part of the lightning protective system.

B. Shop Drawings: Detail the lightning protection system, including air-terminal locations, conductor routing and connections, and bonding and earthing locations and provisions. Include indications for use of raceway and sleeves, and data on how concealment requirements will be met.

C. Record (As-Built) Drawings: Indicate nature of soil, special earthing arrangements, date and particulars of additives to soil or in bore-holes if used, test conditions and results obtained.

D. Records: Submit the following:

1. Actual layout and components of the system.
2. Nature of soil and characteristics and any special earthing arrangement.
3. Test conditions and results.

E. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects/engineers and owners, and other information specified or required by Engineer.

330.000 EXECUTION

330.010 INSTALLATION

A. Install lightning protection components and systems according to IEC 62305.

B. Install conductors with direct paths from air terminals to earth connections. Avoid sharp bends and narrow loops.

C. Conceal the following conductors:

1. System conductors.
2. Down conductors.
3. Interior conductors.
4. Conductors within normal view from exterior locations at grade within 60 m of building.
5. Notify Engineer at least 48 hours in advance of inspection before concealing lightning protection components.

D. Cable Connections: Use approved exothermic-welded connections for all conductor splices and connections between conductors and other components.

E. Bond lightning protection components with intermediate-level interconnection loop conductors to earthed metal bodies of building at 20m intervals.

F. Down conductors shall follow most direct path between air terminals and earth pit, avoiding sharp bends and narrow loops. Where necessary, the formation of loops in down conductors shall not violate the code restrictions in terms of the gap formed across the loop.

G. Mechanical Protection of Down Conductors: Unless otherwise shown on drawings, provide PVC conduit, starting 0.3 m below earth and to a height of 1.9 m above earth with proper fixing for the conduit. Test link shall be positioned 2 m above earth.

H. Joints and Bonds: Clean and treat contact surfaces with non-corrosive compound. Protect joints between dissimilar metals from moisture by inert, tenacious material, and with overlapping joints

© Copyright protected

not less than 30 mm long. Provide as few joints and bonds as possible and make mechanically and electrically effective by clamping, bolting or exothermic welding. Cross-sectional areas of joints and bonds shall not be less than that of main conductor.

I. Bond exposed metal parts of structure to lightning protective system if clearance between any element of lightning system and metal part is less than 1800 mm or the distance allowed by the specified Standard, whichever is smaller.

J. Inspection (Earth) Pit: Extend 150 mm below top of earth rod. Cover earth rod connector with suitable protective compound, which can be easily removed for inspection. Connector shall not be covered with backfill material and shall remain clean.

330.020 CORROSION PROTECTION

A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

B. Use conductors with protective coatings where conditions would cause deterioration or corrosion of conductors.

330.030 FIELD QUALITY CONTROL

A. Periodic Inspections: Perform periodic inspections during installation of lightning protection systems and at Substantial Completion.

330.040 COORDINATION

A. Coordinate installation of lightning protection with installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies requiring bonding to lightning protection components, and building finishes.

© Copyright protected

W57 - SURGE PROTECTIVE DEVICES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes factory installed or field-mounted SPDs for:

1. Low-voltage (up to 1000 V) power distribution and control equipment whose specific requirements are covered under Articles 120.01 to 120.06 inclusive.
2. Telecommunications and Signal Processing Equipment whose specific requirements are covered under Articles 120.07 to 120.010 inclusive.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Codes and Standards: Comply with the following standards:

1. IEC 61643-11.
2. IEC 61643-12.
3. IEC 61643-21.
4. IEC 61643-22.
5. BS 7671 (IET Wiring Regulations – Latest Edition).
6. IEC 61000-6-3.
7. IEC 61000-4-5.

110.020 DEFINITIONS AND ABBREVIATIONS

A. I_n: Nominal discharge current.

B. I_{imp}: Impulse current.

C. I_{max}: Maximum discharge current.

D. I_{cw}: Combination wave generator short-circuit current.

E. U_c: Maximum continuous operating voltage.

F. MOV: Metal-oxide varistor; an electronic component with a significant non-ohmic current-voltage characteristic.

G. GDT: Gas discharge tube.

H. SAD: Silicon avalanche diode.

I. SPD: Surge protective device.

J. TOV: Temporary overvoltage.

K. U_p: Voltage protection level.

L. U_{oc}: Open circuit voltage.

M. U_T: Temporary overvoltage test value.

N. f_G: Cut-off frequency is equivalent to the frequency which induces an insertion loss of 3 dB under certain test conditions as per IEC 61643-21. Unless otherwise indicated, this value refers to a 50 Ω system

© Copyright protected

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REQUIREMENTS FOR AC POWER SURGE PROTECTIVE DEVICES

A. Maximum continuous operating voltage (U_c) of the SPD shall be equal to 110% of the nominal system voltage as a minimum or the next higher rating to ensure the ability of the system to withstand temporary r.m.s overvoltage (swell conditions), unless otherwise shown on the Drawings.

B. The SPD shall be suitable for a supply main's frequency between 47 Hz and 63 Hz.

C. All installed SPDs shall be connected in common mode to eliminate overvoltage between each phase and earth and between neutral and earth, unless otherwise specified.

D. SPDs shall have the following features and accessories:

1. Integral or external fused-disconnect switch. Fuses shall be current limiting type to IEC 60269 with short circuit interrupting capacity 120 kA as a minimum.
2. Indicator light display for protection status and end of life.
3. Control interface: SPD shall be equipped with dry contacts for monitoring and displaying the SPD's status and alarms from the BMS. As an alternative, software interface with BMS may be provided. Coordinate with BMS supplier for interface requirements.
4. Surge counter, for SPDs in compliance with ANSI/UL Standards.

E. SPDs shall comply with IEC 61000 For EMC.

F. SPDs installed adjacent to the protected equipment shall have galvanized and electrostatic painted enclosure with IP 54 degree of protection to IEC 60529 and provided with suitable DIN rails for SPD and fused-disconnect switch fixation, unless otherwise recommended by the manufacturer and approved by the Engineer.

G. Generally, SPDs shall be installed as follows, unless otherwise specified or shown on the Drawings:

1. Class I+II SPDs shall be installed at:

a) Incomer(s) of all MDB(s).
b) Incomer(s) of EMDB(s) / Synchronization switchboards.
c) Incomer of all MCC(s) fed directly from transformer.
d) Utility incomer of ATS(s) fed directly from transformer.

2. Class I SPDs shall be installed at:

a) Roof mounted / outdoor equipment control panel, unless otherwise recommended by the equipment manufacturer.

3. Class II SPDs shall be installed at:

a) Distribution panels.
b) Utility incomer of ATS(s) fed from main distribution board / distribution panels.
c) Incomer of MCCs / MCPs fed from main distribution board / distribution panels.
d) Foundation distribution cabinets for data centers.

4. Class III SPDs shall be installed at:

a) Power distribution units for data centers.
b) Final distribution panelboards feeding sensitive equipment.
c) Outdoor luminaires installed at high masts and street lighting poles, unless otherwise recommended by the manufacturer.

H. All SPDs shall be installed within or adjacent to the protected equipment within a distance not exceeding 10 m. Where distance between two consecutive SPDs is less than 10 m, the downstream SPD is not required.

© Copyright protected

120.020 COMBINED CLASS I + II OR TYPE 1 HYBRID SURGE PROTECTIVE DEVICES

A. Combined surge protective devices shall utilize MOV and GDT technologies and shall provide common mode and differential mode protection to eliminate overvoltage between each phase and neutral and between neutral and earth.

B. Class I + II surge protective devices shall be provided where specified or shown on the Drawings.

C. SPDs: Comply with IEC 61643-11, combined Class I + Class II.

D. SPD shall be tested for I_{imp} simulated with 10/350 microseconds waveform, with the following parameters for common mode: I_{imp} 100 kA within 50 micro seconds, charge (Q) 50 As within 5 ms and energy (W/R) 2500 kJ/Ohm within 5 ms, unless otherwise recommended by the manufacturer and approved by the Engineer.

E. SPD shall be tested for I_{imp} simulated with 10/350 microseconds waveform, with the following parameters for differential mode: I_{imp} 25 kA within 50 micro seconds, charge (Q) 12.5 As within 5 ms and energy (W/R) 156 kJ/Ohm within 5 ms, unless otherwise recommended by the manufacturer and approved by the Engineer.

F. Voltage protection level (U_p) shall not exceed 1500 V.

G. Short Circuit Withstand Capability (I_{sccr}): Match the Switchboard short circuit level as a minimum.

H. Common Mode Nominal Discharge Current (I_n): 100 kA with 8/20 microseconds waveform unless otherwise recommended by the manufacturer and approved by the Engineer.

I. Differential Mode Nominal Discharge Current (I_n): 25 kA with 8/20 microseconds waveform unless otherwise recommended by the manufacturer and approved by the Engineer.

J. Maximum Discharge Current (I_{max}): 100 kA with 8/20 microseconds waveform.

K. SPDs temporary overvoltage withstand shall comply with IEC 61643-11 requirements.

L. As an alternative to combined Class I+II SPD, hybrid surge protective devices may be used. Hybrid SPDs shall be constructed using a primary and secondary stage hybrid transient suppression system separated by suitable line inductive impedance to ANSI/UL 1449. The primary stage shall utilize SAD technology, while the secondary stage shall be constructed using multiple surge current diversion modules utilizing MOV technology and tested for manufacturing defects. The SAD module shall not be self-sacrificing to protect the system; rather it shall provide immediate transition to the secondary stage when subjected to potentially harmful levels. The modules shall be designed and constructed in a manner that ensures surge current sharing.

120.030 CLASS I SURGE PROTECTIVE DEVICES

A. Class I surge protective devices shall utilize MOV technology.

B. Class I surge protective devices shall be provided where specified or shown on the Drawings.

C. SPDs: Comply with IEC 61643-11, Class I.

D. SPD shall be tested for I_{imp} simulated with 10/350 microseconds waveform, with the following parameters: I_{imp} 25 kA within 50 micro seconds, charge (Q) 12.5 As within 5 ms and energy (W/R) 156 kJ/Ohm within 5 ms.

E. Voltage protection level (U_p) shall not exceed 2500 V.

F. Short Circuit Withstand Capability (I_{sccr}): 100 kA_{rms} (220 kA_{peak}) as a minimum.

G. Nominal Discharge Current (I_n): 25 kA with 8/20 microseconds waveform, unless otherwise recommended by the manufacturer and approve by the Engineer.

H. SPDs temporary overvoltage withstand shall comply with IEC 61643-11 requirements.

120.040 CLASS II SURGE PROTECTIVE DEVICES

A. Class II surge protective devices shall utilize MOV technology.

© Copyright protected

B. Class II surge protective devices shall be provided where specified or shown on the Drawings.

C. SPDs: Comply with IEC 61643-11, Class II.

D. SPD shall be tested with simulated 8/20 microseconds waveform, with I_n 12.5 kA.

E. Voltage protection level (U_p) shall not exceed 1500 V.

F. Short Circuit Withstand Capability (I_{sccr}): 50 kA_{rms} as a minimum.

G. Maximum Discharge Current (I_{max}): 25 kA with 8/20 microseconds waveform.

H. SPDs temporary overvoltage withstand shall comply with IEC 61643-11 requirements.

120.050 CLASS III SURGE PROTECTIVE DEVICES

A. Class III surge protective devices shall utilize MOV technology and shall provide common mode and differential mode protection to eliminate overvoltage between each phase and neutral and between neutral and earth.

B. Class III surge protective devices shall be provided where specified or shown on the Drawings.

C. SPDs: Comply with IEC 61643-11, Class III.

D. SPD shall be tested with a simulated combination wave of 8/20 microseconds waveform for short circuit current and 1.2/50 microseconds waveform for open circuit voltage with U_{oc} 6 kV.

E. Voltage protection level (U_p) shall not exceed 1500 V.

F. Short Circuit Withstand Capability (I_{sccr}): 6 kA_{rms} as a minimum.

G. Nominal Discharge Current (I_n): 3 kA with 8/20 microseconds waveform.

H. SPDs temporary overvoltage withstand shall comply with IEC 61643-11 requirements.

120.060 IDENTIFICATION

A. The following information shall be provided by the manufacturer on the nameplate as a minimum:

1. Manufacturer's name and model number.
2. Maximum continuous operating voltage.
3. SPD class and discharge parameters for each mode of protection declared by the manufacturer:

    a) Class I+II, I_{imp} in kA and I_n in kA.
    b) Class I and I_{imp} in kA.
    c) Class II and I_n in kA.
    d) Class III and U_{oc} in kV

4. Nominal discharge current.
5. Voltage protection level.
6. Identification of terminals.
7. Compliance standards.

120.070 PROTECTION OF TELECOMMUNICATIONS AND SIGNAL PROCESSING EQUIPMENT

A. Telecommunications and signal processing equipment, being sensitive devices susceptible to destruction by surge voltages induced by lightning or by electrical switching operations, shall be protected by SPD's.

B. The SPD's shall be deployed based on the source of the surge and its intensity at the boundary of each lightning protection zone (LPZ $0_A/0_B/1/2$) as defined by IEC 62305-4.

C. SPD's shall be properly designed to take into account the surge energy that they will be subjected to and to limit the transient over-voltages to safe levels for equipment within the protected zone.

D. SPD's shall be able to limit conducted interference to a safe level so that the immunity of the protected terminal equipment is not exceeded in accordance with the requirements of the immunity

© Copyright protected

and the test set-up described in EN 61000-4-5. The voltage protection level has to be adapted to the immunity of the equipment to be protected.

E. SPD's shall comply with the standardized test waveforms with peak currents used to test SPD's at each LPZ boundary given in IEC 61634-21 Table 3. Accordingly, each protective device shall be labeled and tested to multiple categories and performance classes.

F. Identification, Documentation and Marking

1. Identification, documentation and marking shall be in accordance with IEC 61643-21:
2. The SPDs shall be clearly marked with the following items:

a) The Manufacturer's name or trademark.
b) Model number.
c) Manufacturing traceability.
d) The maximum continuous operating voltage.

3. The following information shall be either marked on the body of the SPD or included in the submittals for review. For each test performed on the SPD, the test conditions shall be stated in the documentation:

a) Manufacturer's name or trademark
b) Year and week of manufacture, or serial number.
c) Model number.
d) Service conditions.
e) Maximum continuous operating voltage U_c (AC and/or DC).
f) Rated current.
g) Voltage protection level U_p.
h) Impulse reset (if applicable).
i) AC durability.
j) Impulse rating (according to IEC 61643-21 Table 3 - category and corresponding parameters e.g. C2: 2k V/ 1kA).
k) Transmission characteristics (appropriate to the intended SPD use).
l) Additional information such as surge currents I_n, I_{imp}, series resistance.
m) SPD Category and rating.

G. SPD's for telecommunications and signal processing equipment may be classified into three basic application groups:

1. Telephone and data transmission equipment.
2. Data processing networks.
3. Radio communication equipment.

120.080 SPD'S FOR TELEPHONE AND DATA TRANSMISSION EQUIPMENT

A. Surge protectors for telephone and data transmission equipment are divided into three types :

1. Surge protectors for telecom networks.
2. Surge protectors for industrial networks.
3. Surge protectors for Local Area Networks (LANs).

B. Surge protectors for telecom networks.

1. Designed to protect telecom transmission devices such as PBX, modems, data terminals.
2. Designed and selected to fit into the existing installations such as:

a) Mounting on DIN rail.
b) Insertion in connection strips.
c) Wall mounting.
d) Mounting on telecom Main Distribution Frames.
e) Plug-in on termination outlets.

C. Surge protectors for industrial networks.

1. Equipment to be protected shall include but shall not be limited to:

© Copyright protected

a) Fire detection system
b) Access control system
c) Input / Output cards
d) Industrial process equipment
e) SCADA system
f) Converters and interfaces
g) Actuators
h) Probes
i) Transmission systems

2. Surge protectors shall be designed to fit on DIN rail and shall be available in various configurations, as required.

a) Number of protected wires: 1 wire or 2 pairs.
b) Plug-in modules: removable to facilitate maintenance.
c) Transmission and protection of the shield wire.

D. General Features of SPD's for telephone and data transmission equipment:

1. SPD's shall be based on a multi-stage hybrid design that combines a high discharge current capacity with fast response time to provide:

a) A nominal discharge current greater than 5 kA at 8/20 µs impulse.
b) An ultra-fast response time < 1 ns.
c) Safe operation in end of life scenarios (fail-safe behavior: short circuit in case of removal of device with no line-cut-off).
d) Low insertion loss.

E. Protection Configurations

1. Protection configurations shall be selected based on the type of network being protected:

a) Standard Protection: Used mainly for the analog telecom network (PSTN):

1) A combination of a 3-electrode gas discharge tube, line resistors and fast clamping diode.

b) Enhanced Protection: For very low voltage transmission lines.

1) A combination of a 3-electrode gas discharge tube, line resistors and 3-pole clamping diode.

c) Line + Shield Protection: Transmission and protection for the shield wire.
d) K20 Protection: Complying with the ITU-T K20 International recommendation:

1) A combination of a 3-electrode gas discharge tube, fast clamping diodes and thermistors.

e) Low Capacitance Protection: For high bit rate links (> 1 Mbit/s):

1) A combination of a 3-electrode gas discharge tube, line resistors and 3-pole low capacitance diodes.

f) Cat 6/Cat6A Protection: Designed for very high bit rate LAN (up to 1000 Mbit/s):

1) A combination of a 3-pole low capacitance diode and MOV.

2. Below Table shows characteristics of typical protection configurations of combined lightning protection and surge arresters that shall be required at Service Entrances (LPZ 0_A-LPZ 2 or higher) of common building services. Final selected configuration shall be based on type of line to be protected, number of lines to be protected and type of installation in addition to the recommendations of the protected equipment manufacturer.

120.090 DATA PROCESSING NETWORKS

A. Ethernet network surge protectors shall be designed for computer networks with very fast data transfer speeds, up to 1 Gbit/s networks of Category 5E/6/6A and PoE / PoE+ installations.

B. Surge protectors for Local Area Networks (LAN's) shall be based on a combination of 3-pole gas tubes and fast clamping diodes.

C. Surge protectors shall be equipped with standard data processing connectors (such as RJ45 connectors) and shall be available in either a single enclosure to protect terminal equipment or to fit in a 19'' rack to protect at the switch level.

D. Video Transmission

1. Video Transmission shall be protected at the remote equipment level as well as at the local digital recording devices.
2. Surge protectors for video transmission shall be designed to support different configurations:

a) Analog Cameras: combining analog video and power supply protection into a single unit.
b) IP Camera: combining Ethernet and power supply protection in a single unit.
c) Power Over Ethernet (PoE) Video: designed for Power Over Ethernet applications.

E. The installation of surge protectors on data-processing networks shall be applied in accordance with IEC 61643-21 in areas of high electromagnetic disturbance, inter-building networks and wide area networks.

F. Below Table shows characteristics of typical protection configuration for SPD's at transition from lightning protection zone (LPZ 0_B to LPZ 2 and higher). Final selected configuration shall be based on type of network, application voltage level and data transmission speed.in addition to the recommendations of the protected equipment manufacturer.

Characteristic	Application

Maximum Operating DC Voltage (U_c)	48V
Maximum Operating AC Voltage (U_c)	34V
Maximum Continuous DC Voltage Pair-Pair (PoE) (U_c)	57V
Nominal Current (I_L)	1A
C2: Nominal discharge current (8/20 µs) line-line (I_n)	150A
C2: Nominal discharge current (8/20 µs) line-earth (I_n)	2.5 kA
C2: Total nominal discharge current (8/20 µs) line-earth (I_n)	10 kA
C2: Nominal discharge current (8/20 µs) pair-pair (PoE) (I_n)	150A
Voltage protection level line-line for I_n C2 (U_p)	≤190V
Voltage protection level line-earth for I_n C2 (U_p)	≤600
Voltage protection level line-line for I_n C2 (PoE) (U_p)	≤600
Voltage protection level line-line at 1 kV/µs C3 (U_p)	≤145V
Voltage protection level line-earth at 1 kV/µs C3 (U_p)	≤500V
Voltage protection level pair-pair at 1 kV/µs C3 (PoE) (U_p)	≤600V
Insertion loss at 250MHz	≤2.0 dB
Transmission class to EN50173-1	Class E_A
Wiring	8 wires + shield

120.100 RADIO COMMUNICATION EQUIPMENT

A. General features of surge protectors for radio communication equipment:

1. Generally, SPD's shall employ Gas Discharge Tube (GDT) technology for the following reasons:

   a) GDT's have very low capacitance at very high frequency transmission lines (several GHz).
   b) Following an overvoltage incidence, the GDT will return to its original condition of high isolation and will become operational again. This occurs since the GDT is connected in parallel between the central conductor and the external shield of a coaxial type installation.
   c) The GDT's have a very wide bandwidth from DC to 6GHz.

2. "Quarter-Wave" SPD's shall be used as 'band-pass" filters to act as a short circuit between the conducting core and the external ground for the tuned frequencies. They filter out the lightning low-frequency spectrum from the operating frequencies.
3. Connector Types: N, TNC, SMA, F, BNC, etc. as required by the protected installation.

B. SPD's for outdoor use shall be suitable for the prevailing outdoor environmental conditions described in Division V, Section "Basic Electrical Materials and Methods".

C. Material:

1. Housing: Brass, with white bronze tri-metal alloy.
2. Contacts: Bronze with gold/silver plating.

D. SPD's shall be installed at the Service Entrance of the installation, to limit the propagation of lightning currents, and also near sensitive equipment.

E. Below Table shows characteristics of typical protection configurations of combined lightning protection and surge arresters that shall be required at Service Entrances ($LPZ0_A$-LPZ2 or higher). Final selected configuration shall be based on type of line to be protected, number of lines to be protected and type of installation in addition to the recommendations of the protected equipment manufacturer.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Manufacturer Qualification: A firm regularly engaged in the manufacture of surge protective devices, of types and capacities required, and whose products have been in satisfactory use in similar service for not less than five years.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store, and handle materials, components, and equipment as per Manufacturer's instructions.

310.030 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

   1. Warranty Period: 1 year from date of substantial completion.

320.000 SUBMITTALS

A. Product Data: For each type of product.

   1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   2. Copy of type test certificate in accordance with IEC 61643.

B. Energy coordination study between SPDs installed at different levels.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's special warranty.

E. Maintenance Data: For SPDs to include in maintenance manuals and to the satisfaction of Employer's requirements.

330.000 EXECUTION

330.010 INSTALLATION

A. Comply with IEC 61643-11, IEC 61643-21 and BS 7671.

B. For equipment installed at the roof / outdoor, coordinate with the equipment manufacturer for surge protection requirements according to the recommendations of the equipment manufacturer.

C. Leads / wires shall be routed through the shortest straight parallel path. Wires shall be twisted type to reduce conductor's inductance.

D. Install SPDs such that the total SPD lead length(s) and size(s) along with the distance between the SPD and the protected equipment does not exceed the values required by IEC 60364-5-53 or recommended by manufacturer for proper operation whichever is more stringent.

E. Use crimped connectors and splices only. Wire nuts are unacceptable.

F. Tighten electrical connectors and terminals, including screws and bolts, according to manufacturer's published torque-tightening values and / or recommendations. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

G. Wiring:

   1. Power Wiring: Comply with wiring methods in Division Y Section "Low-Voltage Electrical Power Conductors and Cables."
   2. Controls: Comply with wiring methods in Division Y Section "Low-Voltage Electrical Power Conductors and Cables."

H. Telecommunications and Signal Processing Equipment

© Copyright protected

1. To be effective, surge protectors shall be installed in accordance with the following principles:
    a) The grounding point of the surge protector and that of the protected equipment shall be inter-connected.
    b) Protection shall be installed at the network entrance to divert impulse currents as fast as possible.
    c) The protected equipment shall be located near the surge protector (less than 10m). If this rule cannot be achieved, secondary protection shall be installed near the equipment for coordinated surge protection.
    d) The grounding conductor between the ground output of the protector and the installation bonding circuit shall be as short as possible (less than 50 cm) and shall have a cross-sectional area of at least 2.5 mm².
    e) The ground resistance shall comply with Project Specifications.
    f) Protected and unprotected wires shall be kept apart to limit the potential for coupling.
2. In an equipotential bonding network and to reduce the residual voltages during lightning discharge currents, the connection of Radio communications protector to the bonding network shall be as short as possible (less than 50 cm) and shall have a proper cross sectional area of at least 4 mm².

330.020 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative.
    1. Compare equipment nameplate data for compliance with Drawings and Specifications.
    2. Inspect anchorage, alignment, grounding, and clearances.
    3. Verify that electrical wiring installation complies with manufacturer's written installation requirements.

B. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

C. Prepare test and inspection reports.

330.030 STARTUP SERVICE

A. Complete startup checks according to manufacturer's written instructions.

B. Do not perform insulation-resistance tests of the distribution wiring equipment with SPDs installed. Disconnect SPDs before conducting insulation-resistance tests, and reconnect them immediately after the testing is over.

C. Energize SPDs after power system has been energized, stabilized, and tested.

330.040 DEMONSTRATION

A. Train Employer’s maintenance personnel to operate and maintain SPDs. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

W60 - CENTRAL CONTROL BUILDING MANAGEMENT

PART 3 SPECIFICATION CLAUSES SPECIFIC TO W60

300.000 GENERAL

300.002 DESIGN PARAMETERS AND PERFORMANCE OBJECTIVES:

- The Contractor shall supply, install, test and commission the Building Management System as detailed in this specifications, control diagrams, design drawings and applicable standards.
- The scope of works includes the supply, installation, testing and commissioning, start up of the BMS and training of the operators.
- The BMS shall use direct digital controllers (DDC) for controlling and monitoring the individual MEP systems.
- The Contractor must note that the Specification describes in general terms the control philosophy for various systems and the means of achieving the same. These are the minimum requirements only. In view of the rapid changes in the field of controls and related technology, the Contractor shall include for the latest technology and systems available from the specified manufacturer at the time of tender. The Contractor shall allow the costs related to loading the latest version of software available at the time of handing over of the installation.
- The Building Management System shall be a Client/server System consistent with latest industry standards operating on a fully open protocol that is widely recognized by many different BMS developers. It shall use simple operating techniques and shall be used to monitor and control building services installations. The Contractor is advised that the full and correct operation of the BMS installation is required and that he shall take all necessary measures to achieve this.
- The proposed system and components shall be compatible with a wide variety of control devices and third party systems using BACnet, Ethernet TCP/IP, Modbus and OPC standard for open system communications and other current international communication standards. The BMS shall be capable of being extended with controllers on the BACNET protocol. The BMS shall allow integrating future BACnet controllers on the management and on the automation levels.

300.003 SYSTEM DESCRIPTION AND REQUIREMENTS:

- The BMS shall be designed to utilize the building's IT network infrastructure, where this is installed and it is practical to do so. The BMS specialist shall, however, allow for integration and connection of all BMS functions and systems by independent systems as required to achieve the functionality of the BMS specified in this specification. The BMS communication backbone shall use BACNET.
- The current system architecture is based on having a dedicated BMS server that is integrated to the various systems within the overall development with BMS Outstation location as shown in BMS network schematic, contractor shall provide the number of BMS outstations as required for the project and not limited to the numbers represented on the schematics.
- The DCC control panels and enclosures shall be linked over the converged data network.
- All hard wired I/O points shall be connected to the above panels/controllers
- Select control components and equipment, suitable to meet system objective requirements. Ensure that system safety complies with:
    - BS EN 61508-series for control of systems where an assessed safety integrity level is required
    - BS EN ISO 13849 and BS EN ISO 13849-2 for safety-related components of control systems

    - BS EN ISO 13850 for design of emergency stop functions
    - BS EN 61511-1 for functional safety of programmable controllers
- Comply with BS EN 15500-1 for electronic individual zone control equipment.
- Comply with relevant parts of BS EN 60730 for automatic electric controls.
- Comply with the following standards for building automation and control systems (BACS) components:
    - BS EN ISO 16484-2 for hardware
    - BS EN ISO 16484-3 for functions
- Comply with the requirements of the relevant parts of BS EN 50491, BS EN 63044-1 and BS EN IEC 63044-3 appropriate to the project, for Home and Building Electronic Systems (HBES) and Building Automation and Control Systems (BACS).
- Refer to Part 4 of this specification section W60 and other relevant clauses of the Particular specification sections R, S, T, U, V and W. Refer to BMS schematics for sequence of operation and I/O point schedules.

300.020 CONTROL SYSTEM:

- Provide a Building Management System (BMS) to meet the particular requirements detailed in the system objectives, descriptions and control strategies.
- Provide a Building Management System, including:
    - Equipment design
    - Development of design
    - Supply
    - Installation
    - Commissioning
    - Setting to work
    - Operator training
    - Fine tuning and seasonal commissioning during the defects period
    - Integration with other systems as specified elsewhere within this specification

300.030 CONTROLS SPECIALIST:

- Use a controls specialist to design, supply, install, test and commission complete controls installation.

300.060 CONTROL COMPONENTS MANUFACTURER:

- Unless otherwise indicated use control components and equipment from one manufacturer throughout.

300.100 ELECTROMAGNETIC COMPATIBILITY:

- Ensure all monitoring system equipment is compatible and does not adversely affect any other equipment installed in the same location.
- Ensure all systems are designed and installed with due consideration to good electromagnetic compatibility (EMC) practice, and in line with EMC requirements of relevant standards including:
    - BS 7671 (IET Wiring Regulations)

- BS EN 50310 for earthing and bonding in relation to communications system components
- BS EN 50174-series for communications and control cabling
- BS EN 61000-6-7 and BS EN 61000-1-2 as relevant for EMC in relation to functional safety

- Ensure all equipment complies with BS EN 50130-4 where relevant.
- Ensure fire alarm interface equipment complies with BS EN 50130-4 where relevant.

310.020 GENERAL REQUIREMENTS - ELECTRICAL SAFETY:

- Ensure that the BMS installation complies with BS 7671.
- Ensure that control panels comply with:
  - Relevant parts of BS EN 61439-series.
  - BS EN 60204-1 where the control panel is classed as Machinery in accordance with the Supply of Machinery (Safety) Regulations 2008.

310.030 GENERAL REQUIREMENTS - ELECTRICAL SUPPLY:

- Ensure that the BMS can operate when supplied with electricity conforming to:
  - BS EN 50160 - voltage characteristics of electricity supplied by public distribution systems
  - Additional voltage drop within the consumer's electrical installation in accordance with BS 7671 (IET Wiring Regulations)

310.050 GENERAL REQUIREMENTS - EMERGENCY RESTORATION PROCEDURES:

- Ensure that the BMS fully restores all control and monitoring functions following an emergency shut down period.
- Time period for restoration of plant [5 minutes]
- Ensure that the start delay times can be adjusted according to the magnitude of the load.
- Ensure that the system restart does not cause unsafe operating states.

310.070 GENERAL REQUIREMENTS - TIME SYNCHRONISATION:

- Ensure that all time-dependent BMS components are time synchronised:
  - System synchronisation source:
    - BMS client device
    - BMS system servers

- Ensure the BMS system time synchronisation source maintains at least the following accuracy requirements:
  - Unsynchronised accuracy better than 0.2 s / day.
  - Synchronised accuracy better than 0.1 s with respect to the master synchronisation source.
- BMS system time synchronisation source's master time synchronisation method:
  - Manual
  - Local Area Network (LAN)
    - Network type
      - Wireless.

        - Wired.
    - Time protocol
        - Network Time Protocol (NTP)
            - NTP v2.
            - NTP v3.
            - NTP v4.
            - Unicast RFC1305.
            - Broadcast RFC1119.
        - Simple Network Time Protocol (SNTP)
            - SNTP v3.
            - SNTP v4.
            - Unicast RFC1305.
            - Broadcast RFC1119.
        - TIME protocol RFC868
            - UDP mode.
            - TCP mode.
        - Time servers
        - Global Positioning System (GPS)
- Ensure that the BMS can automatically handle daylight saving adjustments
- Ensure that the BMS can automatically accommodate time adjustments such as leap years and leap seconds.

310.080 GENERAL REQUIREMENTS - SYSTEM SECURITY:

- Standards
    - IET Code of Practice for Cyber Security in the Built Environment
- Provide, as a minimum, operator access for the following levels based on user's login credentials:
    - Level 1 - Ability to display all point data
    - Level 2 - Ability to display all point data and to initiate data logging functions
    - Level 3 - Ability to display all point data; to initiate data logging functions; and to change set points and time schedules
    - Level 4 - Ability to display all point data; to initiate data logging functions; to change set points and time schedules; and to change control strategies and schematic/graphics functions and password assignment
- Ensure that appropriate credential-based operator and maintenance technician access is set up for clients, servers and field controllers
    - Login access type (field controllers):
        - Password
    - Login access type and complexity for operator clients and servers:
        - In accordance with information technology (IT) strategy
- Ensure that the BMS software is protected from unauthorised entry.

- Manage information security of systems, software and data during design, implementation and commissioning in line with BS EN ISO/IEC 27001.
- Ensure that the BMS can be maintained by a service provider in accordance with BS EN ISO/IEC 27001 and BS ISO/IEC 20000-1.

310.090 GENERAL REQUIREMENTS - SYSTEM SOFTWARE:

- Obtain on behalf of the end users all appropriate licences, permissions, copyright waivers, rights of use and the like from the owners of the software rights. Ensure that the end user is properly registered with the software supplier for support and appropriate updating. Provide documentation for application software in accordance with BS ISO/IEC 26513 and BS ISO/IEC 26514.
- Ensure that, as far as practicable, all software is commercially available off-the-shelf.
- Ensure that any programmable configuration, customisation and bespoke software is developed, tested and commissioned using relevant processes and procedures complying with BS ISO/IEC 12207 or BS ISO/IEC/IEEE 15288, supported by a quality management system meeting the requirements of BS EN ISO 9001.
- Ensure that IT industry standard operating systems are used.
- Ensure that copies of all BMS vendor-specific software are held by an independent third party and that this software can be released to the client.
- Ensure that the ESCROW Agreement is completed and signed.

310.093 GENERAL REQUIREMENTS - CHOICE OF CONTROL STRATEGY:

- Ensure that the selected control strategies are appropriate for the building services systems and their intended application.
- Ensure that selected control strategies are robust and not over complex.
- Where a novel control strategy is to be implemented, ensure that testing/evaluation is performed to confirm its suitability.
- Ensure that wherever possible selected control strategies are those provided in the BSRIA Library of System Control Strategies: AG 7/98.

310.095 GENERAL REQUIREMENTS - DESIGN FOR COMMISSIONABILITY:

- Ensure that the BMS specification details required for commissioning are made available to the BMS commissioning engineer.
- Ensure that all field controllers, sensors and controlled devices are easily accessible and can be removed for testing and future maintenance.
- Liaise with the mechanical contractor to ensure that air handling units are provided with appropriate access doors.
- Ensure that access is available to all control devices. Comply as appropriate with:
    - BS EN 547-series
    - BS 7671 (IET Wiring Regulations) requirements for maintenance gangways
- Ensure that the requirements of the following documents are met:
- Ensure that sensors are installed correctly in order to give representative readings.
- Ensure that reference labels are attached to each control device.

310.096 GENERAL REQUIREMENTS - FUTURE SYSTEM EXPANSION:

- Ensure that the BMS is capable of dealing with a future 20% increase in the number of points without compromising the system's functionality or speed of operation.

310.097 GENERAL REQUIREMENTS - DESIGN FOR MAINTAINABILITY:

- Ensure that a full O&M manual is prepared which reflects any system changes made during the installation and commissioning stages.
- Ensure that adequate access to BMS equipment and components is provided.
- Ensure that all components and wiring are identified by a consistent numbering system.

310.100 GENERAL REQUIREMENTS - SYSTEM SUPPORT:

- Ensure that a viable strategy is in place to fully support the BMS for a minimum of 10 years from the date of practical completion.

310.110 OPERATOR CLIENT / SERVER - OPERATIONAL CHARACTERISTICS:

- Ensure that the control of plant is independent of the operator workstation.
- Ensure that no data of a control nature is transferred between field controllers via the client / server, i.e. data relating to control strategies.
- Ensure that the client / server can communicate with all addressable field devices.
- Provide complete system integrity such that the network of field controllers will continue to fully operate following a failure of the client / server.
- Ensure that the appropriate control strategy configuration data can be downloaded to all addressable field devices.
- Provide a means of displaying and modifying each addressable field controller's control strategy, time schedules and set-points via the client / server.
- Allow the operator to re-schedule plant operation times. Ensure that re-scheduling can be applied globally to a number of items of plant at one or more sites (or one or more controllers on one site) as selected by the operator.
- Allow an operator with sufficient user privileges (e.g. Administrator access) to create, modify and delete control strategies within all addressable field controllers.
- Ensure that the client / server incorporates a data storage management system that warns against impending online storage overflow and allows for data archiving to, and retrieval from, offline non-volatile media. Ensure that the operator is prompted at pre-defined intervals to carry out the data archiving procedure.
- Ensure that it is possible to perform a complete backup of the Plant control strategies, set-points and logged data to the server.
- Where neither network-attached storage (NAS) storage area network (SAN) or cloud storage are utilised to backup purposes by the system, provide an electronic data archival device that uses readily available non-volatile media that is appropriate for long term storage of system software, configuration data and logged data (including alarm data).
- Allow the transfer of data from the system memory and other storage devices to the archive mediums, and vice versa for the preparation of reports.
- Ensure that the system can be fully restored from backup data.

310.115 BMS SERVER EQUIPMENT:

- Type, 19” Rack mounted server
- Standard
    - BS EN ISO 16484-3
    - BS EN 60950-1
    - BS EN 62368-1
- Approach

- Virtual server shall be used when more than one physical server is required. The virtual environment shall be implemented on the physical servers.
- Physical server (s)
- Location as indicated in the design drawings
- Duty-standby server
    - Type
        - Hot standby.
- Local storage
- Hard disk
- Capacity (GB) 2000

- RAM (GB) 32
- Processor
    - Ensure that the processor speed is such that delays in processing system data do not exceed 500 mseconds
- Administrator interface
    - Remote desktop
    - Local user interface
        - Rack drawer Monitor KVM
            - UK QWERTY keyboard with touchpad
            - Monitor size 19”
            - Monitor resolution FHD 1080p

- Operational and maintenance user interfaces:
    - Concurrent users at least 10
    - Client application
        - Laptop.
        - Desktop through thin client (web browser access)

310.120 CLIENT DISPLAY EQUIPMENT:

- Standard
    - BS EN ISO 16484-2
    - BS EN 60950-1
    - BS EN 62368-1
- Client
    - Personal computer.
    - Laptop.
    - Local disk
        - Solid state disk for operating system
        - Hard disk for working data
        - Capacity (GB) 1
    - RAM (GB) 16

- Processor
    - Ensure that the processor speed of each client meets the data processing requirements.
    - Ensure that the processor speed is such that delays in processing system data do not exceed 500 mseconds
- Monitor / display
    - Type
        - Separate monitor.
        - Built-in to client device.
    - Use a colour display with a resolution no less than 1080p
    - Diagonal dimension of the monitor 25”
    - Protection against reflection
- User access
    - Provide a UK QWERTY keyboard with full upper/lower case ASCII key-set, numeric keys and mouse

310.125 PRINTER:

- Type, Laser
- Standard
    - BS EN 60950-1
    - BS EN 62368-1
- Ensure that the printer can print all monitored and logged data (including graphs of logged data); all point data (hard and soft); control logic and plant/building schematics in colour; alarm data/text; and system help text.
- Ensure that the automatic printing of alarm data can be switched on/off.
- Ensure that alarm data can be routed to specific clients and/or individual operators as identified by their specific logon information.
- Ensure that the printer has a minimum output of four pages per minute.

310.130 SYSTEM MONITORING AND LOGGING FUNCTIONS:

- Ensure that all monitored point data can be displayed at the client. Ensure that analogue, digital and soft-points can be displayed simultaneously.
- Ensure that all changes made by the operator (e.g. set-point changes) can be logged and identified by both operator and date/time stamp.
- Provide a facility to allow the display, at the client, of 'real time' data superimposed on plant schematics and refreshed automatically as the monitored value changes.
- Ensure that a minimum of six 'real time' data points can be displayed simultaneously, on one graph, in the form of data plots.
- Provide a facility to allow the monitoring and display, on the same 'page', of common criteria/plant functions.
- Ensure that any hard or soft-point log can be displayed and stored on any operator workstation.
- Ensure that logs can be set up from any client and that optional logging start and stop dates and times are adjustable.
- Ensure that log samples can be recorded either on a polled basis, where the logging intervals are user adjustable between 1 second and 24 hours, or when the value changes by an amount greater than an adjustable hysteresis threshold.

- Ensure that the server has sufficient data storage capacity to accommodate the defined amount of logged data and that the data can be backed up.
    - Amount of logged data: 2 years
- Provide a facility to allow the simultaneous display of different logged data. Ensure that this function is operator adjustable.
- Provide a facility to allow the export of logged data to other software packages. Ensure that the format of the exported data can be fully defined

310.140 GRAPHICAL USER INTERFACES:

- Standard
    - BS EN 61082-1 for general schematic and information presentation
    - BS EN 60073 for indications and actuator states
    - ISO 7000 / IEC 60417-series, IEC 60617 and ISO 14617-series for symbols in general
    - BS 1553-1 for piping systems and plant symbols and schematics
    - BS 1553-2 for power generating plant symbols and schematics
    - BS 1553-3 for compressing plant symbols and schematics
    - BS 1635 for fire protection system symbols and schematics
    - BS 4737-5.2 for the intruder alarm system symbols and schematics
    - BS EN 1861 for refrigerating system and heat pump symbols and schematics
- Provide a library of plant schematics and symbols, the format/contents of which should be confirmed with the specifier based on samples.
- Provide a facility to allow the operator to generate additional schematics and symbols using readily available drawing formats (e.g. bitmap, jpeg).
- Ensure that the system can accommodate the addition of 20% extra graphics 'pages'.
- Provide an easy to use facility to allow the operator to modify plant schematics and to generate new ones. New elements for schematics to be available on a Tool Palette, and the association with data points in controller outstations to be made using drag-and-drop.
- Ensure that graphics can be displayed in a layered approach (building layout graphics down to plant subsystems and components). Ensure that the operator can modify the structure of the layered approach.

310.150 USER INTERFACE - HELP AND ASSISTANCE:

- Provide a facility to allow the display of help text covering all operator functions and system fault conditions.
- Provide a facility to allow the display (including a hard copy) of points list (hard and soft-points) and control strategy.

310.160 INTEGRATION WITH THIRD PARTY MANAGEMENT SOFTWARE:

- Energy monitoring and targeting software
    - Provide a facility to allow the direct transfer of recorded energy consumption and external air temperature readings from the BMS to the monitoring and targeting software. Ensure that real time data is available in a standard database format (e.g. SQL, ODBC, etc).
- Maintenance management software

- Provide a facility to allow the direct transfer between the BMS and the maintenance management software of plant run hours; number and frequency of plant starts; critical alarms requiring immediate attention; and maintenance (non-critical) alarms.
- Ensure that real time data is available in a standard database format (e.g. SQL, ODBC, etc).

310.170 SYSTEM ALARMS:

- Standard
  - BS EN 62682
  - Engineering Equipment and Materials User Association publication No.191 "Alarm systems: A guide to design, management and procurement"
- Ensure that alarms are displayed on a rolling basis in chronological order.
- Ensure that the operator can acknowledge alarms, including muting of audible or flashing annunciators.
- Provide a facility to silence audible alarms or inhibit flashing annunciators without performing alarm acknowledgement.
- Ensure that alarms can be inhibited for reasons of time and/or priority as selected by the operator.
- Ensure that the BMS can be configured to avoid fleeting alarms, i.e. ensure that alarms can accommodate start-up and shutdown delays.
- Ensure that the administrator can alter the limits at which the measured values cause alarms to be triggered.
- Ensure that alarms can be limited to the source items(s) of plant.
- Ensure that alarm limits can accommodate sliding limits, e.g. set-point changes.
- Ensure that alarms can be differentiated by means of alarm type and identification.
- Ensure that alarms can be prioritised (including a high priority that will be annunciated regardless of other activity) and a low priority or information status that is only annunciated on demand.
- Ensure that the time taken to receive alarms does not exceed 2 seconds
- Ensure that visual, audible and printed annunciation of alarms, or any combination of these, can be selected by the operator.
- Ensure that the reception and acknowledgement of alarms can take precedence over other operations. However, ensure that the reception of alarms does not hinder user log-in.
- Allow the user to acknowledge alarms individually and on a group basis. Acknowledgement should include muting or flashing annunciators.
- Provide distinction between active alarms whose conditions are not cleared and unacknowledged alarms.
- Provide an alarm-latching facility with manual reset.
- Ensure that alarm data provides condition identity; condition value; alarm source; alarm time and date; and acknowledgement status.
- Ensure that the alarm file can be sorted by the above criteria.
- Allow alarms to be automatically redirected to other operator workstation or to individual operators, regardless of which workstation they are logged on to.
- Provide sufficient data storage capability for the storage of alarms.
- Ensure that any stored alarm data can be analysed in conjunction with other monitored conditions or stored logged data.
- Ensure that an alarm review facility is available.
- Allow the display of stored alarm data based on user definable selection criteria.
- Ensure that the operator can define the requirement for acknowledgement of alarms; a time programme for annunciation of alarms to different destinations; and text messages associated with alarm conditions.

- Ensure that critical alarms can be relayed by SMS text message and/or email to a distribution list of operators. The definition of a 'critical alarm' is to be wholly adjustable by the administrator.

310.175 FIELD CONTROLLERS - GENERAL:

- Type, Direct Digital Controller BTL Listed B-AAC, B-ASC
  - B-AAC
    - Controller shall be 32 bit microprocessor based BACnet® Advanced Application Controller.
    - The application control program shall be resident within the same enclosure as the input/output circuitry, which translates the sensor signals.
    - All Advanced Application Controller shall be fully programmable with the help of Windows based software programming tool and shall at all times maintain their BACnet® compliance.
    - All control sequences within or programmed into the B-AAC shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained.
  - B-ASC
    - Controller shall be 32 bit microprocessor based BACnet® Application Specific Controller.
    - The application control program shall be resident within the same enclosure as the input/output circuitry, which translates the sensor signal.
    - Mains powered ASCs serving FCUs shall have provide 24 VAC output that serves to power the modulating valve actuator.
- Application
  - B-AAC: HVAC plants control such as Air Handling Equipment
  - B-ASC: Terminal Unit Controllers
- Standard
  - BS EN ISO 16484-2
  - BS EN 15500-1
- Mounting
  - In control panel
- Casing material
  - Rigid plastic.
  - Rigid plastic with die cast aluminum finish.
  - DIN rail mount

310.180 FIELD CONTROLLERS - MODES OF OPERATION:

- All field controllers shall be direct digital controllers (DDCs).
- Ensure that the field controllers perform all control actions independently of the HMI.
- Ensure that the field controllers perform all control actions independently of the operator workstation.
- Ensure that all field controllers can operate independently and in real time following a failure of the BMS communication network.

- Ensure that field controllers can operate with the loss of shared data through the use of default values and final data reading before the loss of network communications.

310.190 FIELD CONTROLLERS - PHYSICAL CONSTRUCTION:

- For internal plant room applications, construct field controller enclosures to give a minimum degree of protection to IP54 in accordance with BS EN 60529. Where the field controller is fitted inside a control panel that is protected to IP54 then the field controller protection can be reduced to IP41. For external applications, construct field controller enclosures to IP65.
- Where an enclosure is to be provided ensure that field controller enclosures are lockable.
- Ensure that modular construction is used for field controllers. Ensure that this allows the removal and replacement of devices without the need for rewiring of field wiring.
- Ensure that I/O modules can be removed and replaced without the need to power down the entire modular system (i.e. I/O modules are hot-swappable).

310.200 FIELD CONTROLLERS - TERMINATIONS:

- Use terminals of the screw down clamp-type fixed to purpose made mountings.
- Segregate into groups terminals of different voltage bands (in accordance with BS 7671).

310.210 FIELD CONTROLLERS - FUTURE EXPANSION:

- Make provision for a future 20% increase.

310.220 FIELD CONTROLLERS - CONTROLLER INPUTS:

- Ensure that the interfaces for the field controllers are appropriate for gathering data from sensors and devices. Ensure that the following requirements are met.
- Universal inputs
    - Variable currents (4-20 mA), variable voltages (0-10V), variable resistances or volt-free contacts.
    - Ensure that the scaling tables, necessary to process inputs configured as type analogue, are resident at the field controller.
    - Ensure that a minimum and maximum limit value can be defined for each analogue input.
    - Ensure that each limit is associated with a configured response.
    - Ensure that the field controller can detect open or closed circuit faults and raise an alarm on the operator workstation.
    - Ensure that the configuration tables necessary to process inputs configured as type digital are resident at the field controller.
    - Ensure that the configuration tables necessary to process inputs configured as type multi-state are resident at the field controller.
- Pulsed inputs
    - As derived from volt-free contacts (max 24 volts/20mA) at a pulse frequency of up to 200 Hz.
    - Ensure that the routines necessary to process pulsed inputs are resident at the field controller.
    - Ensure that the field controller has the following capabilities:
        - Storage of cumulative totals daily; weekly; monthly; yearly; and continuously
        - Operator re-set facility of cumulative totals via the operator workstation
        - Ability to re-set the cumulative totals via control strategy as required
        - Ability to use and manipulate pulsed input data within the control strategy

        - Alarm facility based on a user-defined limit being exceeded
    - Ensure that the inputs which are used to monitor fluctuating pulse rate (e.g. maximum demand meter for electricity) have operator adjustable limits.
    - Ensure that when data for pulsed inputs is recorded, the record includes both the pulse count and logging intervals for cumulative counts.
- Run-time totals
    - Include run-time totalling routines to enable the operator to record cumulative run-time for each item of plant selected.
    - Provide the operator with the option to set a different maximum run-time for each item of plant selected.
    - Ensure that when the maximum run-time has been reached an alarm is signalled to the operator.
    - Ensure that the operator workstation can be used to interrogate field controllers for a point-by- point summary of run-time totals and run-time limits.
    - Ensure that it is possible for the user to set an initial value of hours run other than zero.
    - Ability to re-set the value of hours run to zero, or other value, via the control strategy.
- General
    - Ensure that all inputs can be scanned at intervals not exceeding 0.25 seconds.
    - For time-critical control applications, ensure that the field controller can scan at a time interval not exceeding 100 mseconds
    - Ensure that all inputs are protected against spurious out-of-range signals including those caused by contact noise or bounce.
    - Ensure that errors introduced by the analogue to digital conversion of inputs do not exceed 1 LBS.

310.230 FIELD CONTROLLERS - CONTROLLER OUTPUTS:

- Ensure that isolation between controllers and networks meet the requirements of BS EN 63044-series.
- Ensure that the field controllers' interfaces are capable of providing control signals to actuators and switching devices.
- Ensure that routines are configurable, such that one or more events may be enabled in direct response to any defined logical relationship between the status of a number of physical or soft-points.
- Ensure that in the event of power failure, output devices can be driven to their preset, fully open/closed position.
- Provide the following interface characteristics:
    - Analogue output. As variable currents (4-20mA) or as variable voltages (0-10V). Ensure that it is possible to characterise analogue outputs in order to obtain a near linear response from the controlled items of plant.
    - Digital output. Ensure that digital outputs can be selected as 'normally closed' or 'normally open'.
- Ensure that errors introduced by the digital to analogue conversion of outputs do not exceed 1 LSB.
- Ensure that the field controller is capable of receiving feedback signals which allow the comparison between an output signal to a controlled device and its actual condition.

310.240 FIELD CONTROLLERS - POSITIVE FEEDBACK:

- Ensure that the field controllers can include routines necessary to confirm that specific items of plant are functioning correctly. Ensure that this can be performed by monitoring physically separate but functionally related sensors, switches or transducers.
- Ensure that an alarm is raised if the expected response has not been established by a pre-set time following switching on of plant. Ensure that it is possible to operate any specified standby plant. Provide the operator with a facility to adjust the pre-set time delay.
- Ensure that the field controllers are capable of using measured feedback from an actuator position to give a percentage open reading.

310.250 FIELD CONTROLLERS - DATA MONITORING AND LOGGING:

- Ensure that hard and soft-points associated with a field controller can be logged.
- Ensure that the BMS operator can set the start/stop dates and times at the operator workstation.
- Ensure that the BMS operator can choose between polled logging, with a defined interval, and event logging, where the monitored point is logged when it changes state (for digital and multistate points), or changes value by more than a defined amount (hysteresis) in the case of analogue points.
- Ensure that logging is selectable between a finite memory buffer or on a rolling basis.
- Ensure that each log can be defined in terms of log identification (point identification); units; and date/time stamp.
- Ensure that the operator can select all physical and soft-points for logging.
- Ensure that the field controller has sufficient memory to log the equivalent of seven days data at 15 minute intervals for 50% of the total number of physical points on the field controller.
- Ensure that the log data is to be automatically uploaded to the operator workstation / system server and stored in a standard database format (e.g. SQL, ODBC).

310.260 FIELD CONTROLLERS - ENVIRONMENTAL CONDITIONS:

- Ensure that field controllers are suitable for operating normally within the following environmental ranges:
  - Temperature 0 to 55°C
  - Relative humidity 10% to 90% non-condensing
- Ensure that the field controllers will operate in the electrical environment associated with building services plant rooms.
- Ensure that the field controllers are protected against the effects of moisture, dust, dirt and gases.

310.270 FIELD CONTROLLERS - INTERNAL POWER BACKUP:

- Ensure that a rechargeable battery or capacitor, if specified, can hold the controller's volatile memory for a minimum period of 72 hours.
- Ensure that a non-rechargeable battery or capacitor, if specified, can maintain the controller's clock function for a period of two years.
- Ensure that the battery is easily replaceable and raises an alarm on the BMS when battery failure occurs.
- Ensure that the interval between battery maintenance inspections is not less than 12 months.
- Ensure that any battery monitoring functions defined in the Particular Inspection can be met.

310.280 FIELD CONTROLLERS - MEANS OF CONFIGURATION:

- Ensure that the field controllers can be fully configured directly via a laptop type computer and via the operator workstation and BMS servers.

- Ensure that the field controllers can be configured through the use of a configuration interface with full upload and download capability.
- Ensure that configuration details can be easily altered by system operators.
- Ensure that access to make configuration alterations is restricted to operators with access authority through the use of passwords.
- Ensure that field controllers are supplied with a service port that allows connection of wired and Bluetooth wireless devices for configuration via a laptop type computer.
- When connected using the service port, all the controllers in the entire BMS network are to be accessible via the laptop type computer.

310.290 FIELD CONTROLLERS - USER INTERFACES:

- Ensure that all field controllers can be accessed through the use of portable computers.
- Ensure that access allows the display of all configuration details associated with the field controller along with:
    - Password protection for access with a minimum of two access levels
    - Ability to display all point data (both hard and soft)
    - Ability to initiate and display logged data
    - Ability to display and alter set-points and time schedules
    - Ability to make alterations to control strategies
- Ensure that one field controllers for each plant room incorporates a panel-mounted operator interface. Ensure that the interface includes the ability to:
    - Provide password protection for access with a minimum of two access levels
    - Display graphical representations of plant schematics in full colour
    - Display all physical point data
    - Display and alter set-points and time schedules
    - Display the current date and time
    - Review and acknowledge alarms
    - Display logged data in graphical format, with overlaying of up to 8 logs on a single graph.

310.300 OCCUPANT CONTROLS - GENERAL:

- Ensure that the specified occupant controls can be linked to, and communicate over, the BMS communications network.
- Ensure that the occupant controls can control the relevant items of plant.
- Ensure that the status of each occupant controller can be viewed and overridden via the operator workstation.
- Ensure that each occupant controller has a service port available that allows a laptop type computer to be connected using a suitable wired service tool. It shall be possible to disable the service port function via the password protected configuration settings for the occupant control.
- When connected using the service port all controllers in the entire BMS network are to be accessible via the laptop type computer.
- Ensure that the occupant controls allow:
    - Adjustment by the occupants of the set-points
    - Definition, and adjustment by the BMS operator, of high and low limits for each set-point control
- Provide a facility to allow the global alteration of set-point and high/low limits via the operator workstation.
- Provide an override facility to allow plant operation during out of hours occupation.
- Ensure that the occupant controls are intuitive to use and clearly labelled.

- For temperature control ensure that hot/cold and/or red/blue indication is used for the occupant interface.
- For fan speed control ensure that fan fast/slow indicators are used.
- Ensure the +/- symbols are not used without clarification of the controlled function.

310.310 NETWORK CONTROLLER - GENERAL:

- Type, Network Controller or Building Controller BTL Listed B-BC
    - The Network Controller (NC) shall be a Native BACnet® controller based on 32 bit technology to provide the interface between the field control network and the BMS management level and provide global supervisory control functions over the control devices connected to the NC.
    - The NC shall conform to BACnet® Building Controller (B-BC) profile and shall have at least two (2) TIA/EIA-485 ports configurable for BACnet MS/TP, Modbus, etc.
    - The NC shall be provided with appropriate PIC statement defining BACnet® services and objects supported. BACnet® Data Sharing BIBBs supported shall include at a minimum: RP, RPM, WP, WPM and COV. Alarm and Event, Trending, and scheduling including SCHED-A BIBBs support shall also be supported in BACnet® native communications.
    - The NC shall support Master Communication control on the BACnet communication bus and shall physically connect to the LAN without the need for additional Router hardware
    - The NC shall support transmitting and receiving segmented messages as well as BACnet® Broadcast Messages over IP.
    - It should be possible to define any NC / GPC in an IP subnet as a BBMD device.
    - The NC shall also support both Secure (https://) and non secure (http://) remote web server access using commonly used web browsers. It shall be capable of executing application control programs to provide as shown on the drawing provide 32 bit bacnet controllers with BACnet communication: according to ISO 16484-5 and B-BC (BACnet - building controller) profile. Data communication shall be achieved utilizing:
        - Calendar functions
        - Scheduling
        - Trending and Trending Backfill
        - Alarm monitoring and routing
        - Time synchronization
        - Integration of BACnet® devices and BACnet® controller data
        - Integration of MODBUS devices and serial MODBUS RTU controller data.

310.330 CONTROL FUNCTIONS AND ROUTINES - GENERAL:

- Provide a facility to automatically cycle selected actuators through their full range of movement outside normal operating periods in a sequential manner with a periodicity set by the operator (in addition to normal automatic or manual control). Ensure that the cycle finishes as one complete operation. Ensure that any alarm conditions raised during the operation are inhibited as necessary.
- Provide a facility to drive actuators to their open or closed positions at the end of plant operating periods.

310.340 CONTROL FUNCTIONS AND ROUTINES - BASIC CONTROL FUNCTIONS:

- Ensure that configuration routines necessary for direct digital control (DDC) are resident at the field controllers.

- Provide DDC of plant through algorithms giving proportional plus integral plus derivative control (PID).
- Provide two-position control.
- Provide raise-lower or three-point control.
- Allow the selection of either proportional control (P), or Integral only control (I), or proportional and integral control (P+I) or proportional and integral plus derivative control (P+I+D) modes independently for each relevant item of plant. Ensure that proportional, integral and derivative action times can be adjusted by the user.
- Allow the combination of more than one control loop by 'cascading', i.e. using the output signal from one control loop as the input signal to another control loop.
- Ensure control routines provide for bumpless transfer capability when switching from manual mode to automatic mode.
- Ensure that the control routines are capable of controlling the individual plant items listed
- Provide a comprehensive programmable facility using a simple and easy to use program strategy tool that allows comprehensive debugging and live editing of control strategies.
- If a comprehensive programmable facility is not available then a micro function block based tool may be supplied providing the following requirements are met:
    - Provide logic modules covering:
        - Logical combination of digital variables
        - Logic timer module
        - Logic readback module
        - Logic counter module
        - Logic delay module
        - Logic hours run module
    - Provide the following logic functions:
        - AND
        - NOT AND (NAND)
        - NOT OR (NOR)
        - OR
    - Provide the following function modules as a minimum:
        - Filter (applies exponential filter with gain to input signal)
        - Rescale from (rescale an input of 0 to 100 to a user defined output and limits at these values)
        - Rescale to (rescales the input to the output of 0 to 100 and limits at 0 and 100)
        - Limit at (limits the output at user specified values)
        - Limit to (limits the output to 0 or 100 percent at values specified by the user)
        - Logarithm of input; Square root of input; Add to input; Multiply by input; Divide by input
        - Minimum (to select the minimum value from two or more inputs)
        - Maximum (to select the maximum value from two or more inputs)
        - Average (to calculate the average value from two or more inputs)
        - Analogue gate (digital signal switches output between two analogue input signals)
        - Comparator (to compare two inputs, when input X is greater than input Y output of one is produced otherwise the output is zero)
        - Enthalpy (to calculate the enthalpy value from a temperature input and humidity input)
        - Hysteresis (changes a digital state if the input changes outside a defined band)
        - Analogue to digital converter (to change analogue value to binary)
    - Provide comprehensive debugging and live editing of control strategies

- Ensure that the program strategy tool (whether comprehensive or Macro function block based) is not restricted to the use of the systems integrator but is available for suitable trained administrators via the operator workstation.

310.350 CONTROL FUNCTIONS AND ROUTINES - CONTROL INTERLOCKS:

- General
  - Ensure that the BMS is capable of providing all control interlocks
- Frost protection
  - Provide frost protection routines to operate plant and pumps in order to protect building services systems and their components from frost damage
  - Provide the following two stages of protection:
    - Ensure that when the outside temperature falls to the operator set minimum frost-protection temperature, the selected pumps start and circulation is established through pipework systems and their components. Allow the operator to pre-select which plant is to be started. The automatic standby plant is to operate on failure of the duty plant.
    - Ensure that when the return temperature falls below the operator pre-set minimum, the full frost-protection facility is initiated. Ensure that for heating systems, the heat source is turned on and operated to maintain the return flow temperature above the pre-set minimum. Ensure that specified protective devices activate for other liquid systems.
  - Provide a facility to allow frost protection to be logged together with data and time.
- Building/plant protection
  - Provide protection routines to operate the plant in order to protect the building fabric and its contents against the effects of low internal temperatures and of condensation.
  - Ensure that if the internal air temperature falls below the pre-set protection temperature, the heating system and related plant is turned on and heat supplied to maintain the air temperature at or above the protection set-point temperature.
  - Ensure that the building/plant protection routine overrides other control functions unless otherwise specified.
  - Ensure that protection operates whenever the normal heating is switched off.
- Safety interlocks
  - Ensure that all safety interlocks are hardwired and have precedence over all other control functions.
  - Ensure that safety interlocks can only be reset manually and locally (not from the operator workstation).
  - Ensure that all hardwired safety interlocks have corresponding software interlocks to prevent cascading nuisance alarms.
  - Ensure safety interlocks operate when plant selector switches are in 'Hand' or 'Auto' mode.
  - Ensure safety interlocks operate when frequency inverters are selected in 'Local' or 'Auto' mode at the inverter keypad.
  - Ensure safety interlocks comply as appropriate with:
    - BS EN 61508-series for control of systems where an assessed safety integrity level is required
    - BS EN ISO 13850 for design of emergency stop functions

310.360 CONTROL FUNCTIONS AND ROUTINES - TIME SCHEDULES:

- Ensure that each field controller is capable of enabling plant according to multiple pre-set time programmes. Ensure that it is possible to schedule each item of plant for a minimum of six separate switching periods per 24 hours. Ensure that separate schedules can be defined for each day of the week.
- Ensure that individual time schedules can be grouped to form global time schedules.
- Ensure that time schedules can be defined on a weekly basis on a single 'page/screen'.
- Ensure that time schedules can be defined 12 months in advance.
- Provide a time schedule override facility to accommodate holiday periods, etc.
- Allow fixed extensions and contractions to time schedules. Ensure that the time schedule reverts to the 'normal' switching periods following the extension/contraction period.
- Allow time schedules to be copied from existing schedules.
- Ensure that time schedules can be linked to optimum start/stop control facilities.
- Provide an optimum start/stop override facility for user-defined override days. Ensure that optimum start/stop control is enabled following the override period.
- Provide automatic switching between BST and GMT and back. Provide an operator override facility.
- Ensure that time schedules can accommodate leap years.

310.370 CONTROL FUNCTIONS AND ROUTINES - PLANT START/STOP CONTROL:

- Ensure that controllers are capable of starting and stopping plant according to the sequences detailed in the design drawings
    - Including any specific requirements for 'off' position or status of plant items, valves and dampers, etc.
- Ensure that controllers are capable of automatically enabling standby plant on failure of duty plant.
- Ensure that the controllers can automatically report plant failure alarms at the operator workstation.
- Ensure that the failure of a flow switch or other device does not continuously cycle plant.
- Ensure that if a flow switch fails the operator has the option to force either the duty or standby plant to come on.
- Provide the operator with the option to override any start/stop action configured within the controllers. When reverting to normal automatic control, ensure that the original program is automatically reinstated and updated to the correct time.
- Provide delayed plant-starting facilities in order to reduce power surges. Ensure that it is possible to start plant sequentially by adjusting the delay period for each item of plant.
- Ensure that delayed plant-starting occurs following power failure/re-instatement and plant shut down/restart on fire/fireman override.
- Provide the operator with a facility to specify minimum on/off cycle times and/or the maximum number of starts per hour for specified items of plant.
- Ensure that plant protection algorithms are included that define minimum on and minimum off times to prevent damage to items of mechanical plant that may be caused by rapid cycling, whether by faulty control strategy or by manual override.
- Provide a plant protection routine that enables the operator to select and automatically run items of plant for short periods during out of season shut-down. Ensure that the run periods are operator adjustable.
- Provide a routine whereby non-critical items of plant can be disconnected for short periods of time when approaching electrical maximum demand limits, without compromising environmental control.

310.380 CONTROL FUNCTIONS AND ROUTINES - SEQUENCE CONTROL:

- Provide sequence control routines to automatically sequence the operation of multiple items of plant by monitoring load parameters and efficiently matching the plant to the load.
- Ensure that it is possible to define different automatic sequences of control.
- Provide the operator with a facility to override the automatic sequence and define an alternative sequence.
- Ensure that the set-point values for each control action are variable and adjustable by the operator. Ensure that associated alarm limits are modified automatically.
- Allow the operator to adjust switching control differentials to prevent short cycling.
- Ensure that the routines also include a facility to operate all plant ancillaries associated with sequence control unless they have been specifically excluded.
- Ensure that the routines include the facility to proceed with the defined sequence when one of the items of plant in the sequence is isolated or fails to operate (unless the safety requirements dictate otherwise). Ensure that failed items of plant are removed from the sequence.

310.390 CONTROL FUNCTIONS AND ROUTINES - PLANT ROTATION CONTROL:

- Ensure that relevant field controllers are capable of alternating the lead plant items where duty and standby equipment is installed. Ensure that this is achieved both by an operator command and on a time-scheduled basis.
- Ensure that the rotation control can be provided on the basis of run hours, elapsed time and calendar basis.
- Provide routines to ensure that when the maximum number of start/stop cycles for a particular plant is reached, then its schedule is automatically modified, e.g. by rotating the standby equipment or changing the lead machine.
- Ensure that each item of plant operated under rotation control can operate at any stage of the rotation sequence
    - 1-2-3.
    - 2-1-3.
    - 3-2-1.
- Ensure that the plant rotation control can accommodate a plant failure condition, in such a way that a failed item of plant is 'replaced' by the next in the rotation cycle. Ensure that an alarm condition is raised in response to plant failure.
- Ensure that rotation control can be initiated outside normal operating periods.

310.400 CONTROL FUNCTIONS AND ROUTINES - OPTIMUM START/STOP FOR HEATING SYSTEMS:

- Provide an optimum-start routine for the heating system to compute the daily minimum preheat period necessary to achieve target comfort conditions at the start of occupation. Provide an optimum-stop routine to compute the earliest time for the heat source to be shut down in order to retain minimum target comfort conditions in the zone at the end of occupation.
- Ensure that the optimum start/stop routines have access to the system real time clock, calendar facility and time programme to define the occupation periods.
- Ensure that it is possible to apply optimum start/stop control both to individual zones and overall plant operation.
- Ensure that the routines operate the heating and ventilation plant as necessary to achieve the required target conditions, and that the heating and cooling systems do not conflict in any controlled zone.
- Provide independently adjustable start and stop comfort conditions.
- Ensure that weather compensation control can be inhibited during preheat periods.
- Ensure that the heating plant goes into full heating mode with full re-circulation of air (if relevant). Ensure a return to normal fresh air control following the optimum start period.

- Provide the optimum start/stop routines with an automatic self-learning process that seeks to reduce any error in achieving the target conditions at the target time.
- Provide the operator with the facility to adjust the following parameters:
    - Target temperature for optimum start
    - Maximum preheat period
    - Target temperature for optimum stop
    - Minimum space temperature for out-of-hours periods
    - Enable/disable the self adaption function
- The default limit time for handover to the weather compensation routines after the start of occupation.
- Ensure that the internal and external air temperature sensors associated with the optimiser are positioned correctly in order to provide representative readings.

310.410 CONTROL FUNCTIONS AND ROUTINES - OPTIMUM START/STOP FOR COOLING SYSTEMS:

- Provide an optimum-start routine for the cooling system to compute the daily minimum pre-cool period necessary to achieve target comfort conditions at occupation start time. Provide an optimum stop routine to compute the earliest time for the cooling system to be shut down in order to retain minimum comfort conditions in the space at the end of occupation.
- Ensure that the optimum start/stop routines have access to the system real-time clock, calendar facility and time programme to define the occupation periods.
- Ensure that routines are capable of operating the ventilation system for building purging prior to optimum start of cooling plant.
- Ensure that it is possible to apply optimum start/stop control both to individual zones and overall plant operation.
- Provide routines to operate chillers and ventilation plant as necessary to achieve the required target conditions while ensuring that heating and cooling systems do not conflict in any controlled zones.
- Provide the operator with the facility to adjust the following cooling system optimum start/stop parameters:
    - Target temperature for optimum start
    - Maximum pre-cool period
    - Earliest time for building purging during out of hours period
    - Inside and outside temperature limits for building purging
    - Separate time/temperature relationships for optimum start and optimum stop
    - Minimum space temperature during building purging
- Ensure that the internal and external air temperature sensors associated with the optimiser are positioned correctly in order to provide representative readings.

310.420 CONTROL FUNCTIONS AND ROUTINES - WEATHER COMPENSATION:

- Provide weather compensation routines to control the heating system in relation to external weather conditions. Provide the operator with the option to adjust temperature and flow-rate settings for the heating system to re-define the weather compensation.
- Provide automatic adjustment to the weather compensation by comparing measured and required space temperatures with the outside conditions, and provide the facility to correct the compensation where a significant difference between the two space temperatures occurs.
- Ensure that abrupt changes in the heating system performance or space temperature shall not adversely affect the automatic adaptive compensation process.

- Provide a single weather compensation curve for each zone irrespective of the number of temperature sensors provided in the zone.
- Ensure that the routines respond to the reset signals arranged to achieve boost, night set-back and boiler safety.
- Ensure that air temperature sensors associated with the compensator are positioned correctly in order to provide representative readings.

310.430 CONTROL FUNCTIONS AND ROUTINES - LIGHTING CONTROL:

- Ensure that the appropriate field controllers can control lighting in the following ways:
    - On/off switching of external and internal lights at fixed times in accordance with the weekly schedules defined by the operator
    - Switching of internal lights based on the signals from external and internal photo sensors. This is to incorporate a user-adjustable delay
    - Switching internal lights off according to occupancy detectors
    - The on/off switching of external lighting based on signals from an external photo sensor
- Ensure that the automatic control of lighting by the BMS is capable of being overridden by local switches and by the operator at the operator workstation.
- Ensure that the lighting control system can be manually controlled in the event of failure of the BMS.
- Provide a facility to monitor, but not control, the emergency lighting.

310.440 SYSTEM COMMUNICATIONS - GENERAL:

- Ensure that the system communications allows the full transfer of monitored, logged, alarm, backup and configuration data between the servers, operator workstation and addressable field controllers.
- Ensure that the communication protocol selected seeks to achieve error-free data transfer. Ensure that the protocol includes an error detection check; includes an error correction and/or re-try technique; limits re-transmission; and raises an alarm condition on failure.
- Ensure that the available bandwidth is sufficient to avoid excessive delays in transmitting data. Ensure that the maximum permissible time delay does not exceed one second

310.460 SYSTEM COMMUNICATIONS - COMMUNICATIONS PROTOCOLS:

- BS EN 61158-2 (fieldbus).
- BS EN ISO 16484-5 (BACnet).
- Modbus. (For third party systems interface to the BMS)
- Modbus over Ethernet. (For third party systems interface to the BMS)
- KNX (BS ISO/IEC 14543-series) (For third party systems interface to the BMS)
-
- Metering data exchange:
    - Smart metering:
        - BS EN 62056-series electricity metering data exchange
        - BS EN 50491-11 HBES smart metering user display
        - PD CEN/TR 16061 smart gas meters
        - PD CEN/CLC/ETSI TR 50572 functional reference architecture for communications in smart metering systems
        - PD CLC/TS 50568-4 and PD CLC/TS 50568-8 electricity metering data exchange
        - BS EN 61968-9 system interfaces for utility metering interface and control

- Field-level protocols
    - Ensure that the selected protocol can:
        - Run on the required communications media copper and optical fiber
        - Provide a communications throughput sufficient for the intended application
        - Provide appropriate network topology options
        - Allow sufficient maximum physical segment length as per the communication standard.
        - Allow sufficient maximum number of nodes for each physical segment and the logical network as per the communication standard.
        - Provide sufficient maximum distance between nodes as per the communication standard.
        - Make use of off-the-shelf network devices such as repeaters, bridges and routers
        - Allow control devices to be powered from the network as per the manufacturer's requirements
- Ensure that the protocol is compatible with fully developed network configuration and management tools.

310.470 SYSTEM COMMUNICATIONS - DIRECT INTEROPERABILITY:

- Ensure that each of the protocol's objects and attributes are consistent with the achievement of the specified level of direct interoperability.
- Ensure that each of the protocol's arrangements for physical connection, data packaging, network management and error detection/correction are the same.

310.480 SYSTEM COMMUNICATIONS - GATEWAYS:

- Ensure that the gateway can
    - Transfer the specified maximum number of points
    - Limit loss of functionality to the level specified
    - Add functionality where specified
- Limit any time delay across the gateway to the maximum
- Ensure that the specified contingency and alarm measures in response to a failure of the gateway are met
- Ensure that the gateway can be modified in response to any future changes relating to the type and amount of data transferred over it.
- Clearly define who has contractual responsibility for the implementation of the gateway.
- Clearly define the demarcation of responsibility for the binding of the points and graphic display.

310.490 SENSORS AND DETECTORS - GENERAL:

- Interface sensors with controllers and indicators via amplifiers or transmitters, where necessary.
- Ensure that all signals are compatible with interfaces fitted to associated field control devices.
- Ensure that the performance of the sensors and detectors are not adversely affected by the following variations in power supply conditions in accordance with BS EN 50160 (with additional voltage drop in the electrical installation defined in BS 7671), or by anticipated conducted and radiated electromagnetic disturbances for the electromagnetic environment in which the sensors and detectors are to be used.
- Ensure that connections to sensors and detectors are of a screw down clamp type or self-locking connectors.

- Ensure that sensors, detectors and meters are installed in accordance with the manufacturer's instructions and recommendations.
- Ensure that calibration conditions for meters are fully documented in the O&M manuals and clearly marked on or adjacent to the meters.
- Ensure that any calibration and maintenance requirements for sensors, detectors and meters are documented in the O&M manuals.

310.500 SENSORS AND DETECTORS - TEMPERATURE SENSORS:

- Standard
  - BS EN 60730-2-9
  - BS EN 14597
- Use RTD or thermocouple assemblies consisting of element, sleeve and connector.
- Connect thermocouple assemblies to the controller
- Sensor
  - Enthalpy.
  - Ductline.
  - Surface.
  - Room.
  - Thimble ceiling tile.
  - Immersion.
  - Outside air.
- Indicator
  - Provide indicator capable of showing measured value at sensor where indicated in the design
- Time constant
  - Space/outside air temperature - 300s still air
  - Duct air temperature - 120s @ 1m/s
  - Water - 30s @ 1m/s
- Ensure that temperature sensors comply with the minimum requirements of the following table.

Table 1 Temperature sensors - minimum requirements

Fluid	Temperature range °C	Sensor accuracy °C
Air	- 10 to + 40	+/- 0.5
Flue gas	+ 30 to + 850	+/- 3.0 (0.75% of FSD above 450°C)
Chilled Water	- 10 to + 30	+/- 0.25
Water	- 10 to + 150	+/- 0.5

310.505 SENSORS AND DETECTORS - INSERTION TYPE TEMPERATURE SENSOR:

- Type [.....]
- Application [.....]
- Use proportional type insertion sensor.
- Sensor

- Average type temperature sensor for mounting over face of air flow in an air-handling unit or in ductwork adjacent to heating coil.
- Thermistor type temperature sensor, minimum stem length 200mm for mounting in the air flow or distribution ductlines.

310.510 SENSORS AND DETECTORS - HUMIDITY SENSORS:

- Standard - BS EN 60730-2-13.
- Measurement
  - Relative humidity.
- Indicator
  - Provide indicator capable of showing measured value at sensor where indicated in the design.
- Time constant - 300@ 1m/s.
- Ensure that humidity sensors comply with the minimum requirements of the following table.

Table 2 Humidity sensors - minimum requirements

Sensor	Humidity range	Sensor accuracy
Humidity	10 to 90%	+/- 5% RH

310.520 SENSORS AND DETECTORS - AIR VELOCITY SENSORS:

- Method
  - Pitot static tube array.
- Ensure that air velocity sensors comply with the minimum requirement of the following table.

Table 3 Air velocity sensors - minimum requirements

Sensor	Sensor range	Sensor accuracy
Pitot static tube	3 to 80 m/s	+/- 2% of reading
Thermo-electric anemometer	0 to 20 m/s	+/- 3% of reading or +/- 0.1 m/s whichever is greatest

310.530 SENSORS AND DETECTORS - AIR PRESSURE SENSORS:

- Use pressure transducers manufactured in stainless steel.
- Voltage output 0-10V DC
- Connect pressure transducers, via matched transmitters to
  - Single way display/alarm/control unit.
  - Provide indicator capable of showing measured value at sensor where indicated in the design.
- Ensure that air pressure sensors comply with the minimum requirements of the following table.

Table 4 Air pressure sensors - minimum requirements

Sensor	Sensor range	Sensor accuracy
Air pressure	-	+/- 2% of reading

310.535 SENSOR AND DETECTORS - FLOW SENSORS:

- Type [.....]
- Application [.....]
- Standard - BS EN 60730-2-15.
- Provide flow detectors and connect to display/alarm/control unit
- Sensor
    - Venturi.
    - Differential pressure transducer.
    - Electro-magnetic meter.
    - Computed mass flow.
    - Turbine flow.
    - Oscillating vane.
    - Paddle wheel.
    - Nozzle.
    - Magnetic flow.
    - Vortex.
- Sensor range [.....]
- Sensor accuracy [.....]
- Time constant 5 seconds.
- Indicator.

310.540 SENSORS AND DETECTORS - FLOW METERS:

- Type [.....]
- Application [.....]
- Ensure that meters comply with the minimum requirements of the following table.

Table 5 Flow meters - minimum requirements

Meter	Meter range	Meter accuracy
Fuel flow meter	0 to 10 Hz	3% of reading
Water flow meter	>> 5:1	2% of reading
Electricity meter	-	1.5% of reading

310.545 SENSORS AND DETECTORS - LEVEL SENSORS:

- Type [.....]
- Application [.....]
- Provide liquid level detectors and connect, via matched amplifiers, to
    - Single way display/alarm/control units.
    - Multi-way display/alarm/control units.
- Sensor
    - Use capacitance electrodes manufactured from stainless steel and PTFE insulation for use on conductive liquids with a minimum conductivity of 0.01 S/m.
    - Use conductivity electrodes manufactured from stainless steel, either single or multi-tipped.
    - Float type to BS EN 60730-2-15.
- Indicator

- Provide indicator capable of showing measured value at sensor. Calibrate indicators

310.546 SENSORS AND DETECTORS - OTHER SENSORS:

- Type
  - Smoke.
  - Specific gravity.
  - Quantity.
  - CO_2.
  - CO
    - BS EN 50291-1
    - BS EN 50292
  - Refrigeration gases.
  - Combustible gases and oxygen.
    - BS EN 50271.
    - Equipment for use in explosive atmospheres to be in accordance with BS EN 60079-29-1 and installed in accordance with BS EN 60079-29-2
  - Turbidity.
  - Flame ignition failure.
- Sensor range [.....]
- Sensor accuracy [.....]
- Time constant [.....]
- Indicator
  - Provide indicator capable of showing measured value at sensor. Calibrate indicator

310.555 TRANSMITTERS:

- Type [.....]
- Application [.....]
- Use transmitters to interface between sensor and controller, utilizing only one sensor.
- Use transmitters
- Input
  - Input span [.....]
  - Zero offset [.....]
  - DC
  - AC
  - True rms [.....]
  - Voltage [.....]
  - Current [.....]
  - Frequency [.....]
  - Pulse rate [.....]
  - On/off.
  - Resistance [.....]
    - Resistance thermal device (RTD) to BS 1041-3
    - Resistance thermal device (RTD) to BS EN 60751.
  - Thermocouple to BS EN 60584
  - Strain gauge [.....]

- Lead resistance [.....]
- Bandwidth [.....]
- Bias current [.....]
- Input resistance [.....]

310.565 TRANSDUCERS:

- Type [.....]
- Application [.....]
- Manufacturer and reference [.....]
    - Or approved equivalent.
- Use transducers to receive 0-20V dc signal from controller and to convert it to proportional 0-15 psi output. When using transducers use electromagnetic actuators.
- Transducer
    - Electro-pneumatic.
    - Electro-hydraulic.

310.600 SWITCHES AND THERMOSTATS

310.605 AIR DIFFERENTIAL PRESSURE SWITCHES:

- Type [.....]
- Application [.....]
- Adjustment range for trip pressure [.....]
- Maximum operating pressure [.....]
- Electrical rating [.....]
- Ambient temperature limits [.....]
- Reset differential [.....]
- Maximum differential pressure overload [.....]

310.610 AIR THERMOSTATS - ROOM TYPE:

- Type [.....]
- Application [.....]
- Standard
    - BS EN 60730-2-9.
- Position
    - Wall-mounted.
- Ancillaries
    - Built in set point potentiometers.
    - Heat anticipators.
    - Night set-back.
    - Range inserts, when using thermostats in series.
    - Fixed set points.
    - Tamper-proof cover.
    - Remote set point adjustment.
    - Time switch.
    - Controller.

- Reverse action.
- Combined humidistat.

310.620 AIR THERMOSTATS - SURFACE TYPE:

- Type [.....]
- Application [.....]
- Standard
  - BS EN 60730-2-9
  - BS EN 14597
- Use surface type thermostats on
  - Pipelines
  - Windows

310.625 AIR THERMOSTATS - MULTI-STEP TYPE:

- Type [.....]
- Application [.....]
- Steps [.....]

310.630 AIR THERMOSTATS - MASTER TYPE:

- Type [.....]
- Application [.....]
- Provide master type thermostats to measure conditions at one point and reset the point of another (sub-master) thermostat or controller.

310.635 AIR THERMOSTATS - REMOTE BULB TYPE:

- Type [.....]
- Application [.....]
- Connect via
  - Cable
  - Capillary
- Ancillaries
  - Clamp-on detector for pipelines.
  - Solar collector detector.
  - Immersion detector and pocket.
  - Insertion detector.

310.640 AIR THERMOSTATS - FROST PROTECTION TYPE:

- Type [.....]
- Application [.....]
- Standard
  - BS EN 60730-2-9
  - BS EN 14597
- For space mounting use frost protection thermostats with temperature range of 0-20°C and with SPST switching action and electrical rating of 20 amps resistive.

- For heater battery protection use frost protection thermostats consisting of a gas filled sensing element and a bulb, a directly adjustable set point and switching differential.
- For compensated systems use external frost type thermostats with proportional type sensor, the whole unit being weather-proofed.
- Ancillaries
    - Clamp-on temperature detector.
    - Immersion type temperature detector.
    - Controller.
    - Start-up switching and indication.
    - Manual or automatic reset facility.

310.645 WATER IMMERSION THERMOSTATS:

- Type [.....]
- Application [.....]
- Standard
    - BS EN 60730-2-9
    - BS EN 14597
- Use proportional type immersion thermostats with rigid sensing elements ensuring 50mm minimum length is immersed. Use separable pockets, screwed 15mm BSP.
- Pocket material
    - Copper.
    - Corrosion resistant bronze.
    - Stainless steel.

310.650 HUMIDISTATS:

- Type [.....]
- Application [.....]
- Use wall-mounted resistance element type humidistats.
- Room humidity.
- Enthalpy.

310.700 ACTUATORS:

- Include position feedback devices suitable for connection to the BMS.
- Ensure that actuators incorporate a disconnection device to allow manual operation of the valve or damper in the event of actuator failure.
- Where line voltage actuators are used, provide local means of isolation by manual isolator or plug and socket connection.

310.705 ACTUATORS - SOLENOID TYPE:

- Type [.....]
- Application [.....]
- Standard
    - BS EN 60730-2-8.
- Control mode
    - Linear.

        - Proportional.
    - Operation
        - Normally open.
        - Normally closed.
        - Modulating.
    - Ancillaries
        - Spring return.
        - Power failure return.
        - Positioners.
        - Manual control failures.

310.710 ACTUATORS - ELECTRONIC TYPE:

- Type [.....]
- Application [.....]
- Standard
    - BS EN 60730-2-8
- Use low voltage, high torque, electronic type actuators, including mounting brackets, adjustable linkages and necessary attachment devices.
- Control mode
    - Linear.
    - Proportional.
    - Compensating.

310.715 ACTUATORS - ELECTRIC MOTOR:

- Type [.....]
- Application [.....]
- Operation
    - Unidirectional.
    - Reversible.
    - Synchronous.
    - Asynchronous.
        - Provide thermal overload protection with manual reset option.
    - Spring return.
- Control mode
    - Linear.
    - Proportional.
    - Compensating.
- Operation
    - Two-position (ON-OFF).
    - Continuous.
    - Modulating.
- Electrical requirements

- Integral terminal strip or DIN plug and socket connections.
- Two end of travel limit switches, with adjustable cam operation for motor de-energisation.

- Mechanical requirements
  - Self locking gear train.
  - Manual override, geared to prevent backdrop.
  - Travel stops in each direction.
  - Position indicator.
  - Enclose to IP65 minimum.
- Ancillaries
  - Auxiliary switches.
  - Heater.
  - Potentiometers.
  - Proportional current feedback modules.
  - Positioners.
  - Speed adjustment modules.
  - Integral controllers.
  - Manual control facilities.
  - Power failure return.
  - Spring return.

310.800 VALVES AND DAMPERS:

310.805 MOTORISED VALVES:

- Type [.....]
- Application [.....]
- Standard
  - BS EN 60730-2-8
  - Relevant parts of BS EN 60534
- Duties and details as schedule reference Motorised Control Valves
- Type
  - Single seat, on/off
  - Double seat, on/off
  - 3-way mixing, modulating
  - 3-way diverting, modulating
  - Pressure Independent Control Valve (PICV) - tested in accordance with BSRIA BTS 1/2012
  - Butterfly, on/off
- Material
  - Brass to BS EN 12163, BS EN 12164 or BS EN 12167.
  - Copper alloy to BS EN 1982.
  - Cast iron to BS EN 1561.
  - Cast steel to BS EN 10213.
- Connections
  - Screwed to relevant parts of BS EN 10226
  - Flanged to BS EN 1092-3

    - Cast steel only, flanged to BS EN 1092-1
    - Cast iron only, flanged to BS EN 1092-2
    - Aluminium alloy only to BS EN 1092-4
    - EPDM
    - PTFE
- Ancillaries
    - Position indicator
    - Locking device
    - Control device and linkage mechanisms
    - Lever for manual operation
- Actuating motive power
    - Electric motor.

310.900 DAMPERS:

310.905 MOTORISED DAMPERS:

- Type [.....]
- Application [.....]
- Use motorised control dampers manufactured and installed in accordance with Building Engineering Services Association specification DW/144.
- Actuating motive power
    - Electric motor.

310.910 MOTORISED SHUTTERS:

- Type [.....]
- Application [.....]
- Use motorised shutters manufactured and installed in accordance with Building Engineering Services Association specification DW/144.
- Actuating motive power
    - Electric motor.

320.000 INSTALLATION:

320.050 FIXING AND CONNECTION - CABLING INSTALLED AS PART OF THE BMS CONTRACT:

- Plan and install all building management monitoring systems cables in accordance with the cable manufacturer's recommendations.
- Label and record all monitoring cables in accordance with
    - Approved Cable schedules
    - Approved shop drawings
- General
    - This part of the specification covers extra-low voltage wiring (as defined by BS 7671), i.e. signal and data communications wiring.
    - Install all cabling in accordance with BS EN 50173-1-series, BS EN 50174-series and BS EN 7671 (IET Wiring Regulations).

- All cabling must be adequately protected from the environment through which it passes to avoid the possibility of mechanical damage and electromagnetic interference.
- Install cabling and conduits associated with sensors in a manner that prevents spurious transfer of moisture and heat etc from external sources to sensing devices.
- Ensure that all wiring is carried out in a neat manner by skilled operatives. Clip wiring to form a loom and route it to avoid interference with the correct operation or maintenance of other components.

- Cable type and application
  - Ensure that the types of cable installed do not prejudice satisfactory operation of the BMS.
  - Ensure that the type of cables, installation and planning comply with the BMS manufacturers recommendations and the project's electrical specification.
  - Ensure that the cross-sectional area of cables is sufficient to ensure that sensor circuit resistance limits are not exceeded.
  - Ensure that the method of installation and routing of cables does not compromise the satisfactory operation of the BMS.
  - Ensure that the minimum separation distances between data/analogue signal cables and cables of other services (including power cables) comply as relevant with BS 7671 and BS EN 50174-series.

- Identification
  - Ensure that all cables have identification sleeves at their terminations which combine the requirements of BS 7671 with those for specific circuit identification. Ensure that the identification is consistent with the relevant wiring diagrams.

320.060 FIXING AND CONNECTION - USE OF EXISTING CABLE AND WIREWAYS:

- Confirm by testing or obtain appropriate certificates from original suppliers that any existing means of network communication is of a suitable standard for satisfactory operation of the BMS.
- Ensure that any tests performed comply with relevant parts of BS EN 50174.
- Ensure that the potential corruption of data cannot arise from:
  - Other installations not connected to, but in close proximity to, the route of existing cabling
  - Other electrical services using existing cabling
  - Other adjacent cabling
- State in writing at the time of tender whether or not existing cabling is suitable.

320.070 FIXING AND CONNECTION - CONNECTION TO PLANT AND CONTROL EQUIPMENT:

- General
  - Provide all devices and terminals necessary to connect the BMS to items of plant and control equipment.
  - Take account of any existing services that have to remain in continuous operation. Provide for approval, an installation and commissioning plan that identifies how the BMS equipment can be installed an commissioned without disrupting the operation of the existing building services.
  - Where plant and control equipment are supplied by others, provide the adequate interface and integration (physical and functional) needs for installation and commissioning requirements. Provide this information in time and in sufficient detail to enable any other installers and their suppliers to incorporate the BMS connection facilities before delivering their equipment to site.

- Where plant is subject to warranty by others, obtain clearances in writing from those concerned that the proposed modifications do not invalidate the warranties.
- Ensure that modifications carried out as a result of the contract are fully documented and do not affect the satisfactory operation of safety devices connected to any plant or systems affected directly or indirectly by the BMS works. Carry out proving tests to the satisfaction of the Project Supervisor.
- Ensure that the use of existing relays, contactors, starters and switches as part of the BMS installation is fully documented.

- Safety interlocks
  - Provide interlocks as scheduled to establish and maintain safe/pre-determined plant conditions under all modes of operation including fire mode loss, reduction and restoration of power.
  - Ensure that all safety hard-wired interlocks are wired in a closed-loop application to failsafe on loss of power, or on relay coil failure, or on open circuit, e.g. cable breakage.
  - Ensure that all interlocks use voltage-free contacts and AC or DC 24 V relays and field wiring.
  - Complete all wiring and testing of all hard-wired safety interlocks to ensure safe and/or sequenced operation of the plant before the BMS is set to work. Arrange interlocks to prevent unsafe or out of sequence operation of the plant by the BMS.
  - Ensure that plant does not operate using the BMS until all interlocks have been tested to the satisfaction of the Project Supervisor.

- Manual control
  - Provide manual control facilities to enable plant maintenance/facilities staff to operate essential plant in the event of BMS failure and for routine test purposes. Ensure that the facilities include:
    - Start/stop operation of the plant.
    - Automatic operation of motorised control devices such as valves and dampers, etc if the BMS is operating.
    - Manual setting of motorised control devices such as valves and dampers, etc if the BMS has failed.
  - Ensure that the manual control facilities do not override safety devices or hard-wired interlocks.

- Volt-free contacts
  - Ensure that the contact materials are suitable for use in the installation and at the required voltages and currents.
  - Use screw down or locking spade terminals for electrical connections to volt-free contacts.

- Relays
  - Use demountable relays of the totally enclosed type.
  - Use relays with circuit arrangement printed on top.
  - Use screw down clamp or locking spade-terminals, and ensure they are shrouded.
  - Use relays with LED or flag indication of coil status.

- Signalling from starters
  - Provide additional contacts for signalling and remote operation purposes

- Control equipment

- Obtain advice from the relevant supplier when additional facilities are to be fitted to control equipment supplied by others.
- Use the knockouts, cable routes and terminals, etc incorporated into the design of control devices.

- Packaged plant
  - Ensure that connections to packaged plant are made within the packaged plant control panel. Fit an additional enclosure where this is not possible. Ensure that all connections between the BMS and packaged plant are 24 V maximum.

320.080 FIXING AND CONNECTION - ADDITIONAL PROVISIONS FOR RETROFIT INSTALLATIONS:

- Arrange for any necessary control modifications to existing plant to be carried out by the original supplier (with the exception of starter panels). Give the supplier details of the requirements for connection of equipment to the BMS. State the name of the supplier in the Tender together with a priced schedule for the necessary work.
- Where details of existing plant are not available from the original supplier or from record documents, provide a specialist conversant with the particular type of plant to carry out any necessary modifications. Provide the specialist with the details of the BMS connections required. State the name of the specialist in the Tender together with a priced schedule for this work. Advise the Project Supervisor of any difficulties with connections.
- Advise in writing at the time of tender of any potential delay to the contract arising from the difficulty of providing the necessary BMS connections to the plant.
- Use existing relays and volt-free contacts where feasible.
- Fit auxiliary contacts to contactors, etc where adequate space is available. Install additional relays if the space is not adequate.
- Obtain advice from the original supplier when additional facilities are to be fitted to existing control equipment.
- Use the control manufacturer's standard accessories to provide any additional contacts, limit switches and potentiometers, etc.
- Use the knockouts, cable routes and terminals, etc incorporated into the design of control devices wherever possible. Obtain approval from the Project Supervisor for ad hoc fixings and modifications to control devices before action is taken on-site.

320.090 FIXING AND CONNECTION - CABINETS FOR BMS EQUIPMENT:

- Construct BMS equipment enclosures to give the minimum degree of protection to IP54 in accordance with BS EN 60529. Enclosers installed outdoors should be to IP65.
- Ensure that access doors are of a rigid construction and mounted on stout metal hinges capable of supporting the full weight of the open door. Ensure that doors will not sag or drop when open. Fit doors with stout locking handles to prevent access by unauthorised personnel.
- Allow safe access to the BMS equipment where the BMS equipment is incorporated into another control panel without having to isolate the panel.

320.100 CONTROL PANELS - DESIGN, CONSTRUCTION AND INSTALLATION:

- Standards
  - BS EN 63044-series for controllers
  - Relevant parts of BS EN 61439-series where the control panel forms part of switchgear and/or controlgear as defined in the standard
  - BS EN 60204-1 where the control panel may be considered to form part of machinery as defined in the Supply of Machinery (Safety) Regulation 2008

- BS 7671 (IET Wiring Regulations)
- BS EN 62208 for enclosures

- Control panel design
  - Ensure that the layout of control panels reflects the layout of the plant being served. Ensure that indicators and controls for associated plant are grouped.
  - Ensure that all doors on panels containing exposed dangerous voltages are provided with interlocked isolators such that the door cannot be opened except with the isolator in the 'off' position. Ensure that isolation complies with BS 7671.
  - Ensure that equipment that requires on-line adjustment and testing by non-electrically qualified personnel is accessible and usable without interrupting the supply or overriding safety interlocks. Ensure that in general, field controllers are not located within control panels where isolation is necessary to gain access.
  - Design panels to maintain all components within their environmental tolerance limits taking into account ambient environmental conditions. Install fans with thermostatic control and air extract grilles and air intake grilles with replaceable filters where mechanical ventilation is required to control the environmental conditions. Ensure that the specified ingress protection (IP) ratings are maintained.

- Input power supply
  - Voltage and frequency
    - AC **[230]** V 50 Hz single-phase.
    - AC **[400]** V 50 Hz three-phase.
    - DC 24 V protective extra-low voltage (PELV).
    - DC 48 V protective extra-low voltage (PELV).
    - [.....]
  - Supply variations to input voltage and supply frequency to relevant parts of:
    - BS EN 61439
    - BS EN 60038 including voltage drop in accordance with BS 7671 (IET Wiring Regulations)
    - [.....]
  - [.....]

- Usage
  - Control panel.
  - Motor Control Centre (MCC).
  - Single starter enclosure.
  - [.....]

- Electrical ratings
  - Rated operational voltage [.....]
  - Rated insulation voltage [.....]
  - Rated current [.....]
  - Rated short-time withstand current [.....]
  - Rated peak withstand current [.....]
  - Rated prospective short-circuit withstand current [.....]
  - Rated conditional short-circuit current [.....]
  - Rated fused short-circuit current [.....]
  - Rated diversity factor [.....]
  - Prospective short-circuit current [.....]

- Arising from rotating machine [.....]
- Co-ordinate short-circuit protection devices [.....]
- [.....]

- Service conditions
  - Ambient air temperature to relevant parts of BS EN 61439.
  - Suitable for ambient air temperature for outdoor installations [.....]
  - Altitude to relevant parts of BS EN 61439.
  - Suitable for use at altitudes above 1000m.
  - Electromagnetic compatibility
    - Environment A to BS EN 61439-1 (industrial)
    - Environment B to BS EN 61439-1 (domestic and light industrial)
    - Remedies for electrical and radiated interferences [.....]
  - Special service conditions [.....]
  - Conditions during transport, storage and erection [.....]
  - Provide facilities to allow future extension of switchboard.

- Control panel construction
- Enclosure material
  - Steel
    - Painted mild steel
      - Finish [.....]
      - Colour [.....]
    - Stainless steel grade [.....]
    - Plastic [.....]
    - Minimum thickness (mm) [.....]
  - Demountable back panel
    - Galvanised steel [.....]
    - Insulating laminated plastic [.....]
    - [.....]
  - BS EN 60529 ingress protection (IP) rating:
    - IP41 for units installed in other plant or equipment enclosures offering higher IP ratings
    - IP54 for units installed inside buildings
    - IP55 for units installed in boiler rooms and pump rooms
    - IP65 for units installed outdoors
    - Degree of mechanical protection to BS EN 62262, IK [.....]
    - Ensure that all terminations accessible when the control panel is open are fully shrouded, recessed or otherwise protected against accidental contact to at least IP2X or IPXXD.
  - Enclosure door / access panel fastenings:
    - Screw or bolt
    - Locks
      - Type
        - Thumb-lock with integral key

- Multipoint locking system
  - T-handle
  - Flush-folding handle
  - [.....]
- Key type [.....]

- [.....]

- [.....]
- Ensure that control panels weighing more than 50 kg including installed components are fitted with eyebolts to facilitate delivery and installation.
- Ensure that panels are provided with adequate undrilled and/or detachable gland plates of sufficient size and strength to accept glands for all types of cable conduits and cable trunking intended for termination within the panel.

- Internal wiring
  - Standard
    - BS 6231 polyvinyl chloride (PVC) insulated tri-rated switchgear cable [.....]
    - BS EN 50525-3-41 low smoke zero halogen (LSZH) cable [.....]
    - BS 6701, BS EN 50173-series and BS EN 50174-series for telecommunications cables
    - [.....]
  - Identification of conductors
    - Comply with the following standards, as relevant:
      - BS EN 60445 core standard for identification of conductors
      - BS 7671 for wiring forming part of the electrical installation
      - BS EN 60204-1 for control panels that are classed as a component of machinery in accordance with Supply of Machinery (Safety) Regulations 2008
      - BS EN 61439-series for switchgear and controlgear assemblies
      - BS 6701, BS EN 50173-series and BS EN 50174-series for telecommunications cables
    - Identification of earthing and bonding conductors
      - Ensure protective conductors are identified in accordance with BS 7671 and BS EN 60445.
      - Ensure dedicated telecommunication functional earth conductors are identified and labelled in accordance with BS 6701.
      - Ensure combined protective earthing and functional earthing conductors are identified primarily as protective conductors.
    - Control wiring
      - Segregate control and auxiliary contact wiring from power circuits and data communications circuits
      - Provide electrical separation for voltages of different bands in accordance with BS 7671, BS EN 60204-1 and BS EN 61439.
      - Contain control wiring in slotted plastic trunking
  - Take account of thermal effects, temperature internal to the control panel, and grouping, for all wiring.

- Wire termination practice
    - Identify every wire at each end with a unique wire number according to the control panel drawings and cable schedule. Wire numbers may be formed from numbers and uppercase letters. Ensure the system used cannot be confused with alphanumeric conductor function identification requirements of BS EN 60445 and BS 7671.
    - Terminate wiring intended for screw terminals with ferrules to prevent damage to conductors, and facilitate fault finding and maintenance replacement of components.
  - Arrange all wiring within the panel in looms and/or perforated trunking. Ensure that all cables are run continuously from terminal to terminal without intervening joints.
  - Ensure sufficient spare capacity in cable ways and trunking to comply with BS 7671 (IET Wiring Regulations).
  - Ensure that flexible looms are used to connect door mounted to interior-mounted components such that wires will not weaken or break with repeated door openings. Arrange the loom to avoid pinching or looping when the door is closed and ensure that it is fully supported at each end.
- Provide DIN-rail mounting for equipment and terminate to
  - BS EN 60715 dimensional type designation:
    - Top-hat TH 15-5,5
    - Top-hat TH 35-7,5
    - Top-hat TH 35-15
    - Top-hat TH 75-25
    - C-section C 20
    - C-section C 30
    - C-section C 40
    - C-section C 50
    - G-section G 32
  - Ensure steel DIN-rails are manufactured and finished in accordance with Appendix A to BS EN 60715.
- Location
  - Do not locate outstations within control panel compartments where isolation is necessary to gain access.
- Control panel labelling
  - Ensure that all panels and individual panel sections are provided with exterior labels to BS EN ISO 7010 and BS 7671 (IET Wiring Regulations) indicating the voltage within the panel along with clear warnings of risk and instructions for isolation. Display requirements for informing the BMS supervisor and/or disabling alarms prior to isolation of control circuits.
  - Label all switches, controls and indicators on control panels as to function and associated plant.
  - Fix a notice to the front of the panel warning of the need for isolation elsewhere if the panel does not totally control the electricity supply to associated plant.
  - Identify all cables with permanently fixed alphanumeric labelling system. Ensure that the numbering corresponds to the numbers fixed to the terminals. Ensure that identification and coding matches that used on the design drawings, schematics and schedules.

- Lights
    - Use LEDs
    - Use lens colours in accordance with BS EN 60073.
- Audible alarms
    - Ensure that operation of any starter trip lamp, safety circuit lamp or alarm lamp operates a common audible alarm with mute and test facilities and terminals for remote alarm signal.
    - When an alarm condition has had the audible alarm muted, ensure that terminals for a remote 'alarm accepted' light are energized. The audible alarm circuit and terminals for remote alarm signal must still be capable of indicating another fault occurring even though original fault has not been cleared. The test facilities are to test momentarily both the audible alarm and alarm indicator lamps, whilst the push button is depressed.
    - Use alarms that interface with a sensor or controller to sense set-point and measured value. Provide adjustable upper and lower limits on face of unit. Provide unit with indicating lamps to show which limit has been exceeded. Provide each unit with connections for remote alarm.
- Surge and transient suppression
    - Ensure surge arrestors are fitted for star-connected and star-delta started motors to limit peak voltage to 1200 V.
    - Ensure transient suppressors in the form of resistor and capacitor networks are fitted across starter contactor coils.
- Controlgear
    - Terminals for external conductors
        - For main power circuits, accommodate cross-sectional area of copper cables in accordance with BS EN 61439-1, Appendix A.
        - Size neutrals on 3-phase supplies to take account of harmonic content (triple-n's) where relevant, with a minimum of the full current-capacity of the corresponding phase conductors.
        - For control and auxiliary circuits, provide terminal blocks suitable for DIN rail mounting on top-hat rails dimensional type TH 37-7,5 to BS EN 60715.
    - Accessibility for inspection
        - Arrange for following operations to be performed when assembly is in service and under voltage.
        - Visual inspection of switching devices and other apparatus, settings and indicators of relays and releases, conductor connections and markings.
        - Adjusting and re-setting of relays, releases and electronic devices.
        - Replacement of fuse links and indicating lamps.
        - Fault location by voltage and current measuring.
    - Accessibility for maintenance
        - Provide space between functional unit or group and adjacent functional units or groups. Provide retainable fastening means for parts likely to be removed for maintenance.
        - Use barrier protected sub-sections for each functional unit or group.
        - Use compartments for each functional unit or group.
    - Removable parts and withdrawable parts

        - Degree of protection of assembly after removal or withdrawable of part as manufacturer's standard.
        - [.....]
    - Internal separation
        - Form 1
        - Form 2a
        - Form 2b
            - Type 1
            - Type 2
        - Form 3a
        - Form 3b
            - Type 1
            - Type 2
        - Form 4a
            - Type 1
            - Type 2
            - Type 3
        - Form 4b
            - Type 4
            - Type 5
            - Type 6
            - Type 7
    - [.....]
- Mounting
    - Floor standing
    - Wall-mounted
- Access for cabling
    - Front [.....]
    - Top [.....]
    - Bottom [.....]
    - Rear [.....]
    - Side [.....]
- Site modification
    - Do not make site alterations unless authorised. Where site modifications to assemblies are authorised make in accordance with manufacturer's certified drawings and instructions. Ensure that modifications made comply with type test certificate obtained for arrangement of components.
- Provide document pocket inside the control panel, complete with full control panel schematic and wiring schedule.
- [.....]

320.110 SENSORS - GENERAL:

- Ensure that sensors can be removed for testing and maintenance.
- Ensure that a tight-sealing test hole is provided adjacent to every duct sensor. Ensure that Binder test points, or similar, are provided for pipe sensors.
- Provide a sufficient length of spare cable so that the sensor can be removed without disconnecting the wiring.
- Mark and record the location of concealed sensors (e.g. in false ceilings and shafts, etc).
- Provide a labelling plate for each sensor.
- Take account of the active and inactive sections of a sensor probe.
- Take into account the effects of orientation on the functioning of the sensor.
- Take into account:
    - Minimum/maximum ambient temperature
    - Ambient humidity
    - Vulnerability to spray water and/or vibration
    - Explosion protection
    - External influences

320.120 TEMPERATURE SENSORS:

- Pipe-mounted immersion sensors
    - Ensure that the full active length of the sensor is immersed in water.
    - Install sensors against the direction of flow.
    - Install at the correct angle.
    - The sensor should be installed diagonally in a bypass pipe or in a bend if the active length of the sensor probe is longer than the diameter of the pipe.
    - Allow an adequate space between the sensor and the obstruction so that the sensor can be removed from the immersion pocket.
    - Ensure that immersion pockets are made from stainless steel of the appropriate pressure rating.
    - Ensure that immersion pockets are filled with a heat conducting compound.
    - A test point or an additional immersion pocket, adjacent to the sensor, should be provided for test purposes.
    - An adequate distance (10 x pipe OD) between the mixing point and the sensor should be provided when mixing water at different temperatures to take account of stratification.
- Surface temperature sensor - water
    - Ensure a smooth clean contact surface and fill the space between the sensor and the pipe with a heat conductive compound to improve thermal conductivity.
- Immersion sensors for air (ducts)
    - The full active portion of the sensor probe should be exposed to the air flow.
    - Ensure that the active portion of the probe is located central to the airflow with telescopic extendable probe type sensors.
    - A test hole should be provided adjacent to every sensor with plug when not in use.
    - Probe-type sensors should not be used in areas where stratification can occur, e.g. downstream of heating and cooling coils, etc (see averaging sensors).
    - Sensors which are positioned near to coils should be shielded against the radiative heat transfer.
    - Return air duct sensors should be located near to the occupied space to avoid heat gain or loss and radiant effects influencing readings.
    - Sensors must be positioned in an area of representative air flow. This applies to all duct sensors but particularly the return air sensor which may be located in the ceiling plenum.

- The likely cleanliness of the air should be considered when selecting sensors.
- Sensors representing zone temperature should be offset to account for heat gains e.g. space temperature stratification or if light fixtures are used as the return air path.
- Sensors should only be used in return air ducts where air is continuously extracted.

- Capillary sensors with probes
  - The device head must be higher than the sensor probe.
  - The sensor probe should be tilted downwards.
  - The ambient temperature at the device head must always be higher than the temperature to which the sensor probe is exposed.
  - The sensor element must always point downwards. The capillary should not form a U-shape.
  - The capillary should not be bent too tightly (radius of bend >50mm).

- Averaging sensor (for use in ducts/AHU)
  - Allow a distance of at least 50 mm between any heat exchanger and the sensor.
  - The entire length of an averaging sensor must be fully inside the air-duct.
  - The sensor element must be evenly distributed over the full cross-section and adequately secured to prevent vibration.
  - The sensor element should be installed in the air flow, downstream of the eliminator plate when air washers are used for humidification.

- Frost protection thermostat
  - Leave a spare capillary loop of 20 cm to enable sensor testing outside the duct/unit.
  - The capillary loop must be insulated to protect against low plant room temperatures.
  - The measuring head and the test loop of the thermostat must be located inside the ductwork and downstream of the heat exchanger if the ductwork is outdoors or in an unheated space.
  - The capillary should be installed in the air flow, downstream of the first heating coil exposed to frost. The capillary must be installed diagonal to the heat exchanger pipes or in a serpentine manner at right angles to the pipes.

- Room sensor
  - Sensors should be installed at a height of 1.5 m in occupied spaces and at least 50 cm from any adjacent walls.
  - Where room sensors have an adjustable dial they shall be mounted at 1.2m.
  - The sensor should be located in an area representative of the entire control zone.
  - The sensor should be located away from heat sources, e.g. office IT equipment.
  - The sensor should be located in the area it controls.
  - Sensor locations near air currents generated by diffusers or openable windows, for example, should be avoided.
  - The sensor must not be exposed to direct solar radiation.
  - Avoid external walls except were unavoidable. Use insulated backplates.
  - Avoid recesses and alcoves.
  - The conduit entry points to the sensor wall box should be sealed where there is a risk of air from another zone flowing over the sensor element.
  - Do not install near or under lamps or above radiators.
  - Avoid chimney walls.
  - Do not install directly adjacent to doors.
  - Do not install behind curtains.
  - Do not fit to walls concealing hot-water pipes.

- Outdoor air temperature sensors

- Do not install on facades affected by significant rising heat, or facades which will be heated by solar radiation (fix sensors to a north-facing wall or use solar shields).
- Avoid chimney walls and other walls subject to high internal heat gains.
- Do not install under eaves.
- Do not install above windows.
- Do not install above ventilation extracts.
- Ensure accessibility for inspection/verification.
- An alternative to an external mounting is to locate the sensor in the AHU intake duct. This should ideally be upstream of the intake damper and on AHU plant which run continuously (24/7). Where this is not possible it must be a suitable distance before re-circulated air and mechanical devices to avoid their effects.

320.130 HUMIDITY SENSORS:

- Humidity sensor/stat. - duct
  - The air velocity in the vicinity of the sensor must not exceed 10 m/s (a perforated steel plate cover can be used).
  - The sensor must not be located in dead legs (super-saturation can occur in areas where there is no air flow).
  - A test hole must be provided downstream of the sensor, plugged off when not in use.
  - The sensor should be positioned beyond the spray distance of humidifiers.
- Humidity sensor/stat. - room
  - The sensor should be installed at a height of approximately 1.5 m in the occupied space and at least 50 cm from the adjacent wall
  - Avoid locations where the sensor will be exposed to direct solar radiation
  - Avoid external walls except were unavoidable. Use insulated backplates
  - Avoid alcoves and recesses
  - Do not install near lamps or above radiators
  - Do not fit to chimney walls
  - Do not fit directly adjacent to doors

320.140 PRESSURE SENSORS:

- Pressure - general
  - Pressure sensors are affected by orientation.
  - The pressure tubes must be provided with a binder point near the device head for test purposes.
  - The connection must be fitted with a bypass with a stop valve to avoid overload on one side when manipulating the sensors and to enable zero calibration. Isolating valves should also be fitted.
  - The sensor should be installed on a vibration-free surface or vibration-proof base.
  - The pressure-tapping point must not be located in turbulent air flow. Provide 6 x OD upstream and 6 x OD downstream of straight duct or pipe without obstructions.
- Pressure - air
  - Probes for measuring static pressure should be installed parallel to the flow.
  - The differential pressure measuring tube should be correctly sized.
  - The tapping point should not be located where it will be affected by obstructions to the flow.
- Pressure - liquids

- Use a damping coil to avoid transferring vibrations (horizontal loops to avoid trapped air bubbles and condensate).
- The device must always be installed in a location which is lower than the sensing point.
- Do not measure at the top of a pipe (trapped air, bubbles) or at the bottom (dirt).

- Pressure - gases
  - When measuring vapour gases the device must always be installed in a location which is higher than the sensing point.
  - Measure at the top of the pipe to prevent condensate from entering the pressure tube.

320.150 FLOW VELOCITY/FLOW RATE SENSORS:

- Differential pressure for flow monitoring - liquids
  - There should be no stop valves or balancing valves between the sensing points on the pipework.
- Differential pressure for flow monitoring - air
  - Ensure a steadying zone upstream and downstream of the orifice plate/flow grid, etc.
  - The flow or differential pressure must not be monitored where there is a variable resistance such as a filter or fan, etc.
- Velocity sensors
  - Sensors should be positioned at an adequate distance from bends, tees, fans and coils such that the centre line velocity is representative of the average velocity.
  - A single point sensor should be located at a distance from the centre of the duct equal to 0.25 x the duct radius.
- Wilson flow grid
  - Averaging velocity sensors across the duct, e.g. Wilson flow grid or multi-point averaging pitot tubes, should be used where the minimum separation distance from a flow disruption is not available. Ensure that the Wilson flow grid is sized correctly for each duct size.

320.160 INDOOR AIR QUALITY SENSORS:

- CO_2 and mixed-gas sensors - room mounted
  - Ensure that the sensor is located in a representative location, e.g. on an open wall 1.5 to 3 m above the floor.
  - Ensure that the sensor is not mounted in niches or bookshelves or behind curtains.
  - Ensure that the sensor is not located where people are continuously present (within 1 or 2 metres).
- CO_2 and mixed-gas sensors - duct mounted
  - Ensure that the sensor is located in the return air duct as close as possible to the room extract point(s).
  - Ensure that the sensor is located in the vertical position.
  - Ensure the correct orientation of the duct probe with respect to the airflow.
  - Ensure that the sensor is not installed in a vertical position with the head at the bottom.

320.170 ACTUATORS:

- Securely mount actuators to rigid members, free from vibration or distortion in accordance with manufacturer's recommendations. Select mounting positions to require minimum linkages, and to avoid angular drive to operating levers. Allow access for servicing and replacement.
- Ensure that actuators and linkages for valves and dampers operate smoothly from fully open to fully closed without binding and with adequate torque to overcome the resistance of the actuator mechanism and the flow and to provide the specified close off ratings.
- Ensure that linkages are clearly marked with the clamping position such that after maintenance or replacement the mechanism is able to operate correctly.
- Fit actuators with visual position indication.
- Actuators shall have tamper-proof reversible clockwise and anti-clockwise mode selection.
- Ensure that there is sufficient space above the actuator so that it may be removed for testing or maintenance.
- Include position feedback devices suitable for connection to the BMS.
- Ensure that actuators incorporate a disconnection device to allow manual operation of the valve or damper in the event of actuator failure.
- Ensure that actuators are electrically and mechanically protected from the effects of valve or damper seizure.
- Use 24V actuators wherever possible. Where line voltage actuators are used, provide local means of isolation by manual isolator or plug and socket connection.
- Ensure that, during commissioning, valve actuators are fitted in a fully closed/bypass position where they are being fitted to valves which push against a spring.

320.180 VALVES:

- General
    - Ensure that valves have the correct authority without excessive pressure drop.
    - Ensure that valve bodies are suitable for the medium, the temperature and the pressure of the fluid system.
    - Ensure control valves have a close-off pressure rating higher than the circuit pressure design.
    - Ensure that valves will pass the required flow at a pressure drop within the maximum differential pressure rating of the valve.
    - Check for out-of-balance forces, particularly during operation of a three-port valve.
    - Where possible ensure that valves are not installed with their spindles in the horizontal position. If valves cannot be installed with their spindles in the vertical position ensure that they are as near as possible to the vertical.
    - Ensure that valves are not installed with the actuator at the bottom.
- Modulating valves
    - The following additional considerations apply for modulating valves:
    - Ensure system operating pressures, test pressures, pump heads and pressure drops through heat exchangers and associated pipework are known before control valves are selected.
    - Select valves to provide an authority of 0.3 to 0.5 for diverting applications and 0.5 for mixing applications.
    - Select valves with port characteristics appropriate for the intended function.
    - Ensure that all modulating control valves are selected for equal percentage or linear characteristics according to system type, to provide near linear characteristics between the valve position and heating/cooling power as delivered to the air or water-based system.
    - Ensure that the range ability of the selected valves is large enough to provide stable control under low load conditions.

320.190 VALVE SIZING REQUIREMENTS:

- All types of valves and applications
    - Parameter - Body pressure rating.
    - Requirements - To exceed system test pressure.
- All 2-port valves
    - Parameter - Close-off pressure rating.
    - Requirements - To exceed pump or system full differential pressure.
- All 3-port valves
    - Parameters - Close-off pressure rating.
    - Requirements - To exceed out of balance pressures
- All types of valves and applications
    - Parameters - Maximum leakage coefficient.
    - Requirements - 0.05% kv.
- 2-port isolation valves
    - Parameters - Pressure drop at full flow.
    - Requirements - Select at line size for minimal pressure drop.
- 2-port modulating valves
    - Parameters - Pressure drop at full flow.
    - Requirements - Select kv value for pressure drop within an agreed range.
- 3-port modulating valves
    - Parameters - Pressure drop at full flow.
    - Requirements - Select kv value for 30% - 50% authority against coil or circuit pressure drop.
- Isolation valve
    - Parameter - Characteristic.
- Modulating valves (plant valves and zone reheater coil valves)
    - Parameters - Characteristic.
    - Requirements - Equal percentage.
- Modulating valve (fan coil units)
    - Parameters - Characteristic.
    - Requirements - Equal percentage (preferred) or linear.
- Modulating valves (independently pumped mixing and injection circuits)
    - Parameter - Characteristic.
    - Requirements - Linear
- Pressure-independent control valve (PICV's)
    - Parameters - characteristics.
    - Requirements
        - Linear (modulating) or equal percentage (modulating).

320.200 DAMPERS:

- Provide visual position indicators on all damper actuators installed so that they can be seen from the plant room floor.
- Ensure that damper characteristics are as linear as possible.
- Ensure that modulating dampers are sized correctly to give adequate authority.
- Damper actuators shall have tamper-proof clockwise and anti-clockwise mode selection.

320.210 COMMUNICATION NETWORKS - GENERAL:

- Ensure that all addressable control devices can be addressed over the communications network.
- Ensure that the bandwidth and subsequent speed of communications is sufficient to meet the requirements of the selected manufacturer's BMS equipment.
- Ensure that no cross corruption of data occurs when the BMS shares a communication network with other IT-based systems. Ensure that permission has been given by the IT manager to connect BMS components onto the IT network. Comply with the organisation's IT strategy for connection of devices to the IT data network, including allocation of IP addresses.
- Ensure that network testing, identification and documentation comply with BS EN 50173-services and BS EN 50174-series.
- Ensure that all network devices such as routers and bridges are compatible with the network and are capable of operating such that the required throughput of data is achieved.
- Install communication networks in accordance with BS EN 61918.
- Assess the network performance for business-critical functions in accordance with BS EN 61907.

320.220 COMMUNICATION NETWORKS - STRUCTURED CABLING:

- Ensure that the selected BMS components are suitable for operating on the structured cabling system.
- Ensure that the selected BMS topology (star wired, chained or bus-based) is appropriate for the structured cabling system.
- Ensure that each addressable BMS device can be addressed over the structured cabling system.
- Where BMS components are specified to be powered from the structured cabling system ensure that the power available is sufficient. Ensure that overheating of the structured cabling system will not occur.
- Ensure that any changes to the structured cabling system are reflected in updated documentation.

320.230 COMMUNICATION NETWORKS - INTRANET AND INTERNET APPLICATIONS:

- Ensure that the BMS devices to be directly connected onto the Intranet/Internet are TCP/IP compatible.
- Ensure that the BMS is compatible with relevant security techniques in accordance with BS ISO/IEC 27032.

320.240 COMMUNICATION NETWORKS - MAINS-BOURNE SIGNALLING:

- Comply with the requirements of BS EN 50065-1.
- Provide the necessary equipment to ensure that there is no mutual interference between the signalling system of the electricity utility and mains-borne signalling of the BMS.
-
- Ensure that the attenuation of radio signals does not hinder effective data communications.

320.260 INTEGRATION WITH FIRE DETECTION SYSTEMS - GENERAL:

- Application: Monitoring
- Ensure approval from the relevant Fire Prevention Officer or Building Control Officer.
- Ensure that the requirements of BS 5839-1 are not compromised.
- Ensure that the fire detection system can operate autonomously and will not be affected by any failure of the BMS.
- Ensure that the BMS will not be affected by any failure of the fire detection system or fails safe as appropriate.
- Ensure that the loss of electrical power to the BMS will have no adverse effects on the fire detection system.
- Ensure that a full cause and effect testing programme is developed in conjunction with the fire alarm company.
- Ensure that the integrated system is fully commissioned.
- Ensure that the contractual responsibilities of the various parties responsible for the integrated system are fully defined.

320.270 INTEGRATION WITH FIRE SYSTEMS - INTEGRATION DETECTION FOR MONITORING:

- Application: Monitoring
- Unidirectional systems
    - Provide building graphics/schematics on the BMS operator client indicating the location of fire detector heads or zones, along with their respective status.
- Monitoring interface:
    - Digital input for AC or DC 24 V volt-free contacts
    - Communications protocol
        - BS EN 61158-2 (fieldbus)
        - Profibus (BS EN 62769-series)
        - Profinet (BS EN 62769-series)
        - Modbus
        - Modbus over Ethernet
        - KNX (BS ISO/IEC 14543-series)
        - BS EN ISO 1648-5 (BACnet)
- Ensure that a fire alarm condition automatically displays the appropriate building graphic/schematic along with relevant detector head status or zone status.
- Ensure that any time delay in receiving fire alarm data at the operator client does not exceed 2 seconds.

320.310 INTEGRATION WITH LIGHTING CONTROL SYSTEMS:

- Application: Monitoring and Control
- Ensure that the following functionality is provided:
    - Switching of lighting zones in accordance with zone occupation times as set on the BMS.
    - Switching of lighting zones in accordance with occupancy sensing and light level sensing where this is provided by the BMS.
    - Monitoring of lighting zones.
    - Monitoring of lamp run hours.
    - Raising of an alarm on lamp run hours exceeding the specified maximum.
    - The ability to override zones.

- Ensure that re-definition of zones cannot be performed via the BMS.
    - Direct interoperability
    - Gateway link
- Interface:
    - Digital input for AC or DC 24 V volt-free contacts
    - Communications protocol
        - Modbus
        - Modbus over Ethernet
        - KNX (BS ISO/IEC 14543-series)
        - BS EN ISO 1648-5 (BACnet)

330.330 CONTROLS CIRCUITS:

- Supply Voltage
    - Ensure control circuits are DC (negative-earth) or AC **[230]** V sourced from common single-phase supply. Control circuits from single-phase supplies derived from different phases shall not be used in the same enclosure.
- Circuit Voltage
    - Where control circuits are taken outside the panel
    - Use 24 volt operating supply.
    - Use **[230]** volt operating supply.

330.340 CONTROL CIRCUITS TRANSFORMERS:

- Provide control circuit transformers to supply power at voltages to suit control components.
- Standard
    - Use transformers in accordance with BS EN 61558-2-9, BS EN 61558-2-23 or BS EN 61558-1 and provide an external label of approved type and size.
- Protection - Primary and secondary fuses.

340.000 WORKMANSHIP:

340.010 GENERAL:

- Install pipeline control components in accordance with manufacturer's instructions.
- Install ductline control components in accordance with DW/144 and manufacturer's instructions.
- Install control components in accordance with manufacturer's recommendations, in positions indicated.

340.020 APPEARANCE:

- Arrange, support and clip all control wiring, pneumatic tubes and capillaries to present a neat appearance, with other services and the building structure.

340.030 INSULATION:

- Where control components are incorporated in insulated pipelines, ductlines or equipment, provide details for approval of method proposed to insulate component.

340.040 SUPPORTS:

- Arrange supports for control components to ensure no strain is imposed on components.

340.050 ACCESS:

- Arrange control components to ensure adequate access for operation and maintenance.
- Comply as relevant with BS EN 547-series and BS 7671 (IET Wiring Regulations) requirements for maintenance gangways.

340.080 POWER OPERATED CONTROLS:

- Install power operated controls in accordance with manufacturer's instructions and relevant standards.

340.110 ANCILLARIES:

- Install ancillaries in accordance with manufacturer's instructions.

340.120 ENCLOSURES:

- Install enclosures where indicated and where required, providing space for access and maintenance.

340.130 BUILDING MANAGEMENT SYSTEM INSTALLATION:

- Install commission and set to work building management system in accordance with the manufacturer's recommendations.

340.140 BUILDING MANAGEMENT SYSTEM CABLE INSTALLATION:

- Plan and install all building management monitoring systems cables in accordance with the cable manufacturer's recommendations.
- Label and record all monitoring cables in accordance with:
    - Approved Cable schedules
    - Approved Shop drawings

340.150 BUILDING MANAGEMENT SYSTEM QUALITY CONTROL:

- Handle, store and install equipment and components of the building management system in accordance with the manufacturer's recommendations.
- Inspect all equipment and components on delivery, before fixing and after installation and reject and replace any which are defective.
- Record all commissioning tests and site modifications to hardware or software, and revise operating and maintenance instructions accordingly.
- Inspect installed and operational functions of Building Automation, Controls and Technical Building Management System including its configuration in accordance with BS EN 16946-1.
- Manage configuration of software, settings, data and design, in accordance with an appropriate Configuration Management Plan complying as necessary with BS EN ISO 9001, BS ISO 10007, BS ISO/IEC 12207 and BS ISO/IEC/IEEE 15288.

- Provide configuration details along with the operation and maintenance manual on handover.
- Manage information security systems, software and data during design, implementation and commissioning in line with BS EN ISO/IEC 27001.

340.160 CONTROL SYSTEM FUNCTION CHARTS:

- Prepare function charts for the control system in accordance with BS EN 60848. Obtain approval for function chart before design of system hardware or writing control software.
- Function chart format.
    - Combined function chart/circuit diagram.
    - Function chart only.

350.000 COMMISSIONING

- Perform system commissioning in accordance with CIBSE Commissioning Code C.
- Undertake and manage integrated commissioning in accordance with CIBSE Commissioning Code M: Commissioning Management
    - Performance interface testing with all other logically-connected systems
    - Perform whole building integrated testing
    - Perform black building integrated testing
- Carry out seasonal commissioning during four separate occasions with three monthly intervals during the defects liability period in the first year after handover.

360.000 DEMONSTRATION AND HANDOVER

360.010 WITNESSING REQUIREMENTS:

- Ensure that the project supervisor's nominated representative implements the following witnessing requirements. Ensure that on-site commissioning staff facilitate the witnessing process.
- Ensure that the BMS hardware is installed in accordance with the specification.
- Verify any operator software and associated graphics.
- Witness completely the control of any main and/or critical items of plant along with a random sample of other points.
- If less than 300 points, witness all points. Between 300 and 1,000 points witness 50% (minimum of 300 to be witnessed). If more than 1,000 points witness 20% (with a minimum of 500 points witnessed).
- Reserve the right to witness 100% of the points if the failure rate is greater than 5%.
- Witness a sample of specific functions, e.g. 10% of alarms and 10% of data logging.
- Witness one of several identical items of plant in detail with the others witnessed on a random basis.
- Verify the system security access.
- Verify that all safety-related functions perform to that specified, e.g. plant shutdown on fire condition.
- Verify all plant restarts according to that specified after building power failure and local power failure.
- Witness all power meter data-points to ensure that they match the meters.
- Ensure that trend logs are used when witnessing points in order to monitor the performance of control actions.
- Verify the handover of all operating manuals and system documentation.
- Verify the handover of backup copies of software.

- Verify the completion of any specified system operator training.

360.020 OPERATOR TRAINING:

- Ensure that training is completed before the BMS is handed over.
- Ensure that each trained operator signs a training acceptance certificate(s).
- Provide training off-site at the BMS suppliers training facility. Complement this off-site training with 'hands on' on-site training.
- Provide appropriate reference and training manuals for the operator.
- Provide operator training for one or more, as per the employer requirements, of the following levels of operator.
- Basic operator
    - Ensure that the operator is trained to:
        - Call up and view point-data from plant schematics and/or points lists
        - Acknowledge system alarms
        - View trend logs
- Intermediate operator
    - In addition to the requirements for a Basic operator, ensure that the operator is trained to make basic alterations to the BMS including changes to:
        - Time and occupancy programmes
        - Control set-points
        - Setting up trend logs
        - Setting up alarm routines
        - Ensure that the operator is also trained for testing and routine inspection of sensors and actuators
- Advanced operator
    - In addition to the requirements for an intermediate operator, ensure that the operator is trained to:
        - Add or change graphics/schematics
        - Change control strategies
        - Add analogue and digital inputs/outputs to the system
        - Back-up the system and archive logged data
        - Re-load system software/configuration details
        - Add/modify passwords/monitor system security

360.030 OPERATION AND MAINTENANCE MANUALS:

- Ensure that the O&M manual specified in the Employer's Requirements, includes the following and is included in the site health and safety file:
    - A written description of plant operation
    - Plant schematic arrangement of automatic controls drawing
    - Control strategy/logic diagrams recording the final version of configuration software installed at handover
    - Details of system application software configuration
    - A points list including hard and soft-points (all points should have a unique mnemonic)
    - A description of user adjustable points
    - Commissioning record details
    - Detailed data sheets for all control components and equipment

- Wiring circuit details including origin, route and destination of each cable
- Basic security access to the system
- Specific instructions for server shutdown and restart procedures
- Comprehensive instructions for switching on, operation, switching off, isolation, fault finding and procedures for dealing with emergency conditions
- Instructions for any precautionary measures necessary.
- Instructions for the routine operation of the control system including simple day-to-day guidance for those operating the control system with limited technical skill
- Instructions for servicing and system upkeep
- A provision for update and modification

- Ensure that the O&M manual includes comprehensive system operating instructions.

360.040 SOFTWARE:

- Ensure that a copy of the configuration software is securely held both on and off-site.
- Ensure that, as alterations are made to the configuration software, all previous versions of the software are securely archived.
- Ensure that all credentials are transitioned to the operation and maintenance organisation(s) at handover.

360.050 POST-HANDOVER CHECKS:

- Ensure that the following post-handover checks are performed:
  - Global level checks
    - Internal air temperature
    - Relative humidity
    - Ventilation
    - Energy consumption (ensure that the pulse-input counters match the meters).
    - Seasonal commissioning
    - Soft landings requirements
    - Check that each of the above meets the specified requirements.
  - System level checks
    - Control strategies. Check that any suspect control strategies are appropriate for the intended application. Check that the suspect control strategy has been implemented and commissioned correctly. Check that the control strategy is still appropriate for the intended use.
    - Network communications. Check that all relevant field controllers communicate properly. Check for correct sharing between controllers of relevant data and correct inter-controller operation.
    - Control set-points. Check that the set-points in question are correct and appropriate for the actual operating conditions.
    - Control loop settings. Check that the control loop settings result in accurate and stable control. Check that all self-learnt characteristics are valid.
    - Control zones. Check that the control zones are appropriate.
    - Occupant controls. Check that occupant controls work correctly.
  - Sub-system/component level checks
    - Sensors. Check the accuracy and location of any suspect sensors.
    - Actuators. Check that any suspect actuators operate correctly.

- Dampers and valves. Check that any suspect dampers and valves are not jammed and that they operate as intended.

W71 – COMMON CLAUSES FOR STRUCTURED CABLING (EN)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section includes general communications design requirements, administration topics, and installation for Information and Communications Technologies (ICT) cabling infrastructure.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. To be developed

B. Referenced Standards

1. International British (BS), European (EN) and IEC Standards

C. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. EN 50173-1, Information technology – Generic cabling systems– General requirements.
2. EN 50173-2, Information technology – Generic cabling systems – Office premises.
3. EN 50173-3, Information technology – Generic cabling systems – Industrial premises.
4. EN 50173-4, Information technology – Generic cabling systems – Homes.
5. EN 50173-5, Information technology – Generic cabling systems – Data centres.
6. EN 50173-6, Information technology – Generic cabling systems – Distributed building services.
7. CLC/TR 50173-99-1, Cabling guidelines in support of 10 GBASE-T.
8. EN 50174-1, Information technology – Cabling installation – Installation specification and quality assurance.
9. EN 50174-2, Information technology – Cabling installation – Installation planning and practices inside buildings.
10. EN 50174-3, Information technology – Cabling installation – Installation planning and practices outside buildings.
11. CLC/TR 50174-99-1, Information technology - Cabling installation - Remote powering.
12. EN 50310, Application of equipotential bonding and earthing in buildings with information technology equipment.
13. EN 50346, Information technology – Cabling installations – Testing of installed cabling.
14. EN 61935-1, Specification for the testing of balanced and coaxial information technology cabling. Installed balanced cabling as specified in the standards series EN 50173.
15. ISO/IEC TR 14763-2-1, Information technology – Implementation and operation of customer premises cabling – Part 2-1: Planning and installation – Identifiers within administration systems.
16. ISO/IEC 14763-3, Information technology – Implementation and operation of customer premises cabling – Part 3: Testing of optical fibre cabling.
17. EN 61073-1, Fibre optic interconnecting devices and passive components — Mechanical splices and fusion splice protectors for optical fibres and cables — Part 1: Generic specification
18. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

110.020 PROJECT/SITE CONDITIONS

1. To be developed

110.030 DEFINITIONS AND ABBREVIATIONS

A. Definitions: To be developed

B. Abbreviations: To be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. To be developed

120.020 SYSTEM ARCHITECTURE

A. To be developed

B. The objective of this Project is to provide a complete communications structured cabling infrastructure system installation including, but not limited to: fiber optic backbone, horizontal cabling with associated terminations, mounting equipment, cable pathway and management systems, testing and other items/materials

C. The Structured Cabling Solution shall be designed and installed to provide the telecommunications infrastructure (patch panels, frames, patch cords, cables, faceplates and outlets) which will function for a multimedia communications solution.

PART 3 TO BE DEVELOPED.PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS : TO BE DEVELOPED.

300.020 CABLE MANAGEMENT SYSTEM

300.030 LABELING GENERAL REQUIREMENTS

A. All components of the telecommunications infrastructure and pathway system shall be labeled according to the applicable Standard and the adopted ‘System Administration Scheme’ described herein and in coordination with the Employer and Engineer, including but not limited to:

1. Copper and fiber optic cables and patch cords.
2. Workstation outlets faceplates and Individual outlet connectors.
3. Termination panels, blocks, trays.
4. Telecommunications Room entry and exit pathways.
5. Racks, cabinets, and equipment.
6. Fiber optic on either side of the splice closure.
7. Grounding and bonding system for telecommunications.
8. OSP manholes / pull boxes covers.
9. Telecommunications cable tray and conduit pathways.

B. Labels shall provide a direct link to the identifier within the record within the administration system.

C. Labels shall be machine-manufactured by a labeling machine. Handwritten labels will not be accepted for final labeling.

D. Labels shall meet the following legibility and adhesion requirements:

E. Labels should be resistant to the environmental conditions at the point of installation (such as moisture, heat, or ultraviolet light), and should have a design life equal to or greater than that of the labeled component.

F. Labels shall be accessible and, where necessary, able to be modified.

G. Cable Labels: Self-adhesive vinyl or vinyl-cloth wraparound tape markers, machine printed with alphanumeric cable designations.

H. Flat-surface labels: Self-adhesive vinyl or vinyl-cloth labels, machine printed with alphanumeric designations.

I. To be developed.

300.040 AUTOMATED INFRASTRUCTURE MANAGEMENT (AIM)

A. Overview : To be developed.

B. Software Characteristics for the AIM shall be developed

C. Hardware Characteristics for the AIM shall be developed

310.000 QUALITY MANAGEMENT

310.010 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. For the following quality management topics, refer to Division W, Section “Common Clauses for Structured Cabling (EN)”:

1. PRODUCTS AND WORK BY OTHERS / COORDINATION
2. CONFIDENTIALITY
3. QUALITY ASSURANCE
4. DELIVERY, STORAGE, AND HANDLING
5. WARRANTY
6. MAINTENANCE AND SUPPORT
7. SPARE PARTS AND EXTRA MATERIAL

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.000 EXECUTION

330.010 EXAMINATION

A. To be developed.

330.020 SYSTEM ADMINISTRATION SCHEME

A. Comply with EN 50174-1 and ISO/IEC TR 14763-2-1 for system administration scheme.

B. EN 50174-1 and ISO/IEC TR 14763-2-1 Administration Scheme.

1. To be developed.

330.030 GENERAL REQUIREMENTS

A. To be developed

B. Cable Schedule

C. Cabling Administration Drawings

D. Cable and Wire Identification:

1. To be developed

E. Labels shall be pre-printed or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in EN 50174-1

1. Labels that snap-around or slip-around the cable/raceway shall be flexible vinyl or polyester labels that flex as the cable/raceway is bent.
2. To be developed.

330.040 RE-INSTALLATION

A. To be developed

330.050 CLOSEOUT ACTIVITIES

A. Contractor to submit for PC-based, cabling administration system - as detailed in Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

330.060 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W71B - COMMUNICATIONS EQUIPMENT ROOM FITTINGS (EN)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Telecommunications equipment racks and cabinets.
2. Telecommunications mounting elements.
3. Rack mounted power protection and power strips.
4. Rack mounted uninterruptible power supplies (UPS).
5. Backboards.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions: To be developed.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

120.020 COMMUNICATIONS ROOMS GENERAL REQUIREMENTS

A. To Be Developed.

B. Comply with EN 50174-2 for the particular type of premises

C. Check provisions of communications rooms for conformance to the general requirements. Any discrepancy shall be brought to the attention of the Engineer immediately.

D. Communications rooms must be dedicated to designated equipment and services only:

E. Space shall not be used for storage of equipment not related to designated equipment and services.

F. Hazardous or corrosive materials shall not be stored in the space.

G. Piping, ductwork and distribution of power, not related to designated equipment and services shall not pass through or be located within the space.

H. Spaces intended to contain metallic cabling shall be located away from sources of electromagnetic interference. Examples of such noise sources include electrical power supply transformers, motors and generators, x-ray equipment and radio or radar transmitters.

I. Each communication room shall be equipped with fire detection, fire-extinguishing system and prevention devices

J. Contractor shall ensure that foreign piping such as water pipes, HVAC ducts, and other unrelated systems utilized for or containing liquids, or gases are not installed or do not pass through telecommunication rooms. Sprinkler piping shall not pass through the telecommunications space to serve

other areas. Sprinkler piping serving only telecommunications spaces shall not be considered foreign to the telecommunications installation.

K. AC grade plywood as per APA “American Plywood Association”

L. A minimum of three walls shall be covered with AC-grade plywood backboards starting from 300 mm AFF (smooth side to interior of room mounted vertically), capable of supporting mounted hardware and equipment. Fire-treatment verification stamps on plywood shall be left unpainted to be readable.

M. Communications room walls shall extend from floor slab to ceiling deck, with a clear height not less than 3 meters and with no drop ceilings (false ceilings) installed to allow the installation of high-level or ceiling-mounted pathway systems.

N. Cable trays or ladder racks shall be used to distribute cables between rooms through finished wall penetrations.

O. All penetrations through fire-rated building elements (walls and floors) shall be sealed with an approved fire-stopping system. Riser openings, sleeves, cables, conduits, cable trays, and raceways, etc. shall be properly fire stopped.

P. Floors shall have anti-static properties.

Q. Communications rooms with frames or cabinets that are to be cabled from below, shall be provided with access floor (raised floor) systems of sufficient under-floor depth to enable routing of underfloor pathway systems and other underfloor services.

R. Communications rooms shall have only one lockable entrance door, with dimensions not less than 1000mm wide and 2130mm in height, that opens towards the outside of the room, and does not open into another room.

S. Doors shall be provided with a lockset for the appropriate technology key with pinned hinges and anti-pry guards.

T. Door shall not have a door sill.

U. Door shall not have a center post to facilitate access for large equipment.

V. Environmental Conditions: To be developed.

W. Floor loading capacity: To be developed.

X. Plumbing: To be developed.

Y. Electrical: To be developed.

Z. Earthing and Lightning Protection: To be developed.

AA. Labeling: Refer to Division W, Section “Identification for Communications Systems (EN)”.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. To be developed.

300.020 BACKBOARDS

A. Backboards: Plywood, fire-retardant treated.

B. To be developed.

300.030 EQUIPMENT RACKS AND CABINETS

A. General Requirements:

1. Freestanding and wall-mounting, modular-steel and/or aluminium units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
2. Module Dimensions: Width compatible with EIA/ECA-310-E standard.
3. To be developed as per design requirements

B. Floor-Mounted Racks – 2 Post Relay Racks: Modular-type, steel or aluminum construction.

1. To be developed as per design requirements

C. Floor-Mounted Racks – 4-Post Server Frame: Modular-type, steel or aluminum construction.

1. To be developed as per design requirements

D. Modular Freestanding Server Cabinets, steel or aluminum:

1. To be developed as per design requirements

E. Modular Freestanding Network Cabinets, steel or aluminum:

1. To be developed as per design requirements

F. Modular Wall Cabinets:

1. To be developed as per design requirements

G. Cable Management for Equipment Frames:

1. To be developed as per design requirements

300.040 POWER STRIPS

A. Power Strips in free-standing cabinets:

1. Vertical mounting.
2. To be developed as per design requirements

B. Power Strips in wall-mounted cabinets:

1. Horizontal, rack-mounting.

1. To be developed as per design requirements

300.050 INDIVIDUAL RACK MOUNTED UNINTERRUPTIBLE POWER SUPPLIES (UPS) FOR RATINGS UP TO 3 KVA

A. Provide rack mounted UPS units for telecommunication/security active equipment.

B. UPS shall comply with: EN 62040-1 (Safety) and EN 62040-2 (EMC: Category C2).

C. Technical Characteristics:

1. To be developed as per design requirements

300.060 GROUNDING

A. To be developed.

B. Comply with EN 50310, EN 50174-2 and EN 50174-3.

300.070 LABELING

A. Comply with Division W, Section “Identification for Communications Systems (EN)”.

B. Comply with EN 50174-1.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

310.020 MISCELLANEOUS QUALITY MANAGEMENT TOPICS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.030 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.000 EXECUTION

330.010 ENTRANCE FACILITIES

A. Contact telecommunications Service Provider and arrange for installation of demarcation point, protected entrance terminals, and an enclosure when so directed by the Service Provider.

B. To be developed.

330.020 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.030 FIRESTOPPING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Comply with EN 50174-1.

C. To be developed.

330.040 GROUNDING

A. To be developed.

B. Install grounding according to EN 50310, EN 50174-2 and EN 50174-3.

330.050 IDENTIFICATION

A. Comply with requirements specified in Division W, Section "Identification for Communications Systems (EN)".

B. Identify system components, wiring, and cabling complying with EN 50174-1.

C. To be developed.

330.060 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

330.070 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W71C - COMMUNICATIONS BACKBONE CABLING (EN)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Optical fiber cabling.
2. Balanced copper (metallic) twisted pair cabling.
3. Cable connecting hardware, patch panels, and cross-connects.

100.020 PERFORMANCE REQUIREMENTS

A. Backbone cabling system shall comply with both environmental and transmission performance criteria stated in Division W, Section "Common Clauses for IT & Security Systems" in accordance with EN 50173-1, when tested according to test procedures of the relevant Standards.

B. Standard cables shall have a flame retardant overall sheath complying with IEC 60332-1-2.

C. Low Smoke Zero Halogen (LSZH/LS0H) cables shall comply with the following standards:

1. Flame retardant: IEC 60332-1.
2. Halogen-free according to:

a) IEC 60754-1 for amount of halogen acid gas.
b) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).

3. Low smoke density according to IEC 61034-2.

D. Fire resistant cables shall comply with the following standards:

1. Circuit Integrity: IEC 60331-23 (metallic cables); IEC 60331-25 (fiber optic cables).
2. Flame retardant: IEC 60332-1-2.
3. Halogen-free according to:

a) IEC 60754-1 for amount of halogen acid gas.
b) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).

4. Low smoke density according to IEC 61034-2.

E. Cable Connecting Hardware shall be compatible for use with the Automated Infrastructure Management (AIM) system of the Project.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. Standards relevant to optical fiber cables mechanical and environmental requirements include:

1. EN 60793-2, Optical fibres. Product specifications. General.
2. EN 60793-2-10, Optical fibres. Product specifications. Sectional specification for category A1 multimode fibres.
3. EN 60793-2-50, Optical fibres. Product specifications. Sectional specification for class B single-mode fibres.
4. EN 60794-1-1, Optical fibre cables. Generic specification – General.
5. EN 60794-2, Optical fibre cables. Indoor cables. Sectional specification.
6. EN 60794-2-11, Optical fibre cables. Indoor optical fibre cables. Detailed specification for simplex and duplex cables for use in premises cabling.
7. EN 60794-2-21, Optical fibre cables. Indoor optical fibre cables. Detailed specification for multi-fibre optical distribution cables for use in premises cabling.
8. EN 60794-3, Optical fibre cables. Sectional specification. Outdoor cables.

9. EN 60794-3-12, Outdoor cables. Detailed specification for duct and directly buried optical telecommunication cables for use in premises cabling
10. EN 60794-3-21, Optical fibre cables. Outdoor cables. Detailed specification for optical self-supporting aerial telecommunication cables for use in premises cabling.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

C. Abbreviations

1. To be developed.

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

120.020 BACKBONE CABLING DESCRIPTION

A. Backbone cabling system for a generic Information and Communications Technology (ICT) cabling system shall include two subsystems: “Campus Backbone” and “Building Backbone” as described in Division W, Section “Common Clauses for Structured Cabling (EN)”.

B. Backbone cabling system shall also include Data Centers Backbone for Network access system and Main distribution system – as applicable to the Project – and described in Division W, Section “Common Clauses for Structured Cabling (EN)”.

C. Each cabling subsystem consists of backbone cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for backbone-to-backbone cross-connection.

D. Backbone cabling cross-connects may be located in equipment rooms or at entrance facilities. Bridged taps and splitters shall not be used as part of backbone cabling.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. General

1. Refer to Division W, Section W71 “Common Clauses for Structured Cabling (EN)”.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

1. To be developed

300.020 PATHWAYS

A. Comply with requirements in Division Y Sections:
    1. To be developed
B. Comply with requirements in EN 50174-2 and EN 50174-3.

300.030 OPTICAL FIBER CABLE

A. Optical Fiber Cable - For Indoor Use:
    1. Tight buffered, optical fiber cable:
        a) Single-Mode and Lase Optimized Multi-Mode
        b) Non -conductive construction.
        c) Reinforcement:
            1) Central strength element aramid / glass fiber
            2) Aramid / glass fiber yarn around the sub-units of fibers
        d) PVC inner sheath.
        f) PVC sheath with color to designate the type of optical fiber and ripcord applied longitudinally underneath.
    2. Standards: Comply with:
        1) EN 60794-2
        2) EN 60794-2-11
        3) EN 60794-2-21
B. Optical Fiber Cable - For Indoor/Outdoor Use:
    1. Application: indoor/outdoor fiber optic cables are intended to be used to make interconnections within and between adjacent buildings or to the first outdoor splice point. These cables shall be fully resistant to the typical outside plant environment, but also can be routed indoors, where flame rating requirements apply.
    2. Tight-buffered using dry water blocking technology, optical fiber cable:
        a) Single-Mode and Laser Optimized Multi-Mode
        b) Conductive construction.
        c) Reinforcement:
            1) Central strength element aramid / glass fiber yarn.
            2) Aramid / glass fiber yarn around the sub-units of fibers
        d) PVC inner sheath.
        e) Steel tape armour.
            1) The cable shall be spirally wrapped and encased within an interlocking or corrugated armored metal without interruption from end to end for protection and strength.
        f) PVC outer sheath with color to designate the type of optical fiber and ripcord applied longitudinally underneath.
        g) Additional Polyamide/ Nylon sheath for protection against rodents and termites.
    3. Standards: Comply with:
        1) EN 60794-2
        2) EN 60794-2-11
        3) EN 60794-2-21
C. Optical Fiber Cable - For Outdoor Use (Outside Plant):
    1. Jell-filled loose tube optical fiber cable.
        a) Single-Mode or Laser Optimized Multi-Mode
        b) Conductive construction.

c) Reinforcement:

1) Central strength element solid steel
2) Aramid / glass fiber yarn around the sub-units of fibers.

d) Polyethylene (PE) inner sheath.

e) Steel tape armour.

1) The cable shall be spirally wrapped and encased within an interlocking or corrugated armored metal without interruption from end to end for protection and strength.

f) Polyethylene (PE) outer sheath with color to designate the type of optical fiber and ripcord applied longitudinally underneath.

g) Additional Polyamide/ Nylon sheath for protection against rodents and termites.

2. Standards: Comply with:

1) EN 60794-3
2) EN 60794-3-12
3) EN 60794-3-21

D. Optical Fiber Cable - Sheath

1. Cable cordage sheath, fiber, and group color shall be according to EN 50174-1.
2. To be developed as per design requirements

E. Number of Fiber Strands / Cores

1. To be developed as per design requirements

300.040 SINGLE-MODE OPTICAL FIBER CABLE - CATEGORY OS2

A. To be developed

300.050 LASER-OPTIMIZED MULTI-MODE OPTICAL FIBER CABLE - CATEGORY OM5

A. To be developed

300.060 OPTICAL FIBER CABLE HARDWARE

A. Optical Fiber Patch Bays

1. To be developed

B. Patch Cords

1. Patch Cords in lengths to suit application and routing requirements.

C. Cable Connecting Hardware:

1. Comply with EN 50173-1, Clause 8 for “Connecting Hardware Requirements”.

1. To be developed

300.070 OPTICAL FIBER FUSION SPLICING DEVICE

1. To be developed

300.080 BALANCED TWISTED PAIR COPPER CABLE

1. To be developed

300.090 BALANCED CABLE HARDWARE

A. General Requirements for Cable Connecting Hardware: Comply with EN 50173-1, Clause 8 for “Connecting Hardware Requirements”, IDC type, with modules designed for punch-down caps or tools. Cables shall be terminated with connecting hardware of same category or higher.

B. To be developed

300.100 GROUNDING

A. To be developed

B. Comply with EN 50310, EN 50174-2 and EN 50174-3.

300.110 IDENTIFICATION PRODUCTS

A. Comply with Division W, Section "Identification for Communications Systems (EN)."

B. Comply with EN 50174-1.

300.120 CABLE MANAGEMENT SYSTEM

A. Comply with Division W, Section "Identification for Communications Systems (EN)" for cable and asset management software.

310.000 QUALITY MANAGEMENT

310.010 PRODUCTS AND WORK BY OTHERS / COORDINATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.020 CONFIDENTIALITY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.030 QUALITY ASSURANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

310.040 DELIVERY, STORAGE, AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.050 WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.060 MAINTENANCE AND SUPPORT

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

310.070 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed.

320.000 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Cable Pulling Plan: To be developed

C. Splice Plan: To be developed

D. Cable Testing Plan: To be developed

E. Cable Testing Reports: To be developed

330.000 EXECUTION

330.010 ENTRANCE FACILITIES

A. Coordinate backbone cabling with the protectors and demarcation point provided by the telecommunications Service Provider.

330.020 WIRING METHODS AND PATHWAYS

A. Comply with requirements for demarcation point, pathways, cabinets, and racks specified in Division W, Section "Communications Equipment Room Fittings (EN)".

B. Comply with EN 50174-2 for pull-box sizing and length of conduit and number of bends between pull points.

C. Wiring Method: In raceways and cable trays.

D. To Be Developed.

330.030 INSTALLATION OF CABLES

A. General Requirements for Fiber Optic Backbone Cabling:

1. Comply with EN 50174-1, EN 50174-2 and EN 50174-3.
2. To be developed.

B. General Requirements for Balanced Twisted Pair Backbone Cabling:

1. Comply with EN 50174-1, EN 50174-2 and EN 50174-3.
2. To be developed.

C. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
2. To be developed.

D. Installation of Cable Routed Exposed under Raised Floors:

1. To be developed.

E. Group connecting hardware for cables into separate logical fields.

F. Separation from EMI Sources:

1. Refer to Division W, Section “Common Clauses for IT & Security Systems”.
2. Comply with EN 50174-2 and EN 50174-3 recommendations for separating metallic communication cable from potential EMI sources, including electrical power lines and equipment.
3. To be developed

330.040 FIRESTOPPING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

C. Comply with EN 50174-1.

330.050 GROUNDING

A. To be developed

B. Install grounding according to EN 50310, EN 50174-2 and EN 50174-3.

330.060 IDENTIFICATION

A. Comply with requirements for identification specified in Division W, Section "Identification for Communications Systems (EN)".

B. Identify system components, wiring, and cabling complying with EN 50174-1.

330.070 CABLE MANAGEMENT SYSTEM

A. Comply with requirements in Division W, Section "Identification for Communications Systems (EN)" for cable and asset management software.

330.080 FUSION SPLICING DEVICE

A. To be developed

330.090 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

330.100 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W71D - COMMUNICATIONS HORIZONTAL CABLING (EN)

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Section Includes:

1. Twisted Pair (Balanced) cabling.
2. Optical fiber cabling.
3. Consolidation Points.
4. Cable connecting hardware, patch panels, and cross-connects.
5. Telecommunications outlets/connectors.

100.020 PERFORMANCE REQUIREMENTS

A. Horizontal cabling system shall comply with both environmental and transmission performance criteria stated in Division W, Section "Common Clauses for Structured Cabling (EN)" in accordance with EN 50173-1, when tested according to test procedures of the relevant Standards.

B. Standard cables shall have a flame-retardant overall sheath complying with IEC 60332-1-2.

C. Low Smoke Zero Halogen (LSZH/LS0H) cables shall comply with the following standards:

1. Flame retardant: IEC 60332-1.
2. Halogen-free according to:

a) IEC 60754-1 for amount of halogen acid gas.
b) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).

3. Low smoke density according to IEC 61034-2.

D. Fire-resistant data cables shall comply with the following standards:

1. Circuit Integrity: IEC 60331-23 (metallic cables); IEC 60331-25 (fiber optic cables).
2. Flame retardant: IEC 60332-1-2.
3. Halogen-free according to:

a) IEC 60754-1 for amount of halogen acid gas.
b) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).

4. Low smoke density according to IEC 61034-2.

E. Cable Connecting Hardware shall be compatible for use with the Automated Infrastructure Management (AIM) system of the Project.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. Standards relevant to optical fiber cables mechanical and environmental requirements include:

1. EN 60793-2, Optical fibres. Product specifications. General.
2. EN 60793-2-10, Optical fibres. Product specifications. Sectional specification for category A1 multimode fibres.
3. EN 60793-2-50, Optical fibres. Product specifications. Sectional specification for class B single-mode fibres.
4. EN 60794-1-1, Optical fibre cables. Generic specification – General.
5. EN 60794-2, Optical fibre cables. Indoor cables. Sectional specification.
6. EN 60794-2-11, Optical fibre cables. Indoor optical fibre cables. Detailed specification for simplex and duplex cables for use in premises cabling.

7. EN 60794-2-21, Optical fibre cables. Indoor optical fibre cables. Detailed specification for multi-fibre optical distribution cables for use in premises cabling.
8. EN 60794-3, Optical fibre cables. Sectional specification. Outdoor cables.
9. EN 60794-3-12, Outdoor cables — Detailed specification for duct and directly buried optical telecommunication cables for use in premises cabling
10. EN 60794-3-21, Optical fibre cables. Outdoor cables. Detailed specification for optical self-supporting aerial telecommunication cables for use in premises cabling.

110.020 PROJECT/SITE CONDITIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

110.030 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Definitions

1. Consolidation Point (CP): A location for interconnection between horizontal cables extending from building pathways and horizontal cables extending into furniture pathways.
2. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.
3. Multiuser telecommunications outlet (MUTO): a grouping in one location of several telecommunications outlets/connectors.
4. Work Area: building space where the occupants interact with terminal equipment.
5. Telecommunications outlet (TO): fixed connecting device where the horizontal cabling terminates. The telecommunications outlet provides the interface to the Work Area cabling

C. Abbreviations : to be developed

120.000 SYSTEM DESCRIPTION

120.010 SCOPE OF WORK

A. To be developed.

120.020 HORIZONTAL CABLING DESCRIPTION

A. Horizontal cable and its connecting hardware provide the means of transporting signals between the telecommunications outlet/connector and the horizontal cross-connect located in the communications equipment room. This cabling and its connecting hardware are called a "permanent link," a term that is used in the testing protocols.

1. EN 50173-2 requires that a minimum of two telecommunications outlets/connectors be installed for each Work Area.
2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications outlet/connector.
3. Bridged taps and splices shall not be installed in the horizontal cabling.
4. Splitters shall not be installed as part of the optical fiber cabling.

B. To be developed

C. The maximum allowable horizontal cable length is 90 m. This maximum allowable length does not include an allowance for the length of 5 m to the workstation equipment or in the horizontal cross-connect.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 PRODUCTS

300.010 MANUFACTURERS

A. To be developed

300.020 PATHWAYS

A. To be developed

B. Comply with requirements of EN 50174-2.

300.030 TWISTED PAIRS (BALANCED) CABLE

A. General Requirements: to be developed

B. Category 6_A balanced cables so as to support and exceed the channel transmission performance Class E_A of EN 50173-1.

C. Balanced F/UTP (FTP) Cable- Category 6_A - for Indoor Use: 100-ohm, 23 AWG copper conductor, to be developed as per design requirements

D. Balanced U/FTP (STP) Cable- Category 6_A - for Indoor Use: 100-ohm, 23 AWG copper conductor, to be developed as per design requirements

E. Balanced S/FTP (S-STP) Cable- Category 6_A - for Indoor Use: 100-ohm, 23 AWG copper conductor, to be developed as per design requirements

300.040 BALANCED CABLE HARDWARE

A. To be developed

300.050 OPTICAL FIBER CABLE

A. Optical Fiber Cable - For Indoor Use:

1. Tight buffered, optical fiber cable: to be developed as per design requirements
2. Standards: Comply with:

    1) EN 60794-2
    2) EN 60794-2-11
    3) EN 60794-2-21

B. Optical Fiber Cable - For Indoor/Outdoor Use:

1. Application to be developed as per design requirements
2. Standards: Comply with:

    1) EN 60794-2
    2) EN 60794-2-11
    3) EN 60794-2-21

C. Optical Fiber Cable - For Outdoor Use (Outside Plant):

1. Application to be developed
2. Standards: Comply with:

    1) EN 60794-3
    2) EN 60794-3-12
    3) EN 60794-3-21

D. Optical Fiber Cable - Sheath

E. Number of Fiber Strands / Cores: to be developed as per design requirements

300.060 SINGLE-MODE OPTICAL FIBER CABLE - CATEGORY OS2

A. Application: to be developed

B. Specifications of the Cabled Optical Fiber: to be developed as per design requirements

C. To be developed

300.070 LASER-OPTIMIZED MULTI-MODE OPTICAL FIBER CABLE - CATEGORY OM5

A. Application: to be developed

B. Specifications of the Cabled Optical Fiber: to be developed as per design requirements

300.080 OPTICAL FIBER CABLE HARDWARE

A. Optical Fiber Patch Bays

1. To be developed

B. Patch Cords

1. To be developed

C. Cable Connecting Hardware:

1. Comply with EN 50173-1, Clause 8 for “Connecting Hardware Requirements”.

2. To be developed

300.090 CONSOLIDATION POINT (CP)

A. Description: Consolidation points shall comply with requirements for cable connecting hardware.

1. The CP shall comply with EN 50173-2: to be developed

300.100 TELECOMMUNICATIONS OUTLETS/CONNECTORS

A. Jacks: 100-ohm, balanced, twisted-pair connectors; four-pair, eight-position RJ45 modular Category 6_A components, wired to T568A or T568B pin assignments.

B. Workstation Outlets: to be developed as per design requirements

300.110 GROUNDING

A. Comply with requirements in Division Y, Section "Earthing and Bonding" for grounding conductors and connectors.

B. Comply with EN 50310, EN 50174-2 and EN 50174-3.

300.120 IDENTIFICATION PRODUCTS

A. Comply with requirements in Division W, Section "Identification for Communications Systems (EN)".

B. Comply with EN 50174-1.

300.130 CABLE MANAGEMENT SYSTEM

A. Comply with requirements in Division W, Section “Identification for Communications Systems (EN)" for cable and asset management software.

330.010 ENTRANCE FACILITIES

A. Coordinate horizontal cabling with the protectors and demarcation point provided by the telecommunications Service Provider.

330.020 WIRING METHODS AND PATHWAYS

A. To be developed

330.030 INSTALLATION OF CABLES

A. General Requirements for Balanced Twisted Pair Horizontal Cabling:

1. Comply with EN 50174-1, EN 50174-2 and EN 50174-3.
2. To be developed

B. General Requirements for Fiber Optic Horizontal Cabling:

1. Comply with EN 50174-1, EN 50174-2 and EN 50174-3.
2. To be developed

C. Open-Cable Installation:

1. To be developed

D. Installation of Cable Routed Exposed under Raised Floors:

1. To be developed

E. Group connecting hardware for cables into separate logical fields.

F. Separation from EMI Sources:

1. Refer to Division W, Section “Common Clauses for IT & Security Systems”.
2. Comply with EN 50174-2 for separating metallic communication cable from potential EMI sources, including electrical power lines and equipment.

330.040 FIRESTOPPING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. To be developed

C. Comply with EN 50174-1.

330.050 GROUNDING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Install grounding according to EN 50310, EN 50174-2 and EN 50174-3.

330.060 IDENTIFICATION

A. Comply with requirements for identification specified in Division W, Section "Identification for Communications Systems (EN)."

B. Identify system components, wiring, and cabling complying with EN 50174-1.

330.070 CABLE MANAGEMENT SYSTEM

A. Comply with requirements in Division W, Section "Identification for Communications Systems (EN)" for cable and asset management software.

330.080 FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

B. Tests and Inspections: To be developed

330.090 DEMONSTRATION AND TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

W73 – ELECTRONIC VISUAL INFORMATION DISPLAY SYSTEM

1.1 RELATED DOCUMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.2 SUMMARY

A. This section includes the technical specifications for Electronic Visual Information Display System (EVIDS) at for Project.

1.3 REFERENCES

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.4 SYSTEM DESCRIPTION

A. The term EVIDS is also known as Flight / Baggage Information Display Systems (FIDS/BIDS) or Multi-User Flight and Baggage Information Display System (MUFIDS) in the industry. For the purpose of this section definition and the associated drawings the term EVIDS will be used to define the system known as MUFIDS or FIDS/BIDS and includes the following related subsystems and processes:

1. Flight Information Display System (FIDS)
2. Baggage Information Display System (BIDS)
3. Gate Information Display System (GIDS)
4. Counter Information Display System (CIDS)
5. Information Display System (IDS)

B. The EVIDS definition includes software and hardware components such as flat-panel display screens, LED dynamic signage, personal computers workstations, application servers, databases, gateways and interfaces to flight record resources from airlines and other third party systems as required to populate daily and season flight schedules in the EVIDS and AODB databases.

C. To Be Developed

1.5 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. The Contractor shall provide, based on these specifications all equipment, software, licenses, interfaces, material, labor and services required to construct and install the EVIDS .

C. To Be Developed

1.6 SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.7 QUALITY ASSURANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.8 WARRANTY

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.9 PRODUCTS

A. Refer to Section “Common Clauses For IT And Security Systems” in addition to the following requirements.

1.10 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers shall meet all specifications requirements and shall be approved by the Engineer.

1.11 SOFTWARE

A. System software shall be furnished, installed and configured as required to meet operational and performance requirements found within this section.

B. All supplied software running on servers or clients shall synchronize to a Network Time Protocol (NTP) source. The Contractor shall coordinate with other trades such as the LAN provider to develop the exact IP address of the NTP source.

1.12 SYSTEM ARCHITECTURE

A. The system shall utilize a multi-tier architecture. End devices shall be clients to the applications servers. Application servers in turn shall communicate with the database servers. All information shall be communicated between the server(s) and clients using the Airport Local Area Network using a dedicated VLAN.

B. Network communications shall utilize TCP/IP network communications protocol. The Contractor shall identify the network bandwidth required to support the EVIDS.

1.13 PERFORMANCE REQUIREMENTS

A. General: The System Design is based upon IATA and Airport Industry EVIDS systems performance requirements, at a minimum the system shall provide functional real time performance supporting airline operations and passenger information resources.

1.14 NETWORK REQUIREMENTS

A. The system shall utilize the Project Operational Network to provide services to all devices and workstations. The primary and backup servers for the system shall be located in two different main communication rooms and shall be connected to the LAN switches via 1000-BaseT Ethernet. Clients shall be connected to the LAN via 10/100/1000 Mbps Ethernet (auto-negotiating). The clients shall communicate with the system applications utilizing the TCP/IP network protocol.

B. All systems shall be capable of being SNMP managed, and monitored by the centralized remote management system. It is understood that the internal proprietary code of the Contractor may be monitored by a specialized program and not by SNMP. However, this must be coordinated with the requirements of the Network and approved by the Airport Project Representative.

C. The EVIDS System provider is required to coordinate with the network provider and participate in network definition and commissioning as required to define IP, VLAN, NTP and DNS needed for operation of displays, servers, tugman keypads and workstations on the airport network.

1.15 GENERAL HARDWARE REQUIREMENTS

A. Server Requirements:

1. Refer to Division W, Section “Computers and Related Peripherals” for minimum requirements.

B. LCD Flat Panel Integrated Controllers

C. EVIDS Workstation (EW)

1. Refer to Division W, Section “Computers and Related Peripherals” for minimum requirements.

D. Peripheral Devices

1. Refer to Division W, Section “Computers and Related Peripherals” for minimum requirements.

E. Tugman-Input Devices

F. To Be Developed

1.16 LCD FLAT-PANEL DISPLAY SCREENS

A. To Be Developed

1.17 LED DYNAMIC SIGNAGE DISPLAYS

A. To Be Developed

1.18 DELIVERY, STORAGE, AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.19 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. To Be Developed

1.20 EXAMINATION AND FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. To Be Developed

1.21 TESTING AND COMMISSIONING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. To Be Developed

1.22 TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

1.23 CLOSEOUT SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

B. To Be Developed

1.24 COMPLETION AND SYSTEM ACCEPTANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

W74 – COMMON USE SYSTEMS

1.1 RELATED DOCUMENTS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”for requirements.

1.2 SUMMARY

A. This section contains the technical specifications for Common Use Systems (CUS) for the Project.

B. The term CUS refers to Common Use Terminal Equipment (CUTE), Self Boarding Gates (SBG), Document Check E-gate (DCE) and Common Use Self-Service (CUSS) kiosks for purposes of passenger processing services.

1.3 REFERENCES

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements

1.4 SYSTEM DESCRIPTION

A. The term Common Use Systems is also known as Passenger Processing Systems in the industry. For the purpose of this section definition the term CUS will be used to define the system known as Passenger Processing Systems and includes the following related subsystems and processes:

1. Common Use Terminal Equipment (CUTE)
2. Common Use Self Service equipment (CUSS) –.
3. Self Boarding Gates (SBG) –
4. Document Check E-Gate (DCE) –

B. The CUS definition includes software and hardware components such as computer workstations with peripheral devices, kiosks, and boarding pass readers, gateways and interfaces to flight record resources from airlines and other third-party systems as required to provide passenger check-in by agents and self-check-in by passengers.

C. For the expansion scope, the CUS system shall be an extension of the existing CUS system in use at the airport and shall make use of the existing CUS core (servers, core software).

D. The CUS system shall be coordinated with the current CUS provider to meet current technical parameters in place at the airport for the equipment and software and their operation.

1.5 SCOPE OF WORK

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

B. The Contractor shall provide, based on this specification section all equipment, software, licenses, interfaces, material, labor and services required to construct and install the CUS .

C. The Contractor shall coordinate with the current CUS provider at the airport to integrate the installation, configuration, and testing of the CUS systems provided under this specification with the existing systems.

D. The Contractor shall utilize the existing Airport Operational Database (AODB), Resource Management System (RMS), and all existing interfaces to airline host systems and external passenger and flight information sources currently in operation at the airport.

E. The Contractor shall not assume the adequacy of the existing systems and shall be fully responsible for verifying the capacity, performance, compatibility, and overall suitability of these systems and interfaces to support the proposed requirements.

F. The Contractor shall assess the existing AODB system and confirm that it has sufficient capacity, performance, and capability to accommodate the proposed requirements, with adequate provision for future expansion.

G. The Contractor shall identify and implement any required upgrades, modifications, or enhancements to the existing systems and interfaces to achieve full functionality, compliance, and seamless integration with the proposed works. All such works shall be deemed part of the Contractor's scope.

H. The Contractor shall confirm that all associated software licenses are valid, current, and fully compliant with manufacturer requirements. The Contractor shall further verify that all core and head-end equipment are not end-of-life (EOL) or end-of-support (EOS) and remain fully supported by the original manufacturer.

I. Any deficiencies identified in the existing systems, including hardware, software, licensing, or interfaces, shall be rectified by the Contractor.

J. The Contractor shall be fully responsible for the planning, coordination, and execution of all required migration activities, including those associated with the dismantling and reinstatement of equipment.

K. All migration and related activities shall be carried out in a controlled and phased manner to ensure no disruption to ongoing airport operations and services.The Contractor shall configure the Common Use Systems in accordance with the Employer's requirements for the systems. The Employer shall be responsible for providing the data and information necessary to complete the system programming to the Contractor in a timely manner.

L. The Contractor shall configure the Common Use Systems to support all commercial airlines operating from the terminals covered by this project.

M. The Contractor shall update programming and integrations within the existing World Tracer and Airport Management System (AMS) applications to accommodate operations within the Terminal Works.

1.6 CONFIDENTIALITY

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

1.7 SUBMITTALS

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

B. QUALITY ASSURANCE

C. Refer to Division W, Section "Common Clauses for IT & Security Systems".

1.8 WARRANTY

A. Refer to Division W, Section "Common Clauses for IT & Security Systems".

1.9 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

1.10 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

B. Contractor shall handover manufacturer’s recommended spare parts for all major components in the system for two years fault-free operation.

C. However, a minimum of 2.5% peripherals of each type installed, but not less than one from each type shall be included in the deliverables irrespective of Manufacturer’s recommendation.

D. Handover manufacturer’s test equipment and tools required for normal routine inspection and maintenance and testing of system components as appropriate for equipment supplied.

PART 2 - PRODUCTS

2.1 GENERAL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

2.2 MANUFACTURERS

A. Equipment and software under this specification section shall be provided by the existing CUS provider at the airport, and shall be compatible with the equipment currently in use, with the most current hardware and software upgrades provided.

B. Subject to compliance with requirements, manufacturers shall meet all specifications requirements and shall be approved by the Engineer.

2.3 SOFTWARE

A. System software shall be furnished, installed and configured as required to meet operational and performance requirements found within this section.

B. All supplied software running on servers or clients shall synchronize to a Network Time Protocol (NTP) source. The CONTRACTOR shall coordinate with other trades such as the LAN provider to develop the exact IP address of the NTP source.

2.4 SYSTEM ARCHITECTURE

A. The system shall utilize an architecture based on the existing CUS system. End devices shall be clients of the application servers. All information shall be communicated between the server(s) and clients using the Airport Local Area Network using a dedicated VLAN.

B. Network communications shall utilize TCP/IP network communications protocol. The CONTRACTOR shall identify the network bandwidth required to support the CUS.

2.5 PERFORMANCE REQUIREMENTS

A. General: The System Design is based upon IATA and Airport Industry CUS systems performance requirements. At a minimum, the system shall provide functional real-time performance supporting airline operations and passenger processing.

B. The System Design shall support the IATA Fast Travel Program.

2.6 NETWORK REQUIREMENTS

A. The system shall utilize the existing Network to provide services to all devices and workstations. The primary and backup servers are existing. Clients shall be connected to the LAN via 10/100/1000 Mbps Ethernet (auto-negotiating). The clients shall communicate with the system applications utilizing the TCP/IP network protocol.

B. All systems shall be capable of being SNMP managed, and monitored by the centralized remote management system. It is understood that the internal proprietary code of the CONTRACTOR may be monitored by a specialized program and not by SNMP. However, this must be coordinated with the requirements of the Operational Network and approved by the Airport Project Representative.

C. The CUS System provider is required to coordinate with the network provider and participate in network definition and commissioning as required to define IP, VLAN, NTP, and DNS needed for operation of workstations, kiosks, and other CUS devices on the airport network.

2.7 GENERAL HARDWARE REQUIREMENTS

A. Equipment shall conform to the current standard and generation for agent-facing workstations as provided by the Common Use System supplier. Minimally the workstations shall meet the Type 1 workstation requirements, as noted in Division W, section”Computers and Peripherals”.

B. Equipment shall be suitable for use and operation under the project and environmental conditions present at the project site, and the locations for each device.

C. Equipment shall be coordinated with the millwork/cabinetry and electrical and communication infrastructure required to operate the equipment.

D. Free-standing equipment shall be coordinated with the interior design of the facility.

E. All CUS equipment shall use industry standard stock for tickets and baggage tags.

2.8 CUS Agent-Facing Workstation – Check-In

A. Agent-facing workstations shall include equipment for installation at the check-in counters, airline service desks, and airline lounges.

B. Equipment shall include:

1. Screen, keyboard, mouse, CPU, and software
2. Ticket printer, using standard stock
3. Bag tag printer, using standard stock
4. Passport reader
5. Magnetic stripe and Smart Card credit/debit card reader, PCI compliant

2.9 CUS Agent-Facing Workstation - Gates

A. Agent facing stations shall include equipment for installation at the gate counters.

B. Equipment shall include:

1. Screen, keyboard, mouse, CPU, and software

2. Ticket printer, using standard stock

3. Bag tag printer, using standard stock (a single item per gate area only)

4. Passport reader

5. Magnetic stripe and Smart Card credit/debit card reader, PCI compliant (a single item per gate area only)

6. Document printer configurable to serve two or more agent facing positions

7. Boarding pass reader

2.10 Self Boarding Gate

A. Install Automated Boarding Gates at the designated locations at the boarding gates.

B. SBGs shall be integrated with the CUTE equipment at the gates, and with the core Common Use Systems.

C. The SBG shall be secure:

1. To prevent that more than one passenger can pass through at a time.

2. To signal when a passenger does not pass through the SSBG after acceptance by the system and shall be automatically be marked as de-boarded.

D. The SBG shall produce GO/NO GO reply in the form of audial and screen alert to the operator and opening of the gate in case of a GO. In case of a GO the screen alert shall show an international symbol (e.g. arrow) that lit green and in case of a NO GO the screen alert shall lit red accompanied by an international symbol (e.g. cross).

E. SBG shall be equipped with a red light on the back of the gate that shall light in case of a failed attempt in order to alert the passenger handling staff.

F. Equipment shall include:

1. Barcode reader capable of reading paper tickets and mobile devices.

2. Display Device
   a. Provides basic text display capabilities such as that found on a gate reader.
   b. Display at least 2 lines of 16-character text using a 10-point font.
   c. Display text based on the full range of Unicode character set.
   d. Display text from left-to-right or right-to-left based on application controls.

3. Automated, mechanical entry barrier

4. Fingerprint Scanner

2.11 Document Check E-Gate

A. Install Automated Boarding Pass Readers at the designated locations.

B. DCEs shall be integrated with the core Common Use Systems to validate the boarding pass information against the scheduled flight operations at the airport

C. The DCE shall be secure To prevent that more than one passenger can pass through at a time.

D. The DCE shall produce GO/NO GO reply in the form of audible and visual alert to the operator and opening of the DCE gate in case of a GO. In case of a GO the screen alert shall show an international symbol (e.g. arrow) that lit green and in case of a NO GO the screen alert shall lit red accompanied by an international symbol (e.g. cross).

E. DCE shall be equipped with a red light on the back of the gate that shall light in case of a failed attempt in order to alert the passenger handling staff.

F. Equipment shall include:

1. Barcode reader capable of reading paper tickets and mobile devices.

2. Display Device
   a. Provides basic text display capabilities such as that found on a gate reader.
   b. Display at least 2 lines of 16-character text using a 10-point font.
   c. Display text based on the full range of Unicode character set.
   d. Display text from left-to-right or right-to-left based on application controls.

3. Automated, mechanical entry barrier

4. Fingerprint Scanner

2.12 Common Use Self Service Equipment

A. Equipment shall include:

1. Digital color touchscreen display

2. Passport reader

3. 1D/2D barcode scanner

4. Magnetic stripe and Smart Card credit/debit card reader, PCI compliant

5. Ticket printer, using standard stock

6. Baggage tag printer, using standard stock

7. Fingerprint Scanner

B. One or more of the kiosks shall be suitable for Universal Access by persons with disabilities. The quantity provided shall be in accordance with applicable requirements and services for Universal Access as per local codes. Quantities to be determined based on architectural, operational, and regulatory requirements.

2.13 Self bag drop, internet code dispenser kisok and information ask me kiosk shall be provided as per the client specification requirement.

PART 3 - EXECUTION

3.1 DELIVERY, STORAGE, AND HANDLING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems”.

3.2 SYSTEM ORIGIN AND USE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

3.3 INSTALLATION

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

B. Equipment installation shall be coordinated with the architectural millwork and cabinetry, to ensure proper fit and installation.

C. Equipment shall be coordinated with electrical power and communications circuits necessary to support the equipment.

D. Free-standing equipment, such as CUSS kiosks, SBGs, and DCEs, shall be fixed to the floor or structure with a minimum of four attachment points, and in accordance with KSA requirements for seismic attachments. The attachment shall be suitable to prevent the equipment from being moved or tipped due to inadvertent, intentional or natural forces.

3.4 EXAMINATION AND FIELD QUALITY CONTROL

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

B. The works shall be performed by skilled technicians under the direction of experienced engineers, all of whom shall be properly factory trained and qualified for this work.

C. Upon installation of network components, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance to verify that the clocks associated with it are in proper working condition. Remove temporary connections when tests have been satisfactorily completed.

3.5 TESTING AND COMMISSIONING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” in addition to the following requirements.

B. Testing and commissioning shall demonstrate the following:

1. Connectivity of the screens through the Network to the existing Common Use Systems core.

2. Proper operation of the different workstations, printers, devices, and kiosks, including presenting the correct information and allowing the user to perform the required tasks, in the format and manner required, and in accordance with the expectations of the Employer.

3. Demonstrated operation shall verify the CUS equipment provided under this project conforms to the standard and functions used at the airport with the existing CUS elements, core, and equipment.

3.6 TRAINING

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

3.7 CLOSEOUT SUBMITTALS

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

3.8 COMPLETION AND SYSTEM ACCEPTANCE

A. Refer to Division W, Section “Common Clauses for IT & Security Systems” for requirements.

W75 – AUDIO FREQUENCY INDUCTION LOOP

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Particular Conditions apply to this Section.

1.2 SUMMARY

A. The section includes general design requirements, administration topics and installation for Audio-frequency induction loop systems.

B. Section includes:
1. Audio source - typically a microphone or other audio input.
2. Loop amplifier
3. Induction loop.
4. Receiver(s) - any hearing aid with a 'T' or 'MT' switch or a specially designed loop listening device.

C. Related Sections:
1. To be developed

1.3 REFERENCE STANDARDS

A. Compliance with Local Requirements: Comply with applicable building code, local ordinances and regulations, and requirements of authorities having jurisdiction.

B. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. Equipment and system shall comply with the following Standard:

a. UL 813 - Commercial Audio Equipment or

b. IEC 60268 – Sound System Equipment,

c. BS 6259 - Code of practice for the design, planning, installation, testing and maintenance of sound systems.

d. BS 7594 - Code of practice for audio-frequency induction-loop systems (AFILS).

e. EN60118-4 - Magnetic field strength in audio frequency induction loop systems for hearing aid purposes.

f. BS 8300 - Design of buildings and their approaches to meet the needs of disabled people.

g. IEC TR 63079 (also referred to as BS 7594)

h. BS 62489-1 – Electroacoustics - Audio-Frequency Induction Loop Systems for Assisted Hearing Part 1: Methods of Measuring and Specifying the Performance of System Components.

2. Comply with the latest issue of:

a. NFPA 72, "National Fire Alarm Code".

C. All electrical works shall comply with the local Electricity Regulations.

D. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS", in addition to the below:

1. AFILS: Audio-Frequency Induction Loop System.

2. HLS: Hearing Loop Systems.

3. AGC: Automatic Gain Control.

1.5 SCOPE OF WORK

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS".

B. AFILS Equipment shall include all wiring, control cabling, conduit, boxes, connectors and accessories and ancillary work, whether described in the Specification or not, required for a complete and fully operational system.

C. AFILS Equipment shall interface with the Elevator Intercom System.

1.6 PRODUCTS AND WORK BY OTHERS

A. The Employer may separately purchase and/or provide certain equipment and miscellaneous items that will be installed during the course of the installation process. Such items may not be indicated in the documents. Contractor shall coordinate with the Employer and his Suppliers when considering:

1. Structured communications system cabling, termination, identification and testing.
2. Provision and installation of computer hardware, racks/cabinets and related networking software and equipment.
3. Active communication and data processing equipment.
4. Fiber optic cabling infrastructure.
5. Communications grounding busbars and grounding wires connecting to the main building earth electrode system.
6. Dedicated power panels, ground busbars, circuits, floor boxes and utility outlets.
7. Installation and finishing of plywood backboards.
8. Building mechanical ductwork, cooling/heating system and environmental control sensors.
9. Communications and electrical pathway devices both indoors and outdoors such as underground duct banks, manholes, handholes, cable trays, conduits, conduit sleeves, and penetrations in walls and floors.

B. Accordingly, the Contractor shall:

1. Meet jointly with representatives of the above systems, Contractors, Operators, Engineer and Employer to exchange information and agree on details of project implementation, equipment arrangements and interface, etc.
2. Record agreements reached in meetings and distribute record to participants.
3. Adjust arrangements and locations of equipment in technical rooms to accommodate and optimize arrangement and ensure necessary interface with other systems.
4. Coordinate with the other Contractors whose deliveries are necessary for the correct operation of the Audio Frequency Induction Loop system including but not limited to the Data Network, Public Address system, etc.

1.7 CONFIDENTIALITY

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS".

1.8 SUBMITTALS

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS".

1.9 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project

B. Source Limitations: Obtain Audio Frequency Induction Loop system (AFILS) from a single source from a single manufacturer.

C. Electrical Components, Devices, and Accessories: All system components shall be UL and/or CE listed.

D. Manufacturers: Firms regularly engaged in the manufacture of AFILS, whose products have been in satisfactory use in similar service for not less than 5 years.

E. Product, Material, Equipment shall demonstrate compliance with requirements specified in Section 016000 "Product Requirements

1.10 DELIVERY, STORAGE AND HANDLING

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS".

1.11 PROJECT/SITE CONDITIONS

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS".

1.12 WARRANTY

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS". for requirements.

1.13 COMMISSIONING

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

1.14 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

1.15 SPARE PARTS AND EXTRA MATERIAL

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

B. Contractor shall handover manufacturer's recommended spare parts for all major components in the system for two years fault-free operation.

C. However, a minimum of 2.5% peripherals of each type installed, but not less than one from each type shall be included in the deliverables irrespective of Manufacturer's recommendation.

D. Handover manufacturer's test equipment and tools required for normal routine inspection and maintenance and testing of system components as appropriate for equipment supplied.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements.

2.2 FUNCTIONAL DESCRIPTION OF SYSTEM

A. Fixed/permanent type loop systems comprising an audio source/microphone, amplifiers, power supplies, and loop wiring.

B. Audio Frequency Induction Loop System (AFILS) shall meet the requirements set by the international standard for loop systems IEC60118-4 to ensure that the system provides a benefit.

C. Containment, raceways and power supplies required for a portable/desk mounted type AFILS.

D. Hearing loop systems should be specified and designed by an experienced specialist to take account of the effect of building structure and overspill where applicable.

2.3 SYSTEM COMPONENT REQUIREMENTS

A. Type B: Counter / local area loop driver
   1. Where the loop system is to assist a single end user in a defined location such as a retail counter or information point,
   2. Desktop Microphone

B. Type C: Public Elevators loop driver
   1. Where the loop system is to assist passengers within the lift car when using the emergency intercom, each hearing loop driver shall be permanently installed

C. HLS Loops / Wiring:

2.4 Audio inputs

A. Audio inputs should be defined by the use of the space and the requirements of the listeners.

B. The audio provided to the HLS must always provide an improvement in signal to noise ratio over the acoustic sound within the room.

C. The Contractor is required to:
1. Provide dedicated microphones and associated audio equipment for the HLS.
2. Co-ordinate with the Elevator contractor to obtain a line level feed from the Elevator Intercom system.
3. Provide suitable input plates for connection into the HLS.

D. Where microphones are being provided for the HLS they must be as close as possible to the talking position. Directional types are often most effective.

E. A single boundary microphone mounted on the ceiling is unlikely to provide sufficient rejection of background acoustic noise in most rooms and should not be used unless it can be demonstrated that the system delivers tangible benefit to those who experience hearing loss.

F. Input levels shall not be adjustable at the signal source or connection point.

2.5 Power Supplies

2.6 NETWORK EQUIPMENT

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

2.7 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

2.8 SIGNAL TRANSMISSION COMPONENTS

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

2.9 CONDUITS, TRUNKING, ENCLOSURES, AND FITTINGS

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS"..

PART 3 - EXECUTION

3.1 EXAMINATION

A. The Contractor shall, at the earliest opportunity in the project:

1. Use a loop design tool to show that any cross-talk between adjacent looped areas, and that magnetic spill from any HLS where the signal is defined as 'confidential' will, by design, be less than -40dB with normal signal levels.

2. Provide evidence that the field strength of the proposed systems will meet the requirements of IEC 60118-4, whilst taking account of any metal within the building structure. Where necessary, the effect of metal shall be assessed by site survey and tested using trial loops on relevant construction, carried out by a competent test specialist.

3. Ensure that the drivers' rated current and voltage is capable of driving the designed loop without clipping or distortion of the signal with full power bandwidth up to at least 1.6 kHz as per IEC 62489.

B. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting the performance of AFILS.

C. Examine roughing-in for embedded and built-in anchors to verify actual locations of AFILS connections before AFILS installation.

D. Prepare written report, endorsed by Installer, listing conditions detrimental to the performance of AFILS.

E. Inspect built-in and cast-in anchor installations, before installing AFILS, to verify that anchor installations comply with requirements. Prepare inspection reports.

1. Remove and replace anchors where inspections indicate that they do not comply with requirements. Re-inspect after repairs or replacements are made.
2. Perform additional inspections to determine compliance of replaced or additional anchor installations. Prepare inspection reports.

F. For material whose orientation is critical for its performance as a ballistic barrier, verify installation orientation.

G. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install AFILS system components, in accordance with manufacturer's written instructions, requirements of applicable Standards, and in accordance with recognized industry practices to ensure that the installation(s) complies with requirements and provides the intended function.

B. If the proposed contractor is not experienced with a hearing loop or audio systems to the level required in order to competently install and commission these systems, then some or all of the work should be sub-contracted to a specialist with the necessary experience.

C. The contractor shall:
1. Co-ordinate with other relevant contractors to ensure that all appropriate audio signals are connected to the hearing loop system and transmitted clearly.
2. Wire and connect to all items of equipment in accordance with the manufacturer's recommendations.
3. Ensure complete segregation of the HLS from any other ELV or LV wiring system.
4. All wiring between loops and equipment locations shall be installed in appropriate containment.
5. All wiring, including that inside equipment enclosures or racks, will be of a neat and tidy appearance. Wiring shall be identified at both ends of each cable.
6. Following installation, the resistance of each loop circuit and isolation from electrical ground shall be tested and recorded. The Client shall have the opportunity to witness these tests.

D. All commissioning must be carried out using a true RMS, dedicated hearing loop field strength meter, meeting the requirements of IEC 60118-4, with a valid calibration certificate available.

E. Each complete system must be commissioned in accordance with IEC 60118-4 and a certificate of conformity clearly stating test results and performance against this standard must be issued for each HLS. The Client shall have the opportunity to witness these tests.

3.3 FIELD QUALITY CONTROL

A. Field tests shall be witnessed by a Client's representative.

B. Manufacturer's Field Service:

C. Perform tests and inspections.

D. Tests and Inspections:

E. Prepare test and inspection reports.

F. Maintenance Test and Inspection:

G. Annual Test and Inspection:

3.4 PROTECTION AND CLEANING

A. Repair exposed surfaces to match the original finish.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, which guarantee storage of control equipment is without damage or deterioration at the time of Final Acceptance.

3.5 DEMONSTRATION AND TRAINING

A. Refer to Division W " COMMON CLAUSES FOR IT and SECURITY SYSTEMS", in addition to the below requirements.

B. All systems, methods of use and routine maintenance checks must be demonstrated to the end user.

C. Loop receivers shall be provided for operational staff to check and monitor the performance of the HLS system. Any receiver shall have a headphone output, external selectable low-cut filter, and field strength indicators as required by IEC 60118-4.

D. Training shall be provided that enables operational staff to understand the proper use of the HLS and how to ensure that people can make use of the system effectively.

E. Operation and Maintenance manuals shall be provided which include 'as fitted' drawings, data sheets and instruction manuals for all items of hardware and operational instructions for the use and testing of all systems.

W76 - BAGGAGE RECONCILIATION SYSTEM (BRS)

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes performance and design requirements of the Baggage Reconciliation System (BRS) used throughout the airport.

B. The BRS includes the following related subsystems:

1. Baggage Reconciliation Application: A system to verify boarded passengers' information against checked-in luggage information to ensure that no bags are loaded to aircraft without accompanied passenger.
2. Mobile Terminals: Wireless Scanners to scan and identify bags and tug carts.
3. Interfaces to Departure Control Systems (DCS) and Master System Integration (MSI): to obtain Baggage Source Messages and other flight related information

1.2 EXTRA MATERIAL

A. Provide priced list of manufacturer's test equipment and tools required for normal routine inspection and maintenance and testing of system components as appropriate for equipment supplied.

PART 2 - PRODUCTS

2.1 DESIGN REQUIREMENTS

A. System Architecture shall be based on a "Client-Server" configuration.

B. System and applications software shall be controlled and configured by working parameters stored in tables and easy to change without programming.

C. The system shall be easy to deploy throughout the whole airport.

D. The system shall be able to accept multiple devices of different types, technologies and manufacturers.

E. The Contractor shall ensure that the system does not cause any interference to other systems, including radar, radio and navigation systems.

F. Operational Constraints: The system will run 24 hours per day, all the days of the year.

2.2 BRS APPLICATION KEY REQUIREMENTS

A. The BRS shall receive passenger-boarded data from the Boarding Control System and update passenger/baggage status in the BRS database accordingly.

B. The BRS shall provide easy retrieval of information on each bag to include:

1. Flight number.
2. Departing gate number.
3. Flight destination.
4. Outbound flight number.
5. Outbound destination.
6. Passenger name.
7. Passenger class.
8. Passenger status (e.g., standby).
9. Container ID.
10. Container load position.
11. Status of flight.
12. Bag Sequence Number.

C. The system shall include dot matrix printers to facilitate printing of triplicates of manifests and baggage loading instructions.

D. Wireless scanners (Hand-held Scanner)

E. Label Printer

2.3 SYSTEM FUNCTIONAL REQUIREMENTS

A. Graphical User Interface (GUI):

1. All system applications shall have a graphical user interface to facilitate human interaction with the application and easy management of data.Retain paragraph and associated sub-paragraph below if applicable to the Project

PART 3 - EXECUTION

3.1 INSTALLATION
3.2 FIELD QUALITY CONTROL
3.3 DEMONSTRATION AND TRAINING

X10A - ELECTRIC TRACTION LIFTS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes the following:

1. Electric traction passenger lifts.
2. Electric traction service lifts.

110.000 DESIGN PARAMETERS

110.010 DEFINITIONS AND ABBREVIATIONS

A. The following terms used on Drawings and in the Specification are synonymous and may be used interchangeably:

1. "Elevator" and "Lift".

B. Electric Traction Lifts: Lifts in which cars are hoisted by wire ropes using electrically driven traction sheaves and are defined to include driving machines, cars, hoistway doors, guide rails, guide-rail brackets, roping, buffers, counterweights, signals, control systems, electrical wiring within lift system, and devices for operations, safety, security, required performance at rated speed and capacity, and for complete lift installation.

C. Defective Lift Work: Operation or control system failures, performances below specified ratings, excessive wear, unusual deterioration or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise or vibration, and similar unusual, unexpected, and unsatisfactory conditions.

110.020 REFERENCE STANDARDS

A. Regulatory Requirements: In addition to local governing regulations, comply with the applicable provisions of the following standards, referred to as the "Code":

1. EN 81, "Safety Rules for the Construction and Installation of Lifts ".
2. EN 81-20 and EN 81-50 Standards with all listed normative references, including those issued by ISO, IEC, CEN and CENELEC and any other standard referred to.
3. BS ISO 8100-30 "Lifts for the transport of persons and goods, Class I, II, III and VI lifts installation".
4. BS 5655 "Lifts and service Lifts".
5. EN 81- Part 72 "Firefighters lifts".
6. EN 81- Part 73 "Behaviour of lifts in the event of fire".
7. EN 81- Part 70 "Accessibility to lifts for persons including persons with disability".
8. EN81- Part 58 "Landing doors fire resistance test".
9. EN81- Part 28 "Remote alarm on passenger and goods passenger lifts".
10. BS 8486: Part 3, “Examination and Test of new Lifts before putting into service. Specification for means of determining compliance with BS EN 81 - Passenger and goods passenger lifts conforming to BS EN 81-20”.
11. Power supply and electrical installations shall conform to the local power authority practices.
12. All electric power installations shall comply with relevant IEC standards and BS 7671 "IET Wiring Regulations" where not in contradiction with local authority.
13. Electromagnetic compatibility (EMC): EN 12015 (emission) and EN 12016 (immunity).
14. Nominal characteristics of all equipment forming part of the electrical works shall be specified to conform to the relevant International Electro-technical Commission (IEC) Standards and the International Standards Organization (ISO).
15. CIBSE Guide D “Transportation Systems in Buildings”.
16. BS 7255 "Code of Practice for Safe Working on Lifts".

© Copyright protected

17. The local code of practice for electric lifts in buildings.

120.000 SYSTEM DESCRIPTION

120.010 MACHINE AND DRIVE (MACHINE ROOMLESS LIFT TYPE)

A. Machine Room-Less Lifts: All machine-room-less lifts shall be powered by gearless machines with permanent magnet synchronous motors mounted in the overhead inside the lift shaft. Neither machines nor controllers are allowed to be placed in the pit. Provide variable voltage variable frequency drives built into the control panel and located inside the shaft next to the machine. A machine access panel shall be built in either the landing door frame or the adjacent wall at the last served floor to facilitate maintenance, and emergency applications.

B. Gearless Machine-Drive: To have traction sheave and brake.

C. Gearless Machine-Motor: Enclosed, ventilated type.

D. Gearless Machine-Bearings: Sleeve or anti-friction type, properly lubricated, of ample capacity to sustain heavy loads supported by machine, and rigidly mounted in proper alignment. Sleeve bearings shall have automatic lubrication. Sound isolation pads shall be provided to reduce vibration and noise transmission to building structure.

E. Gearless Machine-Brake: Dual independent brakes shall be provided and shall be noiseless, spring applied, magnetically released, self-cooling and capable of holding car securely under maximum speed and load conditions. Brake shall be designed for automatic and instantaneous application immediately after power is interrupted on motor. Brake springs shall work in compression.

F. Gearless Machine-Manual Brake Release: Provide means for manual release of brake, to allow manual winding of unit in emergencies. Necessary levers and handles shall be handed to the Employer, with instructions for use. Brake emergency release shall be self-resetting.

G. Motors shall be rated at a minimum of 180 starts per hour.

H. Gearless Machine motor insulation shall be Class F and have IP 21 degree of protection to IEC 60529, Motor noise shall not exceed 60 dB (A) at 1 meter outside the machine room.

I. Motor Acceleration and Jerk: Motors shall produce a smooth constant acceleration / deceleration and not less than 0.8 m/sec2 with an initial ramp between 0.5 and 0.75 second. Sustained jerk rate shall not exceed 1.5 m/sec3.

J. Traction and Deflection Sheaves: Traction sheave shall be fine grained cast iron of suitable hardness, accurately grooved for number and size of hoisting ropes, and shall give constant traction and long rope life. Bearings for sheaves shall be approved type. Diameter of sheave shall be not less than forty times overall diameter of ropes. Deflection and secondary sheaves shall be of same material and grooved similarly to traction sheave and shall be protected by guards extending below machine level, when required.

K. Stopping accuracy: Maximum tolerance ± 5 mm. Accuracy shall be maintained regardless of change of load or rope stretch.

L. Power Regenerative Converter: a means shall be provided for removing regenerated power from the drive system. This power shall be dissipated in resistors or return to the three-phase A.C. power supply system. Failure of the system to remove the regenerated power shall cause the drive output to be removed from the hoist motor. The energy generated during the inverter braking for regeneration shall be performed through the following method:

   1. For lifts where the result of multiplying load and speed is less than 3500 kg.m/s, combined brake unit and discharging resistors shall be used according to the manufacturer's recommendations.
   2. For lifts where the result of multiplying load and speed is more than 3500 kg.m/s, power converter shall be used.

M. Natural ventilation opening shall be provided at the top or side of the shaft with all required protection against dust and drain, opening size shall be minimum 300 mm x 300 mm subject to supplier final recommendation and engineer's approval. In case the lift is located at atrium; natural ventilation opening shall be at the top of the shaft.

© Copyright protected

N. Motor Rating: It is the contractor's responsibility, and in accordance with the Standards requirements, to provide and install, the motor drive properly sized and suitable to lift the required rated passengers' capacity in addition to the specified car dimensions.

O. Elevator Capacity: It is the contractor's responsibility, and in accordance with the specified car dimensions to provide the related capacity in accordance with the requirements of standards. The capacity of the elevators mentioned in the schedules is nominal and reflects the required transport capacity.

120.020 CAR

A. Construction: Structural steel frame members suitably braced and fastened together, and clad internally and externally with sheet metal at least 1.5 mm thick, which shall not drum during normal operation. Materials shall be fire resistant.

B. Reinforce roof to sustain 150-kg load on any 0.2 m2, and 50 kg at any point. Provide trap door at least 500 x 600 mm, opening outward and capable of being opened from both sides. Opening of trap shall activate electrical interlock preventing operation of lift.

C. Platform: Fill frame with timber sub-floor and provide specified top floor finish. Protect underside of platform with sheet steel covering, at least 1.5 mm thick. Sill shall be anti-slip, with provision for car doors.

D. Load Weighing Device: Build into floor.

E. Isolating Cushion: Rubber pads supported on auxiliary steel frame fastened to car frame shall form isolating cushion between car and car frame.

F. Balustrade and Kick-Plates shall be fitted to car roof in all lifts as per code requirements.

G. Bumper Rails and Kick Plates: shall be fitted inside the car of the freight lifts. They are provided for service lifts if requested in lift data sheets.

H. Bumper Rails and kick-plates fitted to car shall not be less than 75 mm and 150 mm wide respectively.

I. Ventilation and LED Lighting: each car shall have necessary lighting and adequately rated, silent running, properly padded and rigidly fixed exhaust fan of approved type and manufacturer. Fan and lights shall be switched on automatically when car is called or when landing doors are opened, remain switched on whilst car is in operation, and switched off by time delay 30 - 60 seconds after car has stopped. Lighting level shall be minimum 100 lux. Fan shall be provided to bring air into car through the ventilation slots near the wall base and to exhaust through the ceiling. Fan shall be 2-speed to provide at least 1 air change a minute at low speed and 1.5 air change a minute at high speed. A screen grill over the fan shall be provided for mechanical protection of fan. Lighting type and arrangement is subject to Engineer's approval. Battery shall be provided to operate fan, two of the lighting fixtures (subject to complying with EN 81-20 for cabin emergency lighting level), intercom and alarm bell for at least one hour. Battery shall be sealed nickel cadmium or lithium type.

J. For lighting fixtures specifications, refer to Division V section "Interior Lighting".

K. Natural ventilation shall be provided for each car irrespective of provision of forced ventilation.

L. Indicators and control stations shall be provided in each car according to sub-section hereafter.

M. Padded Covers: Provide one set with each type of service lift, to protect car finishes from damage at times lift is used to carry freight. Provide hooks for hanging padded covers.

N. Noise Level Inside the Car shall not exceed the following values:

1. 50 dBA at full speed in both directions with fan off,
2. 55 dBA at full speed in both directions with fan on at high speed.

O. Noise Level outside Car shall not exceed 55 dBA when measured at one meter in front of car entrance during a full door open and close cycle and a reversal cycle, in addition to a lift traveling at full speed inside the shaft.

P. Car Horizontal Acceleration: Lateral quaking, peak to peak, shall not exceed 15 milli-g.

© Copyright protected

Q. Car Inspection Station shall be provided on top of the car and at the lift pit according to EN81-20/50 to include the following:

1. Two-position (auto/inspection) switch.
2. Run button, to be pressed in conjunction with up and down direction buttons. This to prevent accidental running under inspection.
3. Stop switch.
4. Duplex electrical socket standard type.
5. Work light to be either plugged into the electrical socket or directly wired into the top of car station. If directly wired "off/on" switch is required on the top of car station.

When the station is switched to inspection, the lift speed shall not exceed 0.63 m/s and all operating devices in the car shall be inoperative.

R. Notices and Signages: A stainless steel grade 304 load plate shall be provided inside the car indicating the following:

1. Rated load.
2. Name of company, telephone number and emergency instruction.
3. Fire instructions “In case of fire do not use lift”.

S. Car Finish: Refer to lifts schedules and related drawings.

T. Loading Class: Freight and service lifts shall have loading class C3 unless loading class C1 or C2 are specified in lift schedules.

U. CCTV Security Cameras: Install color CCTV security cameras (compatible with the building security contractor’s monitoring system) concealed in the lift dropped ceilings and positioned to view the complete lift cab interiors and the car position indicator. Provide shielded wire pairs or coaxial cables from each CCTV camera run to the lift machine room or to machine location inside shaft for machine-room-less.

120.030 AUXILIARIES

A. Counterweight: Structural steel frame fitted with cast iron sub-weights secured with tie rods or steel sub-weights with locks at the top. Weight shall be equal to total car weight plus 40 to 50% of contract specified capacity. Counterweight shall be screened to a height of 2 m from bottom of pit and fitted with renewable guide shoes at top and bottom. Blocking shall be provided between counterweight and buffer strike plate for at least 250 mm per 60 rope length.

B. Guide Shoes: shall be rolling type for speeds exceeding 2 m/sec and sliding type for speeds 2 m/sec and below. Guide shoes shall be adjustable, renewable, and fastened to top and bottom of car and counterweight frames.

C. Roller Guide Shoes: roller guide shoes shall be adjustable mounting base type, rigidly bolted to the top and bottom of each side of car and counterweight frame. Roller guides shall consist of set of sound reducing rubber-covered wheels with precision ball bearings held in contact with the three finished rail surfaces by adjustable stabilizing springs. Roller guides shall be equipped with adjustable stops to control past wise float. The car and counterweight roller guides shall rotate at an adequate speed (rpm) to maximize roller guide life and car ride comfort. Statically balance the car and counterweight to maintain uniform pressure on the roller guides.

D. Guide Rails: highest quality steel T-sections with tongue and grove joints for the car and counterweight. Guide rails sections shall relate to machine fish plates. Unless otherwise indicated, use car and counterweights guide rails with a suitable rail sizes to EN 81-20/50 and profiles as per ISO standards rail sections. When rail length exceeds 30 m means shall be provided to absorb rail expansion and structural settlement. Guide rail fixings shall be heavy steel brackets using metal C-inserts in concrete walls. Guide rail and fixings shall withstand sudden application of safety gear under maximum load.

E. Inserts: coordinate with builder's works to furnish required concrete inserts and similar anchorage devices for the installation of guide rails, machinery, and other components of lift work where installation of devices is indicated as work. Provide necessary shop drawings for the required works.

© Copyright protected

F. Suspension Ropes: special acid quality steel or high grade traction steel, single factory production patch with safety factor as specified by EN 81-20/50. Ropes shall be securely attached to car and counterweight and shall have independent means of adjustment. Provide test certificates of compliance with appropriate Code and/or Standard prior to shipment. For travels above 60 m, provide steel cord governor ropes to limit movement of the governor tension wheel due to changing humidity values. An automatic tensioning device shall be provided to equalize the tension of suspension ropes.

G. Roping Arrangement: roping arrangements used are subject to verification by the manufacturer and approval of the Engineer.

H. Compensation Ropes:

1. Provide compensation for the weight of the hoist way ropes and unbalanced portion of the traveling cables whenever the travel exceeds 30 m so that the system balance does not vary by more than 50 kg over the entire range of travel.
2. Compensation Ropes: compensation shall consist of steel wire ropes for speeds 3 m/sec & above and chain with a fire retardant round resilient rubber cover for rated speeds less than 3 m/sec.
3. Compensation ropes shall be attached to the underside of the car and to the counterweight passing under a weighed compensation sheave in the pit. Provide lockdown as described in EN 81-20/50 to the compensation sheave assembly, whenever rope compensation is applied. Provisions shall be made for equalizing tension in the compensating ropes. The guide sheave shall be provided with bearings of anti-friction bearing metal, ball or roller type. The guide sheave shall operate in guides, and the guide structure shall be securely fastened in place. Provide metal guards to prevent ropes jumping off sheave and to prevent foreign objects from falling between ropes and sheave grooves and to protect workmen. Provide upper and lower travel limit switched on the compensation guide sheave. When actuated, power to the drive and brake shall be removed.

I. Buffers: buffers shall be of approved design, oil type for speeds exceeding 1 m/sec and spring or polyurethane type for speeds of 1 m/sec and below unless otherwise indicated. Buffers shall be installed under each car and counterweight. Use reduced stroke buffers with associated terminal slowdown devices where runbys are restrictive. Buffers shall be tested by a qualified testing laboratory and approved as complying with the governing Code.

1. Oil Buffers: provide oil buffers with necessary blocking and horizontal steel braces. Oil buffers shall bring the car and counterweight to rest from governor tripping speed at an average rate of retardation not exceeding gravity. Oil buffers shall be of the spring return type and shall have means of the checking oil supply level and shall provide a limit switch as a backup for the oil level. Oil buffers shall have a marking plate indicating the manufacturer's name, the buffers identification number and the stroke.
2. Spring Type or Polyurethane Buffers shall be in full compliance with the code requirements. Buffers shall be designed and constructed to absorb within the limits of their stroke, the whole kinetic energy of the car carrying its rated load when the speed of impact is the maximum governor tripping speed.

J. Governor Actuated Mechanical Safety Gear: mechanical safety gear shall be mounted on and securely fastened to car frame and actuated by a governor mounted in machine room. Governor shall be directly driven by steel cable. Safety gear and governor shall be in compliance with EN 81-20/50. Governor shall be accurately adjusted and sealed to trip safety gear according to EN 81-20/50 requirements. Operation of governor on over speed is also a switch disconnecting power from motor and brake control circuits, which shall be open before safety gear is applied. Restoration of power shall not be possible until safety gear has been manually re-set. Governor shall be sealed and tagged in accordance with EN 81-20/50.

K. Safety Gear: safety gear shall hold car securely under maximum load and governor tripping speed conditions. Jaws shall engage guide rails through self-aligning shoes with surfaces carefully machined parallel to guide rail face. Pressure of jaws on the two guides shall be equal. Safety gear shall bring car to stop from governor tripping speed. Make provisions to release the car safety. In no event the safety shall be released by downward motion of the car. Raising the car to reset the safety gear shall be allowed. An electrical safety plank switch shall be provided to interrupt the power to the hoist machine when the safety gear is set. Safety Gear shall be type tested in accordance

© Copyright protected

with EN 81-20/50 by an approved independent test body. Certified type test report shall be submitted for approval. Install a car safety marking plate of corrosion resistant metal and, in addition to the data required by the governing code, indicate the manufacturer's name and manufacturer's catalogue designation number for the safety gear.

L. Safety Gear Type shall be progressive (gradual) type if the lift rated speed is 1 m/sec or above and progressive (gradual) or instantaneous type if the lift rated speed is below 1 m/sec unless otherwise indicated.

M. Counterweight shall have safety gear for all lifts that have an occupied space below the pit.

N. Governor Ropes: the over speed governor shall be driven by a wire rope designed for that purpose with minimum diameter of 6 mm and shall be easily detachable from the safety gear. The ratio between the pitch diameter of the pulleys for the over speed governor ropes and the nominal rope diameter shall be at least 30. The over speed governor rope shall be tensioned by a tensioning guided pulley. Design the governor rope-tripping device so that no appreciable damage to or deformation of the governor rope shall result from the stopping action of the device in operating the car safety.

O. Lift Pit Stop Switches: Two switches shall be provided at each lift pit as per EN81-20/50 to stop the lift and prevent it from any further movement until placed back to the “Run” position.

P. Pit water drainage system: lift pit bottom shall be smooth pit' bottom with little slop to the drain which shall be provided with automatic water level sensor and connected to the drainage system network.

Q. Pit Access: An access door or pit ladder shall be provided for the access of the lift pit according to EN 81-20/50 requirements.

R. Refuge Space: sufficient refuge space shall be provided at the pit and at the lift headroom. Refuge space shall be clearly demarcated. Signs shall be provided on the car roof and in the pit and shall be readable from the access to the car roof / pit, such signs shall clearly indicate the allowed number of persons and the type of posture considered for the refuge space(s) accommodation. Comply with EN 81-20 requirements.

S. Pit and machine room access doors along with emergency, inspection and trap doors shall be provided in accordance with EN 81-20 requirements and shall satisfy the minimum dimensions indicated in EN 81-20.

T. All civil works required by the standards inside shafts (dividing beams, etc.), inside machine room (beams to support pulleys, etc.) and inside pits (safety screens, pulleys supports, buffer pads, etc.) shall be included in this scope of work.

120.040 DOORS

A. Opening Sizes: Landing and car door openings shall be of the same size.

B. Automatic Sliding Car and Landing Doors: power operated type, open silently, and shall have the following features:

1. Hangers and tracks of two-point suspension ball or roller bearing type; doors guided at bottom by gibes in grooved sill; grooves and tracks cleaned automatically by operation of doors.
2. All landing doors shall be insulated, 2-hours fire rated as per EN 81-58 and EN 1363 standards. Criteria of door performance shall satisfy both integrity (E) and thermal insulation (I) tests. For the low rise residential buildings, 6 floors and less; non-insulated, 2-hours fire rated doors satisfying integrity test (E) can be used.
3. Infrared light-beam (minimum of 35 beams) shall open doors when light-beam is interrupted and to automatically optimize time of opening and reclosing through microprocessor based controller. Alternative protection devices may be used for service lifts, details shall be provided for engineer’s review and approval.
4. Include extended door hold open button in the main car operating panel for all service and freight lifts to extend the door open time (10-20 sec, time to be adjustable through proper programing) to facilitate cart transfer. Registration or re-registration of a car call shall cancel the hold open time.

© Copyright protected

5. Doors shall open automatically and simultaneously when car stops at required floor, shall remain open for a reasonable, adjustable period, and automatically and simultaneously close, as set in lift control sequence.
6. 'Door open' push button on car control panel shall reverse door closing operation, but shall not open an interlocked door.
7. Door contact to prevent operation of the car unless the car door is in the closed position. The door contacts are not be readily accessible from the inside of the car.
8. Nudging facility so that if the doors are held open for a predetermined time (15 to 20 seconds) by interrupting the light beams or by holding the door, or by pressing the door open button, a buzzer shall sound and the doors shall start to close at reduced rate of speed. Doors shall continue to close unless the door force limits are not exceeded, which shall cause doors to reopen or stop. Process shall continue until obstruction is removed from entrance.
9. Adjustable door dwelling time, the time interval that lift doors stand open after a stop shall be independently adjustable for car call stops and hall call stops. A separate door time shall be adjustable for lobby door hall calls.
10. Advance door opening, the car and hall doors shall begin to open while the car is preparing to stop at a landing to answer a call. The distance from a landing at which the doors begin to open shall comply with applicable codes.

C. Electric Door Operator driven by a heavy duty electric motor, minimum IP 23 for firefighting lifts and IP 21 for other lifts, shall open and close car and landing doors simultaneously. Door operation shall be automatically controlled by lift control system. Doors shall be mechanically secured and electrically interlocked when closed. Electric door operator shall have the following features:

1. Variable voltage variable frequency (VVVF) electric motor driving unit, mounted on car top (vibration isolated from car body) to operate the car and hoist way doors simultaneously, with necessary gears, levers, door arms, belts and ropes to achieve smooth operation of doors in both directions and an opening speed higher than closing speed.
2. Digital closed-loop system to monitor and control the door speed.
3. Torque limiting clutch to prevent harm to persons caught by closing door, but to overcome small obstructions in bottom guide track.
4. Manual opening of doors shall be possible in the event of power failure, if car is at landing, landing door shall open with car door; mechanism shall reset automatically.
5. With installations, in which doors commence opening while car is leveling to landing, mechanical and electrical devices shall ensure no dangerous situation can occur during this period.

D. Emergency Doors: for express runs exceeding 11m, provide emergency landing door every 11m complying with EN81-20/50 requirements. Emergency landing doors shall be of same type, size and finish of other landing doors of the same lift group (except where otherwise indicated on the drawings), 2 hours fire rated and shall be provided by the lift supplier.

E. Door Frames and Sills: door support units and sill supports fitted at landing entrance shall be self-contained and provided by lift contractor, comprising sill, two angle uprights and head. Non-slip sill shall be fitted at each landing and car entrance. Sills shall be made of extruded hard aluminum with rubbish disposal halls.

120.050 VARIABLE VOLTAGE VARIABLE FREQUENCY (VVVF) DRIVE CONTROLLER

A. Motor Drive: unless otherwise indicated or specified, use 3-phase, solid state, variable-voltage variable-frequency (VVVF) power drive with regulated closed loop speed monitoring control system. Drive shall utilize IGBT power semi-conductors having means for heat dissipation and overheat protection (include thermal overload).

B. Continuous Operation: drive shall be designed for continuous operation at rated speed and rated load, and for 10 minutes at rated speed and 110 percent of rated load, without overheating. Ensure that, in such operating conditions, normal power sources are not adversely affected and emergency generator circuits (and loads connected to the emergency power bus) are not adversely affected during standby power operation. Protect each power feed line against surge currents. Prevent runaway in the event of closed loop feedback circuit failure.

© Copyright protected

C. Electronic Negative Feedback System: shall be used to limit current through IGBT's and motor, incorporating:

1. Pattern-generator giving a velocity input signal modified by car position, with constant peak acceleration and constant change of acceleration.
2. Encoder to provide a velocity feedback signal.
3. Digital transducer to provide a position feedback signal.
4. Current transformer to provide a current feedback signal.

D. Power line noise shall comply with IEC 61000-3-4. Necessary filters shall be provided to limit the feedback current harmonics to standard limits.

E. Overall Drive System Response: arrange system response so that the elapsed time between fault detection and removal of electric power does not exceed 0.1 second. Overall drive efficiency shall be greater than 95 percent. Power factor shall be 0.95 minimum.

F. Power supply equipment shall be designed to operate at ± 10 percent supply voltage and ± 3 percent supply frequency, without damage to any equipment and to operate at ± 5 percent supply voltage and ± 3 percent supply frequency without affecting operational performance quality. Protective devices shall be provided for both over-voltage and under-voltage conditions. Protect against loss of phase, phase reversal or overload. Incoming power supply shall be provided with contactor inside the control panel.

G. Controller: the controller shall be microprocessor-based and provided with the following operating features and performance functions:

1. Digital control, with adjustments that do not vary, drift or age with line voltage changes.
2. Linearity between required torque and torque output.
3. Precise closed-loop speed, regulated to less than ± 1% by frequency compensation.
4. S-curve 'soft' start/stop, with a fast speed response system.
5. Diagnostic record of the history of the lift operating conditions, from the instant of the last fault occurrence back 30 days minimum, and to include the following as a minimum:

    a) Emergency Faults.
    b) Fire service activation.
    c) Inspection mode.
    d) Independent service.
    e) Time out of service.
    f) Car out of service.
    g) Safety edge failure.
    h) Emergency power.

6. Application-specific memory to support logic function programming, to tailor the drive.
7. Quiet motor operation, based on high switching frequencies and low harmonic content.
8. Full function operator interface with alphanumeric display. Include: a menu structure with scrolling to reveal system options and display parameters; and interactive interface to permit display and ready changing of parameter values; constant pressure jog for pre-set speed control; motor rotation direction selector; run/stop commands.
9. Protective features including phase-to-phase and phase-to-neutral short-circuit protection; ground fault protection; electronic motor overload protection; over-torque and under-torque detection; over current, over-voltage ad over-temperature detection; input/output phase loss.
10. Noise filter between hoist way wiring and controller to eliminate interference.

H. Protection: system shall be protected against the following:

1. An error level exceeds the signal by more than 5 percent.
2. Actual acceleration exceeds a pre-set pattern more than 15 percent.
3. Excessive transistor switching time or overheating of solid-state components.
4. Car positions as derived from a digital transducer and an integrated velocity feedback signals differ by more than 12 mm.
5. No voltage or sustained under voltage.
6. Over current in any component.
7. Phase reversal of power supply.

© Copyright protected

I. Wiring: install copper wiring runs shall be neatly installed. Wire shall be terminated at studs or terminal strips, with connections to ensure substantial electrical and mechanical integrity. All major components shall be exactly identified as indicated on wiring diagrams by engravings or tags mounted immediately adjacent to the component.

J. Enclosure shall be a sheet metal cabinet totally enclosed, IP 21 with removable hinged doors (key-locked) and with filtered ventilation sufficient to maintain interior temperature at a reasonable level.

K. Auxiliary Emergency Supply: control system shall operate from rectified AC supply, at a suitably selected and approved DC voltage. Negative terminal shall be connected to earth. Battery shall be sealed nickel cadmium or lithium type, capable of operating intercom, car fan, lights and alarm circuits for [**one]** hour, in the event of power failure.

120.060 ELECTRICAL EQUIPMENT

A. Equipment generally shall be in accordance with the requirements of relevant Division V Sections.

B. Provide all wiring for proper operation and control of equipment in accordance with electrical Specifications and applicable Codes. Provide wiring for communications facilities and connection to the various related low current systems and building management system.

C. Power Supply Variations: Equipment shall operate satisfactorily if voltage varies ±10% and/or frequency varies ±3% from nominal.

D. Wires and cables inside machine room shall be silicon rubber or PVC insulated, 600/1000 V grade, flame retardant. MICC and silicon rubber insulated cables shall be used for high ambient temperatures. Conductors shall be copper.

E. Conduits and Wireways: Wiring and cables shall be enclosed in heavy gauge galvanized steel conduits.

F. Earthing: Metal frames of lift installations shall be earthed according to Division Y Section "Earthing And Bonding".

120.070 CONTROL ACCESSORIES

A. General: Provide all necessary car, landing and other control accessories as required by specified control system.

B. Car control panel shall be located in an approved convenient position and shall contain at least the following:

1. A call button for each floor served, illuminated when pressed and switched off when the calls are answered
2. LED car position indicator with up/down illumination arrows to indicate the floor at which the car has stopped or passing.
3. Alarm push button.
4. Audible signal to indicate that car is stopping at the required floor.
5. Car fire emergency key switch (for fire fighter lifts).
6. Independent key operated switch.
7. Door open and door close pushes.
8. Extended time hold button for service and freight lifts.
9. Overweight indication and buzzer.
10. Intercom station.
11. Maintenance and test switches with locked cover.
12. Provision for fire jack telephone (including installation of telephone cables with lift travelling cable to machine room / MRL control panel location. Coordinate with main contractor to obtain jack and cable.
13. Provision of outlet for card reader, as required for special floor access. Coordinate with main Contractor for requirements.

C. Car locked service cabinet shall be flush mounted, located below the car call buttons and contain the switches required to operate and maintain the lift, including, but not limited to the following:

1. Key operated priority service switch for isolation purposes.

© Copyright protected

2. Duplex socket standard type.
3. Emergency light test button or switch.
4. Fan switch.

D. Additional Car Features: provide two-car control stations in all passenger and service/freight lifts with through type entrance and passenger lifts above 1000 kg capacity. Equip only one with required keyed control switches (if any).

E. Cross Connection Box: trailing control cable shall terminate at a terminal block in the cross connection box on top of the car. The Cross connection box shall contain necessary control pushes for maintenance, lamp with switch and a convenient power socket.

F. Hall Push-Button Station: provide hall push-button station at each landing for each lift or group of lifts, but not less than two stations for each 3 lifts in a group.

G. Hall Push-Button Stations shall comprise up and down pushes and associated illuminated arrows to indicate registered call. Terminal landings shall have one push and one arrow. Illuminated arrow shall switch off when call is answered. Push buttons shall be most up-to-date, mechanical, soft touch.

H. Hall Push-Button Operation: prevent simultaneous up and down call registration by delaying acceptance of the second call registration for 4 seconds (adjustable).

I. Hall Lanterns: For a group of four lifts and more, provide a visual and audible signal at each entrance to indicate which car will stop in response to the hall call. The lanterns with up and down indications at intermediate landings and a single direction indication at each terminal landing shall sound once for the up direction and twice for the down direction to notify passengers which car will answer the hall call.

J. Hall Position Indicator: provide LED type position indicator at each hoistway entrance. Match materials, finishes, and mounting method of hall push-button stations.

K. Emergency Key shall open all landing doors shall be handed to the Employer.

L. Speech Synthesizer: Provide an English speech synthesizer complete with microprocessor vocabulary chips loudspeaker control and all accessories shall be provided unless otherwise specified. It shall be used for broadcasting to car passengers the following Discretionary messages below shall be provided as a minimum:

1. Floor arrival
2. Up/Down direction
3. Lift full
4. Obstructed doors
5. Other announcements if required by Engineer.

M. Fireman switch, installed in a locked cabinet with break glass feature, shall be provided at fire fighter lift bank. Cabinet shall be located at main landing floor, in an approved easily accessible position. Identification and inscription shall be engraved on the face plate. Refer to "Control Systems" Article for description of operation.

120.080 CONTROL SYSTEMS

A. Interlock: No car shall be able to move unless car and corresponding landing doors are fully closed and interlocked. It shall not be possible to open landing door, except that at which car is stopped, and any other door without the use of special tamperproof key.

B. Anti-Nuisance Feature: in the event of car loading or operation is not commensurate with the number of car calls registered, all calls shall be cancelled.

C. Operation From Emergency Supply: In the event of normal power supply failure all lifts shall stop. Upon receiving signal that emergency a.c. power supply is on, control system shall return lifts one at a time, in sequence, directly to main floor giving priority to loaded cars. When lift arrives at main floor, doors shall open and remain open, and lift shall remain stopped. One lift of each bank, unless otherwise shown on the drawings, is then to be operational and shall respond to car and landing calls. If a car cannot be returned after two attempts, it is removed from the system. When all cars have been returned or removed from the system, one car is automatically placed in service. If car selected for service cannot operate within 60 seconds, the system removes car from service and

© Copyright protected

places another car in service. Cars can be manually put in service on standby power, either for return operation or for regular operation, by switches located at fire command station. Manual operation causes automatic operation to cease. After restoration of normal power supply all lifts shall resume normal service automatically

D. Operation from Emergency Power Batteries: If the normal power supply fails, lifts shall automatically switch to battery operation as a first step. Each lift shall move in the "light" direction, system shall operate at rated speed and shall stop at the nearest available floor, open its doors for passengers to exit and then remain on this floor with its doors opened, all safety features shall remain operational during system operation. When normal power is restored or emergency power from generator supply operates before the lift has reached the next available floor, the lifts operating on emergency battery power shall stop at the next available floor and be automatically removed from service. Emergency battery power is then to be disconnected and normal power or emergency power from the generator shall be applied to the lifts. In case of emergency supply is connected; only one lift of each group, unless otherwise shown on the drawings, in addition to all fire fighter lifts shall be operated from the emergency power supply, and shall respond to car and landing calls. After restoration of normal power supply all lifts shall resume normal service automatically. Batteries shall be sealed lead acid type.

E. Excess Load: Load-weighing device installed in car shall prevent car from starting in either direction if maximum loading is exceeded (adjustable from 100% - 110% of full load capacity and set at 100%). Buzzer shall sound and an 'overweight' light shall be illuminated until car is below maximum load. Excess load shall cause car to by-pass landing calls if car is loaded above normal but within an acceptable load limit.

F. Overload Bypass: excess load shall cause car to by-pass landing calls if car is loaded above normal but within an acceptable load limit. Load capacity shall be set at 70% (adjustable from 60 - 80% of full load capacity).

G. Distributed Parking: When cars are not required for response to calls, they are parked with doors closed and distributed in predetermined zones throughout the building. One zone shall include the main floor and adjacent floors; remaining floors shall be divided into approximately equal zones.

H. Independent Service: Keyswitch in car-control station removes car from group operation and allows it to respond only to car calls. Key cannot be removed from keyswitch when car is in independent service. When in independent service, doors close only in response to door close button.

I. Fire Emergency Service: meet local civil defense regulations for lifts fire emergency operating conditions. Fire emergency operation mode of lifts shall be activated via the following:

1. Actuation of fireman key switch at the main fire control room.
2. Actuation of fireman key switch at the main lobby of the fire fighter lift.
3. Automatic through the fire alarm system.
4. Fire Emergency Operation: through fireman key switch or fire alarm system shall be as follows:

    a) When a lift fire key-operated switch is put in the "on" position or a fire signal is received from the fire alarm system, all relevant lifts which are on automatic service shall return non-stop to the main landing floor and the doors shall open and remain open.
    b) Car(s) travelling away from the main landing floor shall stop at the next available floor without opening their doors and return directly to the main landing floor.
    c) For cars equipped with automatic power-operated doors, standing at a floor other than the main landing floor with doors open, the doors shall close immediately and the car shall proceed to the main landing floor.
    d) Door reopening devices for power-operated doors which are sensitive to smoke, heat or flame shall be rendered inoperative.
    e) All car and landing floor call buttons shall be rendered inoperative and all call registered lights and direction lanterns shall be switched off and remain inoperative.
    f) The activation of fire alarm detection device in any lift hoist way shall cause all lifts having any equipment located in the hoist way and any associated lifts in a group automatic operation, to return non-stop to the main landing floor and their doors shall open and remain open.
    g) The activation of fire alarm detection device in any lift machine room shall cause all lifts having any equipment located in that machine room, and any associated lifts of a group

© Copyright protected

automatic operation, to return non-stop to the main landing floor and their doors shall open and remain open.

h) The activation of fire alarm detection device in any lift hoist way shall cause all lifts having any equipment located in the hoist way and any associated lifts in a group automatic operation, to return non-stop to the main landing floor and their doors shall open and remain open.

i) If the fire alarm detection device at the main landing floor is activated, the cars shall return non-stop to an alternate level, approved by the concerned authority, and their doors shall open and remain open. The operation of the lift requires the manual resetting of the fire alarm system.

j) When the switch is in the "off" position the lift shall revert to normal operation.

J. Fire Fighter Lifts: only fire fighter lifts can resume operation under fire emergency conditions from car push buttons by activation of the car fire emergency key switch. The car fire emergency switch shall be effective only when the hall fireman key switch at the main landing floor is in the "on" position or the fire alarm detection device (if provided) is activated and the car is at the main landing floor. The car key shall be removable only in the "off" position. When the car key switch is in the "on" position, it shall bring the lift into the emergency mode. Emergency operation from inside the car shall be cancelled when the hall fireman key switch is switched to the "off" position with the car at the main landing floor

K. Fire Fighter Lifts: operation under fire conditions shall be as follows after activation of the car fire emergency key switch:

1. The lift shall be operable only by a person in the car.
2. The lift shall not respond to landing floor calls.
3. The opening of power operated doors shall be controlled only by continuous pressure of the "open" button and if the button is released prior to the doors reaching the fully open position, the doors shall automatically reclose. Open doors shall be closed by either the registration of a car call button or by pressure on door "close" button.

L. When sprinklers are installed in the hoistway, control closet, or machinery spaces, a means to automatically disconnect the main line power supply of the affected lift prior to the application of water is to be provided. Smoke detectors shall not be used to activate sprinklers in hoistways, control closets, or machinery spaces or to disconnect the main line power supply.

120.090 LIFT OPERATION MODES

A. General: Provide manufacturer's standard microprocessor operation systems as required to provide type of operation indicated.

B. Push Button control, without attendant, with Automatic Doors: call push is to be provided at each landing served, together with 'lift coming' illuminated signal. In the car, a push is to be provided for each floor served, marked with appropriate floor designation. Calls by momentary pressure on 'floor' pushes in car or pushes at landing are to be registered and is to automatically close door(s) and start lift in direction corresponding to first registered call. Lift is to then answer registered car and landing calls in sequence in one direction and then in the other. On arrival at required floor, door(s) are to open automatically. After door(s) have remained open for an adjustable time, they are to close again automatically, and lift is to answer other registered calls. Non-interference relay is to be incorporated so that a delay of 3 to 5 seconds can be imposed on operation of car and landing calls after car has stopped at floor. Priority is to be given to car push buttons so that after car has stopped at floor, landing calls are rendered inoperative for 5 to 12 seconds.

C. Collective-Selective Group Control: Each lift group shall operate under one control system, handling all landing calls collectively and selectively. It shall be possible for each lift to be switched to attendant operation, removing it from the group. Lift control system shall be so arranged that appropriate car responds to landing calls by automatic selection, and systematic spacing of cars is maintained to minimize delays. Direction in which car will travel shall be determined by calls stored in system. 'Up' and 'down' directional call pushes shall be provided at each landing served by bank, together with 'call registered' illuminated signal for each push. 'Up' or 'down' push only shall be provided at terminal landings. In each car, a push shall be provided for each floor served, marked with appropriate floor designation. When lifts are switched to passenger operation, calls by

© Copyright protected

momentary pressure on 'floor' pushes in car or pushes at landings shall be registered in control system and automatically and selectively cause closing of respective car door and start car in direction of first registered call. Lift shall collectively answer registered car and landing calls in sequence in one direction and then in the other. Having answered all calls stored in system, one car shall return automatically to park at main floor, with doors open, and other car(s) shall remain at floor last reached. When any lift of a group is switched to attendant operation, car shall respond to car calls and landing calls stored in system, but car shall start when attendant presses 'start' button. When attendant presses 'pass' button, landing calls are by-passed but remain registered. When attendant presses 'reverse' button, car shall stop and travel in opposite direction. Unanswered calls shall remain registered. 'Pass' and 'reverse' buttons shall be inoperative in passenger operation mode.

D. Supervisory System For Group Control: Lifts shall operate as one group by a microprocessor controlled supervisory system, automatically regulating movement of cars according to various traffic requirements, classified in five conditions: System automatically adjusts to demand changes for different traffic conditions including heavy incoming, heavy two-way, heavy outgoing, and light off-hours as variations of normal two-way traffic.

1. 'Off-peak and balanced traffic': Generally two way and inter-floor traffic.
2. 'Up-peak': when traffic is predominantly incoming.
3. 'Down-peak': when traffic is predominantly outgoing.
4. 'Light traffic': when traffic is intermittent such as outside normal working hours.
5. 'Night service'.
6. Selection of traffic condition and regulation of movement of cars shall be made automatically according to number and frequency of calls registered in system. In no case are two lifts to answer same directional landing call.

E. Supervisory System For Group Control:

1. During 'off-peak', lifts shall operate as group collective-selective.
2. During 'up-peak', all lifts, except one, shall answer only car calls, and travel directly back to main floor immediately after all calls have been answered; one lift shall also answer 'up' and 'down' landing calls.
3. During 'down-peak', all lifts, except one, shall answer car calls and landing 'down' calls, and travel directly up to highest registered landing call immediately they become free at main landing; one lift shall also answer 'up' landing calls; 'down-peak' operation shall incorporate feature which automatically divides operation into two stages:

    a) Stage 1: Dispatching of cars shall be modified to suit prevailing out-of-balance demand.
    b) Stage 2: If out-of-balance trend continues or becomes more predominant a 'zoned operation' shall be brought in.

4. During 'zoned operation', car or cars in lower zone are, in their upward journey, to operate with high call reversal; 'zoned operation' shall continue until Stage 2 peak condition ceases, when low cars shall revert to Stage 1 operation.
5. During 'light traffic', motor generator sets shall shut down after outstanding calls have been answered, and for a predetermined time when call is registered; motor generator of one car shall restart when call is registered, and others shall restart when calls become more frequent.
6. Arrangements shall be incorporated so that any one car may be left in operation for 'night service'; dispatching system is then to be inoperative and car shall start in response to first car or landing call.

F. Supervisory System For Group Control: At least one car shall be brought back to main floor and remain there with doors open, car lights on and 'this lift' sign illuminated. Other cars arriving at main floor, after all passengers have left, shall remain with doors closed while there is another car with 'this lift' sign illuminated. When first car leaves then second car becomes 'this lift'. Change-over from passenger to attendant control shall be by switch in supervisory panel at main floor.

120.100 LIFT COMMUNICATION SYSTEM

A. Intercom: provide an intercommunication system for all lifts. System shall provide two-way communication between the lift car stations and the master stations.

B. Station Types: the system shall have the following stations:

© Copyright protected

1. Master station in the main fire control room.
2. Master station in the main security/control room.
3. Master station at the lift machine room/control station at last floor for machine room less type.
4. Slave station above each lift car.
5. Slave station in each lift pit.
6. Slave station in each lift car

C. Car Station shall have a loudspeaker and a microphone to provide hands-free communication. The station shall be installed behind the car operating panel.

D. Master Station shall be provided with selector push buttons, annunciator lights for each connected station, speaker microphone, volume control and function buttons. The intercom system shall include test button to verify audio circuit path.

E. Car Intercom Call: an intercom call shall be placed from the lift car station by pressing the emergency alarm push button. This action shall cause the lamp in the corresponding button of all the designated master stations to flash and an intermittent tone to be heard.

120.110 SPECIAL REQUIREMENTS

A. Handicapped and Persons with Disability Requirements: passenger lift design shall include the following requirements:

1. Locate the alarm button and car call buttons on the car operating panel where possible as required by EN81-70 for handicap requirements.
2. Provide car control buttons and hall push buttons with tactile marking, the tactile marking shall be in compliance with EN81-70.
3. The centre line of the hall push button stations shall be 1100 mm above the floor where possible.
4. The hall lanterns shall sound once for the "up" direction and twice for the "down" direction.

B. Connection to the Building Management System: coordinate with the Building Management System (BMS) supplier and provide all necessary interface devices, dry contacts, transducers, instruments, etc. for connection of the required points to the BMS as specified or indicated in the BMS schedules.

C. Building Management System (BMS) provisions:

1. Refer to the BMS specifications, in coordination with the BMS specialist, for the data points and functions to be provided as part of the integration with the BMS. The BMS will provide operation management functionality for the lift where all monitoring and control points will be accessible by the BMS.
2. A demonstration shall be performed for the Engineer, as a proof that a bench test integration has been conducted between the system and the BMS platform prior to materials submission.
3. The lift shall be interfaced with the BMS through one of the following open standards communication protocols: BACnet, LonTalk, Modbus, OPC.
4. Provide all Servers, Network Interface Unit, communication gateways, accessories, etc... as required to ensure seamless integration between the system and the BMS.
5. Provide confirmation and full compliance report that the system shall be seamlessly integrated with the BMS as per the functions and requirements stipulated in this specification section and the BMS specification section, prior to any commitment.
6. Provide comprehensive and complete documentations regarding the requirements of the integration with the BMS, including databases, Object IDs and description, component addresses and any other pertinent information.
7. Validate all functions, with the BMS integrator, prior hand over.

120.120 REMOTE MONITORING AND COMMAND SYSTEM

A. Remote monitoring System: shall be provided and shall be located in BMS room.

B. System Architecture shall be based on a "Client-Server" configuration.

C. Servers, the Contractor shall design Servers architecture to fulfil, as a minimum, the following requirements:

1. Separation of database and application servers.
2. Dual-redundant servers in clusters for high availability.

© Copyright protected

D. Servers Configuration:

1. The servers shall consist of dual, redundant servers. The intent is to prevent a single system point of failure.
2. The servers shall be identical, with one server acting as the primary and the second server acting as a hot stand-by server with automatic fail over capabilities.
3. The two servers shall maintain synchronized databases automatically. Upon loss of communication of the system with the primary host, the secondary server shall automatically assume the control of the system and become the primary server. Upon the re-establishment of communication with the server, the two servers shall automatically resynchronize without requiring re-booting of the servers.

E. The Contractor shall design servers that are able to cope with the foreseen workload:

1. The Contractor shall indicate the percentage increase of workload that the servers will be able to cope with.
2. The Contractor shall configure the required servers.
3. Requirements for servers (in terms of operating system, memory, CPU, screen size, resolution, storage, associated peripheral I/O devices, etc.) shall be submitted for Engineer's review/approval.

F. Servers

1. For minimum requirements of servers and related ancillaries, refer to:

a) Division W, Section "Virtual Servers Environment (VSE)".
b) Division W, Section "Computers & Related Peripherals".

G. System: computerized Lift Remote Monitoring and Command System complete including software and necessary data and communication network shall be provided for all lifts and escalators / moving walks of the project. All material and installation requirements of the communication network within the project shall be coordinated with lift supplier and shall be as per his requirements. Panel shall be located at BMS room, unless otherwise advised by the Client.

H. Software Package: the software shall cover all required monitoring and command functions, maintenance program requirements in coordination with the maintenance contract and necessary communications and interfaces with lift control system and other concerned systems.

I. System: lift remote monitoring and command system shall include a state-of-art, multi-color high resolution, minimum 24-inch display, personal computer with adequate mass storage capacity and a dedicated high quality printer. Monitoring and command facility shall be provided in each machine room, either through local fixed or portable computer unit. Equipment specifications shall be submitted for the Engineer’s approval.

J. Operator Workstation:

1. For minimum requirements of workstations and related peripherals, refer to Division W Section "Computers & Related Peripherals".

K. Monitoring Display: the system shall be capable of displaying the information in graphic or tabular displays as follows:

1. Graphic Status Display of an elevation representation for all cars in a group shall be shown in the same time for each group including the following as a minimum:

a) Floor status.
b) Group operational mode.
c) Car status.
d) Hall calls.
e) Date and time, building and group identification.

2. Tabular Status Display shall include as a minimum the same information as above except for registered hall and car calls.

L. Lift Alarm and Event Data Display: lift remote monitoring and command system shall monitor various discrete signals from the lift system and retain a log of alarms, faults and events. An audible

© Copyright protected

alarm with adjustable volume and silencer shall automatically sound at each lift failure and or alarm condition.

M. Security Display and Command Operation: system shall display one group at a time and shall allow through keyboard commands modification of the security status of the car in the group, including floors the car is allowed to serve, floors that the car is secured from serving and floors that are cut out from having hall calls registered from them.

N. Interactive Lift Operations Display and Control: the ability to use the keyboard to initiate and display interactive lift, moving walk and escalator operations, including but not limited to, the following shall be provided:

1. Display faults and events.
2. Alarm messages.
3. Any other special operations allowed by the manufacturer.

O. Traffic Analysis Display: system shall be capable for viewing various reports generated from the data including the following as a minimum:

1. Total number of hall calls (up/down).
2. Average hall call times (up/down).
3. Maximum hall call time.
4. Number of car calls per car.
5. Number of hall and car calls per landing (up/down).
6. Average hall call time per landing.
7. Histogram of registration times.
8. Record of all events alarms.
9. Statistics showing percentages of time in different operation modes.
10. Playback of the graphic status display.

P. Historical Data: system shall be capable of providing full historical data for minimum 30 days, and tendering for modes of operations, failures, alarms, maintenance requirements as a minimum.

Q. Command Control Feature: Proved password protected command control software to enable building manager to control operation of lifts using the following functions:

1. Floor lockout (hall and car simultaneously).
2. Car call lockout (all cars within a group).
3. Parking operation- remove car from group and place at predetermined zoning floor.
4. Independent operation- remove car from group to respond to car calls only.
5. VIP operation: send any car to any floor and remain there for period of three minutes reassigning all other calls to different cars automatically.

R. Documentation: provide complete documentation, illustrating functions of software systems, including the following:

1. General system overview.
2. High-level functional description.
3. I-O tables and charts, showing output bus and input signals.
4. Applicable technical manuals for adjusting, including drive control adjustment, terminal characteristics for diagnostic work, and user procedures.

120.130 LIFT FIRE CONTROL PANEL

A. Lift fire control panel: design and provide lift fire control panel, with display of car position and door status, group and unit operating modes, and operating status for all lifts. In addition to indicators for each fire fighter car, when running on in-car fire emergency mode. Panel shall be located at main fire control room of the building. Panel shall consist of two sections, an analogue type section for the fire fighter lifts (for simultaneous indication of all lifts) and a digital type section for all other lifts comprising a PC with LCD screen. Panel shall be complete with all necessary controls, indicators, wiring, unless otherwise proposed by the supplier and approved by the engineer.

B. Control Devices: provide the following control devices as a minimum:

1. Fireman key switch, to select between normal (off) and emergency fire operation (on) modes,

© Copyright protected

2. Communication master station.

120.140 SOURCE QUALITY CONTROL

A. Factory acceptance tests shall be performed for equipment under this Contract and shall be witnessed by the Engineer.

B. Factory acceptance tests shall include complete checking and testing for 10% of the Project's lifts, minimum one unit of each type, according to requirements of the specified regulations and standards, as well as special requirements, finishes, software and controls. Selection of lifts for witness test shall be randomly carried out by the Engineer.

C. Test procedure and program shall be submitted for approval prior to test conduction, by at least 14 days. Factory witness test shall include, at Contractor's expenses, all test expenses, business class air tickets, five stars Hotel full accommodation, and transportation, for two persons from the Engineer's or Employer's side.

D. Comply with related quality requirements as specified in Division A.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Requirements include the following:

1. Division E Section "Accessories Cast Into In Situ Concrete" for setting sleeves, inserts, and anchoring devices in concrete.
2. Division F Section "Brick/ Block Walling" for setting sleeves, inserts, and anchoring devices in masonry.
3. Division G Section "Structural Steel Framing" for attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
4. Division G Section "Structural / Carcassing Metal / Timber" for attachment plates, angle brackets, divider beams, and other steel framing for supporting guide-rail brackets.
5. Division G Section "Structural Steel Framing" for hot-rolled steel subsills and entrance frames that are a part of steel frame.
6. Division Z Section "Purpose made metalwork" for hot-rolled steel subsills and entrance frames.
7. Division L Section "Stairs/ ladders/ walkways/ handrails/ balustrades", for handrail and foot railing.
8. Division L Section "Fixed utilitarian access systems" for pit ladders.
9. Division Z Section "Purpose made metalwork" for combination hall push-button stations.
10. Division M Section "Painting Clear Finishing" for epoxy / polyurethane painting.
11. Division M Sections for finish flooring in lift cars, ceiling, mirrors, glazing where applicable.
12. Division U Sections for ventilating hoistways and machine rooms.
13. Division W Section "Central Control / Building Management".
14. Division V Section "Basic Electrical Materials and Methods".
15. Divisions V & Y Sections for electrical service to lifts, including fused disconnect switches, standby power source, and transfer switch.
16. Division W Sections for security card access equipment used to restrict lift use.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 STANDARD COMMERCIAL PRODUCTS

A. Refer to Division A Section "Product Requirements".

© Copyright protected

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Products, materials and equipment shall demonstrate compliance with requirements specified in Division A Section "Product Requirements".

B. Installer Qualifications: Engage the lift manufacturer or an experienced Installer approved by the lift manufacturer who has completed lift installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

C. Manufacturer Certificates: Signed by lift manufacturer certifying that hoistway, pit, and machine room or control closet layout and dimensions, as shown on Drawings, and electrical service, as shown and specified, are adequate for lift system being provided.

D. Mean Time between Failures (MTBF) shall not exceed one failure per year. This time shall be considered for corrective maintenance and not preventive.

E. Components shall be designed in accordance with usual engineering practice and calculation codes, taking into account all failure modes considered in the Code. These shall be made of materials, free of defects, with adequate strength and of suitable quality. Materials classified as harmful shall not be used.

F. Sustainability Requirements: Comply with indicated Codes and sustainability targets and requirements specified in Division A Sustainability sections, as related to lifts, for Energy Efficiency:

310.020 DELIVERY, STORAGE AND HANDLING

A. Packing and Shipping: Deliver materials, components and equipment in original protective shipping containers with labels intact and legible.

B. Delivery on Site: Do not deliver materials, components and equipment on site until adequate protected storage facilities are available or for direct installation.

C. Storage and Protection: Store materials, components and equipment above ground, under cover and in a well-ventilated protected area. Comply with manufacturer's recommendations concerning temperature and relative humidity limitations during storage.

D. Install certified "shock-guards' on the equipment before shipping from the factory and shall be retained in place till unpacked at site and inspected by Engineer, to ascertain whether the "shock-guard" has been activated by any shock/impact during shipment.

310.030 COORDINATION

A. Coordinate installation of sleeves, block outs, lift equipment with integral anchors, and other items that are embedded in concrete or masonry for lift equipment. Furnish templates, sleeves, lift equipment with integral anchors, and installation instructions and deliver to project site in time for installation.

B. Coordinate locations and dimensions of other work relating to electric traction lifts including pit ladders; sumps and floor drains in pits; entrance subsills; electrical service; and electrical outlets, lights, and switches in hoistways, pits, and machine rooms.

310.040 WARRANTY

A. Provide complete system warranty in which Manufacturer, Installer, and Contractor are jointly and severally liable and agree to repair or replace all defective components of the warranted item. Warranty shall include both, materials and workmanship, warranty shall cover:

1. Defective materials and installation.
2. Failure to comply with requirements stated in technical specifications.
3. Structural failures including, but not limited to, excessive deflection.
4. Faulty operation of movable parts such as hardware.

© Copyright protected

5. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.
6. Delamination of exterior or interior facing materials.
7. Making good and installation and finishing all items that are disturbed and that may be required due to repair or replacement of defective items. Coordinate with Employer, manufacturer, and installer of adjacent disturbed items to ensure that their warranty is not cancelled due to the repair work

B. Warranty Period: 1 year from the date of Substantial Completion.

310.050 MAINTENANCE AND SUPPORT

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months full maintenance service by skilled, competent employees of the lift Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper lift operation at rated speed and capacity. Use parts and supplies as used in the manufacture and installation of original equipment.

1. Perform maintenance, including emergency callback service, during normal working hours.

a) Response Time: 1-1/2 to 2 hours for trouble calls and 30 minutes for trapped passengers.

2. Include 24-hour-per-day, 7-day-per-week emergency callback service.

a) Response Time: 1-1/2 to 2 hours for trouble calls and 30 minutes for trapped passengers.

B. Continuing Maintenance Proposal: Submit a continuing maintenance proposal from Installer to Employer, in the form of a standard two-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

310.060 EXTRA MATERIAL

A. Generally: Supply loose equipment, spare parts and accessories as required for normal operation and routine maintenance of the systems and as detailed by the Contractor in his offer for spare parts and accessories.

B. Tools and Accessories: Supply tools and equipment required for routine checking, maintenance, testing and control of installations, with appropriate portable measuring and test instruments.

C. Identification: Parts shall be packed in sealed plastic bags with identifying labels and factory part list numbers.

320.000 SUBMITTALS

A. Product Data (For each lift): Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include product data for car enclosures, hoistway entrances, and operation, control, and signal systems.

B. Sample Warranty: Copy of manufacturer's proposed warranty, stating obligations, remedies, limitations, and exclusions.

C. Country of origin of the Lift shall be indicated in addition to the country of origin of main components including drive, motor, controller, etc.. Complete documentation for factory manufacturing the equipment shall be submitted including but not limited to local and international experience, quality certificates, quality assurance plan, and organization.

D. Sustainable Design Submittals: All related Sustainable Product Data as detailed in Division A Sustainability sections, as applicable.

E. Shop Drawings (For each lift): Show plans, elevations, sections, and large-scale details indicating service at each landing, machine room layout, coordination with building structure, and relationships with other construction. Indicate variations from specified requirements, maximum dynamic and static loads imposed on building structure at points of support, and locations of equipment and signals. Include maximum and average power demands.

© Copyright protected

F. Mock-up: Prior to starting construction and after obtaining the shop drawings approval, Contractor shall provide a mock-up for Employer / Engineer approval. Such mock-up must reflect the approved details and finishes and cabin design. The related comments posted by the Employer/Engineer shall be reflected on the mock-up and the shop drawings and resubmitted for approval. One mock-up shall be provided per type of lift. Mock-up shall be identical to the final product.

G. Construction work shall not proceed until final approval of material/equipment, Shop drawings and mock-up obtained.

H. Samples: For exposed finishes for car, hoistway doors, and signal equipment; 75 mm square samples of sheet materials; and 100 mm lengths of running trim members.

I. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Engineers and Employers, and other information specified or required by Engineer.

J. Maintenance Manuals: For each different electric traction lift, including operation and maintenance instructions, parts listing with sources indicated, recommended parts inventory listing, emergency instructions, and similar information. Include all diagnostic and repair information available to manufacturer's and installer's maintenance personnel. Submit for Employer's information at project Closeout as specified in Division A.

K. Warranties: Warranties specified in this Section.

L. Inspection and acceptance certificates and operating permits as required by governing authorities for normal, unrestricted lift use.

M. Type test reports shall be submitted for the following:

1. Examination type test certificate which shall include a full description of the product, cross reference for the individually certified components, test conditions, test procedures, test results versus allowable limits according to the code EN81-20/50.
2. Landing door fire test to EN 81-58 and EN 1363.
3. Speed governor.
4. Safety gear.
5. Buffer.
6. Brake (main and auxiliary) system.
7. Traction Ropes.
8. Freight lift loading class.
9. Safety circuits.
10. Unintended car movement protection means.

In case, recent type test reports, within 5 years are not available for any of the above components, new type test shall be carried out on the relevant components.

N. As-Built Drawings: At project Closeout, submit record drawings of installed lifts, in accordance with requirements of the specification, Division A.

330.000 EXECUTION

330.010 EXAMINATION

A. Prior to commencing lift installation, examine lift areas, with Installer present, for compliance with requirements, installation tolerances, and other conditions affecting performance of lift work. Examine hoist ways, hoist way openings, pits, and machine rooms, as constructed; verify critical dimensions; and examine supporting structure and other conditions under which lift work shall be installed. Notify Contractor in writing of any dimensional discrepancies or other conditions detrimental to the proper installation or performance of lift work. Do not proceed with installation until unsatisfactory conditions have been corrected.

330.020 INSTALLATION

A. Comply with manufacturer's instructions and recommendations.

© Copyright protected

B. Coordination: Coordinate lift work with work of other trades for proper time and sequence to avoid construction delays. Use established benchmarks, lines, and levels to ensure dimensional coordination of the Work. Coordinate equipment installations with the building construction to prevent alteration to structure and cutting of holes and chases after equipment installation has started. Ensure provision of pit screen separators between adjacent lifts and for screening off counterweight to a height of 2 m from bottom of pit for safety of maintenance personnel.

C. Assembly: equipment is, as far as possible, to be factory assembled, wired and tested. Site work shall be limited to installation and assembly of parts dismantled at factory for transportation, or otherwise to work not possible at factory.

D. Workmanship: Carry out work in a neat, workmanlike and efficient manner in accordance with specified requirements. Installation shall be performed by skilled personnel, specialized in lift installation, who are in the permanent employment of the manufacturer or manufacturer's authorized dealer.

E. Accessibility: Install equipment so that it is readily accessible for operation, maintenance and repair.

F. Builder's Work: Carry out all builder's work necessarily required in connection with installation of lifts, including but not limited to, forming or cutting chases, rebates, etc., grouting, supports, steelwork, scaffolding, etc. Provide convenience power, lighting and other services required, from assigned terminal points, to carry out construction work.

G. Secure machine beams to structural steel and set machines in position for proper alignment with car and counterweight.

H. Lift Shafts: Ensure that entrance shaft wall is in same vertical plane as face of landing doors and that whole face is perfectly smooth.

I. Fixing Lift Guide Rails: Keep rails in proper alignment using steel splice plates of adequate strength. Verticality of rail shall be within 0.2% tolerance. Space fixing brackets to minimize rail vibration during operation, and at not more than 2.5 m centres.

J. Painting: Protect unfinished metalwork by painting, unless technically undesirable. Painting shall include thorough cleaning of metal, application of rust inhibiting prime coat and two finishing coats of approved enamel.

K. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts designed to effectively prevent transmission of vibrations to structure and thereby, eliminate sources of structure-borne noise from lift system.

L. Lubricate operating parts of systems, including ropes, as recommended by manufacturers.

M. Alignment: Coordinate installation of hoistway entrances with installation of lift guide rails for accurate alignment of entrances with cars. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.

N. Set sills flush with finished floor surface at landings. Coordinate with other trades to facilitate and ensure proper grouting of sills.

330.030 FIELD QUALITY CONTROL

A. Acceptance Testing: Upon nominal completion of lift installation and before permitting use (either temporary or permanent) of lifts, perform acceptance tests as required and recommended by the "Code" and governing regulations and agencies.

B. Advise Employer, Engineer, and authorities having jurisdiction in advance of dates and times tests shall be performed on lifts.

1. Field Quality Tests:

a) After installation is complete and before hand-over, carry out acceptance tests as required and recommended by the standards (refer to EN 81-20/50 and inspection check list which shall be submitted by the lift supplier subject to be reviewed and approved by the engineer) and governing regulations and authorities. Carry out any other tests the Engineer may

© Copyright protected

require to check safety and compliance of installation with the Specification. Tests are to be witnessed by the Engineer, and, if required, by the concerned Authority.

b) Equipment Failure: Repair and make good any damage to equipment caused by tests or damage to building caused by failure of any part of the installation, to the satisfaction of the Engineer.

2. Final Acceptance Test: Final acceptance of installation shall be carried out, as required and recommended by the "Code" and governing regulations (local and international) and agencies, only after all field quality tests are complete and all submittals and required certificates approved by the Engineer. Above Field quality tests are to be repeated, in front of same attendees. Compliance of workmanship and equipment with specification is to be checked.

330.040 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel on procedures and schedules for maintaining, operating, adjusting, troubleshooting, and servicing lifts. Refer to Division A sections related to Demonstration and Training.

1. Make a final check of each lift operation, with Employer's maintenance personnel present, just prior to Substantial Completion. Determine that operation systems and devices are functioning properly.

330.050 PROTECTION

A. Temporary Use: Do not use lifts for construction purposes unless otherwise approved in writing by Engineer, and cars are provided with temporary enclosures, either within finished cars or in place of finished cars, to protect finishes from damage.

B. Provide full maintenance service by skilled, competent employees of the lift Installer for lifts used for construction purposes. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper lift operation at rated speed and capacity. Use parts and supplies as used in the manufacture and installation of original equipment.

C. Provide protective coverings, barriers, devices, signs, or other procedures to protect lifts. If, despite such protection, lifts become damaged, engage lift Installer to restore damaged work so that no evidence remains of correction work. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

D. Provide final protection and maintain conditions, in a manner acceptable to lift manufacturer and Installer, that ensure lifts are without damage or deterioration at the time of Substantial Completion.

330.060 LIFT SCHEDULE

A. The Contractor shall coordinate the final space requirements (shaft dimensions, pit depth, overhead height, etc.) with the architectural layout and details. Ensure full compatibility. Any contradiction shall be raised to the Engineer.

B. All finishes shall be subject to Engineer/ID approval.

C. Passenger and service elevator Lift schedules shall be provided as per the below format

D. Lift No.:

1. Type of Service: Passenger/service.
2. Number of Passengers:
3. Load: …..kg.
4. Speed: …..m/sec.
5. Machine Room-Less.
6. Total Travel: As per AR Layout.
7. Floors Served: As per AR Layout.
8. Entrance Door Type:

a) Car: Automatic Sliding.
b) Landing: Automatic Sliding.

© Copyright protected

c) Single Entrance.

9. Main Parking Floor: Ground Floor.
10. Car Dimensions:

    a) Width: …… m.
    b) Depth: ……..m.
    c) Height:…… m.

11. Door Dimensions:

    a) Width: ……m.
    b) Height: ….. m.

12. Hoistway Dimensions (for two elevator in each bank):

    a) Width: …….m.
    b) Depth: ……m.
    c) Construction : ……..

13. Pit Depth : …… m.
14. Overhead: ……..m.
15. Additional Features: CCTV.
16. Finishes:

    a) Car:

        1) Walls: ……..(subject to Engineer's approval).
        2) Doors: …….(subject to Engineer's approval).
        3) Ceiling: ……(subject to Engineer's approval).
        4) Flooring: ……..
        5) Lighting: LED.
        6) Handrail (from 2 sides): ……..(subject to Engineer's approval).
        7) Mirror: ……..

    b) Control and Position Indicator Plates: Hairline stainless steel grade 304.
    c) Landing Doors: Hairline stainless steel grade 304.
    d) Landing Sills: Hairline stainless steel grade 304.

X11 - ESCALATORS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes heavy duty escalators.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Regulatory Requirements: In addition to local governing regulations, comply with the applicable provisions of the following Standards, referred to as the "Code":

1. BS EN 115-1, "Safety of Escalators and moving walks. Construction and installation".
2. BS 5656, "Safety rules for the construction and installation of escalators and passenger conveyors and moving walks".
3. All normative references listed in EN 115-1.
4. Power supply and electrical installations shall conform to the local power authority practices.
5. All electric power installations shall comply with relevant IEC Standards and BS 7671 "IET Wiring Regulations".
6. Nominal characteristics of all equipment forming part of the electrical works shall be specified to conform to the relevant International Electro-technical Commission (IEC) Standards and the International Standards Organization (ISO).
7. Electromagnetic compatibility (EMC): EN 12015 (emission) and EN 12016 (immunity).
8. <**Insert other local codes>**.

110.020 DEFINITIONS AND ABBREVIATIONS

A. Escalators shall be Heavy Duty Escalators: Escalators designed to be used in heavy traffic flow and heavy passenger loadings

B. Defective Escalator Work: Operation or control system failure, including excessive malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; the need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.

C. Escalator Width: The width of the step treads.

120.000 SYSTEM DESCRIPTION

120.010 PERFORMANCE REQUIREMENTS

A. Rated Speed: 0.5 m/s.

B. Inclination Angle: 30°.

C. Components Life Time: Escalator components shall be designed to give a minimum life time of 140,000 hours for heavy duty escalators, based on the load profile specified by code without replacement of major parts and capable of operating continuously in either direction.

D. Operation Time: Escalator shall be designed for a minimum operation time of 20h/day (for Heavy Duty Escalator under load profile described in the code.

E. Braking Performance: Engineer, fabricate, and install escalators to stop the escalator in the up-running mode at a rate no greater than that allowed by the "Code" for the down-running mode.

F. Step width: 1000mm.

© Copyright protected

120.020 COMPONENTS AND ACCESSORIES

A. General: Provide high-traffic escalators complying with requirements. Unless otherwise indicated, provide heavy-duty components as indicated in manufacturers' publications and as required for a complete escalator.

1. Provide escalators with three flat steps at top and bottom landings. Fabricate exposed metalwork, including deck covers, balustrade panels, and trim to provide surface flatness equivalent to stretcher-leveled standard of flatness and sufficient strength for indicated use; increase metal thickness or reinforce with concealed stiffeners, backing materials, or both, as necessary. Support joints with concealed stiffeners as needed to hold exposed faces of adjoining sheets in flush alignment.

B. Supporting Truss: Welded steel lattice-girder construction, designed to support inherent weights of escalators, transport load of 5000 N/m2 and dynamic loads (load surface = useable width of escalator x distance between support points). Sag or downward bending of supporting structure, when under load, shall not exceed 1/1000 for heavy duty and extra heavy duty escalators of free distance between supports. Insulation pads shall be provided at both ends of main truss to prevent noise and vibration transmission to building structure. The truss shall be designed in such a way to accommodate the load without the need of intermediate supports unless otherwise specified or shown on the drawings.

C. Machine Soffit: Smooth steel plate, 4 mm thick, welded and made oil-tight to side members of main truss, installed beneath step band over whole area of escalator, and having oil drain pit in bottom reversing station.

D. Floor Coverings: Stationary parts of escalator shall be heavy duty aluminum profiles. Groove beds of floor surfaces shall be black anodized, and upper surfaces shall be smoothed to the base metal frames, and set flush with finished floor. Floor coverings in area of machine installations shall be squarely seated and tighty fitted to prevent noise development.

E. Steps: Die-cast, corrosion proof, aluminum alloy with front edges grooved vertically so that edges of tread surfaces enmesh in grooves. Tread and front-edge surfaces of steps shall not end in a groove under balustrade skirting. Front edge between tread and front face shall be rounded or bevelled. Four support rollers to each step shall be at least 75 mm outside diameter and shall run on ball bearings completely encapsulated against dust and water (RS sealing), with lifetime lubrication, without lube nipples. Step chain rollers shall be fitted inside chain link plates, and shall be at least 75 mm diameter. Running treads (tires) of rollers shall be non-ageing, hardwearing, noise-dampening and oil and acid-resistant synthetic rubber (e.g. NBR nitrile rubber). Treads shall be at least 15 mm thick and 20 mm wide. Rapid removal of steps shall be possible at both upper and lower ends of escalator without removing balustrade panels or skirting plates. Assembled steps and any attachments to steps are not allowed.

F. Step Color and Demarcation: Steps color shall be [natural] [silver] [black] with [no demarcation] [yellow plastic demarcation] [yellow paint demarcation].

G. Comb Plates and Combs: Comb segments shall be [die-cast aluminum alloy] [stainless steel], maximum 200 mm wide, easily exchanged, and with safety contacts on comb teeth. Combs shall be beveled (minimum 13 to 17 degrees of the angle) so that there is no danger of persons tripping when leaving escalator. Tread surface of comb plates shall be finished as floor coverings.

H. Handrails: Endless, high-quality vulcanized rubber composition with fabric insert/invisible connection and bubble free, sliding layer of nylon webbing and steel cord. Required frictional contact to handrail drive wheel shall be ensured by drive mechanism. Handrail guides shall be stainless steel with minimum breaking strength of 25 kN. Handrail color [Black] [as selected by the Engineer]. Handrails shall be marked with safety messages. Exact marking shall be as per the Employer’s requirements during execution.

I. Lighting: Provide four comb **[LED]** lights at each end, green [**LED**] tubes shall be provided under the steps at the two entrances of the escalators. [Other lighting arrangements can be provided if required by the Engineer e.g. continuous skirt lighting by LED lights, Handrail lighting & soffit spot lights. Provide direction indicator lights in balustrade newels at both upper and lower landings. Green light indicates entrance end, and red lights indicates exit end. When escalator is stopped, red lights are illuminated at both ends. Lighting details are subjected to Engineer’s approval.

© Copyright protected

J. For lighting fixtures specifications, refer to Division V section "Interior Lighting".

K. Oil Drip Pan: Provide metal pan under full width and length of escalator to collect and hold oil and grease drippings from lubricated components. Design and fabricate drip pan to sustain a load of minimum 1.1 kN on a 0.9-sq. m area at any location without permanent deflection.

L. Bolted Connections: Secure bolts by self- locking nuts or locking rings. Only high-tensile bolts shall be used.

M. Corrosion Protection: Unless otherwise specified, main supporting truss shall be corrosion protected according to manufacturer standards subject to Engineer's approval. All traces of rust shall be thoroughly removed from steel components before painting.

N. Balustrades: Inner balustrades, skirtings, outer balustrades, central balustrades and floor coverings shall be as shown on Drawings, and to the following specification:

1. Balustrades shall be designed to be [slim line type and made of toughened safety glass with thickness of 10 mm . Handrail guides shall be practically invisible and sit centrally on the glass panel. The balustrade shall be all glass with [vertically/parallel subject to Engineer's choice] arranged panels, without supports. Glass panel joints shall be in line with the inner and outer decking joints. The trims between glass panels and inner and outer deckings shall be made of aluminum profiles black colour] [made of laminated panels, visible side hairline or etched stainless steel (finish according to Engineer's choice)]
2. Inner and outer deckings shall be made of at least 2mm thick stainless steel (finish according to Engineer's choice). Deckings shall be done in the curved version, mitered version is not allowed.
3. Skirtings are made of minimum 2 mm thick [stainless steel plate][steel plate coated with a black antifriction Teflon compound]. Skirtings shall be provided with brush deflectors, made of aluminum anodised black holders.
4. Visible sides and underside of each escalator shall be cladded with [**etched**] [**hairline**] stainless steel panels of 1.5 mm thickness. Joints of these cladding-panels shall be in line with joints of balustrade panels. Finish shall be according to the Engineer's choice.
5. Height of the balustrade shall be minimum1100 mm] over the entire length of the escalator.
6. Above characteristics are indicative. Contractor to coordinate with Engineer prior to starting any equipment manufacturing.
7. Adjacent Escalators: Provide stainless steel in-fill panels. A protection shall be provided to stop children entry to the fill panel. The protection shall match the surroundings.
8. Balustrade panels shall be attached to permit easy removal for inspection, lubrication, and adjustment of safety devices.
9. Balustrade panels shall be sized so that not more than two (2) persons shall be required to remove a panel and without the aid of special handling equipment.

O. Stainless Steel: Type 304 shall be used

P. Track Radius: upper landing [1m for commercial escalators] [1.5m or 2.6m for heavy duty escalators] [2.6m or 3.6m for extra heavy duty escalators]. Lower landing [1.0m for commercial] [1.0m or 2m for heavy duty escalators] [2.0m for extra heavy duty escalators].

Q. Outdoor Escalators and semi outdoor shall have the following extra characteristics as a minimum:

1. Stainless steel handrail guides,
2. Step chain covers to minimize dirt and water ingress,
3. Weatherproof electrical system,
4. Water drain in lower truss section,

R. Fabricate oil drip pan from galvanized-steel sheet. Provide drain and oil/water separator in oil drip pan. Coordinate with builder's work to provide the pit drain.

S. Outdoor Escalators steel truss shall be hot dipped galvanized after fabrication. [semi outdoor escalators installed in severe environments and as required by engineer shall have hot dipped galvanized truss after fabrication].

© Copyright protected

T. Sound Level: Escalators shall be designed to operate at or below a sixty five (65) decibels sound level, measured at 1 m from the surface of the machinery and at a height of 1.6 m from the floor plate, with the escalator operating normally, either free running or under load. For multiple escalator installations, the noise measurements shall be made with only one (1) escalator unit in operation, but with the entire installation complete and in operating condition. An ambient level not to exceed forty-nine (49) decibels shall be maintained prior to units being turned on.

U. Escalators shall be provided with protection covers to secure and provide the necessary protection for escalators' moving handrail, belt and balustrade to ensure children at most safety and to reduce climbing, hanging and clothes-gripping incidents that exposure to risks.

V. Protection covers shall be provided at start and end points of the escalators so hangings and clothes-gripping incidents will be avoided. And also protection covers shall be added to the balustrade so climbing will not be possible.

W. Protection cover shall be made of [Final selected protection cover shall be approved by the Engineer/Architect.

X. If the escalator is required to operate in both directions and has facility for removable barriers in unrestricted area the absence/presence of these barriers shall be detected to prevent wrong positioning of the barrier resulting in operation towards the barrier.

Y. Device shall be provided to detect the removal of the barrier when the escalator is running, and the absence/presence of a removable barrier intended to prevent access of shopping trolleys and carts and shall permit starting away from the inserted barrier.

120.030 DRIVE UNIT

A. Generally: Complete drive unit including the handrail driving system shall be according manufacturers standard located within the upper truss envelop. All drive components shall be easily accessible. Provide an automatic lubrication system for drive chains, and include drive chain monitoring contacts. Each escalator shall be equipped with an auxiliary brake. An oil level switch shall be provided to monitor the gearbox oil level. The overall mechanical efficiency of the complete drive including motor shall not be less than 90%. Details of the complete drive system shall be submitted with the tender.

B. Input stage of drive shall be a worm-gear for noise suppression. Worm shaft shall be case hardened and ground, and gear rim of worm wheel shall be hard-wearing special bronze.

C. Manual emergency drive shall be provided at upper station, accessible without removal of steps or any part of drive systems.

D. Drive unit shall be variable voltage variable frequency (VVVF, Regenerative) type for nominal speed, standby speed, service speed, soft start and soft stop. Drive and motor shall be suitable for continuous operation.

E. Bearings used in machine transmissions shall be top quality roller/ball bearings with minimal noise development. Plain friction or sleeve bearings shall not be used.

F. Handrail drive shall be automatically tensioned and shall ensure synchronization with step band speed. Asynchronous running of handrails shall not exceed 2% of step band speed.

G. Electric Motor: Totally enclosed, fan cooled, protection IP 54, fitted with low noise life-time lubricated roller/ball bearings, especially designed for escalators according to the manufacturer standard. Motor shall be provided in Class F insulation with temperature rise not exceeding Class B limits. Duty factor shall be S1 or S5, as recommended by manufacturer and approved by the Engineer.

H. Intended reversal of the direction of travel shall be possible, in accordance with EN 115-1 requirements.

I. Brakes Generally: drive machine shall be equipped with an electro-mechanical service brake operating on the high speed shaft of the motor. Brake shall be held off electrically and spring applied to ensure "fail-safe" operation. Action of the break shall be smooth. Electrical monitoring for wear

© Copyright protected

of brake lining and brake lifting shall be included in the design of both the service break and auxiliary break. The brake linings shall be asbestos-free. Details shall be submitted with the tender.

J. Service Brake: Constant torque, self-adjusting, and servo-operated in case of heavy, to exert necessary braking torque for direction of travel, with braking force created by pressure spring. Upon tripping of any safety device, brake shall engage immediately and bring escalator to a smooth stop. An equivalent electronic system is allowed. Details shall be submitted with tender.

K. Safety brake shall be provided for all escalators, in addition to service brake, on main drive shaft assembly, and shall engage after an adjustable time-lag setting. Safety brake shall be actuated by brake release solenoid, manually resettable only, and shall engage in the event of power failure, by stop push button, or operation of any safety device.

L. Step Guides: Guides for step chains and step rollers shall be hot-dip galvanized steel sections with smooth and even surfaces. Joints shall be formed diagonally in direction of travel. Guides shall be designed so that front edges of emerging steps, and rear edges of disappearing steps, follow a horizontal path at least equal to depth of the number of flat steps specified at landings. Guides shall ensure that gap between step and balustrade skirting does not exceed 4 mm at either side or 7 mm at both sides cumulatively.

M. Step Chains: High precision rolled, flat link, hardened chains, provided in pairs of equal length. Pins, sleeves and rollers shall be case-hardened and ground. Spur racks or gear chains shall not be used. Step chains and chain pins shall be 16 mm minimum diameter. Material for chain pins shall be 23 Cr Mo B33E (E stands for case hardened) Material for chain plus shall be 16 Mn Cr 5E. Chain pitch shall not exceed 135 mm.

N. Chain Tensioner: Constant and even pressure shall be maintained by adjustable compression springs. Chain tensioning wheels shall be seated in precision slides (ball and prism guides). Even tensioning of step band chains shall be ensured.

O. Expansion joints: to balance the movement between escalators and building structure special sliding and fixed supports shall be provided.

P. For Remote Monitoring system, interface with BMS,. Refer to Lift specification section "Electric Traction Lifts".

120.040 CONTROL PANEL

A. Generally: Electrical installation comprises connection of all wiring systems from control cabinet to various control devices.

B. Control Cabinet: Each escalator shall have individual instrument and control gear cabinet, protection IP 21 for Indoor Escalators, shed mounted and located within upper escalator station (drive station), and comprising main circuit breaker, motor control gear, protective devices, relays, cut-off and tripping displays, etc. To ensure that there is no interference with other electrical systems (EMC) within the building, the design has to be according to international recommended standards.

C. Control equipment shall include, in addition to the above, a fault finding digital panel with warning lights, located behind lockable cover in upper balustrade newel. Each safety contact shall be connected to one warning light. Cancelling is only to be possible using a separate switch in the balustrade. Key operated switch (up/down) for starting escalator shall be provided in handrail newel.

D. The controller shall be of the micro-processor-type. The controller includes a diagnostic system with an alphanumeric display (LED). This display shall monitor and indicate the general operational status of the escalator, statistical information and status of all safety devices. The system shall be designed in such a way that all this information can be transmitted via a serial interface to the “conveying systems central monitoring system”.

E. Control Voltage: V single phase AC, 48VDC or less.

F. Running time meter shall be provided.

© Copyright protected

G. Main Circuit Breaker: Thermal magnetic type, with inverse time-overcurrent, instantaneous and adjustable earth fault protection. Circuit breaker shall be lockable, and with shunt trip coil for safety trips.

H. Terminal Identification: All terminals shall be marked. All cables shall have coding colours and numbered ferrules.

I. Wiring shall be arranged neatly and clearly in conduits and terminated on shrouded terminal blocks.

J. Electrical cables in main truss shall be moisture and heat resistant and flame retardant with PVC/E insulation and sheathing, and shall have 1000 V rating.

K. Maintenance power circuit at 400 V, **50**Hz, shall be provided for power and lighting sockets. Dual sockets for power and lighting shall be provided at drive and tensioning stations.

L. Control circuit breaker shall be provided at tensioning station.

M. Maintenance sockets for plugging in maintenance push button control device for testing operation of escalator shall be provided at upper and lower stations, with maintenance control extension device and sufficient cable length.

120.050 SAFETY DEVICES

A. Operation: Safety devices shall automatically interrupt power supply to drive motor and brake, thereby inducing braking of escalator.

B. Devices to be provided are as follows:

1. Emergency stop-buttons, at upper and lower newels, located in a suitable place to prevent the inadvertent actuation. Additional emergency stop buttons and locations shall be provided in accordance with EN 115-1 requirements.
2. Step run-in monitors in area of comb plates and at point of entry of steps into combs, which shall induce safety braking of step chain when a foreign body enters between comb and step.
3. Missing step monitors actuated in case step chain without step is installed.
4. Step sag monitors which shall stop escalator when a step sinks by more than [**3**] [**6**] <**Other>** mm due to incorrectly formed or damaged steps or rollers; step shall stop before reaching comb run-in point.
5. Motor overload earth-fault and phase-unbalance protection and excessive temperature protection by thermistors in motor coils.
6. Handrail safety device to stop escalator immediately should foreign bodies become wedged between handrail and inlet points in balustrade newels.
7. Step chain monitors to stop escalator in the event of any chain breaking or becoming excessively elongated.
8. Excessive speed and unintended reversal relay.
9. Service brake-monitoring contact against failure or phase change.
10. Handrail Speed Device: Sounds an alarm if handrail speed varies from step speed by more than 15% and stops escalators if this condition lasts more than 2 seconds.
11. Skirt Obstruction Device: Stops escalator if an object gets caught between skirt panels and steps as the step approaches the comb plate.
12. Handrail Entry Device: Stops escalator if an object gets caught between the handrail and the handrail guard or, alternatively, if an object approaches the area between the handrail and the guard.
13. Broken main drive chain device located on the main drive chain actuated in case of main drive chain breaking or abnormal tension of main drive chain.
14. Floor plate switches located under floor plate of both landings, actuated when floor plate is removed, and escalator cannot move.
15. Machine cover switch located on the machine actuated when motor cover is removed, and escalator cannot be operated.
16. Fire Alarm contact to stop the escalator in case of external signal.
17. Provision for installation of fire alarm detectors in escalator pits.
18. Brushes at handrail entries.

© Copyright protected

19. A fault-finding device shall be provided in the newels, capable of producing indications of the following data:

    a) Date, time, and cause of escalator stoppages.
    b) The fault indication shall remain visible until reset by an authorized person.

20. Pictograph notices and signs which shall be provided by the escalator supplier as per code requirements and shall be installed by the main contractor.
21. Traffic lights at top and bottom to indicate running direction. Type LED, Bicolor; location in inner decking.
22. Comb lights.
23. Speed sensors at both newels.
24. Direction change key switches.

120.060 SOURCE QUALITY CONTROL

A. Factory acceptance tests shall be performed for equipment under this Contract and shall be witnessed by the Engineer.

B. Factory acceptance tests shall include complete checking and testing for 10% of the Project's escalators, minimum one unit of each type, according to requirements of the specified regulations and standards, as well as special requirements, finishes, software and controls. Selection of escalators for witness test shall be randomly carried out by the Engineer.

C. Test procedure and program shall be submitted for approval prior to test conduction, by at least 14 days. Factory witness test shall include, at Contractor's expenses, all test expenses, business class air tickets, five stars Hotel full accommodation, and transportation, for two persons from the Engineer's or Employer's side.

D. Comply with related quality requirements as specified in Division A.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Requirements include the following:

1. Division E Section "In Situ Concrete Construction Generally" for setting sleeves, inserts, and anchoring devices in concrete.
2. Division G Section "Structural Steel Framing" for attachment plates, angle brackets, and other preparation of structural steel for supporting escalators.
3. Division Q Section "Site Street Furniture Equipment" for metal bollards.
4. Division L Section "Stairs ladders walkways handrails balustrades" for balustrade glazing where applicable.
5. Division L Section "Doors Shutters Hatches" for wall and ceiling access panels and access doors in escalator enclosures.
6. Division W Section " Digital, Addressable Fire Alarm System " for smoke detectors that activate escalator alarm and, after at least 15 seconds, cause the interruption of power to the escalator motor and brake and for connection to escalator controllers.
7. Division W Section "Central Control / Building Management".
8. Division V Section "Basic Electrical Materials and Methods".
9. Division V and Y Sections for electrical service to escalators, including fused disconnect switches.
10. Division X Section "Electric Traction Lifts" for remote monitoring and command system.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 STANDARD COMMERCIAL PRODUCTS

A. Refer to Division A Section "Product Requirements".

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Products, materials and equipment shall demonstrate compliance with requirements specified in Division A Section "Product Requirements".

B. Installer Qualifications: Engage the escalator manufacturer or an experienced Installer approved by the escalator manufacturer who has completed escalator installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

C. Source Limitations: Obtain escalators, through one source from a single manufacturer.

D. Conformity to Standards: Contractor shall be responsible for the provision of a complete installation in total conformity with the Standards. It is the Contractor’s responsibility to provide all Standards requirements even if not accounted for in this Specification. It is the Contractor's responsibility to coordinate with the Engineer on the issues related to the safety of the installations.

E. In the event of a conflict between any of the above applicable or reference Standards, the more stringent requirements shall take precedence.

F. In case Contractor proposes part of equipment in accordance with other Standards, then detailed comparison documents including one original copy (in English – translation to English should be the approved one by the Standard originating Committee) of the latest edition of the referred to Standard (and related annexes) shall be submitted for Engineer's approval. These documents shall detail discrepancies and advantages of offer. Submittals shall be preceded by a written approval of the Engineer on such. However, the Employer and the Engineer reserves the right to accept or reject such proposals.

310.020 DELIVERY, STORAGE AND HANDLING

A. Packing and Shipping: Deliver materials, components and equipment in original protective shipping containers with labels intact and legible.

B. Delivery on Site: Do not deliver materials, components and equipment on site until adequate protected storage facilities are available or for direct installation.

C. Storage and Protection: Store materials, components and equipment above ground, under cover and in a well-ventilated protected area. Comply with manufacturer's recommendations concerning temperature and relative humidity limitations during storage.

D. Install certified “shock-guards’ on the equipment before shipping from the factory and shall be retained in place till unpacked at site and inspected by Engineer, to ascertain whether the “shock-guard” has been activated by any shock/impact during shipment.

310.030 COORDINATION

A. Coordinate installation of sleeves, block outs, escalator equipment with integral anchors, and other items that are embedded in concrete or masonry for escalator equipment. Furnish templates, sleeves, escalator equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.

B. Coordinate sequence of escalator installation with other work to avoid delaying the Work.

C. Coordinate locations and dimensions of other work relating to escalators including sumps and floor drains in pits, electrical service, and electrical outlets, lights, and switches in pits.

© Copyright protected

310.040 EXTRA MATERIALS

A. Generally: Supply loose equipment, and accessories as required for normal operation and routine maintenance of the escalator(s) and as detailed by the Contractor in his offer for spare parts and accessories, for two years continuous operation. Tools required for the diagnosis and configuration of the equipment shall be provided.

B. Spare parts shall include, but not limited to the following, with minimum one piece of each part:

ESCALATOR SPARE PARTS	(%) Qty. of Total Escalator Number
Escalator step assembly	2
Step roller	10
Step spacer	10
Step chain and accessories	2
Step chain roller	10
Drive chain	2
Drive chain extension accessories	2
Roller for handrail support	10
Comb and accessories	2
Interface relay	2
Lifting solenoid	2
Retaining spring	2
Motor protection switch	2
Stop / start switch	2
Proximity sensor	5
Speed monitor impulse counter	1
Limit switches	2
Emergency stop button & buzzer	2
Brake shoe	5
Brake magnet	2
Sliding rail	1
Rubber pads links	2
Handrail entry	2
Tension chain sensor	1

© Copyright protected

C. Tools and Accessories: Supply tools and equipment required for routine checking, maintenance, testing and control of installations, with appropriate portable measuring and test instruments.

D. Identification: Parts shall be packed in sealed plastic bags with identifying labels and factory part list numbers.

310.050 WARRANTY

A. Provide complete system warranty in which Manufacturer, Installer, and Contractor are jointly and severally liable and agree to repair or replace all defective components of the warranted item. Warranty shall include both, materials and workmanship, warranty shall include:

1. Defective materials and installation.
2. Failure to comply with requirements stated in technical specifications.
3. Structural failures including, but not limited to, excessive deflection.
4. Faulty operation of movable parts such as hardware.
5. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.
6. Delamination of exterior or interior facing materials.
7. Making good and installation and finishing all items that are disturbed and that may be required due to repair or replacement of defective items. Coordinate with Employer, manufacturer, and installer of adjacent disturbed items to ensure that their warranty is not cancelled due to the repair work

B. Warranty Period: 3 year from the date of Substantial Completion.

320.000 SUBMITTALS

A. Product Data (For each escalator): Include capacities, sizes, performances, safety features, finishes, and similar information.

B. Sample Warranty: Copy of manufacturer's proposed warranty, stating obligations, remedies, limitations, and exclusions.

C. Country of origin of the Escalator assembly shall be indicated in addition to the country of origin of main components including drive, motor, controller, steps, etc.. Complete documentation for factory manufacturing the equipment shall be submitted including but not limited to local and international experience, quality certificates, quality assurance plan, and organization.

D. Sustainable Design Submittals: All related Sustainable Product Data as detailed in Division A Sustainability sections, as applicable.

E. Shop Drawings (For each escalator): Show plans, elevations, sections, and large-scale details indicating coordination with building structure and relationships with other construction. Indicate variations from specified requirements, maximum dynamic and static loads imposed on building structure at points of support, and power requirements. Indicate access and ventilation for escalator machine space and well ways.

F. Construction work shall not proceed until final approval of material / equipment and shop drawings obtained.

G. Samples for Initial Selection: For exposed materials e.g. color selection, handrail rubber, inlet indicators, etc..

H. Test Certificates/Calculations: To be submitted for the following:

1. The maximum deflection of supporting structure under full passenger load.
2. Breaking strength of handrail.
3. Breaking strength of step chain.
4. Step load test.
5. Step / Landings alignment test.
6. Stamped calibrated step.

In addition to any other test required by the Engineer.

© Copyright protected

I. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Engineers and Employers, and other information specified or required by Engineer.

J. Maintenance Manuals: For each different escalator, including operation and maintenance instructions, parts listing with sources indicated, recommended parts inventory listing, emergency instructions, and similar information. Include all diagnostic and repair information available to manufacturer's and Installer's maintenance personnel. Submit for Employer's information at project closeout as specified in Division A.

K. Warranties: Warranties specified in this Section.

L. Certificates and Permits: Provide Employer with inspection and acceptance certificates and operating permits as required by governing authorities for normal, unrestricted use of escalators.

M. As-built Drawings: At project Closeout, submit record drawings of installed escalators, in accordance with requirements of the specifications, Division A.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine escalator areas, with Installer present, for compliance with requirements, installation tolerances, and other conditions affecting performance of escalator work. Examine supporting structure, machine spaces, and pits; verify critical dimensions; and examine conditions under which escalator work shall be installed. Do not proceed with installation until unsatisfactory conditions have been corrected.

1. For the record, prepare a written report, endorsed by the Installer, listing dimensional discrepancies and conditions detrimental to the performance of escalator work.

330.020 INSTALLATION

A. Comply with manufacturer's instructions and recommendations for work during installation.

B. Set escalators true to line and level, properly supported, and anchored to building structure. Use established benchmarks, lines, and levels to ensure dimensional coordination of the Work.

C. Adjust installed components for smooth, efficient operation, complying with required tolerances and free of hazardous conditions. Lubricate operating parts, including bearings, tracks, chains, guides, and hardware. Test operating devices, equipment, signals, controls, and safety devices. Install oil drip pan and check to ensure that no oil drips outside of pan.

D. Repair damaged finishes so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

E. Assembly: Equipment is, as far as possible, to be factory assembled, wired and tested. Site work shall be limited to installation and assembly of parts dismantled at factory for transportation, or otherwise to work not possible at factory.

F. Workmanship: Carry out work in a neat, workmanlike and efficient manner in accordance with the specified requirements. Installation shall be performed by skilled personnel, specialized in escalator installation, who are in the permanent employment of the manufacturer or manufacturer's authorized dealer.

G. Accessibility: Install equipment so that it is readily accessible for operation, maintenance and repair.

H. Builder's Work: Carry out all builder's work necessarily required in connection with installation of escalators, including but not limited to forming or cutting chases, rebates, etc., grouting, supports, steelwork, scaffolding, etc. Provide convenience power, lighting and other services required from assigned terminal points, to carry out construction work.

© Copyright protected

I. Coordination: Coordinate equipment installations with the building construction to prevent alteration to structure and cutting of holes and chases after equipment installation has started.

J. Fire Protection: Coordinate installations with mechanical works, for provision of fire/smoke detection and fire fighting systems.

K. Painting: Protect unfinished metalwork by painting, unless technically undesirable. Painting shall include thorough cleaning of metal, application of rust inhibiting prime coat and two finishing coats of approved enamel.

330.030 FIELD QUALITY CONTROL

A. Tests: After installation is complete and prior to Substantial Completion, carry out all tests required by the Governing Regulations and Standards (refer to EN 115-1 requirements). Carry out any other tests the Engineer may require to check safety and compliance of installation with specified requirements. Tests shall be witnessed by the Engineer and, if required, by the authorities having jurisdiction.

B. Equipment Failure: Repair and make good any damage to equipment caused by tests, or damage to building caused by failure of any part of the installation, to the satisfaction of the Engineer.

C. Organization of Tests: Provide all labour, materials and instruments required for tests.

D. Before test run, ensure that step bands, skirtings and comb segments are in order, no foreign bodies are in or on escalator, all steps are fitted, main circuit breaker is in closed position, control switch is in on position, safety devices and protective switches are in operation, series of safety contacts are closed and manual control device is connected to inspection run power socket.

E. Test run shall include checking starting from installed service panel, reversing direction of running from manual control device and checking that actual running direction corresponds with direction setting, allowing running in each direction for several cycles. Any adjustments shall be made with inspection control device connected.

F. Testing operation of Safeties: In accordance with manufacturer's service and maintenance instructions, check all alarms and indicators and lubricating oil system against manufacturer's data.

G. After testing, check, and if necessary, re-adjust spring tensions on return shaft, handrail pretension, drive rollers, step inlet and outlet, sag, skirtings, gaps etc., brake stopping distance, and gear oil level.

H. Measurements: Measure motor current in both directions of escalator, and insulation resistance to truss or earth of motor circuit, control circuits, brake circuit, lighting circuits, pump circuit and any other circuits. Insulation resistance shall not be less than 20 M-ohms using a minimum 1000 V d.c. megger.

I. Acceptance Testing: Upon nominal completion of each escalator installation, and before permitting the use of escalators (either temporary or permanent), perform acceptance tests as required and recommended by the "Code" and by governing regulations or agencies.

330.040 DEMONSTRATION AND TRAINING

A. Engage a factory-authorized service representative to train Employer's maintenance personnel on procedures and schedules for maintaining, operating, adjusting, troubleshooting, and servicing escalators. Refer to Division A Sections related to Demonstration and Training.

1. Make a final check of each escalator operation, with Employer's maintenance personnel present, just prior to Substantial Completion. Determine that control systems, operation components and devices are functioning properly.

330.050 PROTECTION

A. At completion of escalator work, provide suitable protective coverings, barriers, devices, signs, or such other methods or procedures to protect escalator work from damage or deterioration. Maintain protective measures throughout remainder of construction period.

© Copyright protected

330.060 ESCALATOR SCHEDULE

A. The Contractor shall coordinate the final space requirements (truss depth, pit depth, overall length, etc.) with the architectural layout and details. Ensure full compatibility. Any contradiction shall be raised to the Engineer.

B. Escalator No <INSERT Reference>:

1. Type **:** Indoor.
2. Conveying Height/Rise: …… m.
3. Inclination Angle: …….deg.
4. Step Width: ……m.
5. Number of Horizontal Steps: 3
6. Speed: …….m/sec.
7. Duty: heavy duty .
8. Track Radius (Lower Landing/Upper landing): …….
9. Intermediate Supports: [YES] [NO].
10. Overall Width: …… m.
11. Overall Length: …… m.
12. Upper Truss Depth: ……. m.
13. Pit Dimensions:

    a) Length: …… m.
    b) Width: …….. m.

X13 - MOVING WALKS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes moving walks.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Regulatory Requirements: In addition to local governing regulations, comply with the applicable provisions of the following Standards, referred to as the "Code":

1. BS EN 115-1, "Safety of Escalators and moving walks. Construction and installation".
2. BS 5656, “Safety rules for the construction and installation of escalators and passenger conveyors and moving walks”.
3. All normative references listed in EN 115-1.
4. Power supply and electrical installations shall conform to the local power authority practices.
5. All electric power installations shall comply with relevant IEC Standards and BS 7671 “IET Wiring Regulations”
6. Nominal characteristics of all equipment forming part of the electrical works shall be specified to conform to the relevant International Electro-technical Commission (IEC) Standards and the International Standards Organization (ISO).
7. Electromagnetic compatibility (EMC): EN 12015 (emission) and EN 12016 (immunity).

110.020 DEFINITIONS AND ABBREVIATIONS

A. The following terms used on Drawings and in the Specification are synonymous and may be used interchangeably:

1. "Moving Walk", "Travellators" and "Auto Walk".

B. Moving Walk Width: The width of the exposed tread, to the next whole 10 mm. Clearance between handrails shall not be less than 203 mm more than the moving walk width.

C. Defective Moving Walk Work: Operation or control system failures; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; the need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.

120.000 SYSTEM DESCRIPTION

120.010 PERFORMANCE REQUIREMENTS

A. General: Provide moving walks consisting of power-driven, continuous treadways that are capable of conveying passengers safely at rated speeds and capacities along either a horizontal surface or an inclined ramp as indicated and that include support trusses, balustrades, floor plates, components, machines, safety and control devices, internal electrical wiring of units, graphics, and other components necessary to produce complete moving walk installations.

B. Rated Speed: 0.5 m/s.

C. Inclination Angle: **0-6°**

© Copyright protected

D. Pallet width: 1000mmIn paragraph below, 100,000 hours can be accepted for commercial projects where heavy traffic is not required.

E. Components Life Time: Moving walk components shall be designed to give a minimum life time of [150,000 – 200,000 hours] based on the load profile specified by code without replacement of major parts and capable of operating continuously in either direction.

F. Operation Time: Moving walk shall be designed for a minimum operation time of [up to 22h/day] under load profile described in the code.

120.020 COMPONENTS AND ACCESSORIES

A. General: Provide heavy duty high-traffic moving walks complying with standards and requirements. Unless otherwise indicated, provide heavy-duty components as indicated in manufacturers' publications and as required for a complete moving walk.

1. Provide four flat pallet at both landings for inclined moving walk with inclination angle above 6°.

B. Supporting Truss: Welded steel construction, designed to support inherent weights of moving walks, transport load of 5000N/m2 and dynamic loads (load surface = useable width of moving walk x distance between support points). Sag or downward bending of supporting structure, when under load, shall not exceed 1/1000 of free distance between supports. Insulation pads shall be provided at both ends of main truss to prevent noise and vibration transmission to building structure.

C. Floor Coverings: Stationary parts of moving walk including ramps shall be heavy duty aluminum profiles. Groove beds of floor surfaces shall be black anodized, and upper surfaces shall be smoothed to the base metal frames, and set flush with finished floor. Floor coverings in area of machine installations shall be easily removable. Floor cover platings shall be squarely seated and tightly fitted to prevent noise development.

D. Pallets: Torsion-resistant design, one piece high tensile die-cast aluminum, at least 400 mm deep, with enmeshing front and rear edges. Transverse diagonal scoring with narrow grooves shall provide non-slip surface. Groove beds of pallet treads shall be black anodized, upper surfaces shall be smooth to base metal.

E. Comb Plates and Combs: Comb segments shall be [die-cast aluminum alloy] [stainless steel], maximum 200 mm wide, easily exchanged, and with safety contacts on comb teeth. Combs shall be beveled (minimum 13 to 17 degrees of the angle) so that there is no danger of persons tripping when leaving moving walk. Tread surface of comb plates shall be finished as floor coverings.

F. Handrails: Endless, high-quality vulcanized rubber composition with fabric insert/invisible connection and bubble free, sliding layer of nylon webbing and steel cord. Required frictional contact to handrail drive wheel shall be ensured by drive mechanism. Handrail guides shall be stainless steel with minimum breaking strength of 25 kN. Handrail color shall be [Black] [as selected by the Engineer]. Handrails shall be marked with safety messages. Exact marking shall be as per the Employer’s requirements during execution.

G. Handrails shall be disinfected in an efficient and environmentally friendly way, in order to avoid the rapid spread of bacteria and viruses that build up on them due to passenger use. Physical disinfection process is to be granted through providing UV LED lighting technology. UV device is to be installed invisibly inside the moving walks handrail system to ensure passenger safety.

H. Lubrication: Main drive chain, pallet band chains and handrail drive chain shall be connected to automatic lubricating system with electrical lube oil pump and dosing unit. Oil supply shall be sufficient for at least one month's operation. Float switch shall be provided to monitor oil level in reservoir and to give alarm to control cabinet in the event of low lubricant level. All bearing points of rotating components shall be fitted with roller/ball bearings, hermetically sealed against dirt and water. Where bearings require lubrication by grease guns, functional discharge openings shall be provided for used grease.

© Copyright protected

I. Oil Drip Pan: Provide metal pan under full width and length of moving walk to collect and hold oil and grease drippings from lubricated components. Design and fabricate drip pan to sustain a load of 1.1 kN on a 0.9-sq. m area at any location without permanent deflection.

J. Bolted Connections: Secure bolts by self- locking nuts or locking rings. Only high-tensile bolts shall be used.

K. Corrosion Protection: Unless otherwise specified, main supporting truss shall be corrosion protected according to manufacturer standards subject to Engineer's approval. All traces of rust shall be thoroughly removed from steel components before painting.

L. Balustrades: Inner balustrades, skirtings, outer balustrades, central balustrades and floor coverings shall be as shown on Drawings, and to the following specification:

1. Balustrades shall be designed to be (finish according to the Engineer's choice)]
2. Skirtings are made of minimum 2 mm thick [stainless steel plate] [steel plate coated with a black antifriction Teflon compound]. Skirtings shall be provided with brush deflectors, made of aluminum anodized black holders.
3. Balustrade height shall be 1000 mm throughout the length of the moving walk.
4. Above characteristics are indicative. Contractor to coordinate with Engineer prior to starting any equipment manufacturing.
5. Adjacent Moving walks: Provide stainless steel in-fill panels. A protection shall be provided to stop children entry to the fill panel. The protection shall match the surroundings.

M. Deck Covers and Trim: [Satin stainless steel] [Polished stainless steel] [Gold-colored, satin stainless steel] [Gold-colored, polished stainless steel] [Satin bronze] <other finish specified by Engineer>.

N. Floor Plates: [die-cast aluminum alloy] [stainless steel], grooved or patterned surface.

O. Lighting: Provide four comb [LED] lights at each end, green [LED] tubes shall be provided under the pallets at the two entrances. [Other lighting arrangements can be provided if required by the Engineer e.g. continuous skirt lighting by LED lights, Handrail lighting]. Provide direction indicator lights in balustrade newels at both entrance and exit ends. Green light indicates entrance end, and red lights indicates exit end. When moving walk is stopped, red lights are illuminated at both ends. Lighting details are subjected to Engineer's approval.

P. For lighting fixtures specifications, refer to Division V section "Interior Lighting".

Q. Stainless Steel: Type 304 shall be used

R. Outdoor Moving walks and semi outdoor shall have the following extra characteristics as a minimum:

1. Exposed components from stainless steel unless otherwise indicated.
2. waterproof electrical system,
3. Provide drains, weeps, and drips to prevent water accumulation on horizontal surfaces and to direct water away from electrical equipment and moving parts.

S. Fabricate oil drip pan from galvanized-steel sheet. Provide drain and oil/water separator in oil drip pan. Coordinate with builder's work to provide the pit drain.

T. Outdoor Moving walk steel truss shall be hot dipped galvanized after fabrication. [Semi outdoor moving walk installed in severe environments and as required by engineer shall have hot dipped galvanized truss after fabrication].

U. Moving walks shall be provided with protection covers to secure and provide the necessary protection for moving handrail and belt to reduce clothes-gripping incidents that exposure to risks

V. Protection covers shall be provided at start and end points of the moving walks so hangings and clothes-gripping incidents will be avoided.

W. Protection cover shall be made of [transparent acrylic] [material and finish similar to the balustrade] <Insert material and finish>. Final selected protection cover shall be approved by the Engineer/Architect.

© Copyright protected

120.030 DRIVE UNIT

A. Generally: Drive unit shall be self-contained, compact assembly, placed outside and in front of pallet band, and comprising motor (flange mounted to speed reducing gear box and resiliently coupled to drive input), service brakes and precision duplex chain mechanism to transmit motion to main drive shaft assembly comprising chain sprocket, wheels for main drive, pallet band drive wheels, handrail drive and safety brake. Details of this or alternative arrangements shall be submitted to the Engineer for approval.

B. Input stage of drive shall be a worm-gear for noise suppression. Worm shaft shall be case hardened and ground, and gear rim of worm wheel shall be hard-wearing special bronze.

C. Manual emergency drive shall be provided at drive station, accessible without removal of pallets or any part of drive systems.

D. Drive unit shall be variable voltage variable frequency (VVVF, Regenerative) type for nominal speed, standby speed, service speed, soft start and soft stop. Drive and motor shall be suitable for continuous operation.

E. Bearings used in machine transmissions shall be top quality roller/ball bearings with minimal noise development. Plain friction or sleeve bearings shall not be used.

F. Handrail drive shall be automatically tensioned and shall ensure synchronization with pallet band speed. Asynchronous running of handrail shall not exceed 2% of step band speed.

G. Drive station shall be easily accessible for servicing and repair. Hatches or doors shall be provided, finished flush to other panel sections when closed. Suitable ventilation system shall be included.

H. Electric Motor: Totally enclosed, fan cooled protection IP 54, fitted with low noise life-time lubricated roller/ball bearings, especially designed for moving walks according to the manufacturer standard. Motor shall be provided in Class F insulation with temperature rise not exceeding Class B limits. Duty factor shall be S1 or S5, as recommended by manufacturer and approved by the Engineer.

I. Intended reversal of the direction of travel shall be possible, in accordance with EN 115-1 requirements.

J. Service Brake: Constant torque, self-adjusting, and servo-operated, to exert necessary braking torque for direction of travel, with braking force created by pressure spring. Upon tripping of any safety device, brake shall engage immediately and bring moving walk to smooth stop.

K. Safety brake shall be provided for all moving walks, in addition to service brake, on main drive shaft assembly, and shall engage after an adjustable time-lag setting. Safety brake shall be actuated by brake release solenoid, manually resettable only, and shall engage in the event of power failure, by stop push button, or operation of any safety device.

L. Pallet and Chain Guides: Roller guide tracks shall extend for entire length of runway, and shall be hard drawn steel sections with special galvanization, supported at approximately 1.0 m centres. Joints between sections shall be formed diagonally in direction of travel. Joints connecting pallets and drive chains and all carrier rollers on pallets shall be maintenance free and fitted with life-time lubricated roller/ball bearings, encapsulated to be completely dust and water tight (RS sealing). Running treads of rollers shall be non-aging, hard wearing, noise dampening and oil and acid resistant material.

M. Drive Chains: High precision rolled, flat link, hardened chains, provided in pairs of equal length. Pins, sleeves and rollers shall be case-hardened and ground. Spur racks or gear chains shall not be used. Drive chains and chain pins shall be 14.6 mm minimum diameter. Material for chain pins shall be 23 Cr Mo B33. Chain pitch shall not exceed 135 mm.

N. Expansion joints: to balance the movement between moving walks and building structure special sliding and fixed supports shall be provided.

O. For Remote Monitoring system, interface with BMS, Refer to Lift specification section "Electric Traction lifts".

© Copyright protected

120.040 CONTROL PANEL

A. Generally: Electrical installation comprises connection of all wiring systems from control cabinet to various control devices.

B. Control Cabinet: Each moving walk shall have individual instrument and control gear cabinet, protection IP 21 for indoor moving walksshed mounted and located within front moving walk station (drive station), and comprising main circuit breaker, motor control gear, protective devices, relays, cut-off and tripping displays, etc. To ensure that there is no interference with other electrical systems (EMC) within the building, the design has to be according to international recommended standards.

C. Control equipment shall include, in addition to the above, fault finding digital panel with warning lights, located behind lockable cover. Each safety contact shall be connected to one warning light. Cancelling is only to be possible using a separate switch. Key operated switch (up/down) for starting moving walk shall be provided in handrail newel.

D. The controller shall be of the micro-processor-type. The controller includes a diagnostic system with an alphanumeric display (LED). This display shall monitor and indicate the general operational status of the moving walk, statistical information and status of all safety devices. The system shall be designed in such a way that all this information can be transmitted via a serial interface to the "conveying systems central monitoring system".

E. Control Voltage: <**400AC Voltage**> V single phase, 48VDC or less.

F. Running time meter shall be provided.

G. Main Circuit Breaker: Thermal magnetic type, with inverse time-overcurrent, instantaneous and adjustable earth fault protection. Circuit breaker shall be lockable, and with shunt trip coil for safety trips.

H. Terminal Identification: All terminals shall be marked. All cables shall have coding colors and numbered ferrules.

I. Wiring shall be arranged neatly and clearly in conduits, and terminated on shrouded terminal blocks.

J. Electrical cables in main truss shall be moisture and heat resistant and flame retardant with PVC/E insulation and sheathing, and shall have 1000 V rating.

K. Maintenance power circuit of <400> V, 50 Hz, shall be provided for power and lighting sockets. Dual sockets for power and lighting shall be provided at drive and tensioning stations.

L. Control circuit breaker shall be provided at tensioning station.

M. Maintenance sockets for plugging in maintenance push button control device for testing operation of moving walk shall be provided at upper and lower stations, with maintenance control extension device and sufficient cable length.

120.050 SAFETY DEVICES

A. Operation: Safety devices shall automatically interrupt power supply to drive motor and brake, thereby inducing braking of moving walk.

B. Devices to be provided are as follows:

1. Emergency stop-buttons, at the two ends, located in a suitable place to prevent the inadvertent actuation. Additional emergency stop buttons and locations shall be provided in accordance with EN 115-1 requirements.
2. Pallet run-in monitors in area of comb plates and at point of entry of pallets into combs, which shall induce safety braking of pallet chain when a foreign body enters between comb and step.
3. Pallet band lock.
4. Pallet sag monitors which shall stop moving walk when a pallet sinks by more than 6 mm due to incorrectly formed or damaged pallets or rollers; pallet shall stop before reaching comb run-in point.
5. Motor overload earth-fault and phase-unbalance protection and excessive temperature protection by thermistors in motor coils.

© Copyright protected

6. Handrail safety device to stop moving walk immediately should foreign bodies become wedged between handrail and inlet points in balustrade newels chain monitors to stop moving walk in the event of any chain breaking or becoming excessively elongated.
7. Excessive speed and unintended reversal relay.
8. Service brake monitoring contact against failure or phase change.
9. Skirt Obstruction Device: Stops moving walk if an object gets caught between skirt panels and pallets as the pallets approaches the comb plate.
10. Handrail Entry Device: Stops moving walk if an object gets caught between the handrail and the handrail guard or, alternatively, if an object approaches the area between the handrail and the guard.
11. Broken main drive chain device located on the main drive chain actuated in case of main drive chain breaking or abnormal tension of main drive chain.
12. Floor plate switches located under floor plate of both sides, actuated when floor plate is removed, and moving walk cannot move.
13. Machine cover switch located on the machine actuated when motor cover is removed, and moving walk cannot be operated.
14. Fire Alarm contact to stop the moving walk in case of external signal.
15. Brushes at handrail entries.
16. A fault-finding device shall be provided in the entrances, capable of producing indications of the following data:

    a) Date, time, and cause of moving walk stoppages.
    b) The fault indication shall remain visible until reset by an authorized person.

17. Pictograph notices and signs which shall be provided by the moving walk supplier as per code requirements and shall be installed by the main contractor.
18. Comb lighting: At the entrance and exit of moving walks flashing comb lights (LED) have to be provided.
19. Speed sensors to be provided at both newels.
20. Intermediate stop switches as per code.
21. Missing pallet safety switch.
22. Pallet demarcation light at both sides.

120.060 SOURCE QUALITY CONTROL

A. Factory acceptance tests shall be performed for equipment under this Contract and shall be witnessed by the Engineer.

B. Factory acceptance tests shall include complete checking and testing for 10% of the Project's moving walks, minimum one unit of each type, according to requirements of the specified regulations and standards, as well as special requirements, finishes, software and controls. Selection of moving walks for witness test shall be randomly carried out by the Engineer.

C. Test procedure and program shall be submitted for approval prior to test conduction, by at least 14 days. Factory witness test shall include, at Contractor's expenses, all test expenses, business class air tickets, five stars Hotel full accommodation, and transportation, for two persons from the Engineer's or Employer's side.

D. Comply with related quality requirements as specified in Division A.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Requirements include the following:

© Copyright protected

1. Division E Section "In Situ Concrete Construction Generally" for setting sleeves, inserts, and anchoring devices in concrete.
2. Division G Section "Structural Steel Framing" for attachment plates, angle brackets, and other preparation of structural steel for supporting moving walks.
3. Division Q Section "Site Street Furniture Equipment" for metal bollards.
4. Division L Section "Stairs ladders walkways handrails balustrades" for balustrade glazing where applicable.
5. Division L Section "Doors Shutters Hatches" for wall and ceiling access panels and access doors in moving walk enclosures.
6. Division W Section " Digital, Addressable Fire Alarm System " for smoke detectors that activate moving walk alarm and, after at least 15 seconds, cause the interruption of power to the moving walk motor and brake and for connection to moving walk controllers.
7. Division W Section "Central Control / Building Management".
8. Division V Section "Basic Electrical Materials and Methods".
9. Division V and Y Sections for electrical service to moving walks, including fused disconnect switches.
10. Division X Section “Electric Traction Lifts” for remote monitoring and command system.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 STANDARD COMMERCIAL PRODUCTS

A. Refer to Division A Section "Product Requirements".

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Products, materials and equipment shall demonstrate compliance with requirements specified in Division A Section "Product Requirements".

B. Installer Qualifications: Engage the moving walk manufacturer or an experienced Installer approved by the moving walk manufacturer who has completed moving walk installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

C. Source Limitations: Obtain moving walks through one source from a single manufacturer.

D. Conformity to Standards: Contractor shall be responsible for the provision of a complete installation in total conformity with the Standards. It is the Contractor’s responsibility to provide all Standards requirements even if not accounted for in this Specification. It is the Contractor's responsibility to coordinate with the Engineer on the issues related to the safety of the installations.

E. In the event of a conflict between any of the above applicable or reference Standards, the more stringent requirements shall take precedence.

F. In case Contractor proposes part of equipment in accordance with other Standards, then detailed comparison documents including one original copy (in English – translation to English should be the approved one by the Standard originating Committee) of the latest edition of the referred to Standard (and related annexes) shall be submitted for Engineer's approval. These documents shall detail discrepancies and advantages of offer. Submittals shall be preceded by a written approval of the Engineer on such. However, the Employer and the Engineer reserves the right to accept or reject such proposals.

310.020 DELIVERY, STORAGE AND HANDLING

A. Packing and Shipping: Deliver materials, components and equipment in original protective shipping containers with labels intact and legible.

© Copyright protected

B. Delivery on Site: Do not deliver materials, components and equipment on site until adequate protected storage facilities are available or for direct installation.

C. Storage and Protection: Store materials, components and equipment above ground, under cover and in a well-ventilated protected area. Comply with manufacturer's recommendations concerning temperature and relative humidity limitations during storage.

D. Install certified “shock-guards’ on the equipment before shipping from the factory and shall be retained in place till unpacked at site and inspected by Engineer, to ascertain whether the “shock-guard” has been activated by any shock/impact during shipment.

310.030 COORDINATION

A. Coordinate installation of sleeves, block outs, moving walk equipment with integral anchors, and other items that are embedded in concrete or masonry for moving walk equipment. Furnish templates, sleeves, moving walk equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.

B. Coordinate sequence of moving walk installation with other work to avoid delaying the Work.

C. Coordinate locations and dimensions of other work relating to moving walk including sumps and floor drains in pits, electrical service, and electrical outlets, lights, and switches in pits.

310.040 EXTRA MATERIALS

A. Generally: Supply loose equipment, [**spare parts**] and accessories as required for normal operation and routine maintenance of the moving walk(s) and as detailed by the Contractor in his offer, for two years continuous operation. Tools required for the diagnosis and configuration of the equipment shall be provided.

B. Spare parts shall include, but not limited to the following, with minimum one piece of each part:

MOVING WALKS SPARE PARTS	(%) Qty. of Total Moving Walks Number
Moving walk pallet assembly	2
Pallet chain and accessories	2
Pallet chain roller	10
Drive chain	2
Drive chain extension accessories	2
Roller for handrail support	10
Comb and accessories	2
Interface relay	2
Lifting solenoid	2
Retaining spring	2
Motor protection switch	2
Stop / start switch	2
Proximity sensor	5
Speed monitor impulse counter	1

© Copyright protected

Limit switches	2
Emergency stop button & buzzer	2
Brake shoe	5
Brake magnet	2
Sliding rail	1
Rubber pads links	2
Handrail entry	2
Tension chain sensor	1

C. Tools and Accessories: Supply tools and equipment required for routine checking, maintenance, testing and control of installations, with appropriate portable measuring and test instruments.

D. Identification: Parts shall be packed in sealed plastic bags with identifying labels and factory part list numbers.

310.050 WARRANTY

A. Provide complete system warranty in which Manufacturer, Installer, and Contractor are jointly and severally liable and agree to repair or replace all defective components of the warranted item. Warranty shall include both, materials and workmanship, warranty shall include:

1. Defective materials and installation.
2. Failure to comply with requirements stated in technical specifications.
3. Structural failures including, but not limited to, excessive deflection.
4. Faulty operation of movable parts such as hardware.
5. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.
6. Delamination of exterior or interior facing materials.
7. Making good and installation and finishing all items that are disturbed and that may be required due to repair or replacement of defective items. Coordinate with Employer, manufacturer, and installer of adjacent disturbed items to ensure that their warranty is not cancelled due to the repair work.

B. Warranty Period: **3**year from the date of Substantial Completion.

320.000 SUBMITTALS

A. Product Data (For each moving walk): Include capacities, sizes, performances, safety features, finishes, and similar information.

B. Sample Warranty: Copy of manufacturer's proposed warranty, stating obligations, remedies, limitations, and exclusions.

C. Country of origin of the moving walk assembly shall be indicated in addition to the country of origin of main components including drive, motor, controller, pallets, etc.. Complete documentation for factory manufacturing the equipment shall be submitted including but not limited to local and international experience, quality certificates, quality assurance plan, and organization.

D. Sustainable Design Submittals: All related Sustainable Product Data as detailed in Division A Sustainability Sections, as applicable.

E. Shop Drawings (For each moving walk): Show plans, elevations, sections, and large-scale details indicating coordination with building structure and relationships with other construction. Indicate variations from specified requirements, maximum dynamic and static loads imposed on building structure at points of support, and power requirements. Indicate access and ventilation for moving walk machine space and wellways.

© Copyright protected

F. Construction work shall not proceed until final approval of material / equipment and shop drawings obtained.

G. Samples for Initial Selection: For exposed materials e.g. color selection, handrail rubber, inlet indicators, etc..

H. Test Certificates/Calculations: To be submitted for the following:

1. The maximum deflection of supporting structure under full passenger load.
2. Breaking strength of handrail.
3. Breaking strength of pallet chain.
4. Pallet load test.
5. Pallet / Landings alignment test.

In addition to any other test required by the Engineer.

I. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Engineers and Employers, and other information specified or required by Engineer.

J. Maintenance Manuals: For each different moving walk, including operation and maintenance instructions, parts listing with sources indicated, recommended parts inventory listing, emergency instructions, and similar information. Include all diagnostic and repair information available to manufacturer's and Installer's maintenance personnel. Submit for Employer's information at project closeout as specified in Division A.

K. Warranties: Warranties specified in this Section.

L. Certificates and Permits: Provide Employer with inspection and acceptance certificates and operating permits as required by governing authorities for normal, unrestricted use of moving walks.

M. As-built Drawings: At project Closeout, submit record drawings of installed moving walks, in accordance with requirements of the specifications, Division A.

330.000 EXECUTION

330.010 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide [**12 months**] full maintenance service by skilled, competent employees of the moving walk Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper moving walk operation at rated speed. Use only parts and supplies as used in the manufacture and installation of original equipment.

1. Include 24-hour-per-day, 7-day-per-week emergency callback service.

a) Response Time: [**2 hours or less**]

330.020 EXAMINATION

A. Examine moving walk areas, with Installer present, for compliance with requirements, installation tolerances, and other conditions affecting performance of moving walk work. Examine supporting structure, machine spaces, and pits; verify critical dimensions; and examine conditions under which moving walk work shall be installed. Do not proceed with installation until unsatisfactory conditions have been corrected.

1. For the record, prepare a written report, endorsed by the Installer, listing dimensional discrepancies and conditions detrimental to the performance of moving walk work.

330.030 INSTALLATION

A. Comply with manufacturer's instructions and recommendations for work during installation.

© Copyright protected

B. Set moving walks true to line and level, properly supported, and anchored to building structure. Use established benchmarks, lines, and levels to ensure dimensional coordination of the Work.

C. Adjust installed components for smooth, efficient operation, complying with required tolerances and free of hazardous conditions. Lubricate operating parts, including bearings, tracks, chains, guides, and hardware. Test operating devices, equipment, signals, controls, and safety devices. Install oil drip pan and check to ensure that no oil drips outside of pan.

D. Repair damaged finishes so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

E. Assembly: Equipment is, as far as possible, to be factory assembled, wired and tested. Site work shall be limited to installation and assembly of parts dismantled at factory for transportation, or otherwise to work not possible at factory.

F. Workmanship: Carry out work in a neat, workmanlike and efficient manner in accordance with specified requirements. Installation shall be performed by skilled personnel, specialized in moving walk installation, who are in the permanent employment of the manufacturer or manufacturer's authorized dealer.

G. Accessibility: Install equipment so that it is readily accessible for operation, maintenance and repair.

H. Builder's Work: Carry out all builder's work necessarily required in connection with the installation of moving walks, including but not limited to forming or cutting chases, rebates, etc., grouting, supports, steelwork, scaffolding, etc. Provide convenience power, lighting and other services required from assigned terminal points, to carry out construction work.

I. Coordination: Coordinate equipment installations with the building construction to prevent alteration to structure and cutting of holes and chases after equipment installation has started.

J. Fire Protection: Coordinate installations with mechanical works, for provision of fire/smoke detection and fire fighting systems.

K. Painting: Protect unfinished metalwork by painting, unless technically undesirable. Painting shall include thorough cleaning of metal, application of rust inhibiting prime coat and two finishing coats of approved enamel.

330.040 FIELD QUALITY CONTROL

A. Tests: After installation is complete and prior to Substantial Completion, carry out all tests required by the Governing Regulations and Standards (refer to EN 115-1 requirements). Carry out any other tests the Engineer may require to check safety and compliance of installation with specified requirements. Tests shall be witnessed by the Engineer and, if required, by the authorities having jurisdiction.

B. Equipment Failure: Repair and make good any damage to equipment caused by tests, or damage to building caused by failure of any part of the installation, to the satisfaction of the Engineer.

C. Organization of Tests: Provide all labour, materials and instruments required for tests.

D. Before test run, ensure that step bands, skirtings and comb segments are in order, no foreign bodies are in or on moving walk, all steps are fitted, main circuit breaker is in closed position, control switch is in on position, safety devices and protective switches are in operation, series of safety contacts are closed and manual control device is connected to inspection run power socket.

E. Test run shall include checking starting from installed service panel, reversing direction of running from manual control device and checking that actual running direction corresponds with direction setting, allowing running in each direction for several cycles. Any adjustments shall be made with inspection control device connected.

F. Testing Operation of Safeties: In accordance with manufacturer's service and maintenance instructions, check all alarms and indicators and lubricating oil system against manufacturer's data.

© Copyright protected

G. After testing, check, and if necessary, re-adjust spring tensions on return shaft, handrail pretension, drive rollers, step inlet and outlet, sag, skirtings, gaps etc., brake stopping distance, and gear oil level.

H. Measurements: Measure motor current in both directions of moving walk, and insulation resistance to truss or earth of motor circuit, control circuits, brake circuit, lighting circuits, pump circuit and any other circuits. Insulation resistance shall not be less than 20 M-ohms using a minimum 1000 V d.c. megger.

I. Acceptance Testing: Upon nominal completion of each moving walk installation, and before permitting the use of moving walks (either temporary or permanent), perform acceptance tests as required and recommended by the "Code" and by governing regulations or agencies.

330.050 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel on procedures and schedules for maintaining, operating, adjusting, troubleshooting, and servicing moving walks. Refer to Division A Sections related to Demonstration and Training.

1. Make a final check of each moving walk operation, with Employer's maintenance personnel present, just prior to Substantial Completion. Determine that control systems, operation components and devices are functioning properly.

330.060 PROTECTION

A. At completion of moving walk work, provide suitable protective coverings, barriers, devices, signs, or such other methods or procedures to protect moving walk work from damage or deterioration. Maintain protective measures throughout remainder of construction period.

330.070 MOVING WALK SCHEDULE

A. The Contractor shall coordinate the final space requirements (truss depth, pit depth, overall length, etc.) with the architectural layout and details. Ensure full compatibility. Any contradiction shall be raised to the Engineer.

B. Moving Walk No :

1. Length: …….. m.
2. Overall Width: ……m.
3. Inclination of Ramp: …….degrees.
4. Width of Pallet: …… m.
5. Speed: ……..m/sec.
6. Pit Dimensions (at each side):

a) Length: …….. m.
b) Width: ……. m.
c) Depth: ……m.

7. Intermediate Pit Depth: …….. m.

X20 - HOISTS

PART 3 SPECIFICATION CLAUSES SPECIFIC TO X20

300.000 GENERAL

300.010 COMPLIANCE WITH LEGISLATION:

- Ensure the installation, commissioning and setting to work of the hoists complies with the general requirements of the Health and Safety at Work etc. Act 1974 and where appropriate,
    - The Factories Act 1961.
    - The Lifting Operations and Lifting Equipment Regulations 1998.

300.020 HOIST SPECIALIST:

- Engage a specialist to supply, install and commission the hoist installation.

310.000 PRODUCTS/MATERIALS

310.010 DOMESTIC PERSONNEL LIFT OR HOIST:

- Manufacturer and reference
    - Style
    - Stair lift.
    - Powered domestic lift.
    - Manual home lift.
    - Platform hoist.
- Standard
    - BS 5900.
    - BS 5965.
    - BS 6440.
    - BS EN 81-40.
- Operation
    - Dedicated user.
    - General use.
    - For use by disabled person.
- Position of users
    - Sitting.
    - Standing.
    - Seated in wheelchair.
- Location
    - Indoors.
    - Outdoors.
    - Domestic.
    - Non-domestic.

- Controls
    - Left handed use.
    - Right handed use.
    - Duplicate controls.
    - Attendant controls.
    - On/off key switch.
- Ancillaries
    - Automatic car doors.
    - Automatic car barriers or gates.
    - Manual car doors.
    - Manual car barriers or gates.
    - Seats.
    - Handrail.
    - Wheelchair stops.
    - Alarm system to
        - BS EN 50134-1 - System requirements.
        - BS EN 50134-2 - Trigger devices.
        - BS EN 50134-3 - Local unit and controller
        - DD CLC/TS 50134-7 - Application guidelines.
    - Emergency lighting.
    - Landing doors or gates.
    -
- Drive type
    - Electric, rack and pinion.
    - Electric, screw and nut.
    - Direct hydraulic to BS ISO 4413.
    - Direct pneumatic to BS ISO 4414.
    - Suspended, electric.
    - Suspended, electro-hydraulic.
    - Manual operation.
- Liftway protection
    - Intermediate landing.
    - Upper landing.
    - Lower landing.
    - Total enclosure.
    - Access to platform to BS 8300-1 and BS 8300-2.
    - Method of door or barrier operation
    - Door or barrier locking

310.030 VEHICLE LIFTS:

- Standards
    - BS EN 1493 and BS 7980.
- Lift Type

    - Wheel supporting.
    - Axle supporting.
    - Frame supporting.
    - Single ram.
    - Multi-ram.

    - Hand chocks.
    - Hinged ramps.
    - Handrails and toe boards.
    - Access gates.
    - Synchronised multiple lifts.
    - Overbalanced axle or chassis supports.
    - Non-overbalanced axle or chassis supports.
    - Warning notices.

- Platform arrangement
    - Platform surface.
    - Lifting pads.
    - Balcony construction.
- Location
    - Indoors.
    - Outdoors.
    - Surface-mounted.
    - Flush-mounted.
    - Recessed.
- Ancillaries
    - Wheel free supports.
    - Wheel free auxiliary lifts.
    - Scissor action jacking beam.
    - Radius plates.
    - Lighting.

310.040 HOISTS:

- Manufacturer and reference Materials and equipment shall be standard products of manufactures regularly engaged in the fabrication, Sales and Service of hoists.
- Or approved equivalent
- Safety requirements for non-fixed load lifting attachments to BS EN 13155.
- Standard
    - Applicable Local Building Laws as far as congruent with the stated EN codes and standards.
    - Local Codes, Ordinances and Laws as far as congruent with the stated EN codes
    - and standards.
    - 2006 / 42 EC European Machinery Directive.
    - 2006 / 95 EC European Directive relating to electrical equipment designed for use
    - within certain voltage limits.
    - 2004 / 108 EC European Directive relating to Electromagnetic Compatibility
    - EN ISO 12100 Safety of machinery – General principles for design – Risk assessment and risk reduction.
    - EN ISO 13850 Safety of machinery: Emergency stop - Principles for design.
    - EN ISO 13857 Safety of machinery: Safety distances to pre-vent danger zones being reached by upper and lower limbs.
    - EN ISO 13849-1/2 Safety of machinery - Safety related parts of control system.
    - EN ISO 14122-1/2/3/4 Safety of machinery: Permanent means of access to machinery.
    - EN 60204 - 1 / 32 Safety of machinery - Electrical equipment of machines.
    - EN ISO 14118 Safety of machinery: Prevention of unexpected start-up.
    - EN 1090-2 Execution of steel structures and aluminium structures.
    - EN 1993-3 Euro code 1: Actions on structure.
    - EN 1993-1-1 / 6 Eurocode 3: Design of Steel structures.
    - EN 13001-1 / 2 / 3-1 Crane safety – General design.
    - EN 15011 Cranes – Bridge and gantry cranes
    - FEM 1.001 Rules for the design of hoisting appliances

- Applicable requirements of the following sections of this specification apply to all work required under this section.
    - 1. Conditions of the Contract.
    - 2. Division 1-General Requirements of the Contract.

- Hoist Type
    - Pallet lifter.
    - Loading platform.
    - Cellar hoist.
    - Car parking hoist.
    - Cantilevered platform.
    - Fixed.
    - Mobile.
    - Installed to crane.
    - Self-propelled.
    - Mobile elevating work platform (MEWP) to BS EN 280.
- Drive type
    - Hydraulic rated as BS ISO 4409.
    - Hydraulic as relevant parts of BS EN 1570.
    - Pneumatic to BS ISO 4414
    - Rack and pinion to ISO 1328-1 and ISO 1328-2
    - Screw and nut
    - Chain drives to BS ISO 1275.
    - Power operated.
    - Manually operated to BS 5655-14.
- Characteristics
    - Safe working load , the hoist shall be equipped with an electro-mechanical load limiting device that shall prevent lifting more than 110% of the rated load.
    - Lifting speed [shall be two-speed/two winding squirrel cage type with a speed that should be in range of low speed 1-3 m/min and high speed 4-8 m/min.....]
    - Noise level
    - Hoisting motor(s) shall be totally enclosed fan cooled with IP55 protection, minimum class B insulation, bimetal switch for thermal protection and shall have a 60% ED rating.
    - Hoist motor brake shall be DC disc type with adequate torque to stop and hold over 125% of the hoist rated load.
    - Wire rope shall be constructed from galvanized steel having a minimum safety factor of 5.
    - Trolley shall be furnished with an adjustable frequency inverter drive and two step or infinitely variable speed control for smooth acceleration and deceleration.
    - Trolley motors shall be inverter duty motors with minimum class "F" insulation and motor enclosures shall be - TEFC [totally enclosed fan cooled].
    - Rotary cam type limit switch equipped with 4 micro-switches shall be provided.
    - Limit switch shall provide upper and lower limit of hoist travel, hoist slow down prior to reaching upper limit and phase sequence supervision at upper limit. An additional block operated limit shall be included.
    - Large diameter rope drum with a minimum of 18:1 drum to wire rope diameter ratio. Groove depth shall be at least 35% of rope diameter. The rope drum shall be equipped with a rope guide to help keep the rope aligned in the grooves of the drum.
    - Hoist reeving shall be single reeved. Lateral hook drift shall not exceed 3 mm per 300 mm of vertical travel on single reeved models.

- The actual hoist control enclosure rating shall be at least equivalent to IP55 / 4 type.
- Hooks shall be made of forged alloy steel (34CrMo4QT or 34CrNiMo6QT or equivalent) and shall be fitted with a spring-loaded flipper-type safety latch.
- Hoist shall have a duty rating suitable for the load class and load cycles of the EN 13001, as applicable, for Crane Class HC2 S3 FEM 9,511 group 2m.
- Bridge drive gearing, according to European Standards.
- Trolleys shall have safety drop lugs and energy absorbing bumpers, calculated according to EN 13001 with reduced speed.

- Controls
  - Automatic.
  - Automatic levelling.
  - Manual, dead-mans' type.
  - Foot.
  - Lever.
  - Wander lead.
  - Duplicate controls.
  - Stop.
  - Call.
  - Raise.
  - Lower.
  - Indexing.
  - Emergency stop.
  - Photo electric cell limit switches.
  - Hoist shall be 2 speed magnetic reversing type.
  - Six-way operation, pushbutton pendant suspended from hoist carrier or crane. Radio control may be quoted as an option.
  - Electrical control enclosures shall be IP55 Pushbutton enclosure shall have a rating of IP65.
- Safety devices
  - Mechanism guarding.
  - Enclosure degree of protection to BS EN 60529
  - Trip bars.
  - Sensitive edges.
  - Sensitive surfaces.
  - Re-set control.
  - Scotching device.
  - Inspection hatch.
  - Safety load flaps or stops.
  - Automatic safety load flaps or stops.
  - Handrails.
  - Toe boards.
  - Gates.
  - Synchronising of multiple drives.
  - Phase failure device.
  - Phase reversal device.
  - Warning device Horn and Light.
- Location
  - Indoors.
  - Outdoors.

- Installed into pit.
- Installed into dock.

- Platform arrangement
  - Lifting table.
  - Platform surface.
  - Working platform.
  - Goods lift.
  - Lorry loader.
  - Handling system.

- Ancillaries
  - Wheels.
  - Castors.
  - Lift forks.
  - Fork lift channels.
  - Turntable.
  - Roller conveyor top.
  - Loading ramps.

320.000 WORKMANSHIP

320.010 WORK ON-SITE:

- Ensure that all structural and building works are carried out and that service connections are provided,

320.015 SUBMITTALS:

- General: Submit the following according to Conditions of Contract and Division 1 Specification Sections.
- Product data including rated capacities and duties of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories. Indicate dimensions, required clearances, methods of assembly of components and wiring connections. Include the following
- Wiring diagrams for each item of equipment with electric power supply. Include ladder-type wiring diagrams for interlock and control wiring required for final installation. Differentiate between portions of wiring that are factory-installed and field-installed

- Maintenance data for inclusion in Operating and Maintenance Manuals as specified in Division A

320.020 QUALITY CONTROL:

- Handle, store and install all equipment and components of the hoist in accordance with the manufacturer's recommendations and,
  - BS 5900.
  - BS 6440.
  - BS 7980.
  - BS EN 1493.

- Relevant parts of BS EN 1570.
- BS EN 81-40.

- Inspect all equipment and components on delivery, before fixing and after installation and reject and replace any which are defective.
- Record all commissioning measurements and tests.
- Provide listing/approval stamp, label, or other marking on equipment made to specified standards
- Listing and Labeling: Provide equipment and accessories that are listed and labeled.

320.030 INSTALLATION OF DISABLED PERSONS PLATFORM:

- Install, commission and set to work disabled persons' platform lift in accordance with BS 6440, BS EN 81-40 and manufacturer's recommendations. Provide test and examination certificate and instruct user in its operation.

320.050 INSTALLATION OF VEHICLE LIFTS:

- Install, commission and set to work vehicle lifts to BS EN 1493 and the manufacturer's recommendations. Provide test and examination certification for vehicle lifts.

320.060 INSTALLATION OF HOISTS:

- Install, commission and set to work hoists in accordance with the manufacturer's recommendations. Provide test and examination certification for hoists.

320.070 INSTALLATION OF DOCK EQUIPMENT:

- Install, commission and set to work dock equipment in accordance with the manufacturer's recommendations.

X21 - CRANES

PART 3 SPECIFICATION CLAUSES SPECIFIC TO X21

300.000 GENERAL

300.010 CRANE SPECIALIST:

- Engage a specialist to carry out all aspects of crane installation.

300.020 COMPLIANCE WITH LEGISLATION:

Ensure the design installation, commissioning and setting to work of the crane complies with the general requirements of the local authorities having jurisdiction

310.000 PRODUCTS/MATERIALS

310.010 CRANE INSTALLATION:

- Standard - Supply, install, commission and set to work crane in accordance with
  - BS 5744
  - BS 7121
  - BS EN 12999
  - BS EN 13001
  - BS EN 13135
  - BS EN 14492
  - BS ISO 12448-1
  - BS ISO 16881-1
  - 2006 / 42 EC European Machinery Directive.
  - 2006 / 95 EC European Directive relating to electrical equipment designed for use
  - within certain voltage limits.
  - 2004 / 108 EC European Directive relating to Electromagnetic Compatibility
  - EN ISO 12100 Safety of machinery – General principles for design – Risk assessment and risk reduction.
  - EN ISO 13850 Safety of machinery: Emergency stop - Principles for design.
  - EN ISO 13857 Safety of machinery: Safety distances to pre-vent danger zones being reached by upper and lower limbs.
  - EN ISO 13849-1/2 Safety of machinery - Safety related parts of control system.
  - EN ISO 14122-1/2/3/4 Safety of machinery: Permanent means of access to machinery.
  - EN 60204 - 1 / 32 Safety of machinery - Electrical equipment of machines.
  - EN ISO 14118 Safety of machinery: Prevention of unexpected start-up.
  - EN 1090-2 Execution of steel structures and aluminium structures.
  - EN 1993-3 Euro code 1: Actions on structure.
  - EN 1993-1-1 / 6 Eurocode 3: Design of Steel structures.
  - EN 13001-1 / 2 / 3-1 Crane safety – General design.
  - EN 15011 Cranes – Bridge and gantry cranes
  - FEM 1.001 Rules for the design of hoisting appliances
  - Applicable requirements of the following sections of this specification apply to all work required under this section.
    - 1. Conditions of the Contract.

- 2. Division 1-General Requirements of the Contract.

- FEM - European Federation of Materials Handling and Storage Equipment
- Applicable Local Building Laws as far as congruent with the stated EN codes and standards.
- Local Codes, Ordinances and Laws as far as congruent with the stated EN codes and standards.

- Location
  - Indoors or outdoors as indicated on drawings.
- Special service conditions
  - Crane servicing platforms used for other purposes
  - Fine mesh screens under service platforms.
  - Wind loading as BS EN 1991-1-4
- Load characteristics
  - As per design requirements.
- Crane dimensions
  - As per design requirements
- Type of crane
  - Overhead travelling crane - see clause 310.020
  - Jib crane - see clause 310.030
  - Manual overhead travelling hoist - see clause 310.040
  - Light crane - see clause 310.050
  - Pillar crane - see clause 310.060
  - Cranes - see clause 310.070
- Crane details
  - Crane construction - see clause 310.080
  - Foundations - see clause 310.090
- Installation components
  - Power supply - see clause 310.100
  - Lifting attachments - see clause 310.110
  - Controls - see clause 310.120
  - Control equipment and parameters - see clause 310.130
  - Ancillaries - see clause 310.140
  - Slings - see clause 310.150
  - Ropes and chains - see clause 310.160
  - Crane rails - see clause 310.170

310.020 OVERHEAD TRAVELLING CRANES:

- Standard - BS EN 13001.
- Crane Type
  - Power driven.
  - Overhead travelling.
  - Semi-goliath.
  - Goliath.

- Two trolleys on same bridge or gantry.
- Two point lifting
- Four point lifting
- Offset crab
- Trackless goliath or portal.
- Steerable gantry wheels
- Air supported
- Underslung trolley.
- Top running trolley,
- Single girder.
- Double girder.
- Box girder.
- Cantilevered extension
- Top running bridge carriage
- Underslung bridge carriage
- Travel wheel type
- Traverse wheel type

310.030 JIB CRANES:

- Standard - BS EN 13001 and BS ISO 12488-4.
  -
- Standard - BS ISO 10245-4.
- Mounting
  - On a high pedestal.
  - On portal carriage.
  -
- Jib Construction
  - Strut
  - Cantilever
  - Telescopic
  - Open lattice
  - Plate box
  - Jib extension
  - Hydraulic drive
  - Pneumatic drive
  - Rope drive

310.040 MANUAL OVERHEAD TRAVELLING HOISTS:

- Manufacturer and reference
  - Standard - BS EN 13001.
- Hoist Type
  - Underslung, single girder
  - Top running, single girder
- Characteristics

- Construction of main girder
- Trolley weight
- Crane weight
- Travel wheel loads
- Travel wheel type
- Traverse wheel type
- Chain pulley blocks to BS EN 13157
- Chain lever hoists to BS EN 13157
- Chain drives

310.050 LIGHT CRANES:

- Manufacturer and reference
  - Or approved equivalent
  - Standard - BS EN 13001.
- Crane Type
  - BS 5744 Figure 11 a.
  - BS 5744 Figure 11 b.
  - BS 5744 Figure 11 c.
  - BS 5744 Figure 11 d.
  - Runway beam to BS 2853 without hoist.
  - Runway beam to BS 2853 and hoist
- Characteristics
  - Construction of gantry
  - Gantry height adjustment
  - Construction of main girder or beam
  - Grab weight
  - Crane weight
  - Travel driven wheel loads
  - Travel trailing wheel loads
  - Wheel types
  - Additional safety features
  - Electric chain hoist
  - Chain pulley blocks to BS EN 13157
  - Chain lever hoists to BS EN 13157
  - Chain drives
  - Loose chain box
  - Trolley frame construction
  - Castors
  - Slewing mechanism

310.060 PILLAR CRANES:

- Manufacturer and reference
  - Standard - BS EN 13001.
- Style

- Fixed jib.
- Slewing jib.
- Wall-mounted.
- Overbraced.
- Underbraced.
- Self supporting.
- Twin arm.
- Articulated jib
- Luffing jib
-

- Characteristics
  - Chain pulley block to BS EN 13157

310.070 CRANES:

- Manufacturer and reference
  - Standard - BS EN 13001.
- Style
  - Monorail
  - Radius
  - Diametrical

310.080 CRANE CONSTRUCTION:

- Standard - BS EN 13001.
- Handling molten metal.
- Potentially explosive atmosphere
- Weather protection
- Parking brake, long travel
- Storm anchors
- Parking brake, traversing
- Vertical deflection
- Vibration of structure
- Corrosion allowance
- Exposure to accidental damage
- Enclosed sections
- Strength of joints
- Rail included in effective section
- Effect of wheel loads
- Braced and lattice girders, local bending movements
- Braced and lattice girders, tension members
- Braced and lattice girders, compression member
- Braced and lattice girders, flat lattice bars
- End carriage length
- End carriage wheel base
- Withdrawal of track wheels
- Traverse buffers
- Long travel buffers

- Anti-collision devices
- Traverse end stops
- Drop stops
- Guard rails and toe boards
- Opening in platforms and walkways
- Walkway surfaces
- Ladders
- Stairs
- Emergency escape provision
- Drivers cabin
- Cabin access
- Cabin enclosure
- Cabin lighting
- Audible warning device
- Wheel lateral location
- Wheel construction
- Distribution of tensile forces in ropes
- Rope drum width
- Rope drum capacity
- Rope reeling
- Rope drum flanges
- Rope anchorages
- Rope drum surfaces
- Rope drum grooves
- Rope pulley surfaces
- Rope pulley grooves
- Rope, angle of fleet
- Rope pulley guards
- Brakes generally
- Hoist brakes
- Long travel motion brakes
- Traverse motion brakes
- Slewing brakes
- Luffing brakes
- Other motion brakes
- Gearbox lubrication
- Change-gear levers
- Gearbox inspection covers
- Lubrication of bearings
- Keys and keyways to BS 4235.
- Splines and serrations to BS 2059.
- Guard design to BS EN ISO 12100.
- Inspection covers
- Gear wheel, pinions and chain drive guarding
- Revolving shafts and couplings, guarding
- Hook block guarding
- Provide isolation during repair and maintenance work in accordance with BS EN 62626-1
- Design electrical system in accordance with BS EN 13135
- Select motor using BS EN 13135.
- Power supply isolator
- Main contactor

- Control voltage
- Control circuitry earthing
- Contactors to BS EN 60947-4-1.
- Interlocking of reversing contractors.
- Control circuit transformer to BS EN 61558-1.
- Inter-winding screen
- Control circuit fusing
- Power loss reset
- Control interlocking
- Shrouded push buttons
- Control marking
- Control pendant support
- Non-conductive control security
- Resistor rating to BS EN 60947-4-1
- Maximum motor speed
- Motor pull-out torque
- Enclosure degree of protection to BS EN 60529
- Motor enclosure degree of protection to BS EN 60529
- Interlocking of enclosure access
- Magnet and thruster brake motor ratings
- Minimum brake operating voltage
- Diversion of de-energised motor energy
- Auxiliary equipment operating voltage
- Radio interference suppression to BS EN 55012 and relevant parts of BS EN 55014 + A2.
- Protection of cables
- Cable conductor type
- Minimum conductor size
- Cable rating
- Marking of safe working load

310.090 FOUNDATIONS:

- Ballast
- Fixing down bolts
- Cast in steel work

310.100 POWER SUPPLY:

- Standard
- Provide crane with control, protection and safety equipment in accordance with BS 7671 (the IET Wiring Regulations).

310.110 LIFTING ATTACHMENTS:

- Attachment
    - Hook, to BS EN 1677-5.
    - Hook, to BS EN 1677-5 with safety latch.
    - Liverpool hook.
    - Pole lifts.

- Lifting plate clamps to BS EN 13155.
- Balanced C hook to BS EN 13155.
- Timber dogs.
- Hook rotation locking device.
- Shackles to BS EN 1677-5.
- Lifting beam to BS EN 13155.
- Adjustable lifting beam to BS EN 13155.
- Roll-over beam.
- Lifting spreader.
- Pallet forks.
- Magnet lifting device to BS EN 13155.
- Vacuum lifting device to BS EN 13155.
- Grab.
- Bucket.
- Manipulator.
- Balancer.
- Balancer with float capability.
- Non-fixed load lifting attachment to BS EN 13155.
- Safe working load of lifting attachment

310.120 CONTROLS:

- Standard
- Provide crane control system in accordance with BS 7671 (the IET Wiring Regulations) and the appropriate British Standards.
- Provide crane control system and control station in accordance with BS EN 13557.
- Location and type of controls
    - Panel on crane.
    - Remote panel.
    - Cabin.
    - Pendant.
    - Non - conductive.
    - On lifting attachment.
    - Operator controlled.
    - Automatic.
- Operator controls
    - Push buttons.
    - Levers.
    - Joy stick.
    - Rotary controls.
    - Twist grips.
    - Separate control for each motion direction.
    - Two position single control for each motion direction.
    - Hoist
    - Travel
    - Slew
    - Luff
    - Lifting attachment
    - Other motion

- Stop
- Emergency stop
- Six-way operation, pushbutton pendant suspended from hoist carrier or crane. Radio control may be quoted as an option.

- Cabin
  - On crab.
  - On bridge.
  - At end span.
  - At mid span.
  - Open.
  - Glazed
- Pendant
  - From fixed point on bridge.
  - From crab.
  - Mobile on separate track.
- Non-conductive
  - Infrared
  - Radio
  - Range limitation
  - Warning device in crane

310.130 CONTROL EQUIPMENT AND PARAMETERS:

- Limiting and indicating equipment
  - Standard - BS EN 12077-2.
- Control equipment for
  - main hoist.
  - auxiliary hoist.
  - long travel motion.
  - traverse motion.
  - slewing motion.
  - luffing motion.

310.140 ANCILLARIES:

- Access and Platforms
  - Bridge platforms
  - Trolley platforms
  - Access points
  - Emergency escape devices
- Accessories
  - Light fittings on bridge.
  - Light fittings on crab.
  - Portable lighting.

- Portable tool power sockets.
- Cabin heating.
- Cabin air conditioning.
- Rail clamps.

310.150 ROPES AND CHAINS:

- Select ropes in accordance with BS ISO 16625.
- Ropes and chains for
  - main hoist.
  - auxiliary hoist.
  - traverse motion.
  - travel motion.
  - slewing motion.
  - luffing motion.
  - guy.
  - other motion.
- Type of rope or chain
  - Standard
    - BS ISO 16625
    - BS EN 12385-1.
    - BS EN 12385-2.
    - BS EN 12385-4.
    - BS EN 12385-5.
- Guy anchorages
  - Radii of guy rope anchorages
  - Special anchors

310.160 SLINGS:

- Standard
  - Provide slings and other lifting attachments for use with cranes to BS EN 13001.
    - BS EN 13414-1.
    - BS EN 1492
    - BS ISO 1834.
- Style
  - Two legged.
  - Three legged.
  - Four legged.
  - Collar chain.
  - Endless.
  - Pole lift
  - Lifting plate clamps
  - Hooks to BS EN 1677-5.
  - Hooks

    - Sling ring or eye
- Ropes and chains
- Fittings
    - Master link or ring
    - Chain shortening clutches
    - Auxiliary links or rings
    - Reeving thimbles
    - Hooks
    - Safety latches
    - Hook swivels
    - Shackles
    - Soft eyes

310.170 CRANE RAILS:

- Standard
    - BS ISO 16881-1.
- Rail material and shape
    - BS 4 and BS EN 10034
    - BS EN 10210
    - BS EN 13674
    - BS EN 13674-1
    - BS EN 13674-4
- Rail loading
    - BS EN 1993
    - BS EN 13001
    - BS EN 1090
    - BS EN 1994
    - BS EN 1991
    - Top running crane.
    - Under slung crane.
- Rail fixing
    - Proprietary chairs.
    - Welded to structure.
    - Fixed to structure.
    - Concreted in.
    - [.....]
- Rail installation
    - Track tolerance to BS 466.
- Rail fittings
    - Fish plate joints.
    - Allowance for expansion.
    - Rail end stops.
    - Rail section stops.

- Buffers.
- Resilient buffers to BS EN 13001.
- Rail switches.
- Rail bonding and earthing to BS 5744.

310.180 CURRENT COLLECTION SYSTEM:

- Conductor material
  - Copper.
  - Hard drawn copper.
  - Cadmium copper.
  - Aluminium.
  - Mild steel.
- Conductor shape and size
  - BS EN 50149
- Conductor arrangement
  - Individually shrouded.
  - Common shroud.
  - Bare or unshrouded.
  - Guarding.
  - Number of poles
  - Flat horizontal, spacing
  - Flat vertical, spacing
  - Power track.
  - Enclosure degree of protection to BS EN 60529
  -
- Conductor mounting
- Conductor installation dimensions
- Collector

320.000 WORKMANSHIP

320.010 WORK ON-SITE:

- Ensure that all structural, building and civil engineering works are carried out and that service connections are provided,
- by others

320.015 SUBMITTALS:

- General: Submit the following according to Conditions of Contract and Division 1 Specification Sections.
- Product data including rated capacities and duties of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories. Indicate dimensions, required clearances, methods of assembly of components and wiring connections. Include the following

- Wiring diagrams for each item of equipment with electric power supply. Include ladder-type wiring diagrams for interlock and control wiring required for final installation. Differentiate between portions of wiring that are factory-installed and field-installed

- Maintenance data for inclusion in Operating and Maintenance Manuals as specified in Division A

320.020 QUALITY CONTROL:

- Handle, store and install all equipment and components of the crane in accordance with the manufacturer's recommendations, BS 5744 and BS 7121. Obtain all components for the crane system from approved sources. Inspect all equipment and components on delivery, before fixing and after installation; reject and replace any which are defective. Record all commissioning measurements and tests.
- Provide listing/approval stamp, label, or other marking on equipment made to specified standards
- Listing and Labeling: Provide equipment and accessories that are listed and labeled.

320.030 INSTALLATION OF CRANE:

- Install, commission and set to work the crane in accordance with the appropriate legislation, BS 5744, BS 7121 and manufacturer's recommendations. Provide test certificates as required by legislation and appropriate British Standards.
- requirements of the users insurers

320.040 CERTIFICATION:

- Ensure that tests for certification purposes are witnessed by all parties concerned.
- Witnesses
    - Installers insurers.
    - Contract supervisor.
    - Purchaser.
    - Purchasers insurers.
    - User.
    - Users insurers.

320.050 INSTALLATION OF CRANE RAILS:

- Install crane rails in accordance with the crane supplier's recommendations and,
    - BS EN 1991
    - BS EN 1993
    - BS EN 1994
    - BS EN 13001.
    - BS EN 1090

320.060 INSTALLATION OF COLLECTOR SYSTEM:

- Install, commission and set to work the collector system in accordance with the recommendations of the crane supplier and the collector system manufacturer.

- Current collection system conductors.
- Current collectors.

320.070 TESTING:

- Carry out all tests required under the legislation, under the direction of a Competent Person as detailed in,
- BS 5744.
- BS 7121.

Y10 - PIPELINES AND PIPEWORK

2000 PRODUCTS/MATERIALS PIPELINES

2010A HEAVY BLACK STEEL PIPES TO BS EN 10255:

- Material - Steel
- Standard - BS EN 10255
- Dimensions - Heavy. Random single lengths, 4m to 7m.
- Ends - Screwed to relevant parts of BS EN 10226, taper thread or plain.
- Finish - Varnished.

2010B MEDIUM BLACK STEEL PIPES TO BS EN 10255:

- Material - Steel
- Standard - BS EN 10255
- Dimensions - Medium. Random single lengths, 4m to 7m.
- Ends - Screwed to relevant parts of BS EN 10226, taper thread or plain.
- Finish - Varnished.

2010C MEDIUM GALVANISED STEEL PIPES TO BS EN 10255:

- Material - Steel
- Standard - BS EN 10255.
- Dimensions - Medium. Random single lengths, 4m to 7m.
- Ends - Screwed to relevant parts of BS EN 10226 taper thread.
- Finish - Galvanised to BS EN 10240.

2010D HEAVY GALVANISED STEEL PIPES TO BS EN 10255:

- Material - Steel
- Standard - BS EN 10255.
- Dimensions - Heavy. Random single lengths, 4m to 7m.
- Ends - Screwed to relevant parts of BS EN 10226, taper thread.
- Finish - Galvanised to BS EN 10240.

2010E HEAVY BLACK STEEL PIPES TO BS EN 10255 - GROOVED ENDS:

- Material - Steel
- Standard - BS EN 10255
- Dimensions - Heavy. Random single lengths, 4m to 7m.
- Ends - Grooved for mechanical joints.
- Finish - Unvarnished, varnished, painted.

2010F MEDIUM BLACK STEEL PIPES TO BS EN 10255 - GROOVED ENDS:

- Material - Steel
- Standard - BS EN 10255
- Dimensions - Medium. Random single lengths, 4m to 7m.
- Ends - Grooved for mechanical joints.
- Finish - Unvarnished, varnished, painted.

2010G HEAVY GALVANISED STEEL PIPES TO BS EN 10255 - GROOVED ENDS:

- Material - Steel
- Standard - BS EN 10255.
- Dimensions - Heavy. Random single lengths, 4m to 7m.
- Ends - Grooved for mechanical joints.
- Finish - Galvanised to BS EN 10240.

2010H MEDIUM GALVANISED STEEL PIPES TO BS EN 10255 - GROOVED ENDS:

- Material - Steel
- Standard - BS EN 10255.
- Dimensions - Medium. Random single lengths, 4m to 7m.
- Ends - Grooved for mechanical joints.
- Finish - Galvanised to BS EN 10240.

2030 NON-ALLOY SEAMLESS STEEL TUBES TO BS EN 10216-1:

- Material - non-alloy steel
    - Grade - to suit the application.
- Dimensions
    - BS EN 10220
    - BS EN 10216-1, table 5

2050 WELDED STEEL TUBES TO BS EN 10217-1:

- Dimensions
    - BS EN 10220
    - BS EN 10217-1, table 5

2060A CARBON STEEL FITTINGS, BUTT WELDED TO BS EN 10253:

- Material
    - Carbon steel, grade S235.
- Standard - BS EN 10253-1.
- Size range - 25mm to 400mm.
- Dimensions - BS EN 10253-1.
- Ends - Bevelled.
- Finish - Varnished.

2060B CARBON STEEL FITTINGS, BUTT WELDED TO BS EN 10253:

- Material
    - Carbon steel, grade P235TR2 or P265TR2.
- Standard - BS EN 10253-2. Type B fittings.
- Size range - 25mm to 400mm.
- Dimensions - BS EN 10253-2.

- Ends - Bevelled.
- Finish - Varnished.

2070# MALLEABLE CAST IRON FITTINGS, SCREWED:

- Material - Cast iron to BS EN 1562.
- Standard - BS 143 & 1256 or BS EN 10242.
- Size range - 10mm to 164mm.
- Dimensions - BS 143 & 1256 or BS EN 10242.
- Ends - screwed to relevant parts of BS EN 10226

2080E GALVANISED CAST IRON FITTINGS, GROOVED FOR MECHANICAL JOINTS:

- Material - Steel fittings to ASTM A-536, grade 65-45-12.l
- Standard - Manufacturer's.
- Size range - 20mm to 600mm.
- Ends - Grooved or mechanical joints.
- Finish - Galvanised.

2080F PAINTED STEEL FITTINGS, GROOVED FOR MECHANICAL JOINTS:

- Material - Steel fittings to ASTM A-53.
- Standard - Manufacturer's.
- Size range - 20mm to 600mm.
- Ends - Grooved for mechanical joints.
- Finish - Painted.

2090 STEEL FITTINGS, SCREWED TO BS EN 10241:

- Standard - BS EN 10241.
- Size range - 6mm to 150mm.
- Dimensions - BS EN 10241.
- Ends - Screwed to relevant parts of BS EN 10226.
- Finish
    - Black or galvanized to suit pipework system.

2220 LIGHT GAUGE STAINLESS STEEL TO BS EN 10312:

- For use with push and pressfit piping systems.
- Material - Stainless steel, austenitic grade 316 (1.4401).
- Standard - BS EN 10312.
- Dimensions - BS EN 10312 as per tables 1 and 2.
- Ends - Plain.
- Finish - Uncoated.

2230 AUSTENITIC STAINLESS STEEL TO BS 4825-1:

- Material - austenitic stainless steel.
- Standard

- Dimensions
    - BS 4825-1 table 2.
- Ends - plain.

2231 AUSTENTIC STAINLESS STEEL TO BS EN 10357:

- Material - austenitic stainless steel tube
- Type - welded.
- Dimensions
    - BS EN 10357 tables 1 and 2.
- Ends - plain.

2240 AUSTENITIC STAINLESS STEEL FITTINGS:

- Material
    - Fittings - austenitic steel.
    - Gaskets
        - natural rubber tested to BS ISO 48
        - synthetic rubber tested to BS ISO 48
- Standard BS EN 10357 and BS 4825-1.
- Size range
    - BS 4825-2, 12mm to 219.1mm.
    - BS 4825-3, expanded type 25mm to 76.1mm.
    - BS 4825-3, welded type 25mm to 219.1mm.
    - BS 4825-4, 12mm to 101.6mm.
    - BS 4825-5, expanded type 25mm to 76.1mm.
    - BS 4825-5, welded type 25mm to 101.6mm.
- Dimensions
    - BS 4825-2 - Bends and Tees.
    - BS 4825-3 - Clamp type couplings.
    - BS 4825-4 - Screwed couplings.
    - BS 4825-5 - Recessed ring joint type coupling.
- Ends - Plain.

2250A AUSTENITIC STAINLESS STEEL TO BS EN 10216-5:

- Material - Austenitic stainless steel, seamless.
- Standard - BS EN 10216-5.
- Dimensions - BS EN ISO 1127.
- Ends - Plain.
- Finish - Uncoated.

2250B AUSTENITIC STAINLESS STEEL TO BS EN 10217-1:

- Material - Austenitic stainless steel, welded.

- Standard - BS EN 10217-7.
- Dimensions - BS EN ISO 1127.
- Ends - Plain
- Finish - Uncoated.

2255A STAINLESS STEEL FITTINGS, GROOVED MECHANICAL JOINTS:

- Material - stainless steel grades 304, 316, 316L, 316T, schedules 5S, 10S, 20S, 40S.
- Standard - Manufacturer's.
- Size range - 20mm to 600mm.
- Dimensions - manufacturer's standard.
- Ends - grooved for mechanical joints. Use special 'RX' type roll sets for stainless steel pipe.
- Finish - natural.

2257 STAINLESS STEEL PUSH-FIT FITTINGS

- Material - Stainless steel
- Standard - Manufacturer's standard.
- Size range - 15mm to 54mm.
- Dimensions - to suit stainless steel pipe to BS EN 10216-5 and BS EN 10217-7.
- Ends - push-fit with EPDM O ring.
- Finish - Natural.
- Jointing - Provide manufacturer's recommended tool for releasing push-fit fittings in push-fit jointing systems.

2270# COPPER, HALF HARD:

- Kitemarked.
- Material - copper.
- Standard - BS EN 1057, R250, (Class X).
- Dimensions - BS EN 1057 table 3.
- Ends - plain, grooved for mechanical joints; copper-tube dimensioned.

2280# COPPER, SOFT:

- Material - Copper.
- Standard - BS EN 1057, R220, (Class Y).
- Dimensions - BS EN 1057 table 3.
- Ends - Plain.

2290# COPPER, HARD:

- Material - Copper.
- Standard - BS EN 1057, R290, (Class Z).
- Dimensions - BS EN 1057 table 3.
- Ends - Plain.

2310# CAPILLARY FITTINGS FOR COPPER TUBING:

- Material - Copper or dezincifiable resistant copper alloy.
- Standard - BS EN 1254-1.

- Size range - 6mm to 67mm.
- Dimensions - BS EN 1254-1 table 2.
- Ends - Integral (lead-free) solder ring.

2320# TYPE A COMPRESSION FITTINGS FOR COPPER TUBING:

- Kitemarked.
- Material - Dezincifiable resistant copper alloy
- Standard - BS EN 1254-2, type A, non-manipulative.
- Size range - 6mm to 54mm.
- Dimensions - BS EN 1254-2, table 2 and 3.
- Ends - Socket.

2390# CAST IRON PIPES AND FITTINGS TO BS EN 877:

- Material - Cast iron.
- Standard - BS EN 877.
- Dimensions - BS EN 877, table 1.
- Ends - Plain.

2425A FLANGED DUCTILE IRON PIPES AND FITTINGS TO BS ISO 2531:

- Material - Ductile iron.
- Standard - BS ISO 2531.
- Dimensions - Flanged, table 16.
- Ends - Flanged.
- Finish - External, zinc rich, with polyethylene sleeving, extruded polyethylene, extruded polypropylene or polyurethane to BS EN 15189.
- Internal, high alumina cement mortar.

2425B DUCTILE IRON PIPE AND FITTINGS TO BS ISO 2531:

- Material - Ductile iron.
- Standard - BS ISO 2531.
- Dimensions - Spigot/socket, table 17.
    - Permissible deviation on length of fittings, table 6.
- Ends - Spigot or socket.
- Finish - External, zinc rich, with polyethylene sleeving, extruded polyethylene, extruded polypropylene or polyurethane to BS EN 15189.
- Internal, high alumina cement mortar.

2430 MULTILAYERED PIPING SYSTEM FOR HOT AND COLD WATER TO BS EN ISO 21003:

- Piping system to
    - BS EN ISO 21003-1
    - BS EN ISO 21003-2
    - BS EN ISO 21003-3

- BS EN ISO 21003-5

- Materials - as scheduled or specified in the particular specification.
  - Appropriate standards.
    - Polypropylene (PP)
      - BS EN ISO 15874-1
      - BS EN ISO 15874-2
      - BS EN ISO 15874-3
      - BS EN ISO 15874-5
    - Crosslinked polyethylene (PE-X)
      - BS EN ISO 15875-1
      - BS EN ISO 15875-2
      - BS EN ISO 15875-3
      - BS EN ISO 15875-5
    - Polybutylene (PB)
      - BS EN ISO 15876-1
      - BS EN ISO 15876-2
      - BS EN ISO 15876-3
      - BS EN ISO 15876-5
    - Chlorinated polyvinyl chloride (PVC-C)
      - BS EN ISO 15877-1
      - BS EN ISO 15877-2
      - BS EN ISO 15877-3
      - BS EN ISO 15877-5
    - Polyethylene of raised temperature resistance (PE-RT)
      - BS EN ISO 22391-1
      - BS EN ISO 22391-2
      - BS EN ISO 22391-3
      - BS EN ISO 22391-5
- Installation standard - manufacturer's standard.
- Size range - 16mm to 50mm.
- Dimension - manufacturer's standard.
- Ends - compression.
- Finish - black.

2442 PLASTIC PIPING SYSTEMS TO BS EN 15014:

- Standard - BS EN 15014.
- Application - Buried and above ground systems for water (not potable) and other fluids under pressure.
- Performance characteristics for pipes, fittings and their joints.
- Performance characteristics - reaction to fire; external pressure strength; internal pressure strength; dimensional tolerance; tightness (air and water); durability; dangerous substances.

2455A PLASTICS PIPING SYSTEMS FOR WATER SUPPLY - PIPES TO BS EN ISO 1452:

- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - BS EN ISO 1452-2.
- Dimensions - Length - manufacturer's standard range. BS EN ISO1452-2 tables 1, 2, 3, 4 and 5.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, blue or cream.

2475A PLASTICS PIPING SYSTEMS FOR WATER SUPPLY - FITTINGS TO BS EN ISO 1452:

- Plastic piping system for water under pressure up to 45^{o}C and drainage/sewerage under pressure.
- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - BS EN ISO 1452-3.
- Size range - 12mm to 315mm (injection moulding fittings); 63mm to 630mm (bends made from pipe)
- Dimensions - BS EN ISO 1452-3.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey or brown.

2491A ORIENTED UNPLASTICISED PVC TO BS ISO 16422:

- Material - Unplasticised PVC.
- Standard - BS ISO 16422.
- Dimensions - BS ISO 16422.
- Ends - Plain, socket.
- Finish - Blue, grey or cream.

2495A PLASTICS PIPING SYSTEMS TO BS EN 1453:

- Plastics piping system with structured wall pipes for soil and waste discharge (low and high temperature) within the building structure.
- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - BS EN 1453.
- Dimensions - Length - manufacturer's standard range. BS EN 1453 tables1, 2 and 3.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2500A POLYETHYLENE PIPING SYSTEMS FOR UNDERGROUND DRAINAGE AND SEWERAGE TO BS EN 12666:

- Plastics piping system for underground drainage and sewerage both buried in the ground within the building structure, and buried in the ground outside the building structure.
- Material - polyethylene (PE).
- Standard - BS EN 12666-1.
- Dimensions - Length - manufacturer's standard range.
- Ends - Plain; elastomeric ring seal; or socket and spigot; for butt fused joints, electrofusion joints or mechanical joints.
- Finish - Black, or as agreed between manufacturer and purchaser.

2545A PLASTICS PIPING SYSTEMS TO BS EN 1451-1 - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Polypropylene (PP).
- Standard - BS EN 1451-1 and BS EN 15012.
- Dimensions - Length - manufacturer's standard range. BS EN 1451-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2552A POLYPROPYLENE PIPING SYSTEMS FOR UNDERGROUND DRAINAGE AND SEWERAGE TO BS EN 14758-1:

- Plastics piping system for underground drainage and sewerage both buried in the ground within the building structure, and buried in the ground outside the building structure.
- Material - Polypropylene with mineral modifiers (PP-MD).
- Standard - BS EN 14758-1.
- Dimensions - Length - manufacturer's standard range.
- Ends - Plain (with or without chamfer); or single socket with ring seal (with or without chamfer).
- Finish - Black, orange-brown (approximately RAL 8023) or dusty grey (approximately RAL 7037). Other colours may be used.

2553A PIPES AND FITTINGS WITH SMOOTH INTERNAL AND EXTERNAL SURFACE, TYPE A, TO BS EN 13476-2:

- Standards - BS EN 13476-1 and BS EN 13476-2.
- Dimensions - BS EN 13476-2, Section 7.
- Ends - Spigot, Type A1, Type A2, Type B.
- Finish - Black, orange-brown, dusty grey.

2553B PIPES AND FITTINGS WITH SMOOTH INTERNAL AND PROFILED EXTERNAL SURFACE, TYPE B, TO BS EN 13476-3:

- Standards - BS EN 13476-1 and BS EN 13476-3.
- Dimensions - BS EN 13476-3, Section 7.
- Ends - Solid plain, Type A1, Type A2, Type B.
- Finish - Black, orange-brown, dusty grey

2555A PLASTICS PIPING SYSTEMS TO BS EN 1451-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Polypropylene (PP).
- Standard - BS EN 1451-1 and BS EN 15012.
- Size range - 32mm to 315mm.
- Dimensions - BS EN 1451-1 tables 5 - 8.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580A PVC-U PIPING SYSTEMS - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - PVC-U to BS EN 1329-1
- Dimensions - Length - manufacturer's standard range. BS EN 1329-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580B ABS PIPING SYSTEMS - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Acrylonitrile-butadiene-styrene (ABS).
- Standard - ABS to BS EN 1455-1.
- Dimensions - Length - manufacturer's standard range. BS EN 1455-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580C PE PIPING SYSTEMS - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Polyethylene (PE).
- Standard - PE to BS EN 1519-1.
- Dimensions - Length - manufacturer's standard range. BS EN 1519-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580D SAN AND PVC PIPING SYSTEMS - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Styrene copolymer blends (SAN + PVC).
- Standard - SAN + PVC to BS EN 1565-1.
- Dimensions - Length - manufacturer's standard range. BS EN 1565-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580E PVC-C PIPING SYSTEMS TO BS EN 1566-1 - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Chlorinated polyvinyl chloride (PVC-C).
- Standard - PVC-C to BS EN 1566-1.
- Dimensions - Length - manufacturer's standard range. BS EN 1566-1 tables 1, 2, 3 and 4.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2580F STRUCTURED-WALL PVC-U PIPING SYSTEMS - PIPES:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - Structure-wall PVC-U to BS EN 1453-1.
- Dimensions - manufacturer's standard range. BS EN 1453-1.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey.

2585A PVC-U PIPING SYSTEMS TO BS EN 1329-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Unplasticised polyvinyl chloride (PVC-U).
- Standard - PVC-U to BS EN 1329-1
- Size range - 32mm to 315mm.
- Dimensions - BS EN 1329-1 tables 5-14.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2585B ABS PIPING SYSTEMS TO BS EN 1455-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Acrylonitrile-butadiene-styrene (ABS).
- Standard - ABS to BS EN 1455-1.
- Dimensions - BS EN 1455-1 tables 5-12.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2585C PE PIPING SYSTEMS TO BS EN 1519-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Polyethylene (PE).
- Standard - PE to BS EN 1519-1.
- Size range - 32mm to 315mm.
- Dimensions - BS EN 1519-1 tables 5-9.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2585D SAN AND PVC PIPING SYSTEMS TO BS EN 1565-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Styrene copolymer blends (SAN + PVC).
- Standard - SAN + PVC to BS EN 1565-1.
- Dimensions - BS EN 1565-1 tables 5-11.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.

- Finish - Grey, black, or white.

2585E PVC-C PIPING SYSTEMS TO BS EN 1566-1 - FITTINGS:

- Plastics piping systems for soil and waste discharge (low and high temperature) within the building structure.
- Material - Chlorinated polyvinyl chloride (PVC-C).
- Standard - PVC-C to BS EN 1566-1.
- Dimensions - BS EN 1566-1 tables 5-12.
- Ends - Plain; elastomeric ring seal socket and spigot; or socket and spigot for solvent cement.
- Finish - Grey, black, or white.

2595 PLASTICS PIPING SYSTEMS TO BS EN ISO 15874:

- Plastics piping systems for hot and cold-water installations, including heating, within buildings.
- Material - Polypropylene (PP).
- Standards
    - BS EN ISO 15874-1 - General
    - BS EN ISO 15874-2 - Pipes
    - BS EN ISO 15784-3 - Fittings
    - BS EN ISO 15784-5 - Fitness for purpose of system
- Dimensions - manufacturer's standard range.
- Pipe ends - Plain, socket for fusion fittings, socket for electrofusion fittings, for mechanical fittings or fittings with incorporated inserts.
- Fittings ends - Plain, socket fusion fittings, electrofusion fittings, mechanical fittings or fittings with incorporated fittings

2597 PLASTICS PIPING SYSTEMS TO BS EN ISO 15875:

- Plastics piping systems for hot and cold-water installations, including heating, within buildings.
- Material - Crosslinked polyethylene (PE-X).
- Standards
    - BS EN ISO 15875-1 - General
    - BS EN ISO 15875-2 - Pipes
    - BS EN ISO 15875-3 - Fittings
    - BS EN ISO 15875-5 - Fitness for purpose of the system
- Dimensions - manufacturer's standard range.
- Ends - Plain, suitable for electrofusion fittings, mechanical fittings, or fittings with incorporated inserts.
- Fitting ends - Plain, socket fusion fittings, electrofusion fittings, mechanical fittings or fittings with incorporated fittings
-

2599 PLASTICS PIPING SYSTEMS TO BS EN ISO 15876:

- Plastics piping systems for hot and cold-water systems, including heating, within buildings.
- Material - polybutylene (PB).
- Standards:
    - BS EN ISO 15876-1 - General
    - BS EN ISO 15876-2 - Pipes

    - BS EN ISO 15786-3 - Fittings
    - BS EN ISO 15876-5 - Fitness for purpose of the system
- Dimensions - manufacturer's standard range.
- Ends - Plain, sockets for fusion fittings, suitable for electrofusion fittings, mechanical fittings, or fittings with incorporated inserts.
- Fittings ends - Plain, socket fusion fittings, electrofusion fittings, mechanical fittings or fittings with incorporated fittings.
- Finish - Natural or coloured

2601 PLASTICS PIPING SYSTEMS TO BS EN ISO 15877:

- Plastics piping systems for hot and cold-water installations within buildings.
- Material - chlorinated poly (vinyl chloride) (PVC-C).
- Standards
    - BS EN ISO 15877-1 - General
    - BS EN ISO 15877-2 - Pipes
    - BS EN ISO 15877-3 - Fittings
    - BS EN ISO 15877-5 - Fitness for purpose of the system
- Dimensions - manufacturer's standard range.
- Pipe ends - Plain, single socket.
- Fittings ends - Plain, cylindrical sockets or conical sockets.

2603 PLASTICS PIPING SYSTEMS TO BS EN ISO 22391:

- Plastics piping systems for hot and cold-water installations within buildings.
- Material - Polyethylene of raised temperature resistance (PE-RT).
- Standards
    - BS EN ISO 22391-1 - General
    - BS EN ISO 22391-2 - Pipes
    - BS EN ISO 22391-3 - Fittings
    - BS EN ISO 22391-5 - Fitness for purpose of the system
- Dimensions - Length and wall thickness - manufacturer's standard range.
- Pipe ends - Plain, single socket.
- Fittings ends - Plain, cylindrical sockets or conical sockets

2668# POLYETHYLENE PIPES TO BS EN 12201:

- Plastic piping system for water under pressure up to 20°C and 25bar and drainage/sewerage under pressure.
- Material - Polyethylene.
- Standard - BS EN 12201-1, BS EN 12201-2 and BS EN 12201-5.
- Dimensions
    - BS EN 12201-2, table 2.
- Lengths - No requirements, to be agreed between purchaser and manufacturer.
- Marking – BS EN 12201-2, table 6.
- Ends – Plain or Sockets
- Finish

- Blue or Black with Blue Stripes - water for human consumption.
- Black or black with brown stripes - drainage/sewerage.

2669# POLYETHYLENE FITTINGS TO BS EN 12201:

- Material - Polyethylene.
- Standard - BS EN 12201-3.
- Dimensions - BS EN 12201-3, section 6 and Annex A.
- Marking - BS EN 12201-3, section 11, and table 8.
- Ends - Plain.
- Finish – Blue or Black

2685# UNPLASTICIZED PVC PIPES TO BS EN 1401-1:

- Material - Unplasticized polyvinyl chloride.
- Standard - BS EN 1401-1.
- Dimensions
  - Length - manufacturer's standard range.
  - Mean outside diameter - BS EN 1401-1, Table 3.
  - Wall thickness - BS EN 1401-1, Table 4.
- Ends - Socket and spigot for solvent cement.
- Finish - Dusty grey.

2686# UNPLASTICIZED PVC PIPE FITTINGS TO BS EN 1401-1:

- Material - unplasticized polyvinyl chloride.
- Standard - BS EN 1401-1.
- Size range -110mm to 1000mm (nominal outside dia.).
- Dimensions - BS EN 1401-1, Tables 5 to 8.
- Ends - Solvent cement, socket/spigot.
- Finish - Dusty grey.

2880 PRE-INSULATED BONDED PIPE SYSTEMS FOR DISTRICT COOLING/HEATING - STEEL

- Supply pre-insulated bonded pipe systems for underground networks, designed, installed and tested in accordance with BS EN 13941.
- Single service pipes to comprise, straight lengths of prefabricated thermally insulated pipe-in-pipe assemblies comprising mild steel service pipes, polyurethane thermal insulation and high density polyethylene outer casing to BS EN 253.
- Provide fitting and valve assemblies in accordance with BS EN 448 and. Joint assemblies to be in accordance with BS EN 489
- Installation to be in accordance with the manufacturer's instructions.

3000 PRODUCTS/MATERIALS - JOINTING AND ACCESSORIES

3010A CIRCULAR FLANGES FOR PIPES, PN DESIGNATED - WELDED FLANGE:

- Material - BS EN 1092-1.

- Flange type - Weld neck flange or hubbed slip-on flange for welding.
- Flange facings - Raised face - type B.
- Bolting - In accordance with BS EN 1092-1.

3010C CIRCULAR FLANGES FOR PIPES, PN DESIGNATED - CAST IRON FLANGE:

- Material - BS EN 1092-2 - Ductile cast iron.
- Bolting - In accordance with BS EN 1092-2.

3020A JOINTING RINGS - NON-METALLIC FLAT GASKETS:

- Non-metallic flat gaskets for flanges to BS EN 1092-4.
- Standard - BS EN 1514-1
- Gasket type - Full face for type B.

3020B JOINTING RINGS - METALLIC GASKETS:

- Corrugated, flat or grooved metallic and filled metallic gaskets for flanges to BS EN 1092-4.
- Standard - BS EN 1514-4
- Gasket type - Corrugated metal.
- Gasket design - Self centring for type B.

3020C JOINTING RINGS FOR CAST IRON:

- Non-metallic flat gaskets for flanges to BS EN 1092-2
- Standard - BS EN 1514-1.
- Gasket type - Suitable for flanges to BS EN 545, BS EN 598 and BS EN 969.

3030A SCREWED JOINTS TO BS EN 10226:

- Use PTFE tape to BS 7786 or use hemp and jointing compound to BS 6956-5, or BS EN 751-2.

3030C SCREWED JOINTS TO BS EN 10226 WITH CHEMICAL CLEANING:

- Use hemp and jointing compound to BS 6956-5 or BS EN 751-2, prior to chemical treatment and use PTFE tape to BS 7786 after chemical treatment.

3050A WELDED JOINTS, WELDING RODS FOR STEEL PIPES:

- Gas welding, BS EN 12536; electric arc welding BS 2971.

3070# CAPILLARY JOINTS:

- Use materials as follows:
  - Solder
    - BS EN ISO 9453

        - Use lead-free fittings in accordance with BS EN 1254-1 on potable water systems.
    - Flux
        - Copper pipe - classification labelling and packaging to BS EN ISO 9454-1 and performance requirements to BS EN ISO 9454-2.
        - Stainless steel pipe - BS 5245.

3110A SPIGOT/SOCKET CAULKED JOINTS:

- Use for spun cast iron pipe.
- Yarn - Tarred hemp or spun yarn; or sterile inorganic yarn.
- Lead - Virgin blue pig lead.

3125 JOINTING EQUIPMENT FOR PRESS FITTING SYSTEM:

- Provide the manufacturer's recommended press fitting tool for use with press fitting system.

3130# PRESS FITTING JOINTING SYSTEM ON STAINLESS STEEL PIPE:

- Standard
    - To BS EN 10312.
- Size range
    - 15mm to 108mm for water.
    - 15mm to 108mm for gas.
- Dimensions
    - To BS EN 10312.
- Ends
    - With O ring seal for use with water to manufacturer's standard.
    - With O ring seal for use with gas to manufacturer's standard.
    -
- Finish - Natural.

3152A MECHANICAL JOINTS, GROOVED STAINLESS STEEL PIPES:

- Material - ductile cast iron to ASTM A536, grade 65-45-12 carbon or stainless steel type 316 conforming to ASTM A531, A743 and A744, grade CF8M
- Joint type
    - For applications where vibration attenuation and stress relief is required use flexible 2 piece housing type.
    - Use rigid 2 piece housing type where stress relief is not required .
    - For pipe sizes 350mm and above use 2 segment, wedge shaped grooved with lead-in chamfer on housing key.
- Size range
    - 20mm to 300mm, rigid: housing shall engage the bottom of the groove.

- 350mm and larger: 2 segment, wedge shaped grooved with lead-in chamfer on housing key.

- Gaskets
  - Grade 'E' EPDM.
- Finish - painted to manufacturer's standard or self colour.

3190A WALL, FLOOR AND CEILING CHROMIUM PLATED MASKING PLATES:

- Material - Copper alloy, chromium plated.
- Type - Heavy, split on the diameter, close fitting to outside of pipe.
- Fixing - Chrome raised head fixing screws.

3190B WALL, FLOOR AND CEILING PLASTIC MASKING PLATES:

- Material - Plastic.
- Fixing - Clipped with plastic lug.

4000 WORKMANSHIP, GENERAL

4010 APPEARANCE:

- Arrange all exposed pipe runs to present neat appearance, parallel with other pipe or service runs and building structure, subject to gradients for draining or venting.
- Ensure all vertical pipes are plumb or follow building line.

4020 SPACING:

- Space pipe runs in relation to one another, other services runs and building structure, allow for specified thickness of thermal insulation and ensure adequate space for access to pipe joints, etc.
- The following are recommended as minimum clearances in spacing of pipe runs:-

Between	and	Clearance (mm)
Pipeline insulated or uninsulated	Wall Finish	25
	Ceiling Finish	50
	Soffit Floor Finish	150
Insulated Pipeline	Adjacent service runs	25
Uninsulated pipeline	Adjacent service runs	50
Adjacent pipelines	Both uninsulated	150
	One uninsulated	75
	Both insulated	25

4030 GRADIENTS:

- Install pipework with gradients to allow drainage and/or air release, and to the slopes where indicated.

4040A AIR BOTTLES:

- Provide a means of venting the pipe system at all high points.
- Provide a vertical extension from the pipe approximately 100mm long, at the bore of the pipe, with a copper extension pipe with a manual vent cock located in an easily accessible position.

4040B AUTOMATIC AIR VENTS:

- Provide a means of venting the pipe system at all high points.
- Provide an automatic air vent valve with a copper outlet pipe from the valve to a tundish in an adjacent drain line or to another suitable location.

4050 DRAIN REQUIREMENTS:

- Grade pipework to allow system to be drained. Provide a means of draining the system at all low points.

4060 EXPANSION AND CONTRACTION:

- Arrange supports and fixings to accommodate pipe movement caused by the thermal changes, generally allow the flexure at changes in direction. Allow for movement at branch connections.
- For water systems, using a grooved pipework system, the proprietary flexible couplings may be used to accommodate thermal growth, contraction and for the elimination of expansion loops. The type, quantity required, locations and installation/support details of flexible couplings proposed shall be in accordance with the manufacturer's written recommendations and show on the installation drawings. Where loops are required, use flexible couplings on the loop.

4070# PIPE FITTINGS:

- Use eccentric type reductions and enlargements on horizontal pipe runs to allow draining and venting, concentric on vertical pipes, with easy transition and an included angle not exceeding 30 degree. Do not use bushes, except at radiators and at fittings where required size is not of standard manufacture. Where required, use eccentric bushes to allow draining or venting; maximum aspect ratio not to exceed two pipe sizes; above this ratio use reducing fittings. Use square tees at venting and draining points. Square elbows are not acceptable.

4110 PIPES THROUGH NON-FIRE RATED WALLS AND FLOORS:

- Enclose pipes passing through building elements, (walls, floors, partitions, etc.) concentrically within purpose made sleeves. Fit masking plates where visible pipes pass through building elements, including false ceilings of occupied rooms. Unless detailed elsewhere, carry insulation including vapour barrier where necessary through pipe sleeves.

4120A PIPE SLEEVES IN NON-FIRE RATED WALLS AND FLOORS - INSULATION NOT CARRIED THROUGH:

- Where pipe insulation is not carried through pipe sleeve, cut sleeves from material same as pipe one or two sizes larger than pipe to allow clearance. Do not use sleeves as pipe supports.
- Install sleeves flush with building finish. In areas where floors are washed down install with a 100mm protrusion above floor finish and cap off end of sleeve.

4120B PIPE SLEEVES IN NON FIRE RATED WALLS AND FLOORS WITH INSULATION CARRIED THROUGH:

- Where pipe insulation is carried through pipe sleeve, cut sleeves from material same as pipe one or two sizes larger than pipe and insulation to allow clearance. Do not use sleeves as pipe supports.
- Install sleeves flush with building finish. In areas where floors are washed down to install with a 100mm profusion above floor finish and cap off end of sleeve.

4150A TEMPORARY PLUGS, CAPS AND FLANGES:

- Seal all open ends as installation proceeds by plugs, caps or blank flanges, to prevent ingress of foreign matter.
- Use plugs of metal, plastic or wood to suit pipework material.
- In the event of such precautions not being taken, strip out pipework adjacent to open ends to demonstrate that fouling of bores has not occurred.

4160 FLANGED JOINTS GENERAL:

- Use number and diameters of bolts to standard. Fit bolts of length to give not less than one thread, or more than 3mm protrusion beyond nut when joint is pulled up.
- Fit washers under each nut.

4170 DISSIMILAR METALS:

- Take appropriate means to prevent galvanic action where dissimilar metals are connected together.

4180 PIPE RINGS AND CLIPS:

- Select type according to the application and material compatibility, give particular attention where pipes are subject to axial movement due to expansion or contraction.

4190 ANCHORS:

- Construct to resist axial stress transmitted by flexure of horizontal and vertical pipe runs or loading on vertical pipes assuming that unbalanced forces exist at all anchor points, even when these are situated in intermediate positions between two expansion loops or bellows. Use similar or compatible materials to the attached pipe.

- Provide and fix all associated backing plates, nuts, washers and bolts for attachment to or building into building structure; ensure structure is suitable for transmitted stress. Set out and line up anchors accurately in position. Inspect final grouting into building structure.

4200 SLIDE GUIDES:

- Direct movement of expansion and contraction from pipe anchor points towards loops, bellows or flexible inserts. Ensure that thrust is linear relative to the axis of pipe.
- Apply a friction reducing material between metal faces subjected to movement.

4205 PIPE SUPPORTS:

- Arrange supports and accessories for equipment, appliances or ancillary fitments in pipe runs, so that no undue strain is imposed upon pipes.
- Ensure that materials used for supports are compatible with pipeline materials.

4220 SUPPORT SPACING:

- Space supports as tables.

Pipe Size (mm)	Maximum Support Spacing (m)					
Nominal	Steel Pipe (Insulated)		Copper or Light Gauge Stainless Steel Pipe (Insulated)		Iron Pipe	
	horizontal	vertical	horizontal	vertical	horizontal	vertical
Up to 15	1.8	2.4	1.2	1.8	-	-
20	2.4	3.0	1.2	1.8	-	-

200	6.0	8.5	-	-	3.7	3.7
250	6.5	9.0	-	-	4.5	5.4
300	7.0	10.0	-	-	8.0	10.0
350	10.0	12.0	-	-	-	-
400	10.5	12.6	-	-	-	-
450	11.0	13.2	-	-	-	-
500	12.0	14.4	-	-	-	-
600	14.0	16.8	-	-	-	-

Pipe OD	Maximum Support Spacing (m) PVC or ABS Pipe Contents up to 20°C	
	Horizontal	Vertical
15	0.8	1.2
20	0.8	1.2
25	0.9	1.3

32	1.0	1.5
40	1.1	1.6
50	1.3	1.9
80	1.6	2.4
100	1.9	2.8
150	2.1	3.0
200	2.4	3.6
250	2.6	3.9
300	2.8	4.2

- For grooved steel and copper pipe, no individual pipe length should be left unsupported.
- Vertical support spacing
    - Check total self-weight and pressure loading against manufacturer's recommendations when using mechanical joints or end load capable flexible couplings. Ensure adequate pipe support when using non-end load capable flexible couplings.
    - Space vertical support intervals for plastics pipe at not greater than twice horizontal intervals tabulated.
    - Space external vertical PE gas pipes in accordance with the current edition of IGEM/UP/2
- Space horizontal and vertical pliable corrugated stainless steel gas pipes in accordance with the current edition of IGEM/UP/2.
- Where multiple pipe runs of differing bores are supported from a common point, use support spacing of pipe requiring closest spacing.
- Spacings given for PVC-U pipe to BS EN ISO 1452

4230A ISOLATION AND REGULATION:

- Provide valves, cocks and stop taps for isolation and/or regulation where indicated, and on:
    - Mains to isolate major sections of distribution;
    - The base of all risers and drops except in cases where one item of apparatus only is served which has its own local valve or stop tap;
    - Points of pipe connection of all items of apparatus and equipment except where the item could conveniently be isolated or regulated by valves provided for other adjacent items;
    - Draw-off fittings except where ranges of fittings are served by a common float, the isolator then being fitted with the float.

4240 MAINTENANCE AND RENEWAL:

- Arrange pipework, valves, drains, air vents, demountable joints, supports, etc., for convenient routine maintenance and renewals. Provide all runs with a regularly spaced pattern of demountable joints in the form of unions, flanges, etc., and also at items of equipment to facilitate disconnection.
- Locate valves, drains, flanges etc. in groups.

5000 WORKMANSHIP, STEEL PIPEWORK

5010A WELDING GENERAL, CLASS 1:

- Use skilled craftsman in possession of a current Certificate of Competence appropriate to type and class of work, issued by an approved authority. Mark each weld to identify operative. Submit specimen welds, representative of joints and conditions of site welding, for each

craftsman, test non-destructively, approximately 10% of butt weld joints and 5% of all other joints.
- Weld pipeline joints to BS 2633 as appropriate. Carry out non-destructive testing on 10% or as indicated.

5010B WELDING GENERAL, CLASS 2:

- Use skilled craftsman in possession of a current Certificate of Competence appropriate to type and class of work, issued by an approved authority. Mark each weld to identify operative. Submit specimen welds, representative of joints and conditions of site welding, for each craftsman, test non-destructively, approximately 10% of butt weld joints and 5% of all other joints.
- Weld pipeline joints to BS 2971 and to BESA (formerly HVCA) TR/5 Code of Practice: Welding of Carbon Steel Pipework, as appropriate.

5020 WELDED JOINTS, STEEL PIPES:

- Preparation, Making and Sealing.
  - Arc welding, conforming to BS 2971 appropriate to system temperature and pressure. Use arc welding process on piping greater than 100mm.

5030 PAINTING WELDED JOINTS, STEEL PIPES:

- Unless pipework is being prepared for galvanizing after manufacture, wire brush and paint all welds with red oxide paint when welds are complete.

5040 FLANGED JOINTS, STEEL PIPES:

- Welded Flanges
  - Weld neck and bore of 'slip on' flange.
  - Butt weld neck of welding neck flange.
- Screwed Flanges
  - Apply jointing materials. Screw on flange and expand tube into flange with roller expander where necessary.
- Preparation
  - Ensure that flange mating faces are parallel; flange peripheries are flush with each other; and bolt holes are correctly aligned.
- Making and Sealing
  - Insert jointing between flange mating faces. Pull up joint equally all round.

5050 SCREWED JOINTS, STEEL PIPES:

- Preparation
  - Ensure that plain ends are cut square. Reamer out bore at plain ends.
  - Screw plain ends, taper thread.

- Making and Sealing
    - Coat male pipe threads with jointing compound and hemp, or PTFE tape on small sizes. Immediately after applying coating, connect with female end of socket or fitting, and tighten ensuring that coating does not intrude into pipe. Leave joint clean.

5060 MECHANICAL JOINTS, GROOVED STEEL AND STAINLESS STEEL PIPES:

- Preparation
    - Ensure installers receive training from manufacturer on correct installation technique, and correct and safe use of pipe grooving tool by a factory trained manufacturer's representative. The grooving tool must be manufactured by the grooved coupling manufacturer. Ensure that cut ends are square, free of bumps, dents and score marks and that pipe outside diameter is within mechanical joint manufacturer's tolerances. Form groove in accordance with manufacturer's recommendations and to manufacturer's groove diameter tolerances. Ensure that the manufacturer supplies a grooved measuring tape to be able to check the groove is in tolerance. Manufacturer must provide certification to anyone grooving onsite or in a fabrication shop to show the correct training has been provided. Assemble joint in accordance with manufacturer's instructions.
- Making and Sealing
    - Ensure gasket material is suitable for service. For standard couplings thoroughly lubricate gasket, externally and internally, using manufacturer's recommended lubricant. Stretch gasket over one pipe end and bring pipe ends together. Slide gasket into central position over both pipe ends. Position joint half housings over gasket and insert bolts and nuts. Joints should not require any torque to show visual bolt pad to pad connection, if alternative joints are to be proposed that require torque this must be notified at the time of tender for approval. Tighten bolts to manufacturer's instructions. Check alignment of joint and pipework.
- Earth continuity
    - Full earth continuity shall be achieved by both rigid and flexible couplings. If the manufacturer's coupling selected cannot achieve this, install proprietary earth continuity clips to ensure compliance with IET regulations at each joint.
- Installation-ready couplings
    - Do not dismantle the coupling. Lubricate inner sealing lips of gasket using manufacturer's recommended lubricant. Assemble the joint by inserting the grooved pipe ends into each opening of the coupling until the ends make contact with the gasket center leg. Tighten bolts to manufacturer's instructions. Check alignment of joint and pipework.

5070A ANCHORS, STEEL PIPES, U-BOLTS:

- Provide anchors constructed using mild steel over-straps or heavy U-bolts. Secure to channel section, adequately attached to or grouted into building structure; weld longitudinal edges of strap to pipe.

5070B ANCHORS, STEEL PIPES, SLIP-ON FLANGES:

- Provide anchors constructed by passing two slip-on flanges over pipe to anchor point. Bolt together through an interposed mild steel channel section attached to or grouted into building structure, and finally weld flanges to pipe.

5090 STEEL PIPEWORK PAINTING:

- Remove scale, rust or temporary protective coating by chipping, wire brushing or use of approved solvents and paint with one coat of red oxide primer, as work proceeds.

5100 COMPRESSION JOINTS, STAINLESS STEEL PIPES:

- Use BS EN 1254-2 Type 'A' fittings.
- Preparation - Ensure that plain ends are cut square. Reamer out bore at plain ends to full bore size. Clean plain ends with fine steel wool.
- Making and Sealing - In accordance with fitting manufacturer's instructions.

6000 WORKMANSHIP, COPPER PIPEWORK

6030 COMPRESSION JOINTS, COPPER PIPES, LIGHT GAUGE:

- Preparation for fittings to BS EN 1254-2.
    - Type `A' fitting
        - Ensure that plain ends are cut square. Reamer out bore at plain ends to full bore size. Clean plain ends with fine steel wool or fine sandpaper.
- Type `B' fitting
    - Ensure that plain ends are cut square. Reamer out bore at plain ends to full bore size. Clean plain ends with fine steel wool or fine sandpaper. Then comply with manufacturer's instructions.
        - Making and Sealing - As manufacturer's instructions.

6040 CAPILLARY JOINTS, COPPER PIPES, LIGHT GAUGE:

- Preparation - Ensure that plain ends are cut square. Reamer out bore at plain ends to full bore size. Clean plain ends with fine steel wool.
- Making and sealing - Use specified flux ensuring no excess material used. Make joint in accordance with manufacturer's instructions. Clean off traces of flux when joint is completed.

6060A ANCHORS, COPPER PIPES, SADDLE CLAMPS:

- Provide anchors constructed by fitting two flanges to copper female adapters in pipe run at anchor point. Bolt together through an interposed mild steel channel section attached to or grouted into building structure.

6060B ANCHORS, COPPER PIPES, SADDLE CLAMPS :

- Anchor pipework using saddle clamps to mild steel channel section attached to or built into building structure.

7000 WORKMANSHIP, CAST/DUCTILE IRON PIPEWORK

7010 FLANGED JOINTS, CAST IRON/DUCTILE IRON PIPES:

- Preparation - Ensure that flange mating faces are parallel, flange peripheries are flush with each other and bolt holes are correctly aligned.
- Making and Sealing - Coat both sides of joint ring with jointing compound to BS 6956-5 or BS EN 751-2. Insert joint ring between flange mating faces. Pull up joint with bolts, nuts and washers, ensuring that excess compound does not intrude into the pipe. Leave joint clean.

7020 CAULKED JOINTS, CAST IRON/SPUN CAST IRON PIPES:

- Preparation - Ensure plain ends are cut square.
- Making and sealing - Caulk socket with yarn, fill socket with molten lead, allow to cool and caulk home. Ensure bore of pipe is not obstructed.

7030 FLEXIBLE JOINTS, CAST IRON PIPES:

- Preparation - Ensure that cut ends are square. Form groove to manufacturer's detail. Assemble joint in accordance with manufacturer's instructions.
- Making and Sealing - Ensure joint ring is suitable for service. Thoroughly lubricate joint ring. Slip ring over pipe end and bring ends together. Slide ring into central position over both pipe ends. Position metal half housings over joint ring and insert bolts and nuts. Tighten bolts to manufacturer's instructions. Check alignment of joint and pipework.

8000 WORKMANSHIP, PLASTIC PIPEWORK

8005 THERMOPLASTIC PIPING SYSTEMS FOR SOIL AND WASTE DISCHARGE:

- Comply with recommendations in PD CEN/TR 13801 and general installation practice given in
    - BS EN 12056-1
    - BS EN 12056-2
    - BS EN 12056-3
    - BS EN 12056-4
    - BS EN 12056-5

8006 THERMOPLASTIC PIPING SYSTEMS FOR HOT AND COLD WATER AND HEATING:

- Install pipes and associated fittings to all parts of BS 7291 in accordance with BS 5955-8 and the manufacturer's recommendations.

8010 SOLVENT WELDED JOINTS, PVC PIPES:

- Use solvent welded joints generally, ring seal joints at expansion joints and elsewhere as necessary.
- Preparation - Ensure that plain ends are cut square. Reamer out bore at plain ends. Clean plain ends with solvent cleaner.
- Making and Sealing - In accordance with fitting manufacturer's instructions.

8020 FUSION JOINTS, POLYETHYLENE PIPES:

- Preparation - Square cut plain ends. Form pipe ends for socket type joints.
- Making and Sealing - In accordance with fitting manufacturer's instructions.
- Carry out butt fusion jointing of pipes and fittings in accordance with the procedures given in BS ISO 21307.

8030 MECHANICAL FITTINGS FOR POLYETHYLENE PIPE:

- Preparation - Ensure that cut ends are square. Check wall thickness/pressure rating of fitting.
- Making and sealing - Ensure correct gasket type is used for service (e.g. water or gas). Assemble fitting in accordance with manufacturer's instructions.

8040 ANCHORS - PVC PIPES:

- Clamp pipework to mild steel channel section attached to or grouted into building structure, using PVC coated over-straps, or clamps and with a polypropylene strip between pipe and mild steel section.

8050 JOINTING POLYBUTYLENE PIPES AND FITTINGS:

- Carry out installation of polybutylene pipes and fittings in accordance with manufacturer's instructions.

8070 WORKMANSHIP, PLASTIC PIPES WITH SECONDARY CONTAINMENT AND FITTINGS FOR UNDERGROUND FUEL OIL SYSTEMS:

- Install plastic pipes with secondary containment for underground fuel oil systems in accordance with OFTEC TI/134 and the manufacturer's recommendations.

9000 WORKMANSHIP

9010 FLEXIBLE COUPLINGS AND FLANGE ADAPTERS, SLEEVE TYPE:

- Preparation - Ensure that cut ends are square and free of bumps, dents and score marks and are within manufacturer's tolerances.
- Making and sealing - Ensure gasket is suitable for service. Thoroughly lubricate gasket using manufacturer's recommended lubricant. Assemble coupling in accordance with manufacturer's instructions.
- For non-end load capable couplings, ensure that adequate pipe anchorage is provided to prevent pipe disengagement.

9020B STEAM AND CONDENSATE MAINS:

- Steam mains
    - Whenever possible install with a fall not less than 1:100 in the direction of steam flow. In circumstances where this is not practical lower falls may be acceptable but no lower than 1:250.

        - Where a stream main has to rise in the direction of flow, install with a slope not less than 1:40.
    - Condensate return lines
        - Install discharge lines from trap sets with a fall of 1:70.
        - Lift pumped condensate from receivers immediately after the pump and wherever possible size and install the return pipe with a gravity fall to the end of the line ensuring the fall is adequate to overcome frictional resistance of the pipe. Install a vacuum breaker at the top of the lift and install automatic air vents whenever the pipe has to drop/rise to avoid clashing with other services/building structure.
    - Take steam connections to plant and equipment from the top of the steam main.
    - Connect condensate discharge from trap sets into the top of the condensate main.
    - Do not use trap sets to lift condensate on equipment with automatic control valves to avoid stall in the heat exchanger.
    - Install strainers on their sides when they are part of a steam line to avoid water hammer.
    - Use thermodynamic traps on pipelines which may be subject to freezing conditions.
    - On steam mains, provide drain points comprising drain pocket and trap set trap sets discharging into condensate mains.
        - Drain pocket minimum dimensions
            - Pocket diameter - mains diameter for mains up to 100mm; 100mm diameter for main sizes 125mm - 200mm; for mains 250 diameter and above - 0.5 x mains diameter.
            - Depth - for mains up to 100mm diameter - 100mm deep; for main sizes 125mm - 200mm diameter - 150mm deep; for mains 250 diameter and above - depth to be equal to mains diameter.
        - Locate drain points at all low points on steam mains, at intervals not greater than 50m (but where possible at 30m intervals) and immediately before all automatic control valves on steam mains.

9030 PROTECTION OF UNDERGROUND PIPEWORK:

- Protect where indicated against corrosion by the application of a compatible anti-corrosive, non-cracking, non-hardening waterproof sealing tape.
- Apply, after cleaning pipework, by wrapping contrawise with two layers spirally around the pipe, ensuring a 50% minimum overlap.

9040# PROTECTION OF BURIED PIPES, MARKED:

- Provide earth cover as follows
- Water pipework
    - 900 mm minimum; 1200 mm maximum where practicable.
- Fuel oil and gas - 500 mm minimum.
- Under roadways provide minimum cover of 900 mm.
- Provide a marker tape to identify buried pipe services as indicated.

9060# INSTALLATION OF THERMALLY INSULATED UNDERGROUND PIPELINES:

- Install pre-insulated bonded steel pipelines to BS EN 253, BS EN 448, BS EN 488 and BS EN 489 in accordance with manufacturer's instructions and BS EN 13941 or BS EN 15698-1 for twin pipe systems.
- Install pre-insulated bonded flexible pipe system, with plastic service pipes to BS EN 15632-1 and BS EN 15632-2 in accordance with manufacturer's instructions.
- Install pre-insulated non bonded flexible pipe system with plastic service pipes to BS EN 15632-1 and BS EN 15632-3 in accordance with manufacturer's instructions.
- Install pre-insulated bonded flexible pipe system with metal service pipes to BS EN 15632-1 and BS EN 15632-4 in accordance with manufacturer's instructions.

9100 CORROSION PROTECTIVE TAPE:

- Apply basic cotton carrier tape saturated with petroleum hydrocarbons with inert siliceous fillers. Wind tape spirally contrawise round pipework applied and overlapped to manufacturer's recommendations.

9110 MECHANICAL PROTECTIVE TAPE:

- Apply hessian based bituminous tape over the corrosion protective tape. Wind tape spirally contrawise round pipework applied and overlapped to manufacturer's recommendations.

9120# STEELWORK PAINTING:

- Prepare supports, bearers and other uncovered steelwork as steel pipework.
- Where not exposed, paint with one coat zinc chromate or red oxide primer.

Y11 - PIPELINE ANCILLARIES

1010 SAFETY AND RELIEF VALVES, SELF OPERATED, APPLICATION:

- Safety - to discharge with rapid opening action to prevent pre-determined safe pressure being exceeded.
- Relief - to discharge with opening action proportional to increase in pressure above set pressure.
- Standards - select, supply and install safety devices in accordance with relevant parts of BS EN ISO 4126 to suit the project particular requirements.

2000 PRODUCTS/MATERIALS

2015A STOP VALVES TO BS EN 1213 FOR POTABLE WATER SUPPLIES - COMPRESSION ENDS FOR COPPER:

- Pattern - Straight.
- Material - copper alloy.
- Flow rate class - VA (straight and angle pattern stopvalves).
- End connections - Compression to BS EN 1254-2.

2015B STOP VALVES TO BS EN 1213 FOR POTABLE WATER SUPPLIES - COMPRESSION ENDS FOR PLASTICS:

- Pattern - Straight.
- Material - copper alloy.
- Flow rate class - VA (straight and angle pattern stopvalves).
- End connections - Compression to BS EN 1254-3.

2015C STOP VALVES TO BS EN 1213 FOR POTABLE WATER SUPPLIES - CAPILLARY:

- Pattern - Straight.
- Material - copper alloy.
- Flow rate class VA (straight and angle pattern stopvalves).
- End connections - Capillary to BS EN 1254-1.

2015D STOP VALVES TO BS EN 1213 FOR POTABLE WATER SUPPLIES - THREADED:

- Pattern - Straight.
- Material - copper alloy.
- Flow rate class - VA (straight and angle pattern stopvalves).
- End connections - Threaded to relevant parts of BS EN 10226

2020A THREADED ENDS GATE VALVES TO BS EN 12288:

- Series - B.
- Gate valve type - Solid or split wedge.
- Ends - Threaded to BS EN ISO 228-1 or ISO 7-1.
- Stem - Inside screw non-rising stem.

- Trim material - Manufacturer's standard.
- Operation - Handwheel.

2020B COMPRESSION ENDS GATE VALVES TO BS EN 12288:

- Series - B.
- Gate valve type - Solid or split wedge.
- Ends - Compression to BS EN 1254-2.
- Stem - Inside screw non-rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.

2020C FLANGED ENDS GATE VALVES TO BS EN 12288:

- Series - B.
- Gate valve type - Solid or split wedge.
- Ends - Flanged to BS EN 1092-3.
- Stem - Inside screw non-rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.

2020D LOOSE NUT/UNION ENDS GATE VALVES TO BS EN 12288:

- Series B.
- Gate valve type - Solid or split wedge.
- Ends - Loose nut/union end.
- Stem - Inside screw non-rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.

2030A FLANGED GATE VALVES TO BS EN 1171:

- Valve type - Solid or split wedge.
- Seat - Metal.
- Ends - Flanged to BS EN 1092-2.
- Body and bonnet material - Grey cast iron.
- Trim category - Copper alloy faced.
- Operation - Handwheel.

2040A THREADED END GLOBE VALVES TO BS 5154:

- Series - B.
- Pattern - Straight.
- Ends - Threaded to relevant parts of BS EN 10226.
- Stem - Inside screw rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.
- Options - Non-metallic renewable seat/disk rings.

2040B FLANGED GLOBE VALVES TO BS 5154:

- Series - B.
- Pattern - Straight.
- Ends - Flanged to BS EN 1092-3.
- Stem - Inside screw rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.
- Options - Non-metallic renewable seat/disk rings.

2040C COMPRESSION GLOBE VALVES TO BS 5154:

- Series - B.
- Pattern - Straight.
- Ends - Compression fitting to BS EN 1254-2.
- Stem - Inside screw rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.
- Options - Non-metallic renewable seat/disk rings.

2040D COMPRESSION GLOBE VALVES TO BS 5154 FOR PLASTIC PIPE:

- Series - B.
- Pattern - Straight.
- Ends - Compression fitting to BS EN 1254-3.
- Stem - Inside screw rising stem.
- Trim material - Manufacturer's standard.
- Operation - Handwheel.
- Options - Non-metallic renewable seat/disk rings.

2040E QUICK COUPLING VALVE ASSEMBLY

- 1. QUICK COUPLER BODY: it shall be factory-fabricated, bronze or brass and a two-piece type with removable upper body.
- 2. HOSE SWIVEL: hose swivel will be threaded on outlet for garden hose. The swivel shall provide 360 degree movement to ease watering in all directions.
- 3. COVER: The upper body shall be equipped with spring-loaded or weighted, durable rubber cover or stainless steel cap marked "DO NOT DRINK" in English and the same in local language. The cover shall have locking feature with two matching keys and shall be colored coded for use with unconventional water sources.
- 4. VALVE OPERATING KEY: the valve shall be opened and closed by a brass key supplied by valve manufacturer having a 25 mm male top pipe threads and 19 mm female top pipe threads outlet. The valve throat shall have a keyway with detent positions for regulating water flow. Operating keys are to be supplied at the rate of 1 per five couplings installed or fraction thereof.

2050A FLANGED GLOBE VALVES TO BS EN 13789:

- Pattern - Straight.
- Stem - Rising stem outside screw.

- Ends - Flanged to BS EN 1092-2.
- Material - Grey cast iron.

2060A PARALLEL SLIDE VALVES TO BS EN 1984:

- Ends - Flanged BS EN 1092-2.
- Stem - Rising stem.
- Valve faces - Stainless steel disc and seat.

2070A FLANGED STOP VALVES - GATE TYPE TO BS EN 1984:

- Pattern - Full bore or reduced bore.
- Materials - Cast steel body and materials to suit fluid and operating conditions.
- Ends - Flanged.
- Operation - Handwheel.

2070D THREADED STOP VALVES - GATE TYPE TO BS EN 1984:

- Pattern - Full bore or reduced bore.
- Materials - Cast steel body and materials to suit fluid and operating conditions.
- Ends - Threaded to relevant parts of BS EN 10226
- Operation - Handwheel.

2080A THREADED END BALL TYPE VALVES - SCREW DRIVER/KEY OPERATED:

- Materials - bronze or DZR copper alloy body.
- Ends - threaded to relevant parts of BS EN 10226.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - screw driver operated or key operated.

2080B COMPRESSION END BALL TYPE VALVES - SCREW DRIVER/KEY OPERATED:

- Materials - bronze or DZR copper alloy body.
- Ends - compression fittings to BS EN 1254-2.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - screw driver operated or key operated.

2080C THREADED END BALL TYPE VALVES - LEVER OPERATED:

- Materials - bronze or DZR copper alloy body.
- Ends - threaded to relevant parts of BS EN 10226.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - lever operated.

2080D COMPRESSION END BALL TYPE VALVES - LEVER OPERATED:

- Materials - bronze or DZR copper alloy body.
- Ends - compression fittings to BS EN 1254-2.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - lever operated.

2080E THREADED END BALL TYPE VALVES - LOCKSHIELD:

- Materials - bronze or DZR copper alloy body.
- Ends - threaded to relevant parts of BS EN 10226.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - lockshield.

2080F COMPRESSION BALL TYPE VALVES - LOCKSHIELD:

- Materials - bronze or DZR copper alloy body.
- Ends - compression fittings to BS EN 1254-2.
- Chrome or nickel plated DZR sphere with full bore flow aperture. PTFE seats and stem seals. Anti-blowout stem.
- Operation - lockshield.

2085A SCREWED END SERVICING VALVES - HANDWHEEL OPERATED:

- Materials - copper alloy body.
- Ends - screwed to BS EN 1254-2.
- Operation - handwheel operated.

2085B COMPRESSION END SERVICING VALVES - HANDWHEEL OPERATED:

- Materials - copper alloy body.
- Ends - compression fittings to BS EN 1254-2.
- Operation - handwheel operated.

2085C CAPILLARY END SERVICING VALVES - HANDWHEEL OPERATED:

- Materials - copper alloy body.
- Ends - capillary ends to BS EN 1254-1.
- Operation - handwheel operated.

2085D SCREWED END SERVICING VALVES - LEVER OPERATED:

- Materials - copper alloy body.
- Ends - screwed to BS EN 1254-2.
- Operation - lever operated.

2085E COMPRESSION END SERVICING VALVES - LEVER OPERATED:

- Materials - copper alloy body.
- Ends - compression fittings to BS 864 and BS EN 1254-2.
- Operation - lever operated.

2085F CAPILLARY END SERVICING VALVES - LEVER OPERATED:

- Materials - copper alloy body.
- Ends - capillary ends to BS EN 1254-1.
- Operation - lever operated.

2085G SCREWED END SERVICING VALVES - SCREW DRIVER OPERATED:

- Materials - copper alloy body.
- Ends - screwed to BS 864 and BS EN 1254-2.
- Operation - screw driver operated.

2085H COMPRESSION END SERVICING VALVES - SCREW DRIVER OPERATED:

- Materials - copper alloy body.
- Ends - compression fittings to BS EN 1254-2.
- Operation - screw driver operated.

2085I CAPILLARY END SERVICING VALVES - SCREW DRIVER OPERATED:

- Materials - copper alloy body.
- Ends - capillary ends to BS EN 1254-1.
- Operation - screw driver operated.

2090A LEVER OPERATED BUTTERFLY VALVES TO BS EN 593 BETWEEN FLANGES:

- Construction - provide controlled elastomer compression on flange faces; semi-lugged wafer type design, for installation between flanged pipework connections, body to suit BS EN 1092.
- Provide lever and gear operated valves with long body neck for lagging clearance.
- Seat - bonded.
- Materials - ductile iron body; stainless steel shaft; aluminium bronze or stainless steel disc to suit application; EPDM seat.
- Operation - lever and graduated notch plate.

2090B GEAR OPERATED BUTTERFLY VALVES TO BS EN 593 BETWEEN FLANGES:

- Construction - provide controlled elastomer compression on flange faces; semi-lugged wafer type design, for installation between flanged pipework connections, body to suit BS EN 1092.
- Provide lever and gear operated valves with long body neck for lagging clearance.
- Seat - bonded.
- Materials - ductile iron body; stainless steel shaft; aluminium bronze or stainless steel disc to suit application; EPDM seat.
- Operation - gear operated.

2090C LEVER OPERATED BUTTERFLY VALVES BETWEEN MECHANICAL JOINTS:

- Construction - one piece body with grooved ends or wafer type design, for installation between mechanical joints (up to 300mm only).
- Provide lever operated valves with long body neck for lagging clearance.
- Seat - bonded, pressure responsive elastomer..
- Materials - ductile iron body; stainless steel shaft; electroless nickel coated ductile iron offset disc; EPDM seat.
- Operation - lever and graduated notch plate.

2090D GEAR OPERATED BUTTERFLY VALVES BETWEEN MECHANICAL JOINTS:

- Construction - one piece body with grooved ends or wafer type design, for installation between mechanical joints. Grooves for 350mm and larger to be wedge shaped, for example, Victaulic advanced groove system (AGS).
- Provide gear operated valves with long body neck for lagging clearance.
- Seat - bonded, pressure responsive elastomer in sizes up to 300mm, disc mounted seal for 350mm and larger.
- Materials - ductile iron body; stainless steel shaft; electroless nickel coated ductile iron offset disc; EPDM seat.
- Operation - gear operated.

2090E BUTTERFLY VALVES FULLY-LUGGED TO BS EN 593:

- Construction - provide controlled elastomer compression on flange faces; fully-lugged type design, body to suit BS EN 1092.
- Provide lever and gear operated valves with long body neck for lagging clearance.
- Seat - bonded.
- Materials - ductile iron body: stainless steel shaft; aluminium bronze or stainless steel disc to suit the application; EPDM seat.
- Operation - lever and graduated notch plate or gearbox.

2110A STOP VALVES - KEY OPERATED SLUICE TYPE A TO BS 5163-1 AND BS 5163-2:

- Valve type - A
- Seat - Resilient or metal seated.
- Stem seal - Stuffing box and gland; injector packing foil; or toroidal sealing rings (O-rings).
- Operation - T key.
- Materials - Manufacturer's standard and WRAS approved.
- Options - Stem cap.

2210A LEVER OPERATED REGULATING BUTTERFLY VALVES TO BS EN 593 BETWEEN FLANGES:

- Construction - Provide controlled elastomer compression on flange faces; semi-lugged wafer type design, for installation between flanged pipework connections, body to suit BS EN 1092-2.
- Provide lever and gear operated valves with long body neck for lagging clearance.
- Seat - Bonded seat.

- Materials - Cast iron body; stainless steel shaft; aluminium bronze disc; EPDM seat.
- Operation - Infinitely variable setting with travel stops and indicator, lever operation.

2210B GEAR OPERATED REGULATING BUTTERFLY VALVES TO BS EN 593 BETWEEN FLANGES:

- Construction - Provide controlled elastomer compression on flange faces; semi-lugged wafer type design, for installation between flanged pipework connections, body to suit BS EN 1092-2.
- Provide lever and gear operated valves with long body neck for lagging clearance.
- Seat - Bonded seat.
- Materials - Cast iron body; stainless steel shaft; aluminium bronze disc; EPDM seat.
- Operation - Infinitely variable setting with travel stops and indicator, gear operation.

2210C LEVER OPERATED REGULATING BUTTERFLY VALVES TO BS EN 593 BETWEEN MECHANICAL JOINTS:

- Construction - installation between mechanical joints with grooved ends (up to 300mm only).
- Provide lever operated valves with long body neck for lagging clearance.
- Seat - bonded seat, pressure responsive elastomer.
- Materials - ductile iron body; stainless steel shaft; rubber coated ductile iron offset disc; EPDM seat.
- Operation - infinitely variable setting with travel stops and indicator, lever operation.

2210D GEAR OPERATED REGULATING BUTTERFLY VALVES TO BS EN 593 BETWEEN MECHANICAL JOINTS:

- Construction - installation between mechanical joints with grooved ends.
- Provide gear operated valves with long body neck for lagging clearance.
- Seat - bonded seat, pressure responsive in sizes up to 300mm, disc mounted seal for 350mm and larger.
- Materials - ductile iron body; stainless steel shaft; rubber coated ductile iron offset disc; EPDM seat.
- Operation - infinitely variable setting with travel stops and indicator, gear operation.

2220A THREADED END DOUBLE REGULATING VALVES TO BS 7350, COPPER ALLOY:

- BS 7350, section 3.1.
- Ends - Threaded to relevant parts of BS EN 10226.
- Material - Bronze or DZR copper alloy to BS 5154 and BS EN 12288.
- Series B; oblique or Y pattern; inside screw non-rising stem; manufacturer's standard trim material.
- Options - Provide drain plug facility; independent means for positive isolation on pressure tapping or adapter; and test and manufacturer's certificates as indicated.

2220B FLANGED DOUBLE REGULATING VALVES TO BS 7350, COPPER ALLOY:

- BS 7350, section 3.1.
- Ends - Flanged to BS EN 1092-2.
- Material - Bronze or DZR copper alloy to BS 5154 and BS EN 12288.

- Series B; oblique or Y pattern; inside screw non-rising stem; manufacturer's standard trim material.
- Options - Provide drain plug facility; independent means for positive isolation on pressure tapping or adapter; and test and manufacturer's certificates as indicated.

2220C FLANGED DOUBLE REGULATING VALVES TO BS 7350, CAST IRON:

- BS 7350, section 3.1.
- Ends - Flanged to BS EN 1092-2.
- Material - Cast iron to BS EN 13789.
- Oblique or Y pattern; copper alloy, nickel alloy or resilient valve face; rising stem outside screw or non-rising stem inside screw; manufacturer's standard materials.
- Options - Provide drain plug facility; independent means for positive isolation on pressure tapping or adapter; and test and manufacturer's certificates as indicated.

2230A THREADED ENDS FLOW MEASUREMENT DEVICES TO BS 7350, COPPER ALLOY:

- BS 7350, section 3.2 - type 3
- A fixed orifice either integral with or as a fixed orifice fitting close coupled to a double regulating globe valve.
- Ends - Threaded to relevant parts of BS EN 10226
- Material - Double regulating globe valve, bronze or DZR copper alloy to BS 7350 table 6.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2230B FLANGED ENDS FLOW MEASUREMENT DEVICES TO BS 7350 TYPE 3, COPPER ALLOY:

- BS 7350, section 3.2 - type 3
- A fixed orifice either integral with or as a fixed orifice fitting close coupled to a double regulating globe valve.
- Ends - Flanged to BS EN 1092-3.
- Material - Double regulating globe valve, bronze or DZR copper alloy to BS 7350 table 6.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2230C FLANGED FLOW MEASUREMENT DEVICE TO BS 7350 CAST IRON, TYPE 3:

- BS 7350, section 3.2 - type 3
- A fixed orifice either integral with or as a fixed orifice fitting close coupled to a double regulating globe valve.
- Ends - Flanged to BS EN 1092-2.
- Material - Double regulating globe valve to BS EN 13789 and close coupled fixed orifice fitting to BS 7350, table 6.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2230E THREADED ENDS FLOW MEASUREMENT DEVICES TO BS 7350 TYPE 4, COPPER ALLOY:

- BS 7350, section 3.2 - type 4, variable orifice valve.
- Ends - Threaded to relevant parts of BS EN 10226

- Material - Variable orifice, double regulating globe valve, bronze or DZR copper alloy to BS EN 12288 and BS 5154 series B.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2230F FLANGED FLOW MEASUREMENT DEVICES TO BS 7350 TYPE 4, COPPER ALLOY:

- BS 7350, section 3.2 - type 4, variable orifice valve.
- Ends - Flanged to BS EN 1092-3.
- Material - Variable orifice, double regulating globe valve, bronze or DZR copper alloy to BS EN 12288 and BS 5154 series B.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2230G FLOW MEASUREMENT DEVICES TO BS 7350 TYPE 4, CAST IRON:

- BS 7350, section 3.2 - type 4, variable orifice valve.
- Ends - Flanged to BS EN 1092-2.
- Material - Variable orifice, double regulating globe valve, cast iron to BS EN 13789.
- Options - Independent means for positive isolation on pressure tapping or adapter.

2260A RADIATOR VALVES TO BS 2767 (TYPE 4):

- Material - Bronze or brass copper alloy body.
- Pattern - Angle or straight to suit application.
- Straight - Threaded to relevant parts of BS EN 10226 or compression to BS EN 1254-2 to suit pipework as indicated.
- Angle - Threaded to relevant parts of BS EN 10226 with one end internal and other end external with union nut and tail pipe; or compression joint to BS EN 1254-2 one end and other end externally threaded to relevant parts of BS EN 10226 with union nut and tail pipe to suit pipework as indicated.
- Options - Fit wheel valves on flow connections to radiators, and other heat emitters, without thermostatic radiator valves. Fit lockshield valves on return connections.

2270A THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.1:

- Material to A.1.
- Pattern - Straight or angle pattern to suit application.
- Dimensions - Table A.1 series D.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270B THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.2:

- Material to Annex A.
- Pattern - Straight or angle pattern to suit application.
- Dimensions - Table A.2 series F.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270C THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.3:

- Material to Annex A.
- Pattern - Straight or angle pattern to suit application.
- Dimensions - Table A.3 series S.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270D THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.4:

- Material to Annex A.
- Pattern - Straight or angle pattern to suit application.
- Dimensions - Table A.4 series GB.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270E TAMPER PROOF THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.1:

- Material to Annex A.
- Pattern - Straight or angle pattern to suit application.
- Provide tamper proof TRV's.
- Dimensions - Table A.1 series D.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270F TAMPER PROOF THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.2:

- Material to Annex A.
- Pattern - Straight or angle pattern to suit application.
- Provide tamper proof TRV's.
- Dimensions - Table A.2 series S.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270G TAMPER PROOF THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.3:

- Material - Annex A.
- Pattern - Straight or angle pattern to suit application.
- Provide tamper proof TRV's.
- Dimensions - Table A.3 series S.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2270H TAMPER PROOF THERMOSTATIC RADIATOR VALVES TO BS EN 215 TABLE A.4:

- Material -Annex A.
- Pattern - Straight or angle pattern to suit application.
- Provide tamper proof TRV's.
- Dimensions - Table A.4 series GB.
- Thermostatic valve type - Integral sensor unless otherwise indicated.

2280A FLOAT OPERATED VALVES TO BS 1212-1, COPPER FLOAT:

- Piston type float operated valve to BS 1212-1.

- Connection - Side or bottom entry to suit application.
- Float - Copper to BS 1968.

2280B FLOAT OPERATED VALVES TO BS 1212-1, PLASTIC FLOAT:

- Piston type float operated valve to BS 1212-1.
- Connection - Side or bottom entry to suit application.
- Float - Plastic to BS 2456.

2290A THREADED END FLOAT OPERATED VALVES, BALANCED EQUILIBRIUM:

- WRAS approved.
- Bronze or DZR copper alloy body.
- Inlet - Threaded to relevant parts of BS EN 10226
- Spindle and head effectively guided and arranged with stops to engage with valve body and prevent over travel. Linkage fulcrum adjustable relative to vertical plane, securely locked to body tapping when set.
- Screwed plug from access cover.
- Float and lever arm.
- Spun copper float, halves brazed or welded together, with centre sleeve connecting to lever arm. For feed and expansion application use long arm type arranged to close when tank contains 150mm depth.

2315A OPEN/CLOSE CONTROL BALL VALVES:

- Valve - Open/Close valve.
- Rotary Actuator - Open/close.
- Material - Nickel-plated brass; stainless steel ball; PTFE seal; stainless steel spindle; EPDM spindle seal.
- Connections - Threaded to relevant parts of BS EN 10226.
- Ancillaries - Lever for manual operation.

2315B TWO WAY CONTROL BALL VALVES:

- Valve - Two way control valve.
- Rotary Actuator - Modulating.
- Material - Nickel-plated brass; stainless steel ball; PTFE seal; stainless steel spindle; EPDM spindle seal.
- Connections - Threaded to BS EN 10226
- Ancillaries - Lever for manual operation.

2315C THREE WAY CONTROL BALL VALVES:

- Valve - Three way control valve.
- Rotary Actuator - Modulating.
- Material - Nickel-plated brass; stainless steel ball; PTFE seal; stainless steel spindle; EPDM spindle seal.
- Connections - Threaded to relevant parts of BS EN 10226

- Ancillaries - Lever for manual operation.

2320A THREADED ENDS SWING CHECK VALVES TO BS 5154:

- Series B; horizontal pattern.
- Ends - Threaded to relevant parts of BS EN 10226
- Trim material - Manufacturer's standard.

2320B FLANGED SWING CHECK VALVES TO BS 5154:

- Series B; horizontal pattern.
- Ends - Flanged to BS EN 1092-3.
- Trim material - Manufacturer's standard.

2330A FLANGED SWING CHECK VALVES:

- Standard
- BS EN 16767
- Check valve type as defined in BS EN 736-1 - Swing.
- Body type - Flanged.
- Ends - Flanged to BS EN 1092-2.
- Orientation of pipework - Horizontal or vertical.

2330B WAFER BODY SWING CHECK VALVES:

- Standard
- BS EN 16767
- Check valve type as defined in BS EN 736-1 - Swing.
- Body type - Wafer.
- Orientation of pipework - Horizontal or vertical.

2330C FLANGED LIFT CHECK VALVES:

- Standard
    - BS EN 16767.
- Check valve type as defined in BS EN 736-1 - lift.
- Body type - flanged.
- Ends - flanged to BS EN 1092-2.
- Orientation of pipework - horizontal or vertical.

2330D WAFER BODY LIFT CHECK VALVES:

- Standard
- BS EN 16767
- Check valve type as defined in BS EN 736-1
- Check valve type to BS EN 736-1 - Lift.
- Body type - Wafer.
- Orientation of pipework - Horizontal or vertical.

2340A FLANGED SWING CHECK VALVES:

- Standard
- BS EN 16767
- Wafer pattern design suitable for installation between flanged pipework, body to suit BS EN 1092-2.
- Disc - Double disc.
- Type - Light spring type.
- Seat - Bonded.
- Materials - Cast iron body; bronze disc; EPDM seat.

2370# CHECK VALVES GLOBE STOP AND CHECK TYPE:

- Standard - BS EN 13709.
- Pattern
  - Straight.
  - Angle.
- Ends
  - Flanged to BS EN 1092-1 PN
  - Butt-weld body ends.
- Materials
  - Manufacturer's standard to suit fluid and operating conditions.
- Options
  - Body tappings and plug.
  - Indicator.

2385A COMBINED CHECK AND ANTI-VACUUM DEVICE TO PREVENT CONTAMINATION OF WATER BY BACKFLOW TO BS EN 14451:

- Standard - BS EN 14451 combined check and anti-vacuum valves.
- WRAS approval.
- Ends - Compression connections to BS EN 1254-2.

2390A COMBINED CHECK AND ANTI-VACUUM TYPE ANTI BACK SYPHONAGE VALVES:

- Bronze or DZR copper alloy body assembly with compression connections to BS EN 1254-2.
- Pattern - In-line pattern.
- Components - Stainless steel domed air inlet. Non-return valve with plastic body, rubber actuator and stainless steel to plastic seal. WRAS approval.

2391A HOSE UNION ANTI-VACUUM TYPE ANTI BACK SYPHONAGE VALVES:

- Bronze or DZR copper alloy body assembly with fittings to BS EN ISO 228-1.
- Pattern - In line pattern.
- Sizes - DN15 to DN25.

- WRAS Approval.

2395A VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ) VALVE - GENERAL REQUIREMENTS:

- Provide an application to the local water supplier using the WRAS "RPZ Valve Assembly - Application for Installation" form.
- Obtain Water Supplier agreement that a Type BA device is a suitable means of backflow protection in the water supply system under consideration.
- Test methods and maintenance regimes shall be in accordance with the Water Suppliers requirements and any failure to comply may result in termination of supply or removal of the device. These maintenance requirements must be detailed within the project Operation & Maintenance documentation.
- The fitting must be included in the WRAS "Products and Materials Directory" and satisfy the requirements of the Regulations.
- The installer must obtain formal Water Supplier agreement that a Type BA device is a suitable means of backflow protection in the plumbing system under consideration before installation.
- Confirm that any Type BA device installed provides protection against back pressure and back siphonage at the point of use from fluids up to and including Category 4 as defined in
    - England and Wales - The Water Supply (Water Fittings) Regulations 1999 as amended, the Water Act 2014 and the Construction Products Regulations 2013.
    - Scotland - The Water Supply (Water Fittings) Byelaws 2014.
    - Northern Ireland - The Water Supply (Water Fittings) Regulations 2009.
- Comply with the stipulations and requirements set out in WRAS Approved Installation Method Document AIM-08-01.

2395B VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ) VALVE - INSTALLATION:

- The Type BA device shall not be installed in a place or position which is:
    - Liable to flooding
    - Above electrical equipment
    - Liable to mechanical or other damage
    - Exposed to freezing - unless measures are taken to prevent the assembly from freezing
    - Concealed
- The assembly shall be:
    - Installed horizontally with the relief valve discharging downwards
    - Installed with an inline strainer fitted immediately upstream of the device - to prevent fouling of elements of the assembly
    - Installed above ground at a height enabling effective inspection and maintenance
    - Installed not less than 300mm above ground or floor level or the base of any cabinet to the underside of the exit port of the relief valve
    - Installed no more than 1500mm above ground or floor level
    - Installed with an air break between the relief outlet port and the top of the allied tundish
- Following installation the assembly shall be flushed and disinfected in accordance with BS EN 806-4 and complimentary guidance in BS 8558

- Following flushing and prior to commissioning and site test, the assembly shall be checked by the installer to ensure that the relief valve functions correctly - in accordance with the guidelines in WRAS Approved Installation Method Document AIM-08-01.

2395C VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ) VALVE - ON-SITE INSPECTION AND TESTING:

- Site testing must only be carried out by an accredited tester approved by the Water Supplier.
- Testing shall be carried out at intervals not exceeding 12 months.
- Test data during the commissioning of the assembly and at subsequent intervals shall be entered on the "RPZ Valve Test Report Form" produced by the WRAS.
- The inspections and testing shall be in accordance with WRAS Approved Installation Method Document AIM-08-01.
- On completion of site tests, a certificate must be completed by the tester in accordance with WRAS Guidance Note and copies submitted to the water supplier and the person responsible for the device. Copies shall be included in the Operation and Maintenance Manuals, including interval periods for subsequent testing.

2395D VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ) VALVE - RECORD OF INSTALLATION AND TEST DATA:

- Provide records for each assembly in accordance with WRAS Approved Installation Method Document AIM-08-01.
- In general, the record shall indicate the following:
    - Purpose of the assembly
    - Precise location of the assembly
    - Data pertaining to prescribed tests
    - Details of the person who carried out the test
    - Frequency of tests
    - Defects found and measures taken to remedy these defects
- The installation, commissioning and subsequent test data shall be forwarded to the Water Supplier and copies retained by the Tester and the Water Supplier's customer for a period of at least five years.

2430A SAFETY VALVES, COPPER ALLOY, SINGLE SPRING:

- Material - bronze or DZR copper alloy body.
- Standard - BS EN ISO 4126-1, BS EN ISO 4126-7.
- Ends - threaded to relevant parts of BS EN 10226
- Spring type - single spring loaded, high lift type.

2430B SAFETY VALVES, COPPER ALLOY, DOUBLE SPRING:

- Material - bronze or DZR copper alloy body.
- Standard - BS EN ISO 4126-1, BS EN ISO 4126-7.
- Ends - threaded to relevant parts of BS EN 10226
- Spring type - double spring loaded, high lift type.

2440A DRAIN COCKS, THROUGHWAY GLAND COCK:

- Bronze body threaded male to relevant parts of BS EN 10226
- Tapered plug with square shank for loose lever; bolted gland; strap and blank cap screwed on hand tight.
- Outlet to accept hose union.

2450 DRAIN COCKS - SCREWDOWN TO BS 2879, TYPE 1:

- Bronze body threaded male to relevant parts of BS EN 10226
- Screw down plug with square shank for loose lever.
- Serrated outlet to accept hosepipe, fixed or union pattern. Lockshield to accept key.

2460 DRAIN COCKS - BALL TYPE:

- Bronze or DZR copper alloy body; chrome-plated DZR ball; PTFE seats and stem seals; blow-out proof stem; strap and blank cap screwed on hand tight; serrated outlet to accept hose pipe. Lockshield key operated.

2470 VENT COCKS - TWO WAY GLAND COCK TYPE:

- Bronze body threaded to relevant parts of BS EN 10226; tapered plug with square shank for loose lever; plug position indicator; bolted gland

2480 VENT COCKS - BALL TYPE:

- Bronze or DZR copper alloy body; chrome-plated DZR ball; PTFE seats and stem seals; blow-out proof stem.
- Permanently identified ports in T-configuration.
- Lever operated.

2490 VENT COCKS - THREE WAY GLAND COCK TYPE:

- Bronze body threaded to relevant parts of BS EN 10226; tapered plug with square shank for loose lever; plug position indicator; port markings to indicate inlet, vent, waste; bolted gland.
- Port configuration, T port.

2500A THREE WAY PLUG VALVE VENT COCKS - WRENCH OPERATED:

- Cast iron body, plug and bottom cover. PTFE thrust washer.
- Ends - Flanged to BS EN 1092-2.
- T port configuration. Wrench operation.

2500B THREE WAY PLUG VALVE VENT COCKS - GEAR OPERATED:

- Cast iron body, plug and bottom cover. PTFE thrust washer.
- Ends - Flanged to BS EN 1092-2.
- T port configuration. Gear operation.

2510A AUTOMATIC AIR VENTS, FLOAT TYPE:

- Construction - Bronze or DZR copper alloy body with threaded inlet to relevant parts of BS EN 10226. Solid polypropylene float and air release valve. Ensure valve is self closing.
- Operating Conditions - Maximum temperature 130°C. Maximum pressure 10 bar.
- Options - Provide connection for piping away released air and integral non-return valve where indicated.

2515A MICROBUBBLE TEMPERATURE DIFFERENTIAL DEAERATORS:

- Construction - Vertical mild steel housing incorporating internal spiral wound copper mesh system.
- Provide automatic air release mechanism.
- Ends - Line size with flanges to BS EN 1092-1, PN 16.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2520A LTHW PRESSURE DIFFERENTIAL DEAERATORS:

- Unit - Provide a self circulating unit connected to the system by two 15mm connections at least 500mm apart.
- Isolation - Provide valves to isolate the vessel from the main system.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2520B CHILLED WATER PRESSURE DIFFERENTIAL DEAERATORS:

- Unit - Provide a self circulating unit connected to the system by two 15mm connections at least 500mm apart. Insulate to prevent condensation.
- Isolation - Provide valves to isolate the vessel from the main system.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2521A CENTRIFUGAL AIR SEPARATORS:

- Construction - Vertical steel housing with offset inlet and outlet ports to remove bubbles via centrifugal force. Provide automatic air release mechanism.
- Ends - Line size with flanges to BS EN 1092-1, PN 16.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2522A GRAVITATION DIRT SEPARATORS:

- Construction - Vertical mild steel housing with internal reservoir, sludge pipe, perforation plate and automatic air release mechanism.
- Ends - Line size with flanges to BS EN 1092-1, PN 16.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2524A MICROBUBBLE AIR AND DIRT SEPARATORS:

- Construction - Vertical steel housing with internal large surface area mechanism to remove microbubbles via coalescence effect. Fitted with dirt drain at its lowest point for removing dirt that sinks, and fitted with a dirt drain valve on the side of the housing for removing dirt that floats on the water.

- Provide automatic air release mechanism.
- Ends - Line size with flanges to BS EN 1092-1, PN 16.
- Operating conditions - Maximum temperature 110°C, maximum pressure 10 bar.

2540# STEAM TRAPS - THERMOSTATIC TYPE, BALANCED PRESSURE:

- Bronze or DZR copper alloy body with threaded ends to relevant parts of BS EN 10226. Seamless stainless steel capsular element. Stainless steel internal components with renewable seat.
- Provide with close coupled straight pattern strainer.

2560# STEAM TRAPS - FLOAT TYPE:

- Material
    - Malleable iron body.
    - Cast iron body.
        - Stainless steel float, air vent and internal components.
- Ends - Threaded ends to relevant parts of BS EN 10226
- Mounting
    - Horizontal in-line.
- Options
    - Steam lock release facility.
    - Combined thermostatic air vent and steam lock release facilities.

2570# STEAM TRAPS - THERMODYNAMIC TYPE:

- Material
    - Stainless steel body.
    - Cast steel body.
        - Stainless steel disc with screwed cap.
- Ends
    - Threaded ends to relevant parts of BS EN 10226
- Integral strainer with access plug and stainless steel screw.
- Options
    - Isolating cover.
    - Blowdown cock fitted to strainer cap.
    - Air venting disc.

2590# STEAM TRAP FAILURE INDICATORS:

- Materials
    - Cast iron sensing chamber body.
    - Cast steel sensing chamber body.

    - Stainless steel internal sensor and sensor gasket.
- Ends - Threaded ends to relevant parts of BS EN 10226.
- Connect into assembly upstream of steam trap
- Provide plug-in solid state electronic indicators complete with batteries, number

2600# SIGHT GLASSES:

- Bronze or DZR copper alloy body threaded female to relevant parts of BS EN 10226
- Glass window.
    - Single window type.
    - Double window type.
- Locate remote from fluid discharges to avoid damage by thermal or pressure shock conditions.

2610A STEEL EXPANSION LOOPS:

- Provide expansion loop in material and finish of associated pipeline. Size to limit stress set up in material of pipe wall to 69 MPa.
- Forge bend from a single length of pipe or join by welding fittings if expansion loops are too large to manufacture in one piece.
- Where indicated, galvanize after manufacture.
- Where scheduled or detailed in the particular specification provide expansion loops installed with grooved flexible mechanical joints and elbows. The joint manufacturer shall undertake calculations for sizing of the expansion loops. Installation to be strictly in accordance with the manufacturer's instructions.

2620 EXPANSION LOOPS - COPPER:

- Provide expansion loop in material and finish of associated pipeline. Size to limit total stress set up in material of pipe wall to less than 51.5 MPa.
- Forge bend from a single length of pipe.

2630A THREADED END EXPANSION COMPENSATORS, AXIAL BELLOWS:

- Ends - Threaded to relevant parts of BS EN 10226
- Bellows - Stainless steel, multi ply or single-ply construction fitted with stainless steel inner sleeves.
- Operation - Supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation.
- Design, manufacture and install metal bellows expansion joints in accordance with BS EN 14917.

2630B FLANGED EXPANSION COMPENSATORS, AXIAL BELLOWS:

- Ends - Flanged to BS EN 1092-1.

- Bellows - Stainless steel, multi-ply or single-ply construction fitted with stainless steel inner sleeves.
- Operation - Supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation
- Design, manufacture and install metal bellows expansion joints in accordance with BS EN 14917.

2630D THREADED ENDS EXPANSION COMPENSATORS, ARTICULATED BELLOWS:

- Ends - Threaded to relevant parts of BS EN 10226.
- Bellows - Stainless steel, multi-ply or single-ply construction fitted with stainless steel inner sleeves.
- Operation - Supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation.
- Design, manufacture and install metal bellows expansion joints in accordance with BS EN 14917.

2630E FLANGED EXPANSION COMPENSATORS, ARTICULATED BELLOWS:

- Ends - Flanged to BS EN 1092-1.
- Bellows - Stainless steel, multi-ply or single-ply construction fitted with stainless steel inner sleeves.
- Operation - Supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation.
- Design, manufacture and install metal bellows expansion joints in accordance with BS EN 14917.

2630J GROOVED END EXPANSION COMPENSATORS:

- Material - ductile cast iron to ASTM A536, grade 65-45-12.
- Ends - grooved for mechanical joints.
- Operation - supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation.
- Type - slip-type expansion compensation device, gasketed, with grooved coupling ends and 'telescoping' body.
- Size - 50mm to 150mm.
- Maximum axial end movement - 76mm.
- Limiting test pressure - 24bar pressure rated.
- Gasket - grade 'E' EPDM for water services to 110°C.
- Installation to be strictly in accordance with the manufacturer's instructions.

2630K GROOVED END MULTIPLE FLEXIBLE COUPLINGS TYPE COMPENSATORS:

- Coupling material - ductile cast iron to ASTM A536, grade 65-45-12.
- Ends - grooved for mechanical joints.

- Operation - supply expansion joints capable of not less than 2000 complete reversals of movement at the given working conditions; and of withstanding a pressure test of 1.5 times the design pressure without deformation.
- Type - multiple standard flexible grooved couplings joined by grooved end nipples.
- Axial movement - dependent on number of couplings in the compensator, refer to schedule/particular specification.
- Gasket - grade 'E' EPDM for water services to 110°C.

2650A FLANGED EPDM RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 100°C:

- Material - EPDM rubber with wire reinforced cuffs.
- Steel reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Flanges to BS EN 1092-1 that can swivel and are removable.
- Operation - Ensure flexible connections have a design life of 120 months at 100°C. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650B THREADED END EPDM RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 100°C:

- Material - EPDM rubber with wire reinforced cuffs.
- Steel reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Threaded to relevant parts of BS EN 10226 with one union end.
- Operation - Ensure flexible connections have a design life of 120 months at 100°C. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650C FLEXIBLE CONNECTIONS ABOVE 100°C:

- Material - Convoluted stainless steel, fully welded.
- Ends - Flanged to BS EN 1092-1. Ensure flanges can swivel.
- Operation - Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650D FLANGED EPDM RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 70°C:

- Material - EPDM rubber with wire reinforced cuffs.
- Synthetic fibre reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Flanges to BS EN 1092-1 that can swivel and are removable.

- Operation - Ensure flexible connections have a design life of 120 months at 100°C. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650E THREADED END EPDM RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 70°C:

- Material - EPDM rubber with wire reinforced cuffs.
- Synthetic fibre reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Threaded to relevant parts of BS EN 10226 with one union end.
- Operation - Ensure flexible connections have a design life of 120 months at 100°C. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650F FLANGED FLEXIBLE CHLOROBUTYL RUBBER CONNECTIONS UP TO 10 BAR AND 100°C:

- Material - Multi-ply reinforced chlorobutyl rubber with wire reinforced cuffs. Synthetic fibre or steel reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Flanges to BS EN 1092-1 that can swivel and are removable.
- Operation - Ensure flexible connections have a design life of 120 months at given conditions. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650G THREADED END CHLOROBUTYL RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 100°C:

- Material - Multi-ply reinforced chlorobutyl rubber with wire reinforced cuffs. Synthetic fibre or steel reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Threaded to relevant parts of BS EN 10226 with one union end.
- Operation - Ensure flexible connections have a design life of 120 months at given conditions. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650H FLANGED CHLOROBUTYL RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 60°C:

- Material - Multi-ply reinforced chlorobutyl rubber with wire reinforced cuffs. Synthetic fibre reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Flanges to BS EN 1092-1 that can swivel and are removable.

- Operation - Ensure flexible connections have a design life of 120 months at given conditions. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2650I THREADED END CHLOROBUTYL RUBBER FLEXIBLE CONNECTIONS UP TO 10 BAR AND 60°C:

- Material - Multi-ply reinforced chlorobutyl rubber with wire reinforced cuffs. Synthetic fibre reinforcement within the body.
- Marking - Mould date of manufacture on bellows.
- Show manufacturer and type.
- Ends - Threaded to relevant parts of BS EN 10226 with one union end.
- Operation - Ensure flexible connections have a design life of 120 months at given conditions. Provide tie bars with rubber top hat washers where working pressure exceeds 4 bar. Supply threaded tie bars with adjustable length. Ensure flexible connections are tied when the plant is on vibration isolation mountings.

2660A TERMINAL UNIT CONNECTIONS FOR HEATING SERVICES - STAINLESS STEEL:

- Material - Stainless steel convoluted hose with stainless steel overbraiding. Carbon steel, stainless steel or copper tube end connections. Fully welded construction.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning.
- Working pressure 15 - 20 bar and temperature 95°C.

2660B TERMINAL UNIT CONNECTIONS WITH QUICK RELEASE COUPLINGS FOR HEATING SERVICES - STAINLESS STEEL:

- Material - Stainless steel convoluted hose with stainless steel overbraiding. Carbon steel, stainless steel or copper tube end connections. Fully welded construction.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning. Working pressure 15 - 20 bar and temperature 95°C.
- Options - Supply quick release couplings with screwed ends.
- Materials - Male and female nickel plated brass halves each with shut-off valve with rubber seat. Locking mechanism of stainless steel balls and stainless steel internal valve springs.

2660C TERMINAL UNIT CONNECTIONS FOR HEATING SERVICES - RUBBER:

- Material - EPDM inner liner with stainless steel wire braid. Nickel plated brass fittings with stainless steel ferrules.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning. Working pressure 15 - 20 bar and temperature 95°C.

2660D TERMINAL UNIT CONNECTIONS FOR CHILLED WATER SERVICES - STAINLESS STEEL:

- Material - Stainless steel convoluted hose with stainless steel overbraiding. Carbon steel, stainless steel or copper tube end connections. Fully welded construction. Nitrile rubber Class `O' insulation with vapour seal and end protection caps.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning. Working pressure 15 - 20 bar and temperature 95°C.

2660E TERMINAL UNIT CONNECTIONS WITH QUICK RELEASE COUPLINGS FOR CHILLED WATER SERVICES - STAINLESS STEEL:

- Material - Stainless steel convoluted hose with stainless steel overbraiding. Carbon steel, stainless steel or copper tube end connections. Fully welded construction. Nitrile rubber Class `O' insulation with vapour seal and end protection caps.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning. Working pressure 15 - 20 bar and temperature 95°C.
- Options - Supply quick release couplings with screwed ends.
- Material - Male and female nickel plated brass halves each with shut-off valve with rubber seat. Locking mechanism of stainless steel balls and stainless steel internal valve springs.

2660F TERMINAL UNIT CONNECTIONS FOR CHILLED WATER SERVICES - RUBBER:

- Material - EPDM inner liner with stainless steel wire braid. Nickel plated brass fittings with stainless steel ferrules. Nitrile rubber Class `O' insulation with vapour seal and end protection caps.
- Operation - Ensure hose length is sufficient to prevent the minimum hose bend radius from being exceeded during installation and commissioning. Working pressure 15 - 20 bar and temperature 95°C.

2670A TEST PLUGS, SELF SEALING:

- Provide DZR copper alloy self sealing test plugs for measurement of temperature and pressure, complete with captive cap for sealing when not in use. Ensure test plugs are suitable for system operating temperature and pressure.
- Provide one thermometer and pressure gauge for each range of conditions, for use with test plugs.

2670B TEST PLUGS, VALVE CONTROLLED:

- Provide DZR copper alloy self valve controlled test plugs for measurement of temperature and pressure, complete with captive cap for sealing when not in use. Ensure test plugs are suitable for system operating temperature and pressure.
- Provide one thermometer and pressure gauge for each range of conditions, for use with test plugs.

2680A THREADED PIPELINE STRAINERS, BRONZE:

- Material - Bronze to BS EN 1982.
- Ends - Threaded to relevant parts of BS EN 10226.

- Pattern - Y pattern body.
- Screen free area - Not less than 250% of pipe bore.
- Screen perforations
    - 15 to 50mm nominal size, within range 0.7 - 0.9 mm diameter.
    - 65mm and over nominal size, within range 1.5 - 1.8mm diameter.
- Internal to external flow through screen. Provide plugged connections for drain, air vent and differential pressure monitoring, threaded to relevant parts of BS EN 10226.

2680B FLANGED PIPELINE STRAINERS, BRONZE:

- Material - Bronze to BS EN 1982.
- Ends - Flanged to BS EN 1092-3.
- Pattern - Y pattern body.
- Screen free area - Not less than 250% of pipe bore.
- Screen perforations
    - 15 to 50mm nominal size, within range 0.7 - 0.9 mm diameter.
    - 65mm and over nominal size, within range 1.5 - 1.8mm diameter.
- Internal to external flow through screen. Provide plugged connections for drain, air vent and differential pressure monitoring, threaded to relevant parts of BS EN 10226.

2680C COMPRESSION PIPELINE STRAINERS, BRONZE:

- Material - Bronze to BS EN 1982.
- Ends - Compression fittings to BS EN 1254-2.
- Pattern - Y pattern body.
- Screen free area - Not less than 250% of pipe bore.
- Screen perforations
    - 15 to 50mm nominal size, within range 0.7 - 0.9 mm diameter.
    - 65mm and over nominal size, within range 1.5 - 1.8mm diameter.
- Internal to external flow through screen. Provide plugged connections for drain, air vent and differential pressure monitoring, threaded to relevant parts of BS EN 10226

2680D PIPELINE STRAINERS, CAST IRON:

- Material - Cast iron.
- Ends - Flanged to BS EN 1092-2.
- Pattern - Y pattern body.
- Screen free area - Not less than 250% of pipe bore.
- Screen perforations
    - 15 to 50mm nominal size, within range 0.7 - 0.9 mm diameter.
    - 65mm and over nominal size, within range 1.5 - 1.8mm diameter.
- Internal to external flow through screen. Provide plugged connections for drain, air vent and differential pressure monitoring, threaded to relevant parts of BS EN 10226

2680E GROOVED END PIPELINE STRAINERS, DUCTILE IRON:

- Material - Ductile iron.
- Ends - Grooved for mechanical joint.
- Pattern - Y pattern body.
- Screen free area - Not less than 250% of pipe bore.
- Screen perforations
    - 50 to 80mm nominal size, 1.6mm diameter.
    - 100mm and over nominal size, 3.2mm diameter.
- Internal to external flow through screen. Provide plugged connections for drain, air vent and differential pressure monitoring, threaded to relevant parts of BS EN 10226.

2680F GROOVED END PIPELINE SUCTION DIFFUSER STRAINERS, DUCTILE IRON:

- Body materials - ductile iron.
- Coupling gaskets - grade 'E' EPDM for water services to 110°C
- Ends - grooved for mechanical joint for jointing to pipework and flanged for jointing to pump.
- Stainless steel frame and perforated steel diffuser to provide optimum flow conditions at pump inlet.
- Unit to be complete with removable stainless steel fine mesh sleeve start-up pre-filter, bosses on either side for pressure measurement and outlet for drain connection.
- Installation to be strictly in accordance with the manufacturer's instructions.

2680G PIPELINE SUCTION GUIDE/STRAINERS:

- Body material - cast iron or ductile iron for water services to 110°C
- Ends - flanged to PN16 or PN25 to suit system maximum working pressure.
- Stainless steel strainer and fine mesh (start-up) strainer.
- Unit to be complete with flow stabilising vanes to allow connection direct to pump suction.
- Unit to be complete with removable stainless steel fine mesh sleeve start-up pre-filter.
- Provide plugged connections for drain, air vent and differential pressure monitoring.
- Installation to be strictly in accordance with the manufacturer's instructions.

2690A TUNDISHES, COPPER:

- Provide tundishes located adjacent to equipment, as indicated.
- Use 3mm minimum thickness copper sheet. Form sheet into a tapered reducing cone with a minor diameter to suit drain line.
- Major diameter nominally 50 mm larger than minor diameter, tapering at approximately 30°.

2690B TUNDISHES, MILD STEEL, GALVANIZED:

- Provide tundishes located adjacent to equipment, as indicated.
- Use mild steel sheet; galvanize after manufacture.
- Form sheet into a tapered reducing cone with a minor diameter to suit drain line.
- Major diameter nominally 50 mm larger than minor diameter, tapering at approximately 30°.

2700A GAUGES, GENERAL:

- Use dial type gauges of robust construction, enclosed in dust tight metal cases. Retain dial glass with bezels screwed to case. Finish with chromium plating.
- Use white dial scales indelibly and clearly marked with black lettering to indicate measured values. Select scale ranges which indicate `Normal' when pointer is vertical or central on scale.

2700B GAUGES, 150MM DIAMETER, FLUSH PANEL:

- Dial case - 150mm diameter, heavy pattern, finished in black stove enamel for flush mounting.
- Mount gauges with dial face in vertical plane flush to panel and conceal casing within a steel metal cubicle.

2700C GAUGES, 150MM DIAMETER, DIRECT MOUNTING:

- Dial case - 150mm diameter, heavy pattern finished in black stove enamel, for direct connection to instrument.
- Mount gauges with dial face in vertical plane and support casing by connection to instrument.

2710A TEMPERATURE GAUGES, GENERAL:

- Mercury in steel type, mounted direct in pocket.
- Use temperature gauges with pocket and provided with gland attachment on thermometer stem.
- Use separable type pockets, threaded 15/19mm BSP and manufactured from stainless steel.
- Screw pockets into tapped bosses or stools set in pipelines or vessels. Fill pockets with oil to ensure contact with thermometer bulb.
- Provide gauges with dial graduation in °C marked on alogarithmic scale. Ensure pointer movement is clockwise for increase in temperature.
- Provide sensing elements for air and gas systems, where indicated, and fix to provide airtight joints.
- Provide with metal shielding around sensing element to prevent effects of local radiation from equipment.

2710B TEMPERATURE GAUGES, MERCURY IN STEEL:

- Provide mercury in steel temperature gauge, mounted direct in pocket.

2710C TEMPERATURE GAUGES, VAPOUR PRESSURE TO BS EN 13190 FOR DIRECT MOUNTING:

- Vapour pressure type to BS EN 13190, mounted direct in pocket, with horizontal or vertical stem as appropriate.

2720 PRESSURE AND ALTITUDE GAUGES:

- Use vapour pressure type gauges to BS EN 837-1. Connect to pipeline systems via matched gauge cocks and cock connectors.
- Ensure dial graduation is from zero to between 1.5 and 3.0 times normal working pressure. Graduate in bar (gauge) on gauges reading head or working pressure, or in Pascals where pressure differences across plant items are to be established. Where fitted on boilers and pressure vessels, clearly mark with operating and maximum permissible working heads in

accordance BS 759. Elsewhere provide gauges with normal working pressure. Ensure dial movement is clockwise for an increasing in head.

- Fit syphons on steam systems.
- Provide flexible piping where gauge is subject to noticeable vibration.
- Fit gauge cocks preceding all connections to altitude and pressure gauges. Copper alloy, tapered ground plug, with ebonite lever. Unless flanged joints are required, screw inlet ends female and Fit-outlet ends with union connections allowing removal of gauges.

2730 VACUUM GAUGES:

- Use vacuum gauges complying with BS EN 837-1. Calibrate in mm of mercury.

2750A GAUGE MOUNTING BOARDS, HARDWOOD:

- Manufacture from 12mm thick, polished hardwood.
- Mount on walls or purpose made steel frames at a height approximately 1.3m above floor level.

3000 ACCESSORIES

3010A LOOSE ITEMS, KEYS FOR SPINDLE SHANK VALVES:

- Provide tee handled short shank keys suitable for each size of valve spindle shank.

3010B LOOSE ITEMS, FOR DRAIN COCKS:

- Provide lever pattern keys suitable for each drain cock and loose hose unions for drain cocks.

4000 WORKMANSHIP

4010 INSTALLATION:

- Install pipeline ancillaries in accordance with manufacturer's recommendations and BS 6683.

4020 LOCATION:

- Install valves, cocks, traps, strainers, test plugs, tundishes and other ancillary equipment in positions indicated.

4025 LOCATION OF THERMOSTATIC RADIATOR VALVES:

- Install thermostatic radiator valves in an area which reflects the space temperature. Ensure that they are not behind curtains or enclosed in heating or radiator panels.

4030 POSITIONING OF COMPONENTS:

- Locate flow and pressure measurement valves to ensure manufacturer's recommended straight length of pipe upstream and downstream of valve is provided.

4040 POSITIONING OF DOUBLE REGULATING VARIABLE ORIFICE VALVE:

- Install double regulating variable orifice valve to ensure equivalent of 10 diameters of straight pipe upstream and 5 diameters downstream of double regulating valve.

4050A POSITIONING OF CONTROL COMPONENTS:

- Install pipeline control components in accordance with manufacturer's instructions and in positions indicated.
- Insulation - Where control components are incorporated in insulated pipelines provide details of insulation method proposed, for approval.
- Supports - Arrange supports for control components to ensure no strain is imposed on components.
- Access - Arrange control components to ensure adequate access for operation and maintenance.

4070 VALVE STUFFING BOXES:

- Adjust glands of all stuffing boxes at normal plant operating temperature and pressure in accordance with manufacturer's instructions. Ensure that valve action is not impaired by over tightening.

4080A DISCHARGE CONNECTIONS, SAFETY VALVES:

- Fit pipework connections, where indicated, to provide discharge connection to Safety and Relief valves terminating at a safe discharge point.

4080B DISCHARGE CONNECTIONS, VENT COCKS:

- Fit pipework connections, where indicated, to provide discharge connection to vent cocks terminating 150mm above floor level.

4080C DISCHARGE CONNECTIONS, AIR BOTTLES:

- Fit pipework connections, where indicated, to provide bleed connection from air bottles terminating with air cock or needle valve in a convenient position.

4080D DISCHARGE CONNECTIONS, AUTOMATIC AIR VENTS:

- Fit pipework connections, where indicated, to provide discharge pipe to automatic air vents terminating over a suitable gully or drain line in a visible location.

4090 EXPANSION DEVICES:

- Where expansion and contraction cannot be accommodated by selected route, provide pipework loops, as indicated. Limit total stress set up in material of pipe wall, taking into account components due to internal pressure, tension and bending to less than 69 MPa for steel pipelines and less than 51.5 MPa for copper pipe lines.
- Where location does not permit sufficient flexibility, provide proprietary devices, as indicated.

4100 EXPANSION COMPENSATORS INSTALLATION:

- Provide anchors and guides to contain all movement and resist maximum loads imposed. Install expansion compensators strictly in accordance with manufacturer's instructions.
- Select and install metallic bellows expansion joints, test/inspect the systems after installation of the expansion joints and 1st full movement and provide certification in accordance with BS 6129-1.

4110 FLEXIBLE CONNECTIONS INSTALLATION:

- Fit rubber bellows as close to source of vibration as practicable. Ensure the pipe at other end of bellows is a fixed point. Install flexible connections strictly in accordance with manufacturer's instructions.
- Ensure flexible connections are tied when the plant is on vibration isolation mountings.

SECTION Y20 - PUMPS

1010 PUMPS:

- Provide pumps manufactured and tested in accordance with appropriate British Standard.
- With regard to safety requirements, comply with BS EN 809 and BS EN 60335-2-51 where applicable.
- Twin headed pumps to be supplied with a matching blanking plate to enable the pump to be operated with a single head fitted during maintenance or replacement of standby head/impeller.
- All pumps for floor mounting to be supplied with proprietary support foot.

1020 PUMP SELECTION AND EFFICIENCY:

- Select pump at or near most efficient part of performance curve for duty required.
- Whenever possible select single stage glanded centrifugal pumps to achieve pump efficiency in the 'optimum efficiency' area (after correcting for pump head) of the figures in the European Guide to Pump Efficiency for Single Stage Centrifugal Pumps as published by Europump 2003.
- Do not select pumps on flat part of performance curve in the anticipated range of the system when used in variable volume applications.
- Comply with EU Regulation 547/2012 on ecodesign requirements of glanded centrifugal water pumps. Minimum Efficiency Index (MEI) to be as scheduled. Pump efficiency tests shall be carried out in accordance with BS EN 16480.
- Comply with EC Regulation 641/2009 and the amendment EU Regulation 622/2012 for glandless circulators. Energy Efficiency Index (EEI) to be as scheduled.

1030 SAFETY GUARDS:

- Fit safety guards around revolving parts on close coupled and belt drive pumps.

1040 PUMP TESTING:

- Ensure pumps comply with BS EN ISO 5198 and BS EN ISO 9906 as appropriate.

2000 PRODUCTS/MATERIALS

2010C CENTRIFUGAL PUMP - CLOSE COUPLED:

- Configuration
  - Pump casing and motor mounted on a bedplate in line (end suction close coupled).
- Standards
  - BS EN ISO 9908
  - BS EN ISO 3661
  - BS EN 12756
  - BS EN 733
- Casing
  - Provide casing with drain connection fitted with plug.

- Provide threaded connections in accordance with relevant parts of BS EN 10226 for drains, vents, water jackets, cooling lines, etc.
- Provide pump with split casing to allow access to the impeller for service and maintenance.

- Impeller
  - Ensure impellers are accurately machined and finished smooth, free from blowholes and other defects and designed to be in dynamic balance at all speeds.
  - Provide open or semi-open type impellers for removal of sludge or other foreign material to prevent clogging.
  - Fix impellers to shafts to ensure that they remain firm if direction of rotation is reversed.
  - Indicate direction of rotation on pump casing.
- Shaft
  - Ensure shaft is of adequate diameter to withstand all imposed loading and has a critical speed when assembled with its impeller at least 10% above normal operating speed.
- Material
  - Casing - Cast iron to BS EN 1561.
  - Impeller - Bronze.
  - Shaft - Stainless steel.
  - Seal Housing - Cast iron to BS EN 1561.
- Bearings - Sleeve.
- Glands and seals - Mechanical.

2010D CENTRIFUGAL PUMP - DIRECT DRIVE IN-LINE:

- Configuration
  - Direct driven unit with pump body incorporating inlet and outlet connections in line, to allow pump to be mounted in pipework.
- Standards
  - BS EN ISO 9908
  - BS EN 12756
- Casing
  - Provide casing with drain connection fitted with plug.
  - Provide threaded connections in accordance with relevant parts of BS EN 10226 for drains, vents, water jackets, cooling lines, etc.
  - Provide pump with split casing to allow access to the impeller for service and maintenance.
- Impeller
  - Ensure impellers are accurately machined and finished smooth, free from blowholes and other defects and designed to be in dynamic balance at all speeds.
  - Provide open or semi-open type impellers for removal of sludge or other foreign material to prevent clogging.
  - Fix impellers to shafts to ensure that they remain firm if direction of rotation is reversed.
  - Indicate direction of rotation on pump casing.
- Shaft

- Ensure shaft is of adequate diameter to withstand all imposed loading and has a critical speed when assembled with its impeller at least 10% above normal operating speed.

- Material
  - Casing - Cast iron to BS EN 1561.
  - Impeller
  - Bronze, (for pools and fountains application, impeller shall be stainless steel)
  -
  - Shaft - Stainless steel to BS EN 10088.
  - Seal Housing - Cast iron to BS EN 1561.
- Bearings
  - Sealed-for-life or pre-packed type requiring no maintenance (in-line pumps).
- Glands and seals - Mechanical.

2010E GLANDLESS CIRCULATOR:

- Configuration
  - Glandless circulator incorporating inlet and outlet connections in line, to allow pump to be mounted in pipework.
- Pump efficiency
  - Comply with BS EN 16297-1 and BS EN 16297-2 for general requirements and procedures for testing and calculation of the Energy Efficiency Index (EEI) for stand-alone circulators.
  - Comply with BS EN 16297-1 and BS EN 16297-3 for general requirements and procedures for testing and calculation of the Energy Efficiency Index (EEI) for circulators integrated into products.
  - Include EEI of pump on name plate together with an indication of which part of BS EN 16297 was applied for the determination of the EEI.
- Motor
  - Provide electronically controlled permanent magnet type or Electronically Commutated (EC) motor.
  - Glandless circulators having a rated input of up to 200W to be tested in accordance with BS EN 16644 for structure and fluid borne noise.
- Casing
  - Provide casing with drain connection fitted with plug.
- Impeller
  - Ensure impellers are accurately machined and finished smooth, free from blowholes and other defects and designed to be in dynamic balance at all speeds.
  - Fix impellers to shafts to ensure that they remain firm if direction of rotation is reversed.
  - Indicate direction of rotation on pump casing.
- Shaft
  - Ensure shaft is of adequate diameter to withstand all imposed loading and has a critical speed when assembled with its impeller at least 10% above normal operating speed.
- Material
  - Casing - cast iron to BS EN 1561, or cast gunmetal to BS EN 1982

- Impeller - manufacturer's standard.
- Shaft - stainless steel to BS EN 10088
- Seal Housing - manufacturer's standard.

- Bearings
  - Sealed-for-life or pre-packed type requiring no maintenance (in-line pumps).

2010F CENTRIFUGAL SPLIT CASE PUMP:

- Standards
  - BS EN ISO 9908
  - BS EN 12756
- Configuration
  - Single stage, horizontally mounted, split case fire pump: Factory assembled and –tested as a one package in country of origin, electric-drive, double-suction, horizontal type. Include pump, driver, controller, etc… mounted on same base and connected with coupling.
  - Multistage, horizontally mounted, split case fire pump: Factory assembled and –tested as a one package in country of origin, electric-drive, two stage, single-suction, horizontal type. Include pump, driver, controller, etc… mounted on same base and connected with coupling.
- Casing
  - Axially split cast iron with suction and discharge flanges
  - Provide casing with drain connection fitted with plug.
  - Provide threaded connections in accordance with relevant parts of BS EN 10226 for drains, vents, water jackets, cooling lines, etc.
  - Provide pump with split casing to allow access to the impeller for service and maintenance.
- Impeller
  - Statically and dynamically balanced, and keyed to shaft.
  - Ensure impellers are accurately machined and finished smooth, free from blowholes and other defects and designed to be in dynamic balance at all speeds.
  - Fix impellers to shafts to ensure that they remain firm if direction of rotation is reversed.
  - Indicate direction of rotation on pump casing.
- Wear Rings
  - Replaceable, bronze.
- Shaft and Sleeve
  - Ensure shaft is of adequate diameter to withstand all imposed loading and has a critical speed when assembled with its impeller at least 10% above normal operating speed.
- Material
  - Casing - Cast iron to BS EN 1561.
  - Impeller - Cast bronze.
  - Shaft - Stainless Steel shaft with bronze sleeve to BS EN 10088.
  - Seal Housing - Cast iron to BS EN 1561.
- Shaft Bearings
  - Grease-lubricated ball bearings in cast-iron housing
- Seals

- Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland

- Coupling
  - Flexible and capable of absorbing torsional vibration and shaft misalignment. Include metal coupling guard
- Driver
  - Electric motor.
- Finish
  - Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping Glands and seals - Mechanical.
- Nameplate
  - Complete with capacities, characteristics, and other pertinent data
- Base
  - Cast Iron Fabricated base attached to pump and driver unit with reinforcement reinforced against deflection, with drip rim, drain tapping, bolt holes, and grouting hole.

2015 VARIABLE FLOW CONTROL:

- Supply centrifugal pump with variable speed drive for variable flow control. Variable speed drive to meet the safety requirements of BS EN 61800-5-1.
- Load characteristic
  - Variable torque centrifugal pumps.
  - Constant torque for positive displacement pumps.

4000 WORKMANSHIP

4010 GENERAL:

- Comply with manufacturer's recommendations for installation of pumps. For in-line pumps ensure that motor is positioned in accordance with manufacturer's requirements.

4020 PIPELINE CONNECTIONS:

- Support pumps independently from connecting pipework to ensure no load is transmitted from pipework to pump casing on pump suction and discharge.

4040 ALIGNMENT:

- Align pump to prevent undue restraint and thrust on interconnecting pipework. Align drives to prevent undue wear and restraint on pump shaft. For belt drives, align pulleys and tension belts to prevent undue wear and out of balance forces.

4050 ACCESS:

- Locate pump within the system with adequate space around it for service and maintenance.

4060 MAINTENANCE REQUIREMENTS FOR SEWAGE PUMPS:

- For ease of service and maintenance, install submersible sewage pumps on guide rails or with lifting cables. Fit pumps with automatic discharge connections, which locate on to permanent pipework at low level in chamber.

Y21 - WATER TANKS / CISTERNS

1010 TANK DESIGN:

- Design and fabricate tanks/cisterns in accordance with British Standards.

1020 DOMESTIC STORAGE WATER CISTERNS:

- Ensure storage cisterns for domestic water purposes comply with
  - England and Wales - The Water Supply (Water Fittings) Regulations 1999 as amended, the Water Act 2014 and the Construction Products Regulations 2013.
  - Scotland - The Water Supply (Water Fittings) Byelaws 2014.
  - Northern Ireland - The Water Supply (Water Fittings) Regulations 2009.

2000 PRODUCTS/MATERIALS:

2020A SECTIONAL A1 GLASS FIBRE REINFORCED SECTIONAL TANK TO BS EN 13280:

- Class A1 - for potable water incorporating screened air inlet, vent pipe entry device for the cover, screened
- Warning and overflow pipes and particle ingress limitation between a one-piece cistern or sectional tank,
- Cover and fittings.
- Sectional tanks - External flanges.

2020B SECTIONAL A2 GLASS FIBRE REINFORCED SECTIONAL TANK TO BS EN 13280:

- Class A2 - for potable water.
- Sectional tanks - External flanges.

4000 WORKMANSHIP

4010 GENERAL:

- Store, handle and erect all in accordance with manufacturer's recommendations and relevant British Standards.
- Make due allowance for valves, fittings, access, etc., to accommodate insulation and weathering where indicated.

4020 PROTECTION AND CLEANING:

- Ensure adequate protection from damage and ingress of foreign matter to tanks and cisterns during storage, erection and commissioning. Thoroughly clean out all tanks and cisterns prior to site testing and commissioning.

4030 INSPECTION AND ACCESS:

- Install tanks and cisterns to allow internal and external surfaces to be easily inspected and cleaned.

Y23 - STORAGE CYLINDERS AND CALORIFIERS

1010 STANDARDS:

- Comply with British Standards indicated.
- Unvented hot water storage systems to be completed with "unvented kits" and pressure regulating valve to comply with Building Regulations safety requirements within Approved Document G3. Indirectly heated storage water heaters to comply with BS EN 12897.

1020 DEFINITIONS:

- Direct cylinder - a closed cylindrical vessel with domed ends.
- Indirect cylinder - a closed cylindrical vessel with domed ends having separate integral means of heating contents by annular or coil type element.
- Combination unit - an indirect/direct cylinder of double or single feed type with attached feed cistern.
- Calorifier - a closed cylindrical vessel having separate integral means of heating contents by 'U' tube chest type element.
- Primary heater - a heater mounted inside a cylinder or calorifier for transfer of heat to stored water from primary medium.
- Capacity - the volume of water storage excluding contents of any primary heater.
- Secondary working head - the vertical distance between bottom of cylinder or calorifier and water line of cistern supplying cylinder or calorifier.

2000 PRODUCTS/MATERIALS

2060A GALVANIZED STEEL CALORIFIER/STORAGE VESSEL TO BS 853-1:

- Method of heating - Hot water.
- Inspection opening
    - Size and position as shown on drawings.
    - Horizontal or vertical as shown on drawings.
    - Fixed or bolted end as shown on drawings.
- Type of heater
    - Fixed helical coil; withdrawable helical coil; or U-tube battery.
- Materials
    - Shell - galvanized steel with sacrificial anode.
    - Material test certificates to BS 853-1
    - Hydraulic test certificates to BS 853-1
- Provide connections and supports as shown on drawings and as indicated.
    - Mountings to BS 853-1
    - Fit and install pressure relief devices to relevant parts of BS EN ISO 4126 to suit the design pressure of the shell relative to the primary hot water working pressure

3000 WORKMANSHIP

3010 GENERAL:

- Store, handle and erect all in accordance with manufacturer's recommendations and relevant British Standards.
- Make allowance for valves, fittings, access etc., to accommodate insulation/weathering where indicated.

3030 PROTECTION AND CLEANING:

- Ensure protection from damage and ingress of foreign matter to cylinders and calorifiers during storage, installation and testing.

3040 INSPECTION AND CLEANING:

- Install cylinders and calorifiers such that internal surfaces and external surfaces can be readily inspected and cleaned.

Y25 - CLEANING AND CHEMICAL TREATMENT

1010 CONDITIONS FOR CLEANING AND CHEMICAL TREATMENT:

- Ensure treatment complies with statutory authority and health and safety regulations.
- Notify manufacturer's and suppliers of equipment of proposed system cleaning and chemical treatment processes. Establish if any manufacturer or supplier of equipment requires any particular cleaning and chemical treatment process due to size of waterways or materials used.
- All chemicals used are to be compatible with the metallurgy of the systems.
- Obtain local water authority approval for disposal of any waste products.

1015 METHOD STATEMENT:

- Provide a method statement covering the sequence of events, chemicals to be used etc. Statement to be provided at least two months prior to the start of any flushing and/or chemical cleaning works.

2000 PRODUCTS/MATERIALS

2010 CLEANING AND CHEMICAL TREATMENT SPECIALIST:

- Use a specialist for analysis and for design, supply, installation and operation of any system cleaning and chemical treatment process.

2020A MAINS WATER ANALYSIS:

- Obtain an analysis of mains water taken from site supply point. Check with local water authority to ensure analysis results are typical for site area and report variances for instruction; or submit a sample of water to water treatment specialist as appropriate.
- Carry out tests to establish total viable counts and Pseudomonas and sulphate reducing bacteria.
- Minimum water quality - as BSRIA BG 29/2012 Table 8.

2030A PRELIMINARY CHECKS:

- Prior to carrying out cleaning or chemical treatment process, ensure that
    - All foreign matter is removed.
    - Certified pressure tests have been carried out in the parts of the system to be cleaned. Carry out further pressure tests on the isolated sections of the system independently.
    - All water used for pressure testing is inhibited. Leave remaining pipework sections full after testing.
    - Circulation has been demonstrated and approval obtained on all parts of the system. Manipulate and leave fully open all valves other than those used to isolate sections. Carry out balancing and certification after the flushing, cleaning and passivation operations.
    - No damage can occur to any item of plant or equipment due to cleaning and chemical processes.
    - Chemicals used are compatible with system materials.
    - All items of plant and equipment subject to damage or blockage due to cleaning and chemical treatment processes are isolated or removed.

- Permanent or temporary by-passes are provided as indicated on drawings.
- Dirt pockets are installed at low points to facilitate solids removal. Supply dirt pockets with drain valves sized to pipework size.
- All drains provided have been tested and approved and that any pumping equipment associated with the drainage system is fully commissioned.
- Dead legs, that are more than 3 pipe diameters in length are looped to allow effective cleaning.
- Strainer baskets and filter media, incorporated within systems, are removed; and where necessary spool or stool pieces are installed.
- Temporary strainers and filters are installed as required for removal of solids during cleaning and chemical treatment processes.
- Strainers are clean prior to the start of the cleaning process, throughout the cleaning and on completion.
- Suitable supply and drainage points are provided with 50mm minimum connections, properly sited and installed, either valved or plugged.
- All automatic/manual air vents are fully commissioned.
- Air vents of a minimum size of 25mm are installed at the tops of large flow risers.
- All requirements of COSHH regulations are complied with during the chemical cleaning and chemical treatment of the system.
- Where required by local water authority, provide effluent tanks for storage of all waste products of cleaning and chemical treatment processes.
- Following local water authority approval, either neutralize and dispose to drain of all waste products; or ensure authorised disposal at registered sites.
- Comply with Waste Management Duty of Care: A Code of Practice and The Hazardous Waste (England & Wales) Regulations 2005 where appropriate.

2040A PROCEDURAL PRECAUTIONS FOR CLEANING AND CHEMICAL TREATMENT:

- Carry out tests to ensure that cleaning and chemical treatment processes are operating as required.
- Carry out tests to ensure that cleaning and chemical treatment processes are operating as required. and detailed in the Method Statement.
- Submit all test and sample results for certification and approval.

2040B PROCEDURAL PRECAUTIONS FOR CLEANING AND CHEMICAL TREATMENT INCLUDING TAKING SAMPLES:

- Take and test samples of the filling/flushing water and the system water, before, during and following chemical treatment and/or cleaning in accordance with BSRIA BG 29/2012, Section 3 and BS 8552.
- Submit samples to an independent specialist for analysis in accordance with BSRIA BG 29.
- Monitor water quality of systems after pre-commission cleaning up to practical completion in accordance with BSRIA BG 29/2012 Section 3.2.
- Submit all test and sample results for certification and approval.
- Ensure all contractually required samples are witnessed.

2050A WATER TREATMENT METHODS FOR HOT WATER HEATING CLOSED CIRCUIT RECIRCULATING SYSTEMS:

- Corrosion and scale control
    - Chemicals as BSRIA Guide BG 50/2013 Table 5.

- Control of microbiological fouling
    - Chemical.
    - Biocides and biodispersants. Chemicals as BSRIA BG 50/2013 Appendix C and European Biocidal Products Regulation (BPR) 528/2012.

2050B WATER TREATMENT METHODS FOR CHILLED AND CONDENSER WATER CLOSED RECIRCULATING WATER SYSTEMS:

- Corrosion control
    - Chemicals as BSRIA Guide BG 50/2013 Table 5.
- Control of microbiological fouling
    - Chemical.
    - Biocides and biodispersants. Chemicals as BSRIA BG 50/2013 Appendix C and European Biocidal Products Regulation (BPR) 528/2012.

2060A CHEMICAL INJECTION AND DOSING METHODS FOR CLOSED SYSTEMS:

- Method of introducing chemicals
    - Dosing pots.

2060B CHEMICAL CLEANING AND DOSING METHODS FOR OPEN RECIRCULATING SYSTEMS:

- Method of introducing chemicals
    - Chemical dosing for scale and corrosion inhibitors
    - Continuous; timer controller; or proportional dosing as appropriate.
    - Bleed-off control.
    - Biocide dosing - automatic dosing control.

2060C PACKAGED CHEMICAL INJECTION AND DOSING PLANT:

- Provide packaged monitoring and treatment plants.

2060D DOSING POTS - CLOSED SYSTEMS:

- Chemical feed
    - Provide feeder (dosing pots) with a tundish for filling; separate air vent with discharge tube; drain and isolating valves. Fabricate from mild steel tube to BS EN 10255, BS EN 10216 or BS EN 10217 to suit maximum working pressure of system.
- Sampling
    - Install in each water system means of taking samples as clause Y25.2070B and as follows:-
        - Chilled water systems - provide a gate valve and discharge.
        - Heating systems - provide a sample cooler with a copper coil and cooling jacket with cooling water valve and drained to waste.

2060E DOSING - OPEN SYSTEMS:

- Chemical dosing
    - Provide an interface between water treatment plant and system pumps to allow the initiation of water circulation in addition to the requirements of the building services.
    - Where control by-passes are used, set valves to allow reduced circulation but not complete isolation of the equipment.
    - Provide control of chemical inhibitors by linking the dosing pump control unit to operate on a signal from a water meter.
    - Provide skid mounted packaged equipment to feed chemical inhibitors including pre-wired controls and dosing pump, high density polyethylene tank, chemical diaphragm pump complete with all necessary valves and tubing.
    - Provide control of total dissolved solids by linking a solenoid purge valve to operate by a signal automatically received from a conductivity sensor.
- Biocide dosing
    - Provide skid mounted packaged equipment to feed two types of biocides on an automatically alternating basis including pre-wired timer controls and twin biocide diaphragm pumps complete with all necessary valves and tubing. Draw biocide chemical direct from the chemical supply drums located on the skid.
- Control
    - Provide low level alarms for all dosing units.
    - Provide BMS connections to monitor dosing and show run and alarm conditions.
- Injection manifold
    - Provide an injection manifold for use with the above water treatment equipment.
    - Connect the manifold across flow and return pipework and mount above the dosing plant modules, unless otherwise indicated.

2065 CHEMICALS - DOSING:

- Provide biocides effective against Legionella Pneumophila, algae, fungi, moulds and slime forming bacteria including pseudomonas and sulphate reducing bacteria.
- Supply biocides as recommended by water treatment specialist.
- Incorporate a bio dispersant in the programme to break up and disperse any slime masses, where required.
- Biocides to comply with European Biocidal Products Regulation (BPR) 528/2012.
- The water treatment specialist shall select the appropriate corrosion inhibitors, to minimise corrosion, and biocides to prevent any proliferation to mild steel, copper and copper alloys.
- Provide a specific inhibitor to protect aluminium when it is present in the system.
- The cleaning agent is to be specified by the water treatment specialist.

2070A MONITORING CLOSED SYSTEMS:

- For closed systems monitor system physical, chemical and bacterial levels from initial fill to practical completion in accordance with BSRIA BG 29/2012 and BS 8552.

2070B SAMPLING CLOSED SYSTEMS:

- For closed systems provide sampling points in accordance with BS 8552 and BSRIA BG 29/2012.
- Provide testing equipment to carry out tests for all inhibitors used in treatment programme indicated.
- Undertake sampling of closed systems in accordance with BSRIA BG 29/2012, Section 3 and Appendices A and B.
- Number and locations of samples in compliance with BG 29/2012, Appendix A.

2070C SAMPLING KITS:

- Provide the following test kits as appropriate
    - Boiler water test kit for steam boilers; conductivity test kit; pH test kit; inhibitor test kit; hardness test kit where a softener is installed; chloride level test kit.
- For open systems - bacteriology monitoring with use of dipslides.
- Log sheets for recording of test results, bacteriological analysis and any actions required or taken.

2070E SAMPLING HOT AND COLD WATER SERVICES:

- Standard
    - BS 8554 - Code of practice for the sampling and monitoring of hot and cold water services in buildings.
- Locate sampling points following the guidance and recommendations in the code of practice (CoP), and document these in a sampling plan in accordance with BS EN ISO 5667-1.
- Undertake sampling following construction completion in accordance with the guidance and recommendations in the CoP.
- Undertake microbiological test on samples and provide the results as part of the handover documentation to demonstrate that the systems are clear of organisms of concern. Preserve and handle samples in accordance with BS EN ISO 5667-3.

2080A CHEMICAL PROVISION, STANDARD ARRANGEMENT:

- Provide consumables for a period of 12 months.
- Where indicated, provide for supply of chemicals from containers refilled by drumless delivery system.
- Include for supply of chemicals for all systems using the basis of:
    - Open circuit systems operating at 100% load for 2080 hours per annum.
    - Closed circuit systems make-up 1% system volume/month.

3000 WORKMANSHIP

3010A FLUSHING CLOSED PIPEWORK SYSTEMS TO BSRIA BG 29:

- Carry out flushing of water systems in accordance with BSRIA Guide BG 29/2012 Pre-commission Cleaning of Pipework Systems.

- Section 4 Installation Considerations.
- Section 5 System Dynamic Flushing.

3010B FLUSHING CLOSED PIPEWORK SYSTEMS:

- Ensure all water used for pressure testing, flushing and system filling is of good quality. Clean and chlorinate temporary site mains to fill and flush closed systems in accordance with BS EN 806-4. Leave remaining pipework sections full and treated after pressure testing.
- Install all necessary pipework ancillaries to enable a specialist to carry out flushing, inspection and witnessing of water systems in accordance with BSRIA Guide BG 29/2012 Pre-commission cleaning of pipework systems. Connections between new and existing systems in accordance with BG 29/2012 Section 7.
- Temporary connection from the mains must be in compliance with
  - WRAS advisory topics B09 or B22.
  - England and Wales - The Water Supply (Water Fittings) Regulations 1999 as amended, the Water Act 2014 and the Construction Products Regulations 2013.
  - Scotland - The Water Supply (Water Fittings) Byelaws 2014.
  - Northern Ireland - The Water Supply (Water Fittings) Regulations 2009.
  - BSRIA BG 29/2012 Table 3 for pipe sizes when using mains water for flushing or installation of a temporary tank and pump arrangement shall be provided.
- Flush systems using mains water until the water is clear.

3010D FLUSHING SERVICES SUPPLYING WATER FOR DOMESTIC USE:

- Domestic water systems are to be flushed and disinfected in accordance with the requirements of BS EN 806-4, complimentary guidance in BS 8558 and PD 855468 and to the satisfaction of the local water supply authority.

3020A TESTING AND PURGING GAS PIPEWORK - INDUSTRIAL AND COMMERCIAL INSTALLATIONS:

- Comply with IGE/UP/1 Strength and tightness testing and direct purging of industrial and commercial gas installations.

3020B TESTING AND PURGING GAS PIPEWORK - SMALL LOW PRESSURE INDUSTRIAL AND COMMERCIAL INSTALLATIONS:

- For systems having a volume not exceeding $1m^3$ comply with IGE/UP/1A Strength and tightness testing and direct purging of small low pressure industrial and commercial natural gas installations.

3020C TESTING AND COMMISSIONING GAS INFRASTRUCTURE TO BS EN 12327:

- Carry out pressure testing and commissioning of gas infrastructure (external to buildings) up to the ECV fitted on the end of the gas service owned by the Gas Transporter in accordance with BS EN 12327.
- Purge each system using nitrogen or carbon dioxide

- This operation is to prove the continuity of the pipework, remove any cutting fluid and ensure that the nozzles are clear.
- Flimsy paper bags are to be attached to all nozzles during the purge and removed upon completion of the purge.

3030A CHEMICAL CLEANING AND SOLIDS REMOVAL - INHIBITED ACID:

- Carry out chemical cleaning procedure in accordance with BSRIA Guide BG 29/2012 Pre-commission Cleaning of Pipework Systems.

3030B CHEMICAL CLEANING AND SOLIDS REMOVAL - FORMULATED PRODUCTS:

- Carry out chemical cleaning procedure in accordance with BSRIA Guide BG 29/2012 Pre-commission Cleaning of Pipework Systems.

3035 CLEANING AND CHEMICAL TREATMENT REGIME:

- The specialist shall submit a method statement prior to commencing work which fully prescribes the proposed regime and sequence for the flushing, cleaning and chemical treatment of all closed and condenser water systems. The following shall be considered in preparation of the method statement:
  - Delay filling the pipework for the first time for as long as possible.
  - If any pipework is to be wet for more than 2 weeks prior to cleaning, treat the fill water with biocide and bio-dispersant.
  - Take samples for microbiological analysis in accordance with BG 29/2012 Section 3.
  - If sample results are poor, undertake a biocide wash on all previously wetted areas after the initial flush. Biocide treated water should be drawn into any previously wetted terminal unit coils slowly (which have been isolated for the clean) to avoid the introduction of debris, after which the coils should be isolated again.
  - During the initial flush flows should be maximised, recorded and witnessed. Batch work on terminal unit by-passes should be carefully undertaken in accordance with BSRIA BG 29/2012, and the correct number of terminal unit by-passes opened at any one time in order to maximise flow along the horizontal runs.
  - Static flushing.
  - Dynamic flushing.
  - Degreasing.
  - Biocide wash.
  - Removal of surface oxides (for systems with carbon steel components).
  - Effluent disposal/final flushing.
  - Neutralisation (for inhibited acid cleans only).
  - Passivation.
  - Corrosion inhibitor and final biocide dosing.
  - Monitoring and sampling of water to practical completion.

3040 DISINFECTION - GENERAL:

- After flushing process, carry out disinfection of water services systems in accordance with BS EN 806-4 and complimentary guidance in BS 8558 and PD 855468.
- Prior to disinfection ensure each system is flushed, cleaned and drained.

- Provide temporary connections to system terminal points suitable for introduction of disinfection chemicals and fluids and 22mm minimum valved drain connection on incoming main immediately downstream of mains isolating valve.
- Fill system with clean, fresh water.
- If the building is not occupied immediately after disinfection, put in hand a system for flushing all outlets to ensure system remains suitable for use when required.
- Repeat disinfection of potable water system immediately prior to handover if required.
- Immediately prior to occupation, retake samples and submit for analysis and report.

3050 DISINFECTION - HOT AND COLD WATER SERVICES SYSTEMS:

- Carry out the following operations in accordance with BS EN 806-4 and complimentary guidance in BS 8558 and PD 855468.
    - Flush system and introduce sterilisation chemical.
    - Agree a list of sentinel points (outlets in a water system that poses the highest risk from infection) prior to disinfection and take samples from these points to ensure correct chlorine concentration.
    - Leave system to stand for period of time indicated by the chemical manufacturer.
    - Repeatedly flush system with clean water until all traces of chlorine have been removed - leave system filled.
    - Submit samples to registered laboratory for microbiological analysis and report.
- Certificate of conformity
    - Immediately prior to handover, retake samples and submit for analysis and report.
- Where necessary repeat disinfection of potable water system immediately prior to handover.

3060 DISINFECTION - WATER STORAGE SYSTEMS:

- Carry out the following operations in accordance with BS EN 806-4, complementary guidance in BS 8558, PD 855468 and HSE L8 Legionnaires' Disease: The control of legionella bacteria in water systems ACOP and all parts of HSG274 (for technical guidance).
- Carry out operations on all water storage tanks and cisterns, cold and hot.
- Carry out procedures as for mains water systems.

3080 SERVICE VISITS:

- Provide monthly service visits for one full year by a fully qualified chemist, to carry out the following:-
    - Review water analysis records, correspondence and reports since previous visit.
    - Test water samples on-site for hardness; all inhibitors; dissolved solids; pH; total alkalinity.
    - Check performance of feeding equipment, softeners, and testing equipment on-site.
    - Submit a written report.
    - Undertake a sampling of closed systems in accordance with BS 8552.
    - Carry out micro-biological analysis using dipslides.
    - Frequency of service visits - monthly.

3090 DOCUMENTATION:

- Provide number of copies as indicated of hard cover binders containing details of
    - Programme outlines.
    - Purpose of chemical treatment.
    - Chemicals used and quantity.
    - On site testing procedures.
    - Control limits of tests.
    - Equipment data and drawings.
    - Product notes and material safety data sheets for all chemicals used.
- Provide a complete training programme for site operatives covering
    - Methods of basic water testing.
    - Explanation of results obtained.
    - Actions to be taken on test results.

Y30 - AIR DUCTLINES AND ANCILLARIES

1010 DUCTWORK INSTALLATION STANDARDS:

- Carry out construction and installation of ductwork in accordance with, as appropriate
  - DW/144
  - DW/154
  - DW/172
  - DW/191
  - BS 9999
  - BS EN 1507
  - BS EN 12237
  - BS EN 13403

1020 DUCTWORK DIMENSIONS:

- Sizes of ductwork are internal dimensions. Where applicable make allowance for any internal lining.

1030 ELECTRICAL BONDING TERMINAL:

- Ensure an electrical bonding terminal is provided suitable for connection of a main protective conductor complying with BS 7671, clause 544.1.

2000 DUCTWORK FABRICATION/MATERIALS

2010# DESIGN INFORMATION:

- Supply ductwork in accordance with classification in DW/144 and DW/154, BS EN 1507 Table 1 and BS EN 12237 Table 2.
- Ductwork classification and air leakage limits
  - Low pressure - Class A - Positive. (0.027 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 10m/s)
  - Low pressure - Class A - Negative. (0.027 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 10m/s)
  - Medium pressure - Class B - Positive. (0.009 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 20m/s)
  - Medium pressure - Class B - Negative. (0.009 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 20m/s)
  - High pressure - Class C - Positive. (0.003 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 40m/s)
  - High pressure - Class C - Negative. (0.003 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 40m/s)
  - High pressure - Class D - Positive. (0.001 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 40m/s)

- High pressure - Class D - Negative. (0.001 x $p^{0.65}$.l/s/m^2 duct surface) (Max air velocity - 40m/s)

2030A HIGH PRESSURE DUCTWORK AIR LEAKAGE TESTING:

- Carry out ductwork air leakage testing on all high pressure ductwork in accordance with DW/144 as procedures set out in DW/143.

2030B MEDIUM PRESSURE DUCTWORK AIR LEAKAGE TESTING:

- Test 10% of medium pressure ductwork (selected at random) in accordance with DW/144 as procedures set out in DW/143, or;
- Test indicated or scheduled % of the medium pressure ductwork for air leakage. Test at the pressure recommended in DW/144 as procedures set out in DW/143 for the classification of the selected ductwork. Carry out the tests as the work proceeds and prior to application of thermal insulation.
- If the test fails, pressure test two further sections as indicated. If the further tests fail, apply remedial action to the complete ductwork system.
- Provide documented evidence of the calculations used to arrive at the allowable loss for the section to be tested and ensure the client or his agent witnesses and signs the results of the tests.
- Testing plant items, DW/144.

2030C LOW PRESSURE DUCTWORK AIR LEAKAGE TESTING:

- Test indicated or scheduled % of the low pressure ductwork for air leakage. Test at the pressure recommended in DW/144 for the classification of the selected ductwork as procedures set out in DW/143. Carry out the tests as the work proceeds and prior to application of thermal insulation.
- If the test fails, pressure test two further sections as indicated. If the further tests fail, apply remedial action to the complete ductwork system.
- Provide documented evidence of the calculations used to arrive at the allowable loss for the section to be tested and ensure the client or his agent witness and signs the results of the tests.
- Testing plant items as DW/144.

2035 STRENGTH AND LEAKAGE TESTING OF CIRCULAR SHEET METAL DUCTWORK:

- Carry out ductwork strength and air leakage testing on circular sheet metal ductwork in accordance with BS EN 12237.
- Test procedure shall be as detailed in BS EN 12237, Section 7.
- Produce a test report as detailed in BS EN 12237, Section 8.

2036 STRENGTH AND LEAKAGE TESTING OF RECTANGULAR SHEET METAL DUCTWORK:

- Carry out ductwork strength and air leakage testing on rectangular sheet metal ductwork in accordance with BS EN 1507.
- Test procedure shall be detailed in BS EN 1507.
- Produce a test report as detailed in BS EN 1507.

2065 KITCHEN EXTRACT SYSTEMS:

- Comply with BESA DW/172 Appendix D' and DW/144.
- Comply with Section 7 of BESA TR/19 for facilities and specific requirements for cleaning.
- Access doors for cleaning (with grease tight gaskets) shall be installed at every bend and connection and at every 3m on straight lengths of ductwork. All joints shall be grease-tight.
- The entire system installation shall comply with all relevant Building Regulations and any specific requirements of the Building Control and Fire Officer.
- Ductwork -:Carbon-Steel Sheets: DW/144, cold-rolled sheets; commercial quality; with oiled, exposed matte finish..

2070 MAN ACCESS AND SAFETY BARS:

- Man access is required where indicated on drawings. Ensure that duct floor is of sufficient strength to comply with safety standards.
- Provide safety bars where indicated at the top of risers.

2100# PLASTICS DUCTWORK TO DW/154:

- Manufacture and install plastic ductwork in accordance with DW/154.
- Material
    - PVC-U (Unplasticized polyvinyl chloride).
    - PPS (Self extinguishing polypropylene).
    - FBPP (Fabric backed polypropylene sheet).
    - PVC-U/GRP (Composite laminate of unplasticised polyvinyl chloride and glass reinforced plastic).
    - PVC-U/FOAM/GRP (Composite laminate of unplasticised polyvinyl chloride, rigid polyurethane self extinguishing foam and glass reinforced plastic).
    - FBPP/FOAM/GRP (Composite laminate of fabric backed polypropylene sheet, rigid polyurethane self extinguishing foam and glass reinforced plastic).
- Construction
    - Rectangular ducts DW/154 Part 3.
        - Provide internal stiffeners.
    - Circular ducts DW/154 Part 4.

2100M PRE-INSULATED DUCTWORK TO BS EN 13403:

- Fabrication/Installation in accordance with manufacturer's technical manuals.
- Material - Closed cell phenolic foam insulation boards.
- Construction - Manufacturer's fabrication/installation manuals.
- Provide internal stiffeners as necessary.

2110A FIRE PROTECTION WITH FIRE DAMPERS:

- Method of protection where ventilation ducts pass through fire-separating elements

- BS 9999 method 1 and method 4 protection using fire dampers and/or automatically actuated fire and smoke dampers triggered by smoke detectors.

- Installation to comply with
  - BESA DW/144 and DW/145
  - Building Regulations Approved Document B
  - BS EN 15650 Ventilation for buildings. Fire dampers
  - Relevant parts of BS EN 1366, BS EN 13501 and BS EN 12101

2110B FIRE PROTECTION WITH FIRE RESISTING ENCLOSURES:

- Method of protection where ventilation ducts pass through fire-separating elements
  - BS 9999 method 2 using fire-resisting enclosures.
- Installation to comply with
  - BESA DW/144
  - Building Regulations Approved Document B
  - Relevant parts of BS EN 1366, BS EN 13501 and BS EN 12101

2110C FIRE RESISTING SMOKE AND HEAT CONTROL DUCTWORK TESTED TO BS 476-24:

- Ensure complete ductwork system complies with the requirements of BS 476-24 for testing, BS 9999 and Building Regulations Approved Document B.
- Method of protection where ventilation ducts pass through fire-separating elements
  - BS 9999 method 3: protection using fire-resisting ductwork.
- Duct constructed to BESA DW/144 has no tested fire resistance, therefore when using protective cladding materials, construction of base duct must comply with the actual construction of the tested duct specimen and cladding material.
- Drop rods and exposed bearers to be insulated in accordance with manufactures recommendations and instructions.
- Where a vapour barrier is required, all exposed edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

2110D FIRE RESISTING DUCTWORK TESTED TO BS 476-24:

- Ensure complete ductwork system complies with the requirements of BS 476-24, BS 9999 and Building Regulations Approved Document B.
- Method of protection where ventilation ducts pass through fire-separating elements
  - BS 9999 method 3: protection using fire-resisting ductwork
- Supply and install fire rated ductwork using fire resisting ductwork using either fire protection cladding on-site, factory applied fire resisting finish or factory manufactured fire rated ductwork as detailed elsewhere in this specification. Ductwork to be in accordance with BESA DW/144.
- Duct constructed to BESA DW/144 has no tested fire resistance therefore when using protective cladding materials, construction of base duct must comply with the actual construction of the tested duct specimen and cladding material.
- Insulation system to be independently tested and carry current valid certification to provide fire protection fully in accordance with the requirements of duct Type A and duct Type B of BS 476-24 and BS 9999.

- Drop rods and exposed bearers to be insulated in accordance with manufacturers recommendations and instructions.
- Where a vapour barrier is required, all exposed edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

2110E FIRE RESISTING DUCTWORK TESTED TO BS EN 1366:

- Supply and install fire resisting ductwork using either fire protection cladding on-site, factory applied fire resisting finish or factory manufactured fire rated ductwork, as detailed elsewhere in this specification. Ductwork to be in accordance with BESA DW/144.
- Duct constructed to BESA DW/144 has no tested fire resistance, therefore when using protective cladding materials, construction of base duct must comply with the actual construction of the tested duct specimen and cladding material.
- Method of protection where ventilation ducts pass through fire-separating elements
    - BS 9999 method 3: protection using fire-resisting ductwork.
- Ensure complete ductwork system complies with EN testing requirements to BS EN 1366-1, be tested by a UKAS accredited notified body, or body accredited by the local Authorities Having Jurisdiction and comply with Building Regulations Approved Document B.
- Classification documents to be in accordance with BS EN 13501-3 for ventilation ducts, the ductwork providing either duct Type A (fire outside) or duct Type B (fire inside). Documents to confirm that systems are suitable for horizontal and vertical applications; and in both rectangular and circular profiles; and any size limitations under the relevant BS EN 1366 test part must be confirmed.
- Where the ductwork passes between fire compartments, fire stopping shall be carried out by the specialist in accordance with the ductwork manufacturer's recommendations; and the ductwork shall be reinforced in line with that used within the actual fire test; and be relevant to flexible or rigid wall / floor constructions. The ductwork shall be stiffened to prevent deformation of the duct in a fire to maintain the cross-sectional area of the duct and ensure that the fire rated penetration seal around the duct is not compromised.
- The specialist ductwork contractor shall be responsible for the design and sizing of the drop rods and bearers (and their centres) for the fire resisting ductwork to suit the fire duration scheduled.
- Drop rods and exposed bearers to be insulated in accordance with manufacturers recommendations and instructions.
- All fire insulation, sealants, gaskets and flexible joints must be non-flammable when tested.
- Where a vapour barrier is required, all exposed edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

2110F FIRE RESISTING AND SMOKE / HEAT CONTROL DUCTWORK TESTED TO BS EN 1366:

- Supply and install fire resisting ductwork using either fire protection cladding on-site, factory applied fire resisting finish or factory manufactured fire rated ductwork, as detailed elsewhere in this specification. Ductwork to be in accordance with BESA DW/144.
- Duct constructed to BESA DW/144 has no tested fire resistance, therefore when using protective cladding materials, construction of base duct must comply with the actual construction of the tested duct specimen and cladding material.
- Method of protection where ventilation ducts pass through fire-separating elements
    - BS 9999 method 3: protection using fire-resisting ductwork.

- Ensure complete ductwork system complies with EN testing requirements to BS EN 1366-1, BS EN 1366-8 or BS EN 1366-9 depending on system function, be tested by a UKAS accredited notified body, or body accredited by the local Authorities Having Jurisdiction and comply with Building Regulations Approved Document B. Smoke extract ducts to conform to the requirements of BS EN 12101-7.
- Classification documents to be in accordance with BS EN 13501-3 for ventilation ducts and BS EN 13501-4 for smoke control ducts sections. Documents to confirm that systems are suitable for horizontal and vertical applications; and in both rectangular and circular profiles; and any size limitations under the relevant BS EN 1366 test part must be confirmed.
- The ductwork providing either duct Type A (fire outside), duct Type B (fire inside) or duct Type C (fire inside smoke control duct). All smoke extract ductwork to be capable of retaining a cross-sectional area of 90% under fire conditions in accordance with BS EN 1366-8 for multi compartment smoke extract systems.
- Where the ductwork passes between fire compartments, fire stopping shall be carried out by the specialist in accordance with the ductwork manufacturer's recommendations; and the ductwork shall be reinforced in line with that used within the actual fire test; and be relevant to flexible or rigid wall / floor constructions. The ductwork shall be stiffened to prevent deformation of the duct in a fire to maintain the cross-sectional area of the duct and ensure that the fire rated penetration seal around the duct is not compromised.
- The specialist ductwork contractor shall be responsible for the design and sizing of the drop rods and bearers (and their centres) for the fire resisting ductwork to suit the fire duration scheduled.
- Drop rods and exposed bearers to be insulated in accordance with manufacturers recommendations and instructions.
- All fire insulation, sealants, gaskets and flexible joints must be non-flammable when tested.
- Where a vapour barrier is required, all exposed edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

2120A INTERNAL THERMAL/ACOUSTIC INSULATION:

- Fit internal linings at works in accordance with DW/144.

2130# PRE-INSULATED EXTERNAL THERMAL/ACOUSTIC DUCTWORK:

- Thickness - to meet maximum permissible heat loss (warm air ducts) - 16.34 W/m^2 and heat gain (chilled/dual-purpose air ducts) - 6.45 W/m^2 in accordance with BS 5422 and Non-Domestic Heating, Cooling and Ventilation Compliance Guide, and Approved Document L2A/L2B.

2130B PRE-INSULATED ALUMINIUM DUCTWORK:

- External aluminium - Thickness 8mm.
  - Finish - Embossed, protected with polyester lacquer
- Internal aluminium - Thickness 8mm.
  - Finish - Embossed, protected with polyester lacquer
- Insulation - 20mm polyurethane.

2140A HANGERS AND SUPPORTS:

- Provide hangers and supports throughout in accordance with DW/144; DW/154 Part 5; or DW/191 Section 7 as appropriate.
- Comply with BS EN 12236.

2150A SUPPORT OF AIR TERMINAL UNITS:

- Support air terminal units and their plenums by the ceiling grids, as DW/144.

3000 ACCESSORIES AND COMPONENTS

3010 CONSTRUCTION AND FINISHES:

- Ensure that materials of accessories are compatible with ductwork and that finishes of accessories comply with any special requirements for ductwork.
- Ensure casing losses of components are compatible with ductwork in which they are incorporated.

3020A METAL DUCTWORK INSPECTION/SERVICING ACCESS OPENINGS:

- Provide access/inspection openings in accordance with DW/144.

3020C PLASTIC DUCTWORK INSPECTION/SERVICING ACCESS OPENINGS:

- Provide access openings in accordance with DW/154 Part 6, Section 15 and Appendix D, Table 14.

3020D DUCTWORK INSPECTION/SERVICING ACCESS OPENINGS:

- Provide access/inspection openings in accordance with BESA TR/19.

3030A METAL DUCTWORK TEST HOLES:

- Provide test holes in ductwork system, to allow complete testing and balancing of system in accordance with CIBSE Commissioning Code A.
- Site drill test holes in accordance with BESA DW/144.

3040 HOLES FOR CONTROLS/INSTRUMENTS - METAL DUCTWORK:

- Provide holes in ductwork, in accordance with BESA DW/144 to accommodate thermostats, humidistats and other control sensors in positions and sizes indicated on drawings.

3041 CONTROLS/SENSING EQUIPMENT - PLASTICS DUCTWORK:

- Install sensors and test points to suit specialist control and sensing equipment in positions and fixing configurations shown on drawings.

3042 INSTALLATION OF INSTRUMENTS AND CONTROLS:

- Instruments and controls should be installed to manufacturers or specialist supplier's requirements. The installation must be checked by the manufacturer or specialist supplier, and rectified as necessary.

3050A CLEANING ACCESS - BASIC LEVEL OF PDI:

- Provide access for cleaning in accordance with BESA documents DW/144 and TR/19.

3050B CLEANING ACCESS - INTERMEDIATE LEVEL OF PDI:

- Provide access for cleaning in accordance with BESA documents DW/144 and TR/19.

3050C CLEANING ACCESS - ADVANCED PDI WITH POST INSTALLATION CLEAN:

- Provide access for cleaning in accordance with BESA documents DW/144 and TR/19.
- The specialist cleaning contractor, in addition to taking advantage of openings fitted by the ductwork installer, shall supply and install any additional cleaning openings to suit their selected specific methods of cleaning and suit the practical site conditions relative to the fabric of the building and position of other services.

3060A STEEL SINGLE-BLADE BALANCING DAMPERS - METAL DUCTS:

- Provide single or double skin steel single blade balancing dampers in accordance with DW/144. Manual operation. Locations and size as shown on drawings and as required for balancing.
- Undertake aerodynamic testing of dampers in accordance with BS EN 1751.
- Where required, determination of sound power levels to be by measurement in a reverberation room in accordance with BS EN ISO 5135.

3060B STEEL MULTI-BLADE BALANCING DAMPERS - METAL DUCTS:

- Provide single or double skin steel multi-blade balancing dampers in accordance with DW/144. Parallel or opposed blade, manual operation. Locations and size as shown on drawings and as required for balancing.
- Undertake aerodynamic testing of dampers in accordance with BS EN 1751.
- Where required, determination of sound power levels to be by measurement in a reverberation room in accordance with BS EN ISO 5135.

3060C STEEL SINGLE-BLADE CONTROL DAMPERS - METAL DUCTS:

- Provide single or double skin steel single blade control dampers in accordance with DW/144. Locations and size as shown on drawings and as required for balancing.
- Aerodynamic testing of dampers in accordance with BS EN 1751.
- Where required, determination of sound power levels to be by measurement in a reverberation room in accordance with BS EN ISO 5135.

100.010 3060D STEEL MULTI-BLADE CONTROL DAMPERS - METAL DUCTS:

- Provide single or double skin steel multi-blade control dampers in accordance with DW/144. Parallel or opposed blade, automatic operation. Locations and size as shown on drawings and as required for balancing.
- Undertake aerodynamic testing of dampers in accordance with BS EN 1751.
- Where required, determination of sound power levels to be by measurement in a reverberation room in accordance with BS EN ISO 5135.

3060F STEEL BACK DRAUGHT REGULATING DAMPERS - METAL DUCTS:

- Provide regulating dampers in accordance with DW/144. Locations and size as shown on drawings and as required.
- Undertake aerodynamic testing of dampers in accordance with BS EN 1751.
- Where required, determination of sound power levels to be by measurement in a reverberation room in accordance with BS EN ISO 5135.

3070A STEEL CURTAIN FIRE DAMPERS - BLADES IN AIR STREAM:

- Supply and install steel folding curtain fire dampers, with blades partially in the air stream, in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.

3070B STAINLESS STEEL CURTAIN FIRE DAMPERS - BLADES IN AIR STREAM:

- Supply and install stainless steel folding curtain fire dampers, with blades partially in the air stream, in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.

3070E STEEL SINGLE BLADE FIRE DAMPERS:

- Supply and install steel single blade fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.

3070F STAINLESS SINGLE BLADE FIRE DAMPERS:

- Supply and install stainless steel single blade fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4

3070G STEEL MULTI-BLADE FIRE DAMPERS:

- Supply and install steel multi-blade fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.

3070H STAINLESS STEEL MULTI-BLADE FIRE DAMPERS:

- Supply and install stainless steel multi-blade fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.

3070I INTUMESCENT FIRE DAMPERS:

- Supply and install intumescent fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Fire resistance tests for intumescent dampers shall be in accordance with BS ISO 10294-5

3070J FIRE DAMPERS ACCESSORIES:

- Provide accessories compatible with fire dampers. Electrical cut-out switches and external visual indication of fire damper blade position.
- Supply spare fusible links for fire dampers to fuse at 72ºC as specified in DW/144.

3071 FIRE STOPS - PLASTICS DUCTWORK:

- Supply and install fire dampers or intumescent sleeves in accordance with DW/154, Part 6, Section 17, size and location as shown on the drawings.

3075 FIRE DAMPERS - GENERAL:

- Types to be as identified elsewhere in the specification, in schedules or on drawings.
- Fire dampers shall be supplied and fixed in accordance with the manufacturer's recommendations and installation methods which conform to the prevailing Building Regulations (ADB) and are acceptable to the local Authorities Having Jurisdiction generally in accordance with DW/144 and DW/145 or DW/154. The proposed installation method must be supported by a valid test report or assessment provided by an approved third party notified body.
- The construction shall allow for all additional framing supports, bracing and fire stopping as may be necessary to adequately attach/install the fire dampers to the structure. The assembly is to be approved by the local Authorities Having Jurisdiction.
- Each fire damper and associated installation method shall have at least the same standard of fire integrity as the wall or floor through which the duct passes.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- The classification of fire dampers is to be in accordance with BS EN 13501-3 and shall have an integrity classification 'E' to meet that of the wall or floor.

- When a fire integrity of 4 hours is required, either 2 dampers (classified E120) factory assembled in series (if acceptable to the Local Authority) or a single damper having a classification E240, may be used.
- To achieve these classifications, fire resistance tests shall be in accordance with BS EN 1366-2, undertaken by a notified body.
- Shutter dampers shall be provided with the shutter blades located outside the air stream (unless other wise indicated). Each damper shall have a stainless steel curtain in all-welded galvanized steel casing with stainless steel side seal gaskets. The damper blade curtain shall be held in the folded position by a dual safe thermal actuator and fusible link.
- All damper blades shall be tensioned to ensure instantaneous closure on thermal activation at 72°C (unless specified elsewhere). A self-latching reset mechanism shall be provided for easy re-setting of the damper curtain.
- On completion of the installation, the contractor shall be responsible for ensuring the inspection and testing of all fire dampers installed are carried out. Upon completion of the tests, the certificates must be issued for confirming that the dampers have been inspected and that they function correctly in accordance with the manufacturer's data sheets.
- Access panels with chains shall be provided adjacent to the access side of all fire dampers.
- In no instances shall flexible duct connections be allowed onto fire dampers through walls or floors. Approved flexible connectors for breakaway joints, or duct expansion in case of fire, may be used in association with fire dampers.
- Provide local external visual indication of fire damper blade position, unless indicated otherwise.

3079 SMOKE DAMPERS - GENERAL

- Types to be as identified elsewhere in the specification, in schedules or on drawings.
- Smoke dampers shall be supplied and fixed in accordance with the manufacturer's recommendations and installation methods with installation mounting frames which conform to the prevailing Building Regulations (ADB) and are acceptable to the local Authorities Having Jurisdiction and are generally in accordance with DW/144 and DW/145 or DW/154. The proposed installation method must be supported by a valid test report or assessment provided by an approved third party notified body.
- The construction shall allow for all additional framing supports, bracing and fire stopping as may be necessary to adequately attach/install the smoke dampers to the structure. The assembly is to be approved the local Authorities Having Jurisdiction.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- The classification of smoke dampers is to be in accordance with the requirements of BS EN 13501-4 and fire-resistance tests shall be in accordance with BS EN 1366-10.
- Smoke control dampers placed on the market and intended to operate as part of a pressure differential system or smoke and heat control system to be in accordance with BS EN 12101-8.
- Smoke dampers shall be of the single blade or multi-blade type as indicated elsewhere in this specification. Damper blades shall be mechanically connected to an actuator to hold the blades in either the open or closed position dependent on the control mode chosen.
- On completion of the installation, the contractor shall be responsible for ensuring the inspection and testing of all smoke dampers installed are carried out. Upon completion of the tests, the certificates must be issued for confirming that the dampers have been inspected and that they function correctly in accordance with the manufacturer's data sheets.
- Access panels with chains shall be provided adjacent to the access side of all smoke dampers (additional access may be required for cleaning purposes and should be supplied if necessary).
- In no instances shall flexible duct connections be allowed through walls or floors. Approved flexible connectors from breakaway joints, or duct expansion in case of fire, may be used in association with smoke dampers.

- Provide local external visual indication of smoke damper blade position, unless indicated otherwise.

3080# SMOKE DAMPERS:

- Supply and install smoke dampers in accordance with DW/144, size and location as shown on the drawings and as required.
- Material
  - Steel.

3089 COMBINATION FIRE AND SMOKE DAMPERS - GENERAL:

- Types to be as identified elsewhere in the specification, in schedules or on drawings and as required.
- Combination smoke and fire dampers shall be supplied and fixed in accordance with the manufacturer's recommendations and installation methods which conform to the prevailing Building Regulations (ADB) and are acceptable to the local Authorities Having Jurisdiction generally in accordance with DW/144 and DW/145 or DW/154. The proposed installation method must be supported by a valid test report or assessment provided by an approved third party notified body.
- The construction shall allow for all additional framing supports, bracing and fire stopping as may be necessary to adequately attach/install the fire dampers to the structure. The assembly is to be approved by the local Authorities Having Jurisdiction.
- Each combination smoke and fire damper and associated installation method shall have at least the same standard of fire integrity as the wall or floor through which the duct passes.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- The classification of combination fire and smoke dampers is to be in accordance with BS EN 13501-4 and shall have an integrity classification 'E' to meet that of the wall or floor supported with an 'ES' classification of at least 60 minutes, unless the wall or floor requires less than this (e.g. 30 minutes).
- When a fire integrity of 4 hours is required, either 2 dampers (classified E120, ES60 (min) factory assembled in series (if acceptable to the Local Authority) or a single damper having a classification E240, ES60 (min)), may be used.
- To achieve these classifications, fire resistance tests shall be in accordance with BS EN 1366-2 and BS EN 1366-10, undertaken by a notified body.
- Combination fire and smoke dampers tested ad-hoc to BS 476-20 and BS 476-22 shall be permitted only under conditions where the Building Regulations (ADB) specifically allow. This requirement shall be confirmed before supplying such tested product.
- Combination smoke and fire dampers shall be of the single blade or multi blade type as indicated elsewhere in this specification. Damper blades shall be released from their open position by means of either a thermal release device rated at a temperature indicated elsewhere in this specification, or via a mechanical actuator connected to a smoke alarm or control system, or a combination of both dependent on the control mode selected.
- On completion of the installation, the contractor shall be responsible for ensuring the inspection and testing of all combination smoke and fire dampers installed are carried out. Upon completion of the tests, the certificates must be issued for confirming that the dampers have been inspected and that they function correctly in accordance with the manufacturer's data sheets.
- Access panels with chains shall be provided adjacent to the access side of all combination smoke and fire dampers.

- In no instances shall flexible duct connections be allowed through walls or floors. Approved flexible connectors for breakaway joints, or duct expansion in case of fire, may be used in association with combination smoke and fire dampers.
- Provide local external visual indication of combination smoke and fire damper blade position, unless indicated otherwise.

3090# COMBINATION SMOKE AND FIRE DAMPERS:

- Supply and install smoke and fire dampers in accordance with DW/144 and BS EN 15650, size and location as shown on the drawings and as required.
- Where required undertake aerodynamic testing of fire dampers in accordance with BS EN 1751.
- Fire-resistance tests of thermal release mechanism in accordance with BS ISO 10294-4.
- Material
    - Steel.

3100A COATED STEEL FLEXIBLE DUCTS:

- Supply and fasten coated steel flexible duct connections as DW/144. Use flexible duct connections in applications listed in DW/144.
- Comply with BS EN 13180 and provide a test certificate proving compliance with the mechanical characteristics of this standard.
- Ductwork and insulation to have a test certificate proving reaction to fire performance requirements of BS 9999. Materials to conform to Euroclass A1 as specified in BS EN 13501 or when tested to BS 476-6 has a fire propagation index of not more than 12 and a sub-index of not more than 6.
- Maximum length 600mm.

3100B ALUMINIUM FLEXIBLE DUCTS:

- Supply and fasten aluminium flexible duct connections as DW/144. Use flexible duct connections in applications listed in DW/144.
- Comply with BS EN 13180 and provide a test certificate proving compliance with the mechanical characteristics of this standard.
- Ductwork and insulation to have a test certificate proving reaction to fire performance requirements of BS 9999. Materials to conform to Euroclass A1 as specified in BS EN 13501 or when tested to BS 476-6 has a fire propagation index of not more than 12 and a sub-index of not more than 6.
- Maximum length 600mm.

3110A FLEXIBLE JOINT CONNECTIONS:

- Supply and install flexible joint connections as detailed in DW/144 or DW/154 Section 18, as appropriate.
- Use flexible joints, as shown on drawings; on fan inlet/outlets; and on building expansion joints.
- All flexible joint connections shall comply with current Building Regulations regarding the spread of fire and smoke.

3120A BIRD WIRE GUARDS:

- Fit bird screens of 13mm square mesh wire on all intake and extract louvres to atmosphere. Wire gauge to be not less than 1mm.
- Finish - Plastic coated wire.

3130A INSECT GUARDS:

- Provide manufacturer's standard insect guards where indicated. Screens to be factory fitted by the manufacturer.
    - Material: Woven wire cloth.
    - Mesh: 16.
    - Gauge: 28.
    - Wire diameter: 0.375 mm.
    - Aperture: 1.212 mm^2.
    - Free area: 58%.

3130B INSECT GUARDS:

- Provide insect guards where indicated. Screens to be supplied in kit form for installation on-site.
    - Material: Black PVC coated glass fibre mesh.
    - Aperture size: 1.1 x 1.55 mm.
    - Weight: 155 g/m^2.
    - Free area: 62%.

4000 WORKMANSHIP

4010 GENERAL WORKMANSHIP:

- Install ductwork in accordance with DW/144, DW/154 and DW/191 as appropriate.
- Ensure that there are no sharp edges or corners on cut edges on ductwork, flanges and supports.
- Install pre-insulated ductwork to BS EN 13403 in accordance with manufacturer's instructions.

4015 FLEXIBLE DUCTWORK INSTALLATION:

- Comply with BSRIA Guide BG43. Flexible ductwork.
- Minimum radius ratio (R/D) to be not less than 2, where R is the centre line radius and D is the duct diameter.
- Maximum support interval – 600mm.
- Support rings to be sized so as not to constrict the cross-sectional area of the ductwork.
- Duct support ring minimum width – 25mm.
- Flexible ducts to overlap rigid duct or terminal device spigot by a minimum of 50mm.
- Make a seal between flexible duct and rigid connection using mastic sealant or duct tape
- Use a mechanical fixing for connection using a duct band.

4020 DUCTWORK SUPPORTS:

- Support ductwork in accordance with DW/144; DW/154 Part 5; or DW/191 Section 7 as appropriate. Install supports to ensure insulation can be applied unless otherwise indicated.

4025 COMPONENT SUPPORT ON PRE-INSULATED ALUMINIUM DUCTWORK:

- Support ducts with dimensions less than 1m at intervals of no more than 4m. Support ducts with dimensions over 1m at intervals of no more than 2m.
- Provide independent support for all accessories.

4030A DUCT SUPPORT FOR VAPOUR SEAL CONTINUITY:

- Where a vapour seal is required, use method of support detailed on drawing as indicated.

4040 EXTERNAL DUCTWORK SUPPORTS:

- Support ductwork external to building as indicated.
- Comply with BESA DW/144 Section 26.
- All supports shall either be constructed from mild steel structural sections and galvanised after manufacture or fabricated using a proprietary support system / support feet to assist in spreading the weight on a roof membrane. Submit proposals to Designer and Structural Engineer for comment.
- Particular care should be taken in selecting structural fixings that will provide a life cycle appropriate to the buildings intended use. All supports and fixings shall comply with Local Authority requirements. Obtain approval from the Local Authority where required.

4050 DUCTWORK FLOOR SUPPORT:

- Support ductwork from floor as indicated.

4060 DRAINAGE OF DUCTWORK:

- Arrange ductwork to drain any entrained moisture and ensure the lapping of joints minimises moisture leakage.

4090A INTERNAL CLEANLINESS - BASIC LEVEL:

- Provide Basic Level of protection, delivery and installation (PDI) as defined in BESA TR/19.

4090B INTERNAL CLEANLINESS - INTERMEDIATE LEVEL:

- Provide Intermediate Level of protection, delivery and installation as defined in BESA TR/19.

4090C INTERNAL CLEANLINESS - ADVANCED LEVEL:

- Provide Advanced Level of protection, delivery and installation as defined in BESA TR/19

4090D DRY METHOD OF CLEANING:

- The specialist cleaning contractor shall select and propose for approval the most appropriate cleaning method from table 8 in BESA TR/19.

4090E WET METHOD OF CLEANING:

- The specialist cleaning contractor shall select and propose for approval the most appropriate cleaning method from table 8 in BESA TR/19.
- The system should be thoroughly dried prior to commissioning/de-commissioning to prevent moisture assisting in the growth of micro-organisms.
- A risk assessment must be carried out before any cleaning chemicals or biocides are considered. The details of any such chemicals or biocides must be recorded and any adverse effects of the applied chemicals assessed and determined, with appropriate safe procedures set out in a formal method statement.
- Steam cleaning and high pressure water wash are not recommended for ductwork that is situated above ceilings or in sensitive areas unless carried out in a controlled manner to contain leakage. Procedures to take account of operative safety must be adopted, and should be set out in written form.
- Careful consideration should be given to the use of chemicals and/or water for surfaces that are porous e.g. internally-lined ductwork, attenuators, fibre board ductwork, attenuators, fibre board ductwork etc., to prevent permanent damage.
- Before applying wet cleaning methods care should be taken that condensed vapours and cleaning fluids can be removed from the ductwork system.

4100A WEATHERPROOFING:

- Fit ductwork with trimming angle and weather cravat, skirt, flashing plate and cowl where ductwork passes through or terminates in roof, to ensure a weatherproof seal to building structure, as indicated.

4110A DUCTWORK SLEEVES:

- Where indicated, enclose ducts passing through building elements, (walls, floors, partitions, etc.) within purpose made sleeves. Cut sleeves of the same material as the duct and pack with mineral fibre or similar non-flammable and fire resistant material to form a fire/smoke stop of adequate rating and to prevent air movement and noise transmission between duct and sleeve.
- Where finished insulation is carried through duct sleeves. Pack space between insulation finish and sleeve with non-flammable and fire resistant material to form fire stop.

4110B DUCTWORK SLEEVES WITH FLANGES:

- Where indicated, enclose ducts passing through building elements, (walls, floors, partitions, etc.) within purpose made sleeves. Cut sleeves of the same material as the duct and pack with mineral fibre or similar non-flammable and fire resistant material to form a fire/smoke stop of adequate rating and to prevent air movement and noise transmission between duct and sleeve.
- Provide flanges on either side of wall where ductwork is exposed in rooms.
- Where finished insulation is carried through duct sleeves. Pack space between insulation finish and sleeve with non-flammable and fire resistant material to form fire stop.

4130 INSTALLATION OF CONTROL EQUIPMENT:

- Fit sensors, damper motors and other control equipment as indicated.
- All control equipment should be installed to manufacturer or specialist supplier's requirements. The installation must be checked by the manufacturer or specialist supplier, and rectified as necessary.

4140 INSTRUMENT CONNECTIONS:

- Provide instrument connections where indicated.
- All instrument connections should be installed to manufacturer or specialist supplier's requirements. The installation must be checked by the manufacturer or specialist supplier, and rectified as necessary.

4160 DAMPER ACCESS:

- Ensure access is provided to damper mechanisms on fire dampers; smoke dampers; combined smoke and fire dampers; and volume control dampers through access doors, false ceilings etc..
- Demonstrate that damper blades close completely.
- Demonstrate that fire links can be replaced. Where more than one fire damper is installed in a frame ensure access is provided to all fire dampers.

Y40 - AIR HANDLING UNITS

1000 GENERAL:

- Comply with BS EN 1886 for mechanical performance of air handling units as a whole. Refer to particular specification or schedules for casing strength, air leakage, thermal transmittance and thermal bridging classifications and general acoustics performance requirements.
- Comply with BS EN 13053 for testing for ratings and performance of air handling units as a whole and components and sections within units.

1001 GENERAL - HEALTHCARE BUILDINGS:

- Comply with HTM 03-01. Should there be a conflict between this document and clauses in this specification HTM 03-01 shall take precedence.

1010B CASING AIR LEAKAGE:

- Ensure air-handling unit is sealed to minimize air leakage at design pressure.
- AHU leakage rate shall not exceed the maximum rate defined in BS EN 1886 for the leakage class of casing scheduled or detailed in the particular specification.
- Test pressure - 400Pa negative and 700Pa positive.

1010C FILTER BYPASS LEAKAGE:

- Filter bypass leakage, at 400Pa test pressure, shall not exceed the acceptable maximum % of volume flow rate defined in BS EN 1886 for the class of filter scheduled or detailed in the particular specification.

1020 FAN SELECTION:

- Air volume - Ensure scheduled volume is provided when operating against resistance of system corrected for changes between specified and selected component resistance.
- System resistance - Adjust scheduled resistance to compensate for actual resistance of selected components.
- Operating point
    - Select operating point on pressure/volume curve to provide stable and efficient operation.
    - Whenever possible the fan supplier shall select fans over the range of air flows where the efficiency is not less than 85% of the optimum efficiency in accordance with Annex E in BS EN ISO 12759
- Fans driven by electric motors with electric input between 125W and 500kW to comply with EU Regulation 327/2011 with regard to eco-design requirements.
- Guaranteed performance
    - Provide fan performance figures in accordance with
    - BS EN ISO 5801
    - BS 848-9

2000 PRODUCTS/MATERIALS

2020# DOUBLE SKIN CASING AIR HANDLING UNITS:

- Panel skin thickness - 0.8 mm as a minimum
- External casing finish - Pre-painted as per manufacturer's standard.
- Internal casing finish - Pre-painted as per manufacturer's standard.

2030# AIR HANDLING UNIT CONSTRUCTION:

- General construction

- Construct unit to withstand maximum fan static pressure without plastic deformation.
- Construct casing from panels, thickness as indicated.
- Ensure panels do not deflect by more than the values given in BS EN 1886 when in operation and withstand maximum fan pressure at design fan speed. No permanent deformation (hysteresis maximum +/- 2.0 mm per m frame/panel span) of the structural parts (structures and supports) or damage of the casing may occur.
    - Casing strength Class D1 - 4 mm/m maximum relative deflection.
- Use corrosion resistant fastenings throughout.
- Do not use self-tapping screws.
- Provide panel gaskets to give a durable seal between panels and frames to prevent excessive air leakage.
- Ensure unit satisfies the fire protection criteria given in BS EN 1886.
- Ensure unit satisfies the mechanical safety criteria given in BS EN 1886.

- Casing thermal performance
    - Ensure the casing thermal performance is tested in accordance with the requirements of BS EN 1886
    - Thermal transmittance U of the casing shall be classified in accordance with BS EN 1886
        - Thermal transmittance Class T2 - greater than 0.5 up to 1.0
    - Thermal bridging factors kb shall be classified in accordance with BS EN 1886
        - Thermal bridging factor Class TB2 - greater than 0.6 but less than 0.75
- Casing acoustic performance - Ensure that the sound insertion loss of the unit is determined in accordance with BS EN 1886
- Casing Insulation
    - Ensure insulation complies with BS 476-7. Ensure insulation is fixed securely to panel, and protected to prevent migration of fibre into air flow.
    - Ensure insulation is vapour sealed throughout and incorporate thermal breaks.
    - Insulation material - Provide insulation that is inorganic, vermin proof and non-hygroscopic
    - Use CFC free rigid polyurethane foam, minimum of 25 mm thick or CFC free injected polyurethane foam, minimum 25 mm thick.
- Framework
    - Ensure framework is rigid enough to prevent distortion during transportation and after final assembly on-site.
    - For vertical units strengthen framework to support additional weight.
    - Seat panels into folded, rolled or extruded frame with purpose made corner joints; or pentapost type frame with purpose made corner joints.
    - Ensure framework is self-supporting.
- Base - Provide rolled steel channel (RSC) support base.

2040A AIR HANDLING UNIT ACCESS:

- Provide access openings and covers complete with opening devices, and sealed to prevent air leakage.
- Ensure seals are designed for normal maintenance operations for a minimum of 10 years.
- Provide hinged access doors, 400mm minimum width.
- Operating device - key operated door locks.
- Provide access to fans, dampers, filters, spray coils, humidifiers and within air handling unit for inspection of nozzles and tanks.

2040B PERMANENT ACCESS PLATFORMS - DOUBLE DECK AHU'S:

- For double deck AHU's design, supply and install permanent maintenance access platforms where the top of the upper deck is 3 m above FFL of general access area.
- Where possible support from the AHU base frame to minimise support legs to FFL.
- Provide handrails and toeboard / kick plate on all open sides of the platform, toeboard height - 100mm.
- Provide access stair(s) for frequent maintenance access to change filters and maintain fans etc.
- Clear width of platform shall be no less than 1.1m wide.
- Details and extent of platform - as indicated on drawings and / or schedules.
- Comply with Work at Height Regulations 2005 and relevant parts of BS EN ISO 14122.
- Materials - galvanised steel, with open mesh flooring.

2060A EXTERNAL AIR HANDLING UNITS:

- Construct air-handling units for external use. Provide weatherproof isolators.
- Roof construction as indicated on drawings.
- Options - Where indicated provide connection for Lightning protection.

3000 ACCESSORIES/COMPONENTS

3010# FAN SECTION:

- Provide frame for motor and fan and comply with fire regulations.
- Ensure frame is isolated from casing.
- For blow through units, ensure air flow in downstream sections of unit have relatively uniform velocity profile.
- Supply fan guards to BS EN ISO 12100 and BS EN ISO 12499
- Accessories
    - Provide flexible connection between fan discharge and casing spigot. Ensure flexible connections comply with fire regulations.
    - Provide manometer connections to measure static pressure at fan inlet eye.
    - Provide manometer connections to measure static pressure at fan discharge.

3030 HEATER BATTERIES:

- Provide slide rails to allow each coil section to be removed independently for access.
- Fit baffle plates to prevent air bypass of coil.
- Coils to be rated in accordance with BS EN 1216
- Frost coils to be constructed of plain tubing without fins unless specified otherwise in the particular specification.
- All hot water frost coils on healthcare projects to use bare tubing. Steam coils on healthcare projects may use finned tube with wide fin spacing approved by the design engineer.

3040 COOLING COIL SECTION:

- Provide slide rails to allow each coil section to be removed independently for access.
- Coils to be rated in accordance with BS EN 1216
- Water shall not be carried over from the cooler into the air stream.
- Incorporate drip trays with drains to both coil and headers.

3042 HEAT RECOVERY EQUIPMENT:

- Thermal wheel
    - Units to be performance tested in accordance with BS EN 308 using the relevant testing protocol of Eurovent or AHRI Standard 1060. Units to be complete with a purge sector.

3050 DRAINAGE FROM AIR HANDLING UNIT COMPONENTS:

- Provide drainage pipework from cooling coils, humidifiers and components where water may collect. Comply with recommendations in CIBSE Technical Memorandum TM13 in connection with Legionnaires' disease and AHU manufacturers' installation recommendations.
- Material - glass drainage system unless specified otherwise in the particular specification.
- Pipe each trap to drain via a tun-dish or pipe each trap separately to discharge over a gully to prevent the potential of cross contamination between AHU's.
- Label each trap to state that it must be checked regularly / kept topped-up.
- Where freezing could occur insulate and trace-heat traps.

3060# CONTROL DAMPERS:

- Provide control dampers in accordance with DW/144.
- Type of air control damper
    - For single-blade damper
        - Operation: Automatic
    - For skin multi-blade damper
        - Opposed blade.
        - Operation: Automatic
- Construction
    - Material - Steel.
- Ancillaries
    - Position indicator.
    - Locking device.
- Motorized control dampers
    - Provide control dampers complete with
        - Extended spindle.
        - Motor.
        - Motor linkage.
        - Motor support.

4000 WORKMANSHIP

4040 DUCT CONNECTIONS:

- Ensure air is straightened as it leaves unit discharge. Ensure ductwork connection is long enough to ensure the aerodynamic performance of the fan is not affected.

4050 SERVICES CONNECTIONS:

- Ensure panels are sealed around electrical cable and pipework service entry points to prevent air leakage, using suitable and approved methods to suit individual services applications.
- Provide flexible cables between fan motor and local isolator.

4060 ISOLATION OF UNITS:

- Provide means of isolating air-handling units electrically to allow maintenance and repairs to be carried out.
- Provide means of isolating pipework to air handling units to allow maintenance and repairs to be carried out.
- Provide means of isolating steam to humidifier when access door is opened.

4070 DRAINAGE OF FREE WATER:

- Make provision for free water to be caught, collected and drained away. Provide U-traps on all drains suitable for the negative/positive pressure created by the fan.

4090# FACTORY TESTS:

- Carry out tests at the factory to measure the following.
  - Fan running to check rotation and vibration.
  - Fan and motor speeds.
  - Ratings and Performance to BS EN 13053
    - Whole unit.
    - Fan section.
    - Coils.
    - Heat recovery sections.
    - Damper sections.
    - Mixing sections.
    - Humidifiers.
    - Filter sections.
    - Sound attenuation sections.
  - Mechanical performance to BS EN 1886.
    - Air leakage test.
    - Filter bypass leakage test.
    - Mechanical strength of casing test (Casing panel deflection).
    - Thermal transmittance performance test.
    - Thermal bridging test.
    - Acoustic insulation test (Casing insertion loss test).
  - Air flow performance test in accordance with BS 6583.
  - Motor starting, running currents and inverter settings.
  - Fan flow rate and developed pressure, using simulated system resistance.
  - Component air pressure drops.
  - Component water pressure drops.
  - Fan sound power levels.
  - External sound pressure level tests unit under conditions of unobstructed propagation over base surfaces.
  - Vibration measurements.
  - Functional tests on electrical equipment.
  - Functional tests on controls systems if provided as part of the AHU.
  - Component functional tests.
  - Power consumption.

4100# TESTING PRIOR TO INCORPORATION IN WORKS:

- Carry out testing to measure the following.
  - Ratings and Performance to BS EN 13053
    - Whole unit.
    - Fan section.
    - Coils.
    - Heat recovery sections.
    - Damper sections.
    - Mixing sections.

    - Humidifiers.
    - Filter sections.
    - Sound attenuation sections.
- Mechanical performance to BS EN 1886.
    - Air leakage test.
    - Filter bypass leakage test.
    - Mechanical strength of casing test (Casing panel deflection).
    - Thermal transmittance test.
    - Thermal bridging test.
- Fan running to check rotation and vibration.
- Acoustic insulation test (casing insertion loss test).
- Fan and motor speeds.
- Air flow performance test in accordance with BS 6583.
- Motor starting running currents and inverter settings.
- Fan flow rate and developed pressure, using simulated system resistance.
- Component air pressure drops.
- Component water pressure drops.
- External sound pressure level tests under conditions of unobstructed propagation over base surfaces.
- Vibration measurements.
- Functional tests on electrical equipment.
- Functional tests on controls systems if provided as part of the AHU.
- Power consumption.
- In duct fan sound power levels.

Y41 - FANS

1000 GENERAL:

- Standards
    - Provide fans manufactured and tested in accordance with appropriate European Standards.
    - With regard to safety requirements, comply with BS EN 60335-2-80 where applicable.
    - Fans for smoke and heat control to be in accordance with BS EN 12101-3
    - Fans for use in potentially explosive atmospheres / flameproof zones to be in accordance with BS EN 14986, relevant parts of BS EN ISO 80079, BS EN 13463 and BS EN 60079, and be compliant with the ATEX directive.
    - Inline and chimney outlet exhaust fans to comply with BS EN 16475-2

1010 DESIGN DUTIES, FAN SELECTION AND EFFICIENCY:

- Air volume - Ensure scheduled volume is provided when operating against resistance of system corrected for changes between specified and selected component resistance.
- System resistance - Adjust scheduled resistance to compensate for actual resistance of selected components.
- Operating point
    - Select operating point on pressure/volume curve to provide stable and efficient operation.
    - Whenever possible the fan supplier shall select fans over the range of air flows where the efficiency is not less than 85% of the optimum efficiency in accordance with Annex E in BS EN ISO 12759
- Fans driven by electric motors with electric input between 125W and 500kW to comply with EU Regulation 327/2011 with regard to ecodesign requirements.
- Comply with EU Regulation 1253/2014 for packaged ventilation units comprising fan(s), heat recovery system, filters and controls (or a combination of these components) up to 1000m^3/hr with regard to ecodesign requirements.
- Guaranteed performance
    - Provide fan performance figures in accordance with
    - BS EN ISO 5801 for all types except those designed solely for air circulation.
    - BS 848-9 for tolerances, methods of conversion and technical data presentation.

1020 PROTECTION:

- Protect casings, impellers and shafts against corrosion.
- Protect bearings against dirt and moisture.

2000 PRODUCTS/MATERIALS

2010A NORMAL OPERATING CONDITIONS:

- Sound Power Level
    - Select fan, motor, drive and speed control system not to exceed fan sound power levels or sound pressure levels scheduled or specified elsewhere. Provide sound power data in accordance with BS EN ISO 5136, BS ISO 13347-1, BS ISO 13347-2, BS ISO 13347-3, BS ISO 13347-4.
- Air Density - Relate fan performance to air density 1.20kg/m^3.
- Temperature Range
    - Minimum to maximum operating temperatures -20°C to 60°C.

2010B POTENTIALLY EXPLOSIVE ATMOSPHERES

- Constructional requirements
  - The constructional requirements for fans intended for use in explosive atmospheres shall be in accordance with BS EN 14986 and relevant parts of BS EN 60079 and BS EN 80079.
    - Ambient atmosphere pressure:
    - Absolute pressure ranging from 0.8bar to 1.1bar.
  - Temperature range
    - Minimum to maximum operating temperatures of -20°C to 60°C inlet gas temperature, -10% to +20% of nominal gas flow.

2020A CONSTRUCTION AND HANDLING:

- Casings
  - Construct rigid casing free from drumming under operating conditions. Supply in sections as required for access or handling. Flange dimensions in accordance with BS EN ISO 13351.
- Safety standards - to BS EN 60335-2-80.
- Rotating assemblies
  - Balance rotor in accordance with relevant parts of BS ISO 21940
- Shafts and hubs
  - Machine impeller bosses and shafts to BS 4500 and key in accordance with BS 4235-1. Hold impeller to shaft with set screw or taper lock fitting.
- Shaft bearings - Sealed for life.
- Drives and guards
  - Provide guards over shaft, couplings and rope in accordance with BS EN ISO 12100 and Factory Inspectorate requirements.
- Lifting
  - Provide lifting eyebolts or similar facilities on fans or sections heavier than 20kg.

2030 TESTING:

- Provide results of aerodynamic performance tests in accordance with BS EN ISO 5801
- Provide results of sound power tests in accordance with BS ISO 13347-1, BS ISO 13347-2, BS ISO 13347-3, BS ISO 13347-4, and/or BS EN ISO 5136 as appropriate to the application.
- Provide fan vibration measurements in accordance with BS ISO 14695
- Provide balancing and vibration measurements in accordance with BS ISO 14695
- The minimum energy efficiency requirements for fans driven by electric motors with electric input between 125W and 500kW should comply with EC Regulation 327/2011.

2070# AXIAL FLOW FANS:

- Fan impeller and casing aerodynamic efficiency
  - Manufacturer's standard to achieve overall efficiency of the fan, motor and drive combination scheduled or detailed elsewhere in the project particular specification.
- Bearings
  - Provide bearings suitable for mounting and direction of flow indicated.

2080# CENTRIFUGAL FANS:

- Fan impeller and casing aerodynamic efficiency
    - Manufacturer's standard to achieve overall efficiency of the fan, motor and drive combination scheduled or detailed elsewhere in the project particular specification.
- Operation - Single.
- Impeller Design
    - Supply fan with impeller to suit operating conditions.
- Mounting - Channel frame.
- Drain - fit drain connection at lowest point of scroll.

2090A PROPELLER FANS:

- Fan impeller and casing aerodynamic efficiency
    - Manufacturer's standard to achieve overall efficiency of the fan, motor and drive combination scheduled or detailed elsewhere in the project particular specification.
- Drives
    - When motor spindle is extended for mounting blade hub, connect motor to casing, diaphragm plate or mounting ring with support arms.
- Impellers
    - Supply profile blades designed to give uniform airflow.
- Mountings
    - Support fans on plate with circular opening sized and located in accordance with fan manufacturer's requirements.

2100A MIXED FLOW FANS:

- Fan impeller and casing aerodynamic efficiency
    - Manufacturer's standard to achieve overall efficiency of the fan, motor and drive combination scheduled or detailed elsewhere in the project particular specification.
- Operation - single.
- Provide bearings suitable for mounting and position as indicated on drawings.

2110# ROOF MOUNTED FANS:

- Fan impeller and casing aerodynamic efficiency
    - Manufacturer's standard to achieve overall efficiency of the fan, motor and drive combination scheduled or detailed elsewhere in the project particular specification.
- Vertical or horizontal discharge as shown on drawings.

3000 ACCESSORIES

3010 INSPECTION DOORS - AXIAL FANS:

- Fit air-tight inspection doors giving access to drive motors and other components requiring regular servicing or maintenance.

3020 INSPECTION DOORS - CENTRIFUGAL FANS:

- Fit air-tight doors in scroll and cover.

3030 INSPECTION DOORS - PROPELLER FANS:

- For diaphragm mounted fans fit an air-tight inspection door positioned to give access to drive, or other sub-components requiring regular servicing or maintenance.

3050A GUARDS:

- Provide guards in accordance with BS EN ISO 12100.
- Fit safety guards on air inlet and air outlet connections where these are freely accessible to personnel in accordance with BS EN ISO 12499.
- Provide bird guards where indicated.

3110 AIR FLOW SENSORS:

- Fit air flow sensors or pressure switches on twin fan units to sense fan failure and provide automatic changeover to standby fan.

4000 WORKMANSHIP

4010 LOCATION:

- Install fans in positions indicated, in accordance with manufacturer's instructions and recommendations in CIBSE TM42 - Fan Application Guide.

4020 ATTITUDE:

- Mount impeller shaft horizontally unless otherwise indicated.

4030 ALIGNMENT:

- Ensure fan is installed aligned to allow optimum air flow path.

4040 TESTING:

- Ensure fan is isolated from installation during air leakage testing of ductwork.

4050 DRAIN CONNECTION:

- Fit trap to drain connection at lowest point of scroll on centrifugal fans where indicated.

Y42 - AIR FILTRATION

1010 PRESSURE LOSS DATA:

- Provide pressure data as initial pressure loss at rated airflow and recommended final pressure loss.

1020 AIR FLOW THROUGH MEDIA:

- Provide filter media surface of area and layout to achieve optimum air velocity through media.

1030 SEALS:

- Provide filters with edge seals as appropriate to prevent air bypassing. Ensure seals remain effective after removal and replacement of cells.

2000 PRODUCTS/MATERIALS

2010A CASINGS WITH BOLTS, NUTS AND WASHERS FIXING:

- Ensure casings are robust to prevent distortion. Drill steel section end frames for bolts, nuts and washers, and rivets.

2010B CASINGS WITH CAPTIVE NUTS OR TAPPED HOLES FIXING:

- Ensure casings are robust to prevent distortion. Drill steel section end frames for captive nuts or tapped holes.

2010C CASINGS WITH CLIPS:

- Ensure casings are robust to prevent distortion. Drill steel section end frames for clips.

2020# FILTER TESTING:

- Test filters in accordance with
    - BS EN ISO 16890-2. Measurement of fractional efficiency and air flow resistance.
    - BS EN ISO 16890-3. Determination of gravimetric efficiency and air flow resistance versus mass of test dust captured.
    - BS EN ISO 16890-4. Conditioning method to determine the minimum fractional test efficiency.
    - BS EN 1822-1 High efficiency filters, classification, performance testing & marking.
    - BS EN 1822-2 High efficiency filters, aerosol production, measuring equipment & particle counting statistics.
    - BS EN 1822-3 High efficiency filters, testing flat sheet filter media.
    - BS EN 1822-4 High efficiency filters, determining leakage of filter elements.
    - BS EN 1822-5 High efficiency filters, determining the efficiency of filter elements.
    - BS EN ISO 10121-2 Test method for assessing the performance of gas-phase air cleaning media / devices.

2040# PANEL FILTERS:

- Ensure filter media is retained in frame.
- Provide disposable filter media of glass fibre with scrim or composite fibre material.

2050A BAG FILTERS:

- Ensure media retains its shape during full airflow conditions.
- Material - Provide synthetic or micro-fine glass fibre with reinforced backing mat.

- Supply holding frame from material suitable for application complete with sealing gasket located in holding frame.

2070C EFFICIENT PARTICULATE AIR (EPA) FILTERS :

- Standard
  - BS EN 1822-1
  - BS EN 1822-2
  - BS EN 1822-3
  - BS EN 1822-4
  - BS EN 1822-5
- Filter media - efficient filter media EPA.
- Filter casing with fitted gasket - stainless steel
- Filter testing
  - Test each EPA cell to relevant parts of BS EN 1822 and mark on a plate/label fixed to filter casing.

2080A ACTIVATED CARBON FILTERS:

- Provide absorbent bed filled with uniform thickness of activated carbon granules constructed to prevent settlement and pinholing.
- Media type - disposable or reactivated as indicated.
- Casing - Supply casing with removable panels, manufactured from mild steel with epoxy resin finish.

2090A ELECTROSTATIC PRECIPITATORS

- Supply electrostatic agglomerator with bag-type collector section. Fabricate casing from material suitable for application.
- Components
  - Supply assembly including perforated baffle or grid; ionizer section; collector section; and wash plant unit including hot water storage, pump, distribution pipework, spray nozzles and drain system, installed in casing.
  - Provide electrical control panel including all controls pre-wired.
- Safety
  - Provide fail-safe interlocks on control panel door.
  - Provide interlock to prevent washdown whilst precipitator is energized.
  - Provide clear indication of high voltage danger.

3000 ACCESSORIES

3010A PRESSURE GAUGE, DIAL TYPE :

- Dial type differential pressure gauge. Clearly mark gauge with positions equivalent to "Filter Dirty" and "Filter Clean" conditions.
- Connect gauge to duct mounting with PVC tubing. Fix external to unit to allow easy observation. Mount within 3m of filter.

3010B PRESSURE GAUGE, INCLINED MANOMETER:

- Inclined manometer type differential pressure gauge. Clearly mark scale with positions equivalent to "Filter Dirty" and "Filter Clean" conditions. Connect gauge to duct mounting with PVC tubing. Fix external to unit to allow easy observation. Mount within 3m of filter.

3010C PRESSURE GAUGE, PRESSURE DIFFERENTIAL SWITCH:

- Pressure differential switch for visual or audio warning of "Filter Blocked Condition".

3030A TERMINAL FILTER HOUSING, GASKET SEALS:

- Supply terminal filter housing for EPA, HEPA and ULPA filters.
- Housing seals
    - Provide gaskets to seal between holding frames on banks of filters.

3030B TERMINAL FILTER HOUSING, STEEL FRAME WITH EPOXY RESIN SEAL:

- Supply terminal filter housing for EPA, HEPA and ULPA filters.
- Housing seals
    - Seal filter into rigid epoxy resin finished steel casing with hard setting synthetic resin cement.

3040# SAFE CHANGE FILTER CHANGING UNIT:

- Supply purpose built unit for changing high efficiency filters in areas where special regulations are enforced.

4000 WORKMANSHIP

4020A ACCESS FOR MAINTENANCE:

- Provide access for changing filter media. Provide access for maintenance of motor drive and associated control equipment without disturbing filter media. Provide access for total duct maintenance.

Y43 - COILS, HEAT RECOVERY EQUIPMENT AND GAS AND ELECTRIC BATTERIES

2000 PRODUCTS/MATERIALS

2010# HEATING/COOLING COILS:

- Casing
  - Make provision for coil expansion. Enclose body of coil, headers and bends within casing.
  - Provide plugs in headers to permit internal cleaning of coils.
- Draining and venting
  - Provide plugged connections in headers to allow fitting of drain cocks / air vents.
  - Provide coil complete with venting and draining devices.
- Arrangement - Supply fins in vertical plate arrangement for cooling coils.
- Drain pan - Provide drainage facility for cooling coils to avoid standing water.
- Coil Testing
  - Pressure test coils to a minimum of 1.5 times design working pressure to ensure leak tight manufacture, and provide signed test certificates. Base coil design and sizing on performance test figures in line with BS 5141-1 for cooling coils and with BS 5141-2 for heating coils.
  - Coils in AHUs to be rated in accordance with BS EN 1216
- Packaging
  - Fit protection for fins prior to despatch.
  - Protect coils from dirt after manufacture by fitting blank flanges / caps to pipe connections.

2040# HEATER BATTERIES - ELECTRIC:

- Terminal Box
  - Construct terminal box of welded steel. Ensure box is treated to provide protection in accordance with BS EN 60529.
- Safety cut-out
  - Provide manual reset safety cut-out switch, wired in series or via contactor with heating elements.
  - Set point - 130°C
- Controls
  - Control panel to include a lockable door interlocked isolator.
  - Provide fan interlock to prevent heating running without fan running.
  - Provide run-on timer to allow airflow to cool heater before switching off fan.
  - Provide facility for 0-10Vdc control signal from remote source.
  - Provide volt free run and trip indication for BMS monitoring.
  - Provide manual reset thermal cut out switch.
- Air flow switch
  - On electric heating coils provide air flow detector switch wired in series with other safety devices.

2070 RUN-AROUND COILS:

- Casing
    - Casing finish to be manufacturer's standard unless indicated otherwise in the particular specification.
    - Enclose body of coil, headers and bends within casing.
    - Make provisions for expansion movement where pipe connections pass through casing and seal against leakage.
    - Provide plugs in headers to permit internal cleaning coils.
- Draining and venting
    - Provide plugged connections in headers to allow fitting of drain cocks / air vents.
    - Provide coil complete with venting and draining devices.
- Droplet eliminator
    - If there is a risk of condensation and the air velocity through the coil exceeds 2.5 m/s fit a droplet eliminator.
- Drain tray - Provide stainless steel drain tray for both coils.
- Coil Testing
    - Pressure test coils to a minimum of 1.5 times design working pressure to ensure leak tight manufacture, and provide signed test certificates. Base coil design and sizing on performance test figures in line with BS 5141-2 heating coils or test coils to establish the performance in accordance with BS EN 1216
    - Coils in AHU's to be rated in accordance with BS EN 1216.
- Packaging
    - Fit protection for fins prior to despatch. Protect coils from dirt after manufacture by fitting blank flanges / caps to pipe connections and enclosing complete units in dustproof containers.
- Accessories
    - Fit a pressure gauge complete with copper alloy gauge cock with lever handle in the pump discharge connection.

2090 PLATE HEAT EXCHANGER:

- Units to be performance tested in accordance with BS EN 308 using the relevant testing protocol of Eurovent and shall be complete with bypass (with pressure drop across the bypass, the same as the heat exchanger).

3000 ACCESSORIES

3010 DRIP TRAYS:

- Incorporate drip tray into base of casing to collect condensate. Fit at a small gradient towards drain socket provided in bottom of tray. Extend tray under external headers/return bends where these are not insulated/ vapour sealed. Extend tray, or provide additional tray, where eliminator plates are fitted.
- Provide removable drip trays.
- Where coils are over 1200mm high provide additional drip trays at 1200mm centre intervals maximum over height of coils, piped in copper or plastic to discharge into base tray.
- Paint internal surfaces with two coats of epoxy resin or alternative water proofing compound.

3020# DRAIN TRAPS:

- Provide drain trap at least twice working air pressure in depth. Provide an air break between trap outlet and drainage system.
- Arrangement
    - Ensure traps under suction have outlet lower than inlet by depth equivalent to at least one and a half times working pressure.
    - Ensure traps under positive pressure have inlet and outlet at same level.
- Pipe each trap to drain via a tun-dish or pipe each trap separately to discharge over a gully to prevent the potential of cross contamination between AHU's.
- Label each trap to state that it must be checked regularly / kept topped-up.
- Where freezing could occur insulate and trace-heat traps.
- Material - glass unless specified otherwise in the particular specification.

3030 ELIMINATOR PLATES:

- Install bank of eliminator plates downstream of coils to prevent carry over of condensate at design air face velocity. Fit plates to allow independent removal from coil casing. Ensure material of eliminators is compatible with casing.

3040 MOUNTING FRAME:

- On heating coils provide mounting frame for grouting into wall.

3050A AHU DUCT CONNECTIONS:

- To match air handling unit and specified method of assembly.

3050B EXTERNAL FLANGE DUCT CONNECTIONS:

- With external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

3050C INTERNAL FLANGE DUCT CONNECTIONS

- With internal flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

3050D SPIGOT DUCT CONNECTIONS:

- With spigot duct connections.

4000 WORKMANSHIP

4010 POSITION / LOCATION:

- Install coils, heater batteries and heat recovery equipment in air distribution system as indicated. Locate in positions where air velocity is substantially equal over face of approach duct.
- Arrange steam coils for horizontal air flow.
- Ensure equipment, controls and instruments positioned adjacent to heating coils, heater batteries and heat recovery equipment are not adversely affected by thermal radiation.

4020A COOLING COIL CONNECTIONS:

- Provide a drain line incorporating deep seal trap.

4040 PROTECTION:

- Protect coils, heater batteries and heat recovery equipment from damage and ingress of dirt during the course of contract. Restore fins and other parts of coils, heater batteries and heat recovery equipment to original condition if any damage has occurred. Ensure all connected ductwork is thoroughly clean before removing protection and passing air through system.

4050 EQUIPMENT INSTALLATION:

- Install equipment in accordance with manufacturer's recommendations.
- Ensure maintenance requirements are incorporated.

Y45 - SILENCERS AND ACOUSTIC TREATMENT

1010 PERFORMANCE:

- Ensure that specified performance is met where protection is applied to infill to protect from moisture and grease.

1020 TESTING:

- Provide certified insertion loss data in accordance with BS EN ISO 7235.
- Provide generated sound power levels with insertion loss data.

1030 PROTECTION:

- Protect silencers where they are installed in positions exposed to external weather conditions.
- Block ends of silencers prior to delivery to site to prevent damage.

1040 DIRECTION OF FLOW:

- Clearly mark direction of air flow on silencers.

2000 PRODUCT/MATERIALS

2010# FIRE PROPERTIES:

- Use non-flammable adhesives. Ensure that all insulating materials and coverings are
  - non-combustible material covered with a material that complies with flame spread requirements of BS 476-7, Class 1.
  - Class O surface rating of Building Regulations.

2020A CIRCULAR SILENCERS - CASING TO DW144 WITH EXTERNAL FLANGES:

- Provide circular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing to DW/144 with external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2020B CIRCULAR SILENCERS - CASING TO DW144 WITH INTERNAL FLANGES:

- Provide circular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing to DW/144 with internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2020C CIRCULAR SILENCERS - CASING TO DW144 WITH SPIGOT ENDS:

- Provide circular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing to DW/144 with plain spigot ends for connection to adjacent plant or ductwork.

2030A CIRCULAR SILENCERS - NON-METAL WITH EXTERNAL FLANGES:

- Provide circular silencers compatible with ductwork installation.
- Provide with external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2030B CIRCULAR SILENCERS - NON-METAL WITH INTERNAL FLANGES:

- Provide circular silencers compatible with ductwork installation.
- Provide with internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2030C CIRCULAR SILENCERS - NON-METAL WITH SPIGOT ENDS:

- Provide circular silencers compatible with ductwork installation.
- Provide with plain spigot ends for connection to adjacent plant or ductwork.

2040A RECTANGULAR SILENCERS - CASING TO DW144 WITH CONNECTIONS TO MATCH AHU:

- Provide rectangular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with manufacturer's standard ends.
- Construct casing to DW/144 with duct connections to match the air handling unit and specified method of assembly.

2040B RECTANGULAR SILENCERS - CASING TO DW144 WITH EXTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with manufacturer's standard ends.
- Construct casing to DW/144 with external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2040C RECTANGULAR SILENCERS - CASING TO DW144 WITH INTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation.
- Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with manufacturer's standard ends.
- Construct casing to DW/144 with internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2040D RECTANGULAR SILENCERS - CASING TO DW144 WITH LOW LOSS FAIRINGS AND CONNECTIONS TO MATCH AHU:

- Provide rectangular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with low loss fairings.
- Construct casing to DW/144 with duct connections to match the air handling unit and specified method of assembly.

2040E RECTANGULAR SILENCERS - CASING TO DW144 WITH LOW LOSS FAIRINGS AND EXTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with low loss fairings.
- Construct casing to DW/144 with external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2040F RECTANGULAR SILENCERS - CASING TO DW144 WITH LOW LOSS FAIRINGS AND INTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation. Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct splitters with low loss fairings.
- Construct casing to DW/144 with internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2050A RECTANGULAR SILENCERS - NON-METAL WITH EXTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation.
- Construct splitters with manufacturer's standard ends.
- Provide external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2050B RECTANGULAR SILENCERS - NON-METAL WITH INTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation.
- Construct splitters with manufacturer's standard ends.
- Provide internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2050C RECTANGULAR SILENCERS - NON-METAL WITH SPIGOT ENDS:

- Provide rectangular silencers compatible with ductwork installation.
- Construct splitters with manufacturer's standard ends.
- Provide spigot ends for connection to adjacent plant or ductwork.

2050D RECTANGULAR SILENCERS - NON-METAL WITH LOW LOSS FAIRINGS AND EXTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation.

- Construct splitters with low loss fairings.
- Provide external flanges drilled for bolting to counter flanges on adjacent plant or ductwork.

2050E RECTANGULAR SILENCERS- NON-METAL WITH LOW LOSS FAIRINGS AND INTERNAL FLANGES:

- Provide rectangular silencers compatible with ductwork installation.
- Construct splitters with low loss fairings.
- Provide internal flanges drilled and threaded for bolting to counter flanges on adjacent plant or ductwork.

2050F RECTANGULAR SILENCERS - NON-METAL WITH LOW LOSS FAIRINGS AND SPIGOT ENDS:

- Provide rectangular silencers compatible with ductwork installation.
- Construct splitters with low loss fairings.
- Provide spigot ends for connection to adjacent plant or ductwork.

2060A ACOUSTIC SPLITTERS TO MANUFACTURER'S STANDARD:

- Mount splitters vertically or horizontally and fix splitters as shown on drawings.
- Construct splitters to ensure that infill is retained and individual acoustic integrity is maintained.
- Construct splitters with manufacturer's standard ends.
- Provide additional stiffening on horizontally mounted splitters.
- Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Material
    - Non-combustible mineral wool or glass fibre with minimum density 48 kg/m^3.
- Retain infill by perforated galvanized mild steel sheet.

2060B ACOUSTIC SPLITTERS WITH LOW LOSS FAIRINGS:

- Mount splitters vertically or horizontally and fix splitters as shown on drawings.
- Construct splitters to ensure that infill is retained and individual acoustic integrity is maintained.
- Construct splitters with low loss fairings.
- Provide additional stiffening on horizontally mounted splitters.
- Provide infill that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Material
    - Non-combustible mineral wool or glass fibre with minimum density 48 kg/m^3.
- Retain infill by perforated galvanized mild steel sheet.

2070A AIR TRANSFER/CROSS TALK ATTENUATORS - EXTERNAL FLANGES:

- Provide attenuators for air transfer and cross talk applications. Provide lining that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing with lock-formed longitudinal joints, mastic sealed.
- Provide external flanges drilled for bolting to counter flanges on adjacent ductwork.
- Fixing

- Interface with building components as indicated.

2070B AIR TRANSFER/CROSS TALK ATTENUATORS - INTERNAL FLANGES:

- Provide attenuators for air transfer and cross talk applications. Provide lining that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing with lock-formed longitudinal joints, mastic sealed.
- Provide internal flanges drilled and threaded for bolting to counter flanges on adjacent ductwork.
- Fixing
  - Interface with building components as indicated.

2070C AIR TRANSFER/CROSS TALK ATTENUATORS - SPIGOT ENDS:

- Provide attenuators for air transfer and cross talk applications. Provide lining that is inert, fire proof, inorganic, vermin proof, non-hygroscopic.
- Construct casing with lock-formed longitudinal joints, mastic sealed.
- Provide plain spigot ends for connection to adjacent ductwork.
- Fixing
  - Interface with building components as indicated.

2110 ACOUSTIC FLEXIBLE DUCT CONNECTORS:

- Provide acoustic flexible duct connectors in accordance with DW/144.

2120A ACOUSTIC LOUVRES:

- Performance
  - Provide certified acoustic performance data measured in accordance with BS EN ISO 10140.
  - Ensure louvre withstands specified wind loads and prevent ingress of rain.
- Construction
  - Construct louvre frame and aerodynamically profiled louvre blades from galvanized mild steel or aluminium as appropriate. Provide integral drainage channels.
- Screen
  - Fit a bird-screen using mesh no coarser than 12mm, across inside face of louvres.
- Quality assurance
  - Ensure manufacturers are a firm of Assessed Capability to BS EN ISO 9001 and produce louvre to relevant Quality Assessment schedule.

2120B ACOUSTIC LOUVRES WITH INFILL:

- Performance
  - Provide certified acoustic performance data measured in accordance with BS EN ISO 10140.

- Ensure louvre withstands specified wind loads and prevent ingress of rain.

- Construction
  - Construct louvre frame and aerodynamically profiled louvre blades from galvanized mild steel or aluminium as appropriate. Provide integral drainage channels.
  - Provide acoustic infill which is inert, fire proof, inorganic, vermin proof and non-hydroscopic.
  - Retain infill on louvre blades by perforated sheet of galvanized mild steel or aluminium as appropriate.
  - Acoustic infill to be wrapped with woven glass scrim cloth or 'Melinex' to prevent migration of particles into the airflow / protect the infill. Full account of the reduction in performance of the acoustic louvre brought about by the addition of the infill protection shall be made when selecting silencers to meet the required performances.

- Screen
  - Fit a bird-screen using mesh no coarser than 12mm, across inside face of louvres.

- Quality assurance
  - Ensure manufacturers are a firm of Assessed Capability to BS EN ISO 9001 and produce louvre to relevant Quality Assessment schedule.

3000 WORKMANSHIP

3030 ACCESS TO ACOUSTIC ENCLOSURES:

- Provide door type openings in enclosures as required for access to items enclosed. Provide openings for inlet and discharge ductwork and for connections as indicated. Provide angle flange connections for mating to ductwork and equipment.

3040 SUPPORTS:

- Supply steel section supporting frames or brackets where silencers are fixed to the walls of air chambers.

3060 SOUND PRESSURE LEVEL READINGS:

- Measure sound pressure levels at the positions indicated using equipment in accordance with BS EN 61672-1 and BS EN 61672-2.

Y46 - GRILLES, DIFFUSERS AND LOUVRES

1010 PERFORMANCE:

- Maximum mean air velocity in the occupied zone in summer and winter shall not exceed the criteria for a category B thermal environment as defined in BS EN ISO 7730 (PPD<10%) table A.5. unless specified otherwise elsewhere in this specification.
- Blades - Supply grilles and diffusers with blade profile to ensure correct aerodynamic performance and minimal noise generation.
- Louvres - Ensure air velocities through face area of louvres minimises 'carry-over' of rain, snow or other precipitation into ducts, shafts or plant rooms and ensure louvres are tested in accordance with BS EN 13030 and are subject of on-going factory production control auditing. Performance classes to BS EN 13030 are given elsewhere in this specification.

1020 SIZE:

- Sizes indicated are 'Nominal'.
- Provide size dimensions of linear diffusers and grilles before manufacture.

1030 NOISE LEVELS:

- Ensure sound power levels indicated are not exceeded. Ensure accessories for grilles and diffusers have low noise generation characteristics, and cause minimum disturbance to airflow.

1033 PROTECTIVE WRAPPING:

- Apply protective wrapping to exposed architectural finishes prior to despatch to site.

1040 ELECTRICAL BONDING TERMINAL:

- Ensure an electrical bonding terminal suitable for connection of 6mm^2 maximum conductor is provided on metal grilles, diffusers and louvres where indicated.

2000 PRODUCTS/MATERIALS

2010# GRILLES - FIXED BLADE TYPE:

- Secure blades within flanged mounting frame or core collar. Provide support mullions to ensure blade stability.

2020# GRILLES - ADJUSTABLE BLADE TYPE:

- Pivot blades within flanged mounting frame and retain blades in set position by tensioners external to the air stream.
    - Blade Rows
        - One row of parallel blades.

- Two rows of parallel blades at right angles to each other.

2050# GRILLES - LINEAR TYPE:

- Supply linear type grilles with one row of parallel blades. Secure blades within mounting frame or opening. Permanently set at angle indicated.

2060# GRILLES - LINEAR FLOOR TYPE:

- Supply linear type floor grilles with one row of parallel blades. Permanently set at angle indicated. Incorporate bar reinforcement.

2070C TRANSFER GRILLES - FIRE RESISTANT NON-VISION TYPE

- Supply grilles comprising Zintec steel frame with an intumescent core and two steel grilles, colour as indicated or scheduled.
- Comply with the requirements of BS 9999.
- Fire resistance tests for wall, ceiling or floor mounting types in accordance with BS EN 1364-5 or BS 476-22.
- Fire resistance tests for door mounting types in accordance with BS 476-22.
- Fix as indicated in accordance with the manufacturer's recommendations.

2070D TRANSFER GRILLES - FIRE RESISTANT NON-VISION TYPE WITH SMOKE CONTROL FACILITY:

- Supply grille assembly comprising Zintec steel frame with an intumescent core with damper and actuator assembly to automatically close in the event of an alarm, power failure or damage to wiring. Units to be complete with steel cover grilles, colour as indicated or scheduled.
- Comply with the requirements of BS 9999.
- Fire resistance tests for door mounting types in accordance with BS 476-20 and BS 476-22.
- Smoke leakage tests for smoke shutter type through door sets to be in accordance with BS 476-31.1.
- Fix as indicated in accordance with the manufacturer's recommendations.

2090A DIFFUSERS - LINEAR TYPE:

- Supply single unit or continuous length linear diffusers manufactured with one or more rigid and smooth line slot units with parallel bars and partitions.
- Fit closing caps at ends of single or multiple continuous length units.
- Provide continuous lengths complete with locating pins or strips with keys to ensure correct alignment of abutted ends.

2100 DIFFUSERS - PERFORATED FACE TYPE:

- Supply perforated face diffusers with rigid and smooth inlet spigot expanded to butt and seal against easily removable framed perforated front panel. Incorporate back deflectors above front panel, set to give required performance.
- Supply type and profile of framed perforated front panel to mount flush with surrounding false ceiling panels.

2130A STRAIGHT LINE, FIXED LOUVRE DIFFUSER WITH FIXED CORE:

- Supply diffusers manufactured from louvre type parallel blades permanently set and securely fixed within frame.
- Pre-set each blade to give directional control of air stream.

2130B STRAIGHT LINE, FIXED LOUVRE DIFFUSER WITH REMOVABLE CORE:

- Supply diffusers manufactured from louvre type parallel blades permanently set and securely fixed within frame.
- Supply core frames which are easily removable from flanged mounting frame.
- Pre-set each blade to give directional control of air stream.

2150 DIFFUSERS - LINEAR LIGHTING/AIR MODULAR TYPE:

- Supply diffusers complete with connecting unit for installation behind module flanges, ensuring neat and unobtrusive appearance.
- Fit plenum box with integral independent air volume regulating vanes to direct an equal air velocity along complete length of connecting air diffuser slot. Ensure easy access from below to regulating vanes. Retain vanes in set position by tensioners external to air stream.
- Fit spigot, suitable for flexible ducting joint connection to plenum box.
- Ensure that supports are independent, and do not depend upon module casing or flanges.

2160 LAMINAR FLOW PANELS:

- Supply laminar flow panels each with a large perforated face plate complete with rear plenum box or spigot entry.

2170 FILTERING ROOF, UNIDIRECTIONAL LAMINAR AIR SUPPLY

- equipped with pressure taps and terminal filters with minimum H14 efficiency (tested according to EN 1822) and perforated grids to ensure uniformity
- Very high efficiency filtration: H14 or U15
- Conforms to EN ISO 14644-1
- equipped with air recirculation boxes
- Acoustic version for attenuation of sound levels.

2180 DIFFUSERS - EXTRACT/EXHAUST VALVE TYPE:

- Supply diffusers incorporating intake ring and adjustable valve disc assembly. Provide bayonet type fixing for purpose made mounting ring with plastic foam sealing gasket. Provide setting template.
- Adjust valve to required setting and lock valve in required position.

2210# MATERIALS:

- Aluminium sheet/extruded aluminium
    - To BS EN 485, BS EN 515 and BS EN 573, or BS EN 755.

- Finish
    - Baked enamel, color selected by Engineer

2220A GRILLE AND DIFFUSER CONSTRUCTION:

- Ensure grilles and diffusers are robust and mounting frame flanges on square and rectangular terminals have mitred corners. Fit a rubber or plastic foam sealing strip or gasket to rear face of flange.
- Diffusers - Ensure face of diffuser outer cone or frame is completely smooth.

3000 ACCESSORIES

3010A OPPOSED BLADE VOLUME CONTROL DAMPERS - LOCAL CONTROL:

- Balance and tension operating mechanisms to give positive setting for blade positions from fully open to fully closed.
- Local blade operation
    - Supply device for operating damper blades through face or side of grille/diffuser as indicated.

3030A ANNULAR RING VOLUME CONTROL DAMPERS:

- Provide manual operation by loose key.

3040A BUTTERFLY VOLUME CONTROL DAMPERS:

- Operate via a simple hooked wire key connecting with a lug on the underside of each plate; or by a loose key locating into a control mechanism.

3060A FIXED AIR FLOW DEFLECTORS:

- Direct air stream evenly from main ducting into branches or spigots serving air grilles and diffusers by using a number of equally spaced curved blades linked together.

3060B ADJUSTABLE AIR FLOW DEFLECTORS:

- Direct air stream evenly from main ducting into branches or spigots serving air grilles and diffusers by using a number of equally spaced curved blades linked together.

3070 BLANKING PLATES:

- Supply blanking plates to restrict projection of air flow from a particular section of grille or diffuser. Ensure that indicated dimensions or angles in degrees are maintained.

3090 PERFORATED SCREENS:

- Fit perforated screens behind grille volume control devices to equalize air flow and pressure. Contain perforated sheet within rigid surrounding frame, incorporating fixing brackets or lugs.

4000 WORKMANSHIP

4010 GRILLE/DIFFUSER LOCATION:

- Fit at terminal air supply, extract and transfer points indicated, in accordance with the HEVAC Air Diffusion Guide.

4040 CONNECTION TO DUCTWORK:

- When connecting directly to duct spigot, secure grille mounting frame or flange with screws, or bolts and nuts, to returned flange, with filled in corners, at end of duct spigot.

4050A INSTALLATION IN BUILDERS WORK:

- Ensure outer edge of grille mounting frame or flange extends on all sides beyond the joint between any builders work frame and surrounding building construction.
- Ensure grilles are sealed to building fabric - including ceilings, to prevent air leakage from pressurised rooms to voids above.
- Fix louvres to building fabric using method indicated on drawings.

Y50 - THERMAL INSULATION

1010 TEMPERATURE RANGE:

- Refer to insulation manufacturer's recommendations to determine suitability of different insulation materials at different temperature ranges.

1020 STANDARDS:

- Comply in general with
  - BS 5422
  - BS 5970
  - BS EN ISO 12241
- For product clauses comply with
  - BS EN 14303
  - BS EN 14304
  - BS EN 14314
- Use the description of terms as BS 3533.
- All insulation products must have a Declaration of Performance (DoP) certificate and be CE marked in accordance with the Construction Products Regulations (CPR).
- Comply with BS EN 16783 and BS EN 15804 in preparing environmental product declarations (EPD's)

1030 MATERIALS:

- Employ materials that comply with BS 476-6 and BS 476-7.
- Materials shall have obtained Class 'O' fire rating in accordance with Approved Document B of the Building Regulations or be non-combustible in accordance with BS 476-4.
- Materials classified according to BS EN 13501-1 shall not show propensity for continuous smouldering combustion when tested in accordance with BS EN 16733.
- Ensure metals and materials that cause galvanic corrosion are not installed in contact.
- Do not use galvanized or zinc coated steel jacketing and accessories on austenitic stainless steel and austenitic nickel steel/alloy equipment and piping.
- Insulants can be selected from BRE Green Guide to Specification.
- All insulation material shall
  - Be non-hydroscopic and in all respects be suitable for continuous use throughout the range of operating temperatures and within the environment indicated.
  - Be wholly compatible with the material it is insulating at the design working temperature and environmental conditions.
  - Be free from chemicals which may contribute to corrosion or degradation of the insulated surface or finish.
  - Have global warming potential (GWP) of less than 5.
  - Have an ozone depletion potential (ODP) of 0.

1032 PRE-INSULATED EQUIPMENT:

- Where fire and surface spread of flame certificates relate to factory made products, ensure that certificates are still valid where products are incorporated in pre-insulated equipment.

1034 PROTECTION APPLIED IN SITU:

- Where fire and surface spread of flame certificates relate to factory made products, ensure that the certificate remains valid when the finish is site applied.

1035A EUROPEAN CLASSIFICATION FOR REACTION TO FIRE PERFORMANCE:

- Supply insulating materials classified in accordance with BS EN 13501-1. Classes acceptable are $A1/A1_L$, $A2/A2_L$ or B/B_L having smoke emission classification of s1 and production of flaming droplets/particles classification of d0.
- Test methods
  - BS EN ISO 1182, BS EN ISO 1716, BS EN 11925-2, BS EN 13823 as appropriate.

1050A SPREAD OF FLAME:

- When completed, ensure surface-finish complies with BS 476-7 Class 1 spread of flame.

1055 SMOKE EMISSION CHARACTERISTICS:

- Ensure only products classified by BS EN 13501-1 as s1 (materials that give off little or no smoke) are used.

1080 ELECTRICAL BONDING TERMINAL:

- Ensure an electrical bonding terminal suitable for connection of $6mm^2$ maximum conductor is provided where indicated.

1090 INSPECTION AND TESTING:

- Arrange performance test of thermal conductivity on materials selected, carried out at manufacturer's works or at an approved laboratory and in accordance with appropriate British Standard.
- Provide assistance to allow for inspection of all sizes of insulation on all services after installation to determine thickness and compliance with specification. Make good any sections that are cut during inspection for thickness and compliance with specification.

2000 PRODUCTS/MATERIALS

2010 THERMAL CONDUCTIVITY:

- All thermal conductivity figures given in insulation product clauses are typical values at the mean temperature stated, as declared in manufacturer's Declaration of Performance (DoP) certificates in accordance with the CPR.

2015A THERMAL PERFORMANCE LIFE EXPECTANCY FOR PLANT DESIGN LIFE:

- Ensure the insulation will maintain it's thermal performance for a minimum of the plant design life.

2015B THERMAL PERFORMANCE LIFE EXPECTANCY DETAILS:

- Provide manufacturer's details which define the life expectancy of the insulation material. Where appropriate this shall include both 'as manufactured' and 'aged' thermal conductivity values in accordance with BS EN 14314.

2020 RESTRICTIONS ON USE OF MATERIALS:

- Protect insulated stainless steel surfaces from the risk of stress corrosion in accordance with the recommendations in BS 5970.
- For all mineral wool insulation products, test evidence must be available showing that the fibres from which the products are made are not classified as a possible human carcinogen, as detailed by European Directive 97/69/EC and the Approved Supply List of CHIP98, and that the fibres should be bio-soluble.

2030A FOIL FACED ROCK MINERAL WOOL PIPE INSULATION:

- Standard - BS EN 14303.
- Nominal density - 120 kg/m^3.
- Thickness - 20mm to 100mm.
- Thermal conductivity - Typical value 0.033 - 0.034 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil with at least 25mm overlap.

2030B CANVAS ROCK MINERAL WOOL PIPE INSULATION:

- Standard - BS EN 14303.
- Nominal density - 120 kg/m^3.
- Thickness - 20mm to 100mm.
- Thermal conductivity - Typical value of 0.033 - 0.034 W/mK at a mean temperature of 10°C.
- Finish - Canvas covered with at least 25mm overlaps.

2030C FOIL FACED GLASS MINERAL WOOL PIPE INSULATION:

- Standard - BS EN 14303.
- Nominal density - 80 kg/m^3.
- Thickness - 20mm to 100mm.
- Thermal conductivity - Typical value of 0.033 W/mK at a mean temperature of 10°C.

2030D CANVAS GLASS MINERAL WOOL PIPE INSULATION:

- Standard - BS EN 14303.
- Nominal density - 80 kg/m^3 to 120 kg/m^3.
- Thickness - 20mm to 100mm.
- Thermal conductivity - Typical value of 0.033 W/mK at a mean temperature of 10°C.

- Finish - Canvas covered with at least 25mm overlaps.

2040A FOIL FACED ROCK MINERAL WOOL SEMI RIGID DUCT INSULATION:

- Standard - BS EN 14303.
- Nominal density - 45 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value not exceeding 0.034 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2040B FOIL FACED GLASS MINERAL WOOL SEMI RIGID DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 45 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value of 0.333 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2050A FOIL FACED ROCK MINERAL WOOL FLEXIBLE DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 28 kg/m^3 to 45 kg/m^3.
- Thickness - 25mm to 60mm.
- Thermal conductivity - Typical value of 0.034 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2050B FOIL FACED GLASS WOOL FLEXIBLE DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 25 kg/m^3 to 45 kg/m^3.
- Thickness - 25mm to 60mm.
- Thermal conductivity - Typical value of 0.033 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2060A FOIL FACED ROCK MINERAL WOOL LAMELLA DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 24-45 kg/m^3.
- Thickness - 25mm to 80mm.
- Thermal conductivity - Typical value of 0.04 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2060B KRAFT PAPER FACED ROCK MINERAL WOOL LAMELLA DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 24-45 kg/m^3.
- Thickness - 25mm to 80mm.

- Thermal conductivity - Typical value of 0.04 W/mK at a mean temperature of 10°C.
- Finish - Plain Kraft paper.

2060C FOIL FACED GLASS MINERAL WOOL LAMELLA DUCT INSULATION:

- Standard - BS EN 14303.
- Nominal density - 24-45 kg/m^3.
- Thickness - 25mm to 80mm.
- Thermal conductivity - Typical value of 0.04 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2060D KRAFT PAPER FACED GLASS MINERAL WOOL LAMELLA DUCT INSULATION:

- Standard - BS EN 14303.
- Nominal density - 24-45 kg/m^3.
- Thickness - 25mm to 80mm.
- Thermal conductivity - Typical value of 0.04 W/mK at a mean temperature of 10°C.
- Finish - Plain Kraft paper.

2065 CRIMPED MAT DUCT INSULATION:

- Standard - BS EN 14303
- Nominal density - 25 to 45 kg/m^3.
- Compression resistance - Maximum of 13% compression at a static load of 2 kPA.
- Thickness - 25mm to 80mm.
- Thermal conductivity - Typical value of 0.034 W/mK at a mean temperature of 10°C.
- Finish - Reinforced aluminium foil.

2070A GALVANIZED METAL MESH ON MINERAL WOOL MATTRESSES - ONE FACE:

- Standard - BS EN 14303
- Application - High temperature ducts, tanks, vessels and other process equipment.
- Nominal density - 66 - 128 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value of 0.041 W/mK at a mean temperature of 50°C.
- Mesh - Galvanized. Faced, one side.

2070B GALVANIZED METAL MESH ON MINERAL WOOL MATTRESSES - BOTH FACES:

- Standard - BS EN 14303.
- Application - High temperature ducts, tanks, vessels and other process equipment.
- Nominal density - 66 - 128 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value of 0.041 W/mK at a mean temperature of 50°C.
- Mesh - Galvanized. Faced, both sides.

2070C STAINLESS STEEL MESH ON MINERAL WOOL MATTRESSES - ONE FACE:

- Standard - BS EN 14303
- Application - High temperature ducts, tanks, vessels and other process equipment.
- Nominal density - 66 - 128 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value of 0.041 W/mK at a mean temperature of 50°C.
- Mesh - Stainless steel. Faced, one side.

2070D STAINLESS STEEL MESH ON MINERAL WOOL MATTRESSES - BOTH FACES:

- Standard - BS EN 14303
- Application - High temperature ducts, tanks, vessels and other process equipment.
- Nominal density - 66 - 128 kg/m^3.
- Thickness - 25mm to 100mm.
- Thermal conductivity - Typical value of 0.041 W/mK at a mean temperature of 50°C.
- Mesh - Stainless steel. Faced, both sides.

2080A FLAT DUCTWORK FIRE PROTECTION INSULATION - MITRED JOINTS:

- Material - Mineral wool, slab for flat ducts, with 45° mitred joints.
- Nominal density - 165 kg/m^3.
- Thermal conductivity - Typical value of 0.035 W/mK at a mean temperature of 10°C.
- Facing - Reinforced aluminium foil.

2080B FLAT DUCTWORK FIRE PROTECTION INSULATION - BUTTED JOINTS:

- Material - Mineral wool, slab for flat ducts, with 90° butted joints.
- Nominal density - 165 kg/m^3.
- Thermal conductivity - Typical value of 0.035 W/mK at a mean temperature of 10°C.
- Facing - Reinforced aluminium foil.

2080C CIRCULAR DUCTWORK FIRE PROTECTION INSULATION - SECTION:

- Material - Mineral wool
    - Section for circular duct, 17 to 610 mm diameter.
- Nominal density - 165 kg/m^3.
- Thermal conductivity - Typical value of 0.035 W/mK at a mean temperature of 10°C.
- Facing - Reinforced aluminium foil.

2080D CIRCULAR DUCTWORK FIRE PROTECTION INSULATION - PSM:

- Material - Mineral wool
    - PSM for circular duct greater than 406mm diameter.
- Nominal density - 165 kg/m^3.
- Thermal conductivity - Typical value of 0.035 W/mK at a mean temperature of 10°C.
- Facing - Reinforced aluminium foil.

2080E CIRCULAR DUCTWORK FIRE PROTECTION INSULATION - FLEXIBLE MAT:

- Material - Mineral wool wire faced flexible mattress.
- Nominal density - 66 kg/m^3.
- Thermal conductivity - Typical value of 0.035 W/mK at a mean temperature of 10°C.
- Facing - Reinforced aluminium foil.

2110A FOIL FACED CLOSED CELL RIGID PHENOLIC FOAM (PF) PREFORMED SECTIONS:

- Standard - BS EN 14314
- Nominal density - 35 - 40 kg/m^3..
- Temperature range - -180 to +120°C..
- Thickness - Minimum 15mm.
- Thermal conductivity - Typical value of 0.025 W/mK at a mean temperature of 10°C when fully aged in accordance with BS EN 14314.
- Finish - Reinforced aluminium foil.
- Phenolic foam sections to be completely treated, at the insulation manufacturer's works, with a suitable dust suppressant, acid neutralising and passivating bore coating. This can be either an impregnated permeable liner or a sprayed coating.

2120A FOIL FACED CLOSED CELL RIGID LAMINATED PHENOLIC FOAM (PF), DUCT INSULATION SLAB:

- Standard - BS EN 14314.
- Nominal density - 40 kg/m^3.
- Thickness - minimum 20mm.
- Thermal conductivity - Typical value of 0.022 W/mK at a mean temperature of 10°C when fully aged in accordance with BS EN 14314.
- Finish - Reinforced aluminium foil.

2120B CLOSED CELL RIGID LAMINATED PHENOLIC FOAM (PF), DUCT INSULATION SLAB:

- Standard - BS EN 14314
- Nominal density - 40 kg/m^3.
- Thickness - minimum 20mm.
- Thermal conductivity - Typical value of 0.022 W/mK at a mean temperature of 10°C when fully aged in accordance with BS EN 14314.

2130A HIGH DENSITY RIGID PHENOLIC PIPE AND DUCT INSULATION FOR DUCT AND PIPE SUPPORTS:

- Standard - BS EN 14314
- Nominal density - 40 kg/m^3.
- Temperature range - -180 to +12°C.
- Thermal conductivity - Typical value of 0.045 W/mK at a mean temperature of 50°C when fully aged in accordance with BS EN 14314.

- CFC and HCFC free.

2140A CLOSED CELL NITRILE AND EPDM RUBBER ELASTOMERIC SHEET AND PREFORMED FLEXIBLE SECTIONS:

- Standard - BS EN 14304
- Nitrile rubber
    - Nominal density - 45 - 100 kg/m^3.
    - Temperature range - -50 to +110°C.
- Thickness
    - Sections - 6mm to 32mm for pipe sizes 6mm to 114mm.
    - Sheets - 6mm to 50mm.
    - Thermal conductivity - Typical value of 0.036 W/mK at a mean temperature of 20°C.
- EPDM
    - Nominal density - 45 - 100 kg/m^3.
    - Temperature range - -50 to +150°C
- Thickness
    - Sections - 10mm to 25mm for pipe sizes 10mm to 89mm.
    - Sheets - 10mm to 32mm.
    - Thermal conductivity - Typical value 0.045 W/mK at a mean temperature of 40°C.

2170 VAPOUR BARRIER PERMEANCE:

- Comply with requirements of BS 5422 and BS 5970.
- Maximum permitted water vapour permeance in relation to plant temperature at an ambient temperature of +20°C (dry bulb) to be in accordance with BS 5422, Table 1.

2180A BITUMEN VAPOUR BARRIER COATINGS:

- Cut-back bitumens with cotton canvas or open mesh glass cloth to reinforce coatings.

2180B VINYL VAPOUR BARRIER COATINGS:

- Vinyl emulsions with cotton canvas or open mesh glass cloth to reinforce coatings.

2180C SOLVENT POLYMER VAPOUR BARRIER COATINGS:

- Solvent-based polymers with cotton canvas or open mesh glass cloth to reinforce coatings.

2180D BITUMEN EMULSION VAPOUR BARRIER COATINGS:

- Bitumen emulsions (with or without elastomer latex) with cotton canvas or open mesh glass cloth to reinforce coatings.

2190 ADHESIVES:

- Comply with the recommendations of clause 10.1 of BS 5970, for insulation bonding adhesives, lagging adhesives; and facing and film attachment adhesives.

2200A SELF ADHESIVE WEATHER RESISTANT ZERO PERM MULTI-LAYER LAMINATE:

- Apply multi-layer laminate directly over ducts and pipework, ensuring 75mm overlap for a complete vapour barrier.
- Test in accordance with BS 476-6 and BS 476-7.
- Finish - Class O
- Laminate to be puncture and tear resistant and have supporting test data in accordance with ASTM D-1000 and ASTM D-624.
- Normal use -5ply laminate.
- Heavy duty use (e.g. Pipework /ductwork which could be walked on regularly or low level pipework in plant areas) -13ply laminate.
- Installation to be in accordance with the manufacturer's recommendations and may be either factory pre-applied or applied in-situ.

2200B ROOFING FELT PROTECTION:

- Secure in position with galvanized wire netting, of 1mm x 25mm mesh. Finish with two coats of black bituminous paint.

2200C FLAT ALUMINIUM-ZINC COATED STEEL PROTECTION:

- Mild steel sheet continuously hot dipped with 185gm aluminium-zinc coating to BS EN 10346, applied directly to insulating material.
- 0.4mm thick flat sheet.

2200D RIBBED ALUMINIUM-ZINC COATED STEEL PROTECTION:

- Mild steel sheet continuously hot dipped with 185gm aluminium-zinc coating to BS EN 10346, applied directly to insulating material.
- 0.4mm thick ribbed sheet.

2200E ALUMINIUM SHEETING PROTECTION:

- Apply flat (embossed) or profiled aluminium cladding directly to insulating material. 0.56mm thick on pipework; 0.71mm thick on ductwork.

2200G CANVAS PROTECTION:

- 130g covering for ductwork with two coats of water based co-polymer solution.
- Canvas sections for pipework with two coats of water based co-polymer solution.

2200H CANVAS PROTECTION WITH ALUMINIUM BANDS:

- 130g covering for ductwork with two coats of water based co-polymer solution, with aluminium bands.
- Canvas sections for pipework with two coats of water based co-polymer solution, with aluminium bands.

2210# REINFORCEMENT:

- Aluminium bands at 300mm centres.
- Aluminium bands at 450mm centres.
- 50mm x 19g galvanised wire netting to BS EN 10223.
- 50mm x 22g galvanised wire netting to BS EN 10223.

2230A ALUMINIUM PROTECTION FOR HEAT EXCHANGERS AND OTHER VESSELS:

- Finish with 0.9mm thick aluminium ribbed or embossed sheeting, with lapped, riveted and sealed joints, laps to shed water. Seal all joints at manholes and stools. Fit cut-outs with purpose made over-plates or collars.

2230B ALUMINIUM PROTECTION FOR HEAT EXCHANGERS AND OTHER VESSELS - WITH CHEST AND ACCESS COVERS:

- Finish with 0.9mm thick aluminium ribbed or embossed sheeting, with lapped, riveted and sealed joints, laps to shed water. Seal all joints at manholes and stools. Fit cut outs with purpose made over-plates or collars.
- Enclose chests and access covers in removable covers lined with high density flexible material. Remove manufacturer's name plate and refix on cladding.

2230E MULTI-LAYER LAMINATE PROTECTION FOR HEAT EXCHANGERS AND OTHER VESSELS - WITH CHEST AND ACCESS COVERS:

- Finish with self-adhesive weather resistant zero perm multi-layer laminate to encapsulate insulation, using the taped system as a quick and easy access point.

2240A MINERAL FIBRE INSULATION FOR BOILER FLUES WITH ALUMINIUM CASING:

- Use bonded mineral fibre preformed sections secured with aluminium bands direct to flue. Use multi-layers and stagger joints for thicknesses in excess of 65mm. Finish with 0.9mm thick aluminium ribbed or embossed sheeting.

2280 PUMPS AND OTHER IRREGULAR SHAPES:

- Where access is required to pumps and other irregular shapes submit proposals for materials and methods of applying a demountable finish, for approval.
- Comply with requirements of BS 5970.

2287 CALCULATION OF INSULATION THICKNESS - ECA ENHANCED:

- The insulation manufacturer selected for a particular project should calculate the minimum required thicknesses of pipework insulation based on the actual conductivity of the product at the relevant temperature and the criteria on the ECA web site for an eligible installation using the methodology set out in BS EN ISO 12241 and the assumptions set out in Table C1 of BS 5422.

2289 INSULATION THICKNESS TABLES:

- Unless stated otherwise the thicknesses given in the tables in this specification are the nearest commercially available material thickness to meet the minimum calculated thickness to BS EN ISO 12241 and the product declared performance data for CE marking. Thicknesses have been calculated by manufacturers for each product and use thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures listed in the relevant tables.
- Should alternative products be offered that may have different performance data the Contractor shall ensure the manufacturer undertakes calculations and submits appropriate thickness table.
- Unless specified otherwise elsewhere, the thicknesses for pipe of greater diameter, flat surfaces or irregular shaped plant items shall not be less than that for the largest pipe size given in the thickness tables.

2290 NON-DOMESTIC HOT WATER SERVICE INSTALLATIONS - BUILDING REGULATIONS ROCK MINERAL WOOL:

- Insulation thickness to achieve the maximum permissible heat loss stated in the Building Regulations Part L Non Domestic Building Services Compliance Guide, Northern Ireland Technical Booklet F2 and Section 6 of the Scottish Non Domestic Technical Handbook.

Outside diameter of steel pipe (mm)	Thickness of rock mineral wool (mm)	
Surface emissivity	0.05	0.9
17	25	30
21	25	30
27	30	35
34	30	35
42	30	35
48	35	40

89	35	45
114	40	45
140	40	45
168	40	50
219	40	50
273 and above	45	50

- Basis: Horizontal pipe at 60°C in still air at 15°C, thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.
    - Use this table for insulation thickness of copper pipework of the nearest equivalent outside diameter.

- Use this table for insulation thickness of plastic pipework of the nearest equivalent outside diameter.

2295 NON-DOMESTIC HOT WATER SERVICE INSTALLATIONS, BUILDING REGULATIONS - GLASS MINERAL WOOL:

- Insulation thickness to achieve the maximum permissible heat loss stated in the Building Regulations Part L Non Domestic Building Services Compliance Guide, Northern Ireland Technical Booklet F2 and section 6 of the Scottish Non Domestic Technical Handbook.

Outside diameter of steel pipe (mm)	Thickness of glass mineral wool (mm)	
Surface emissivity	0.05	0.9
17	25	30
21	25	30
27	30	40

168	50	60	80	80	100	100
219	50	60	80	80	100	100
273	50	60	80	80	100	100

- Basis of calculation: Horizontal pipe at 75°C (LTHW),100°C (MTHW) or 125°C (HTHW) in still air at 15°C. Thermal conductivity calculated from the mean insulation temperature based on the fluid and air temperatures.
    - Use this tale for insulation thickness of copper or plastic pipework of the nearest equivalent outside diameter.

2327 NON-DOMESTIC HEATING INSTALLATIONS, ECA ENHANCED:

- The insulation manufacturer selected for a particular project should calculate the minimum required thicknesses of pipework insulation based on the actual conductivity of the product at the relevant temperature and the criteria on the ECA web site for an eligible installation using the methodology set out in BS EN ISO 12241 and the assumptions set out in Table C1 of BS 5422. The table below defines the maximum permissible heat losses to be used in the calculations.

Non-Domestic Heating Installations Maximum Permitted Heat Loss (W/m)			
Temperature	Low	Medium	High
	< 95°C	96-120°C	121-150°C
Outside Pipe Diameter (mm)			
17.2	7.78	10.57	13.27
21.3	8.42	11.25	14.06
26.9	9.05	12.06	15.02
33.7	9.86	13.04	16.07
42.4	10.83	14.12	17.34
48.3	11.42	14.80	18.09

60.3	12.61	16.22	19.62
76.1	14.12	17.88	21.41
88.9	15.28	19.20	22.87
114.3	17.51	21.66	25.53
139.7	19.72	23.99	27.98
168.3	22.34	26.63	30.69
219.1	26.61	31.15	35.25
273 & above	30.91	35.83	40.05

2330 DOMESTIC CENTRAL HEATING AND HOT WATER SYSTEMS - ROCK MINERAL WOOL:

- Insulation thickness to achieve the maximum permissible heat loss stated in the Building Regulations Part L Domestic Building Services Compliance Guide Northern Ireland Technical Booklet F1, and section 6 of the Scottish Domestic Technical Handbook.

Outside diameter of copper pipe (mm)	Domestic heating and hot water Thickness of mineral wool insulation (mm)	
Surface emissivity	0.05	0.9
17	-	-
22	20	20
28	20	25
35	20	25
42	20	25
54	20	25

- Basis of calculation of thicknesses: Horizontal pipe at 60°C (LTHW) in still air at 15°C. Thermal conductivity calculated from the mean insulation temperature based on the fluid and air temperatures.
- Mineral wool sections are not available for pipe outside diameters less than 17mm.
    - Use this table for insulation thickness for plastic pipework of the nearest equivalent outside diameter.

2331 DOMESTIC CENTRAL HEATING AND HOT WATER INSTALLATIONS, ECA ENHANCED:

- The insulation manufacturer selected for a particular project should calculate the minimum required thicknesses of pipework insulation based on the actual conductivity of the product at the relevant temperature and the criteria on the ECA web site for an eligible installation using the methodology set out in BS EN ISO 12241 and the assumptions set out in Table C1 of BS 5422. The table below defines the maximum permissible heat losses to be used in the calculations.

Domestic Heating & Hot Water Maximum Permitted Heat Loss (W/m)	
Temperature	60°C
Outside Pipe Diameter (mm)	
8	5.82
10	6.20
12	6.52
15	7.03
22	8.02

28	8.87
35	9.63
42	10.58
54	11.83

2456 INSULATION THICKNESS ON DUCTWORK, BUILDING REGULATIONS:

- Insulation thickness to limit heat gains and heat losses stated in the Building Regulations Part L Non Domestic Building Services Compliance Guide, Northern Ireland Technical Booklet F2 and section 6 of the Scottish Non Domestic Technical Handbook.

Material	Thickness of insulation (mm)					
	Warm air ductwork			Chilled air / dual purpose ductwork		
Surface Emissivity	Low (0.05)	Med (0.44)	High (0.9)	Low (0.05)	Med (0.44)	High (0.9)
Rock Mineral wool Ductwrap	40	40	40	50	60	70
Glass mineral wool	40	40	40	50	60	60
Phenolic foam	20	25	25	35	40	40
Nitrile rubber	32	37	40	51	60	62

- Basis:
  - Warm air ductwork - horizontal duct at 35°C, with 600 mm vertical sidewall in still air at 15°C.
  - Chilled air ductwork - horizontal duct at 13°C, with 600 mm vertical sidewall in still air at 25°C.
  - Thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.
  - Thicknesses of mineral wool and phenolic foam are the nearest commercially available thickness to meet minimum requirements.
  - Thicknesses of nitrile rubber are minimum thicknesses.

2460 CONDENSATION CONTROL ON CHILLED AIR DUCTWORK - ROCK MINERAL WOOL:

- Insulation thickness for condensation control on ductwork carrying chilled air in ambient conditions: indoor still air temperature 25°C, relative humidity 80%, dew point temperature 21.3°C.

Minimum air temperature inside duct °C	Thickness of rock mineral wool insulation (mm)		
Surface emissivity	Low (0.05)	Medium (0.44)	High (0.90)
15	30	25	25
10	50	25	25
5	70	40	25
0	90	50	30

- Basis: Table 12 in BS 5422, thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.
- All ductwork shall be insulated where were visible (i.e exposed ductwork) when the duct surface temperature is below the dew point of the air within the space served.

2461 CONDENSATION CONTROL ON CHILLED AIR DUCTWORK - GLASS MINERAL WOOL:

- Insulation thickness for condensation control on ductwork carrying chilled air in ambient conditions: indoor still air temperature 25°C, relative humidity 80%, dew point temperature 21.3°C.

Minimum air temperature inside duct °C	Thickness of glass mineral wool insulation (mm)		
Surface emissivity	Low (0.05)	Medium (0.44)	High (0.90)
15	25	25	25
10	40	25	25
5	50	40	25
0	50	50	40

- Basis: Table 12 in BS 5422, thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.
- All ductwork shall be insulated where were visible (i.e exposed ductwork) when the duct surface temperature is below the dew point of the air within the space served.

2470 CONDENSATION CONTROL ON CHILLED AIR DUCTWORK - PHENOLIC FOAM:

- Minimum insulation thickness for condensation control on ductwork carrying chilled air in ambient conditions: indoor still air temperature 25°C, relative humidity 80%, dew point temperature 21.3°C.

Minimum air temperature inside duct °C	Thickness of phenolic foam insulation (mm)		
Surface emissivity	Low (0.05)	Medium (0.44)	High (0.90)
15	20	20	20
10	30	20	20
5	50	25	20
0	60	30	20

- Basis: Table 12 in BS 5422, thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.

- All ductwork shall be insulated where were visible (i.e exposed ductwork) when the duct surface temperature is below the dew point of the air within the space served.

2475 CONDENSATION CONTROL ON CHILLED AIR DUCTWORK - CLOSED CELL FEF NITRILE FOAM:

- Minimum insulation thickness for condensation control on ductwork carrying chilled air in ambient conditions: indoor still air temperature 25°C, relative humidity 80%, dew point temperature 21.3°C.

Minimum air temperature inside duct °C	Nominal thickness of FEF Nitrile foam insulation (mm)	
Surface emissivity	low (0.05)	high(0.9)
15	12	6
10	21	11
5	31	17
0	40	22

- Basis: Table 12 in BS 5422, thermal conductivity values calculated from the mean insulation temperature based on the fluid and air temperatures.
- All ductwork shall be insulated where were visible (i.e exposed ductwork) when the duct surface temperature is below the dew point of the air within the space served.
- Thicknesses of nitrile rubber are minimum thicknesses.

2490# THICKNESS OF INSULATION TO BS 5422 FOR PROCESS PIPEWORK AND EQUIPMENT:

- Comply with the requirements of sections 4 and 10 and relevant annexes of BS 5422 and supply minimum thickness of insulation for services in accordance with relevant tables in BS 5422 to control heat loss or limit surface temperature.
    - Table 21 - Minimum insulation thickness for process pipework and equipment to control heat loss.
    - Table 22 - Minimum insulation thickness to control the surface temperature of a non-metallic surface with a surface emissivity of 0.90 and design cold face temperature of 59°C.
    - Table 23 - Minimum insulation thickness to control the surface temperature of a metallic surface with a surface emissivity of 0.05 and design cold face temperature of 50°C.
    - Table 24 - Minimum insulation thickness to control the surface temperature of a non-metallic surface with a surface emissivity of 0.90 and design cold face temperature of 50°C.

2495# THICKNESS OF INSULATION TO BS 5422 FOR REFRIGERATION PIPEWORK AND EQUIPMENT:

- To control heat gain and condensation, comply with the requirements of section 6 of BS 5422 and supply minimum thickness of insulation in accordance with relevant tables below and Annexes F and H in BS 5422.
    - Table 1 – Maximum permitted water vapour permeance in relation to plant temperature at an ambient temperature of +20°C (dry bulb).
    - Table 2 – Minimum insulation thickness for refrigeration applications to control condensation and control heat gain on a high emissivity outer surface (0.90) with an ambient temperature of +20°C and a relative humidity of 70%.

- Table 3 – Minimum insulation thickness for refrigeration applications to control condensation and control heat gain on a low emissivity outer surface (0.05) with an ambient temperature of +20°C and a relative humidity of 70%.
- Table 4 – Minimum insulation thickness for refrigeration applications to control condensation and control heat gain on a high emissivity outer surface (0.90) with an ambient temperature of +25°C and a relative humidity of 80%.
- Table 5 – Minimum insulation thickness for refrigeration applications to control condensation and control heat gain on a low emissivity outer surface (0.05) with an ambient temperature of +25°C and a relative humidity of 80%.

3000 WORKMANSHIP

3010 GENERAL:

- Install insulation in accordance with BS 5970.
- Carry out thermal insulation work using one of the scheduled firms employing skilled craftsmen conversant with class of work.
- In locations where insulation cannot be installed adequately after pipeline or ductline installation, pre-insulated sections shall be installed. Insulation to such sections shall be equivalent in thermal and physical properties to that specified for the remainder of the system including vapour barriers.
- Do not apply thermal insulation until installation has been fully tested and all joints proved sound.
- Ensure all materials are kept dry.
- Ensure all pipework surfaces are dry before the installation of thermal insulation.
- Insulate each unit separately. Do not enclose adjacent units together.
- Ensure there is clearance between insulated pipes.
- Application
    - Apply insulants, facings, coatings and protection strictly in accordance with manufacturer's instructions.
- Finish
    - Neatly finish joints, corners, edges and overlaps and, where possible, arrange overlaps to fall on blind side. Ensure overlaps are neat and even and parallel to circumferential and longitudinal joints.

3020 INSTALLATION OF FOIL FACED MINERAL WOOL INSULATION ON PIPEWORK:

- Ensure joints are close butted together. Secure overlaps with adhesive or matching class 'O' tape, a minimum of 50mm wide, on both longitudinal and circumferential butt joints. Insulate fittings to same standard as adjacent pipework and use mitred segments where necessary, taped as above.
- Where a vapour seal or fibre containment is required tape exposed insulation membrane and return to pipe surface.
- Where insulation abuts pipe support inserts that have integral vapour barriers seal using class 'O' foil tape to continue vapour barrier or containment.

3030 INSTALLATION OF FOIL FACED PHENOLIC FOAM INSULATION ON PIPEWORK:

- Ensure joints are close butted together. Secure overlaps with adhesive or matching class 'O' tape, a minimum of 50mm wide, on both longitudinal and circumferential butt joints. Insulate

fittings to same standard as adjacent pipework and use mitred segments where necessary, taped as above.

- Before phenolic foam sectional insulation is applied, ensure that all pipework is clean, dry and free of any debris or corrosive substances such as excess soldering flux, building materials.
- Installation shall be by a contractor approved by the manufacturers strictly in accordance with the manufacturer's installation instructions.
- All exposed edges of phenolic foam insulation shall be sealed to the surface being insulated with a suitable vapour sealing mastic.

3050 INSTALLATION OF CLOSED CELL NITRILE RUBBER INSULATION ON PIPEWORK:

- Install closed cell nitrile rubber in accordance with manufacturer's recommendations.
- Check installation procedure when closed cell nitrile rubber is to be installed on stainless steel pipework.

3060 INSTALLATION OF FOIL FACED RIGID OR SLOTTED PHENOLIC INSULATION ON DUCTWORK:

- Secure the insulation with adhesive in accordance with manufacturer's recommendations. Use insulation hangers that are fit for purpose and in accordance with thermal insulation and insulation hanger manufacturers.
- Cut slabs so that the top and bottom pieces overlap the sides. Seal joints and pin penetrations using 100mm wide class 'O' aluminium foil tape.
- Where cut outs for test holes, etc occur tape over insulation membrane and return to the duct surface.
- Where insulation abuts duct support inserts that have integral vapour barriers seal using class 'O' foil tape to continue vapour barrier.

3070 INSTALLATION OF FOIL FACED FLEXIBLE DUCTWORK INSULATION:

- Secure the insulation with adhesive in accordance with manufacturer's recommendations. Use insulation hangers spaced at maximum 300mm centres on the underside of rectangular and flat oval ducts.
- Seal joints and pin penetrations using 100mm wide class 'O' aluminium foil tape. Where cut outs for test holes, etc occur tape over insulation membrane and return to the duct surface.
- Where insulation abuts duct support inserts that have integral vapour barriers seal using class 'O' foil tape to continue vapour barrier.

3080 INSTALLATION OF FOIL FACED LAMELLA ON DUCTWORK:

- Secure the insulation in accordance with manufacturer's recommendations. Use insulation hangers spaced at maximum 300mm centres on the underside of rectangular and flat oval ducts.
- Seal joints and pin penetrations using 100mm wide class 'O' aluminium foil tape. Where cut outs for test holes, etc occur tape over insulation membrane and return to the duct surface.
- Where insulation abuts duct support inserts that have integral vapour barriers seal using class 'O' foil tape to continue vapour barrier.

3090 INSTALLATION OF INSULATION ON TANKS:

- Fit insulation so that two opposite pieces overlap the sides. Bond insulation to the tank with adhesive, applied in accordance with the manufacturer's recommendations. Closely butt together all slabs and seal joints with a matching self-adhesive tape 100mm wide.

3100 INSTALLATION OF MINERAL WOOL INSULATION ON VESSELS:

- Cut Lamella to length to wrap around duct with an additional 75mm to form an overlap. Remove insulation from facing of overlap together with dust, and seal overlap with adhesive in accordance with manufacturer's instructions. Butt joints closely together and seal with matching self-adhesive tape at least 100mm wide.

3110 INSTALLATION OF PHENOLIC FOAM INSULATION ON VESSELS:

- Use pre-formed segments or pre-slotted foil faced insulation to fit the diameter of the vessel, laid with staggered joints. Vapour seal the joint faces. Use jointing compound to fill and seal joints around protrusions.
- Do not use wire to secure insulation.
- Secure insulation segments up to 3500mm outside insulation diameter with filament tape 38mm wide at 300mm centres.
- Secure insulation segments over 3500mm outside insulation diameter with aluminium banding.
- Finish as manufacturer's recommendations.

3120 INSTALLATION OF POLYISOBUTYLENE (PIB) PROTECTION:

- Wrap pipework and fittings, ductwork or tanks and vessels with PIB sheeting lapped at every joint by at least 50mm. Solvent weld joints and support with banding in accordance with manufacturer's
- Arrange joints to shed water and prevent the ingress of water.

3125 INSTALLATION OF MULTI-LAYERED LAMINATE:

- Install laminated foil/film protection, in accordance with manufacturer's instructions.
- Installation may be either factory pre-applied or applied in-situ.
- Ensure all surfaces are dry and clean, free from dust, oil and grease/silicone.
- Arrange joints to give water shed with the lap facing down.

3130A INSTALLATION OF SHEET METAL FINISH ON PIPEWORK:

- Secure insulation with metal bands at each end of section and at maximum centres of 450mm. Form sheet metal to fit tightly over the outer circumference of insulation with a longitudinal overlap of at least 40mm. Secure the outer part of overlap with self tapping screws or rivets at centres of not more than 150mm. Not on pipes with vapour barrier; or metal bands of same material.
- Ensure circumferential overlaps are at least 50mm, secured with self tapping screws or rivets. Make provision to accommodate expansion and contraction at intervals. Ensure all joints are lapped to shed liquids and seal all joints exposed to weather or spillage. Cover all bends and fittings with matching sheet metal, tailored to fit and sealed as appropriate. Fit pre-insulated, purpose-designed boxes to valves, flanges, etc.

3140A INSTALLATION OF SHEET METAL FINISH ON DUCTWORK, TANKS AND VESSELS:

- Form sheet metal to fit tightly over the insulation with a longitudinal overlap of at least 40mm. Secure the outer part of overlap with self tapping screws or rivets at centres of not more than 150mm. Not on vapour sealed ducts; or metal bands of same material.
- Ensure circumferential overlaps are at least 50mm, secured with self tapping screws or rivets. Make provision to accommodate expansion and contraction at intervals. Ensure all joints are lapped to shed liquids and seal all joints exposed to weather or spillage. Cover all bends and fittings with matching sheet metal, tailored to fit and sealed as appropriate.

3150 INSTALLATION OF CANVAS PROTECTION:

- Cover the whole with 130g (minimum) canvas with at least 50mm overlaps. Seal joints.
- Give two coats of class 'O' polymer solution. Fit aluminium bands where indicated.

3160 INSTALLATION OF ROOFING FELT PROTECTION:

- Apply directly to insulating material with an overlap of at least 50mm on all joints, made to shed water. Secure in position with galvanized wire netting, of 1mm x 25mm mesh. Finish with two coats of black bituminous paint.

3170 INSTALLATION OF ALUMINIUM SHEETING PROTECTION:

- Secure lapped joints (at least 40mm) by means of pop rivets at a maximum spacing of 150mm. For cold piping use matching aluminium straps at maximum spacing of 225mm. On piping operating below ambient temperature seal all joints against moisture. For external use make joints shed water and use sheets with treated surface.
- Where `lockform' seams are used submit proposals for dealing with surfaces curved in three dimensions.

3180 INSTALLATION OF ALUMINIUM-ZINC COATED STEEL PROTECTION:

- Install aluminium-zinc coated steel protection, in accordance with manufacturer's instructions.

3190 INSTALLATION OF RIGID PVC PROTECTION:

- Apply rigid PVC sheet and pre-formed fittings directly to insulation with an overlap of at least 40mm on longitudinal and circumferential joints. Secure longitudinal laps with plastic rivets at 150mm centres.
- Ensure rigid PVC is not installed in contact with heat sources.

3210 FLANGES AND VALVES:

- Cut back to allow removal of bolts and nuts, finish with neat bevel or use end caps.
- Where boxes are used fit over insulation on adjacent piping. Ensure operation of valve remains unimpaired with box in place.

3230A INSTALLATION WHERE INSULATION IS CARRIED THROUGH PIPELINE SUPPORT:

- For load bearing insulation, carry through insulation and finish.
- For non-load bearing insulation on hot pipework close butt to a section of load bearing finished material minimum 100mm long.
- For non-load bearing insulation on cold pipework, close butt to high density phenolic foam pipe supports. Ensure the vapour barrier is maintained.

3230B INSTALLATION WHERE CLOSED CELL INSULATION IS CARRIED THROUGH PIPELINE SUPPORT:

- For load bearing insulation, carry through insulation and finish.
- For non-load bearing insulation on hot pipework up to 120°C, close butt to a high density phenolic or polyisocyanurate pipe support.
- For non-load bearing insulation on cold pipework, close butt to high density phenolic foam pipe supports.
- Ensure the vapour barrier is maintained.

3250 INSTALLATION WHERE INSULATION IS CARRIED THROUGH DUCTWORK SUPPORT:

- Provide insulation between duct and support using high density phenolic foam strips. Butt insulation to spacer and carry over finish by 40mm and tape joint. Provide a sheet metal protecting sleeve. Load bearing materials must have a suitable compressive strength for the applied load.

3260 LIQUID VAPOUR BARRIERS:

- Apply vapour seal solution evenly by brush in accordance with manufacturer's instructions; use solution which dries to a colour distinctive from insulating material.

3270 INTEGRITY OF VAPOUR BARRIERS:

- Where a vapour barrier is indicated ensure its integrity throughout. Repair immediately any damage to vapour barriers and where such barriers have been applied off site, repair to manufacturer's instructions. Where aluminium sheeting is used for protection, submit proposals for securing sheeting without impairing the integrity of the vapour seal for approval.

Y51 - TESTING AND COMMISSIONING OF MECHANICAL SERVICES

2010 PRESSURE TESTING - GENERAL:

- Comply with procedures given in TR/6 Site pressure testing of pipework. Building Engineering Services Association. Guide to good practice. Ensure safety precautions detailed in, HSE Guidance Note GS4 Safety requirements for pressure testing, are adopted.
- Provide a blanked connection to accommodate a check gauge in addition to the accurate gauge fitted to section under test.
- Test concealed or buried pipework before any permanent covering is applied.
- Advise appropriate personnel, in advance, of the time pressure tests may be witnessed.

2015 PRESSURE AND LEAKAGE TESTING - BUILDERS' WORK SHAFTS, VOIDS, ENCLOSURES AND FLOOR PLENUMS:

- Ensure all builder's work shafts, voids and enclosures are pressure and leakage tested, and signify acceptance of standard and integrity of construction, prior to pre-commissioning of engineering installations.
- Pressure test floor plenums / voids using a specialist building airtightness tester ATTMA registered to level 2, using ATTMA standard TSL2 and BSRIA BG 65/2016 - Floor Plenum Airtightness Guidance and Testing Methodology.
- Maximum value of plenum air leakage to be 0.7l/s/m^2 of floor area at a test pressure of 50Pa or 5% of the air volume flow rate supplied to the plenum.
- Maximum raised access floor leakage to be 1.0l/s/m^2 of floor area without carpets, at a test pressure of 50Pa.

2020 PRESSURE TESTING - WATER CIRCULATING AND SUPPLY SYSTEMS

- Carry out hydraulic pressure testing as described in TR/6 Site pressure testing of pipework. Building Engineering Services Association. Guide to good practice. Test section by section for one hour, as the work proceeds and prior to application of thermal insulation as follows
    - Operating gauge pressure less than 3.5 bar, test gauge one and a half times the maximum working pressure.
    - Operating gauge pressure 3.5 - 7.0 bar, test gauge pressure twice the maximum working pressure.
    - Operating gauge pressure greater than 7.0 bar, test gauge pressure 14.0 bar or one and a half times the maximum working pressure, whichever is the greater.

2030# PRESSURE TESTING - UNDERGROUND PIPEWORK:

- Test to a gauge pressure not less than twice the operating pressure for 1 hour.
- Test to a gauge pressure twice the operating pressure or 7 bar, whichever is the greater, for 4 hours.

2040 PRESSURE TESTING - WATER MAINS:

- Test to Local Authority requirements. Ensure the provisions laid down in: TR/6 Site pressure testing of pipework. Building Engineering Services Association. Guide to good practice; for testing underground CWS mains are carried out.

2050 PRESSURE AND FLOW TESTING - FIRE RISERS:

- Undertake static pressure tests followed by flow and pressure tests in accordance with BS 9990. Demonstrate to Fire Brigade when tests are satisfactory.

2055# PRESSURE TESTING - REFRIGERANT PIPEWORK:

- Test refrigerant pipework using the strength test procedure as detailed in Clause R6.4 of the CIBSE Commissioning Code R: 2002.
- Test refrigerant pipework using the leak test procedure as detailed in Clause R6.5 of the CIBSE Commissioning Code R: 2002.
- Test refrigerant pipework using the deep vacuum test method as detailed in Clause R6.6 of the CIBSE Commissioning Code R: 2002.

2065 PRESSURE TESTING - OIL PIPEWORK:

- Test oil pipework installation in accordance with relevant part of BS 5410 to suit the application and TR/6 Site pressure testing of pipework. Building Engineering Services Association. Guide to good practice.

2075 TESTING CONDENSE AND OVERFLOW SYSTEMS:

- Test condensate drainage systems from cooling coils and any overflow pipework / drainage pipework from plant in accordance with BS EN 12056-2 and TR/6 Site pressure testing of pipework. Building Engineering Services Association. Guide to good practice.

2080 PRESSURE TESTING - SOIL, WASTE, VENTILATION, ANTI-SYPHON AND RAINWATER PIPEWORK:

- Test section by section as the work proceeds and subsequently on completion with all sanitary fittings fixed and working. Submit systems to two separate tests: Air test and Hydraulic Performance test in accordance with BS EN 12056-2.

2090 PRESSURE TESTING - UNDERSLAB DRAINAGE:

- For systems inside building comply with relevant parts of BS EN 12056.
- Test section by section as the work proceeds and subsequently after completion of backfilling and compaction to the satisfaction of the Engineers and the Local Authority.
- Individually test sections which will be permanently embedded in the structure or concealed in ducts or voids.
- Submit sections to two separate tests: Water Test and Test for Straightness and Obstruction in accordance with BS EN 752 for drainage outside buildings.

3020 COMMISSIONING CODES:

- Carry out commissioning of installations in accordance with the procedures, checks and tolerances given in the BSRIA Application Guides for water systems and air systems to achieve the standards set in the CIBSE Commissioning Codes.

3025 SEASONAL COMMISSIONING:

- Provide appropriately qualified personnel and all necessary equipment and materials to execute the seasonal commissioning works. The same organisation / team that carried out the original construction works shall undertake the seasonal commissioning.
- A schedule of suitable working periods and essential services to be maintained during any work will be provided by the building operator.
- A programme for the works shall be provided at least 1 month prior to the start date. This should account for any phased hand overs, cause as little disruption as possible and ensure essential services are maintained.
- The works shall comply with all statutory and client specific Health and Safety requirements.
- Any performance deficiencies found during seasonal commissioning shall be corrected.
- All seasonal commissioning shall be carried out in accordance with the project commissioning specification, an approved method statement, manufacturers' guidelines and the day-to day operational requirements of the building users.
- Record all seasonal commissioning works and after completion of the works update all building documentation including O&M manuals, Building Manual, Building Log book, Building User Guide and the Building Information Model (BIM). Any changes made to the systems during the works shall be clearly identified.

3030 COMMISSIONING WATER DISTRIBUTION SYSTEMS:

- Preliminary checks
  - Carry out checks and procedures as detailed in CIBSE Commissioning Code W. Ensure system is statically complete as defined in Section 4 of BSRIA Guide BG 2/2010 - Commissioning Water Systems.
  - Use pre-commissioning checklist from BSRIA Guide BG 2/2010.
- Setting to work and regulation
  - Set to work and regulate water distribution systems in accordance with CIBSE Commissioning Code W and BSRIA Guide BG 2/2010.
- Measurement
  - Use instruments for measurement detailed in BSRIA Guide BG 2/2010.

3040 COMMISSIONING AIR DISTRIBUTION SYSTEMS:

- Preliminary checks
  - Carry out checks and procedures as detailed in BSRIA Guide BG 49/2015 Commissioning Air Systems.
  - Use pre-commissioning checklist in BSRIA Guide BG 49/2015.
- Setting to work and regulate

    - Set to work and regulate constant and variable flow air distribution systems in accordance with CIBSE Commissioning Code A and BSRIA Guide BG 49/2015.
- Measurement of air flow
    - Use instruments for measurement and methods of measurement detailed in BSRIA Guide BG 49/2015 and CIBSE Commissioning Code A.
- Undertake tests and checks to ventilation and air conditioning systems generally in accordance with BS EN 12599 in order to verify the fitness for purpose of the installed systems before, during and after handover. Method statement to include relevant checklists from BS EN 12599.

3050 COMMISSIONING BOILER PLANT:

- Follow the procedures laid down for carrying out Preliminary Checks and Start Operation in accordance with CIBSE Commissioning Code B and manufacturers instructions.
- Apparatus and Instruments
    - Use Apparatus and Instruments detailed in CIBSE Commissioning Code B, Appendix BA1. Apply tolerances defined in Appendix BA1.

3060 COMMISSIONING REFRIGERATING SYSTEMS:

- Follow the procedures given for use and handling of refrigerants, pressure and leak testing, evacuation and dehydration, charging and lubrication of refrigerating systems in CIBSE Commissioning Code R and manufacturer's instructions.
- Pre-commissioning:
    - Carry out the procedures for pre-commissioning detailed in CIBSE Commissioning Code R, Section R5.
- Combined pressure and leak testing:
    - Carry out the procedures for combined pressure and leak testing, including refrigerant charging, detailed in CIBSE Commissioning Code R, Section R6.
- Setting to work and adjusting
    - Carry out the procedures for setting to work and adjusting detailed in CIBSE Commissioning Code R7.
- Absorption Systems.
    - Carry out the procedures for Preliminary Checks, Testing and Charging, and Setting to Work and adjusting detailed in CIBSE Commissioning Code R, Section R10.
- Apparatus and Instruments
    - Use Apparatus and Instruments detailed in CIBSE Commissioning Code R, Section R8. Apply tolerances defined in Section R8.6.

3070 COMMISSIONING AUTOMATIC CONTROL SYSTEMS:

- Carry out commissioning of Automatic Control Systems in accordance with Manual prepared by the controls equipment manufacturer. Carry out the Checking and Setting-Up procedure detailed in the CIBSE Commissioning Code C, Section C1.
- Measurement

- Carry out measurements in accordance with CIBSE Commissioning Code C, Appendix C2.1.

3090A INSTRUMENTS AND GAUGES:

- Ensure instruments are correctly calibrated. Record details of instruments on record sheets.
- Submit evidence of correct calibration of instruments to be used in connection with commissioning and testing.

3100A AIR SYSTEMS COMMISSIONING RECORDS TO BSRIA BG 49/2015:

- Keep a systematic record of commissioning results and distribute as indicated.
- For air systems
  - Use record sheets as described in BSRIA Guide BG 49/2015 Commissioning Air Systems.

3100B WATER SYSTEMS COMMISSIONING RECORDS TO BSRIA GUIDE BG 2/2010:

- Keep a systematic record of commissioning results and distribute as indicated.
- For water systems
  - Use record sheets as detailed in BSRIA Guide BG 2/2010 Commissioning Water Systems.

3110 BMS COMMISSIONING - CONTROL SYSTEM SPECIFICATION DETAILS REQUIRED FOR COMMISSIONING:

- Ensure that the following information is supplied to the commissioning engineer:
  - A network schematic providing a record of the overall control system architecture.
  - Schematics of the systems to be controlled indicating the location of sensors and actuators.
  - A written description of the configured control strategies.
  - Control strategy logic diagrams in the form of logic flow charts.
  - Set-points and other control settings such as initial default parameters for control loops relating to the control strategies.
  - Criteria relating to control accuracy and stability.
  - A points list including digital inputs/outputs and analogue inputs/outputs.
  - Control panel drawings.
  - BMS operator workstation graphics and associated point data displaying monitored conditions.
  - Trend logging archiving requirements and alarm routing.
  - The scope of operational and specified functionality of management software, e.g. utility monitoring and targeting software.
  - Functional requirements of any occupant interfaces.
  - Details of any hard-wired interfaces from, or to, other control devices.
  - Functionality and scope of data to be transferred over any gateway for use as part of an integrated system.
  - Functional profiles for any direct interoperability integration.
- Ensure that the following is included in the BMS commissioning specification:-
  - A clear description of the division of responsibility between the various parties.
  - Off-site and on-site pre-commissioning procedures.

- On-site commissioning procedures.
- Requirements for assistance to air and water balancing testing (e.g. opening and closing control valves) and other plant tests where the controls need to be overridden.
- A requirement for any point-by-point verification of correct operation.
- Requirements for evaluation of control loop performance/loop tuning.
- Requirements for the BMS operator workstation for assistance in the commissioning of plant.
- Arrangement for the management of delays.
- Phased completion requirements.
- Requirements for demonstration/witness testing on the basis of a percentage of points or on a point-by-point basis. Ensure that the witnessing requirement includes the identification of those responsible.
- Requirement for software/configuration data back-up.
- Requirement for, and involvement in, any complete system and sub-system performance testing.
- Requirement for system documentation.
- Requirement for operator training requirements.
- Requirement for post occupancy checks.

3120 BMS COMMISSIONING - PRE-COMMISSIONING:

- Ensure that as much pre-commissioning work as possible is performed off-site:
- Ensure that the following is followed:
    - Pre-commissioning requirements

Pre-commissioning action	Pre-commissioning off-site
Control application software	Yes (final commissioning on-site)
User interface software	Yes (final commissioning on-site)
Control panels	Yes (final commissioning on-site)
Terminal units (fan coil units, etc)	Yes (final commissioning on-site)
Wiring	No
Communications network	No
Sensors	No
Actuators	No
Integration gateways	Partial

- Ensure that a record of all settings, set-points and offsets are maintained throughout the pre-commissioning period.
- Ensure that all final physical adjustments to the field devices are indelibly marked.
- Ensure that all packaged plant interfaced with the BMS is fully tested and commissioned by the manufacturer or installer.
- Ensure that the BMS is pre-commissioned in accordance with the following requirements of CIBSE Code C (Commissioning of automatic control systems).
    - CIBSE Code C automatic control systems pre-commissioning requirements

Pre-commissioning action	CIBSE Code C section reference
Control applications software	C5.2
Control panels	C5.3
Wiring	C5.4

Communications networks	C5.5
Sensors	C5.6
Actuators and valves	C5.7
Digital inputs/outputs	C5.8
Pneumatic actuation with microprocessor control	C5.9
Field control devices	C5.10

3130A BMS COMMISSIONING - PLANT READY FOR CONTROL SYSTEM COMMISSIONING:

- Confirm that the following plant commissioning has been performed before commencing the final BMS commissioning:
- Water systems
    - The system is cleaned and flushed to remove any debris.
    - All regulating, isolating and control valves in place and operating correctly.
    - That all flow measuring devices are in place and in the correct location for accurate measurement (including pressure tappings).
    - The system is vented.
    - That the proportional balancing is completed to obtain the branch flow rates in the correct ratio to each other (or through the use of and setting of self-balancing valves).
    - That the pump flow rate has been adjusted to provide the specified flow rate.
- Air systems
    - Debris has been removed from the air distribution system.
    - That dampers are in the correct location and fully functional.
    - That fire/smoke dampers open.
    - Test holes have been drilled and sealed with removable plugs.
    - That in-situ flow measuring devices have been installed.
    - Ductwork air leakage testing has been performed (if specified).
    - Completion of proportional balancing of regulating dampers so that terminals share the air flow in the correct proportions.
    - Regulation of the fan(s) to provide the specified flow rate.
- Packaged equipment
    - Ensure that plant and controls have been fully commissioned and are functional, ready for integration with other plant/systems.
    - That control equipment inputs/outputs are in the specified format for connection to the main control system.
- Confirm that the plant is commissioned in accordance with:
    - Air distribution systems, CIBSE Code A
    - Boiler plant, CIBSE Code B
    - Refrigeration systems, CIBSE Code R
    - Water distribution systems, CIBSE Code W
    - BSRIA Guide BG 49/2015 Commissioning Air Systems
    - BSRIA Guide BG 2/2010 Commissioning Water Systems

3140 BMS COMMISSIONING - CONTROL SYSTEM REQUIREMENTS FOR PLANT COMMISSIONING:

- Ensure that the BMS is pre-commissioned to allow the building services plant to operate under "manual" running conditions.
- Ensure that the control valves can be manually set in their fully open position to allow the balancing of pipework flows.
- Ensure that dampers can be manually opened to allow the commissioning of air systems.

3150 BMS COMMISSIONING:

- Ensure that the BMS is commissioned in accordance with the following requirements of CIBSE Code C (Commissioning of automatic control systems).
    - Control strategy checking - C6.2
    - Checking procedures for basic control functions - C6.3
    - Lighting controls - C6.4
    - Operator workstations - C6.5
    - Occupant interfaces - C6.6
    - Communication networks - C6.7
    - Integrated systems - gateways - C6.8
    - Integrated systems - direct interoperability - C6.9
    - Integration with fire detection systems - C6.10
    - Security systems - C6.11
    - Interruption of electrical power supplies - C6.12
    - Valves - C7.1
    - Dampers - C7.2
    - Fans - single speed - C7.3
    - Fans - variable speed - C7.4
    - Pumps - C7.5
    - Terminal units - C7.6
    - VRF systems - C7.7
    - Cooling coils - C7.8
    - Chilled water dehumidification coil - C7.9
    - LTHW heating coils - C7.10
    - Electric heater barriers - C7.11
    - Humidifier, steam and atomised spray types - C7.12

4000 PERFORMANCE TESTING

4010 SYSTEM PERFORMANCE TESTING / DEMONSTRATIONS:

- Demonstrate the performance and control sequence, including the operation of all safety devices of installations including single, standby, multi-duty plants and systems, and of plants specified for future use.

4015 TESTING OF RESIDENTIAL VENTILATION SYSTEMS:

- Demonstrate the performance of residential ventilation systems through performance testing and installation checks in accordance with BS EN 14134.

- Comply with the best practice requirements of BSRIA BG 46/2015 Domestic Ventilation Systems - A guide to measuring air flow rates, for measurement of air flow rates use the unconditional method.

4020A ENVIRONMENTAL TESTS, ARTIFICIAL LOADS:

- Carry out environmental testing to prove the performance of the systems.
- Apply artificial loads in the spaces to be tested including sensible and later heat emitters or provide test arrangements to simulate the full range of operating conditions and duties.

4020B ENVIRONMENTAL TESTS, AMBIENT AIR QUALITY

- Carry out environmental testing to prove the performance of the systems.
- Carry out ambient air quality tests in accordance with BS EN 13528-1, BS EN 13528-2 and BS EN 13528-3.

4030 RECORDERS:

- Provide and maintain on free loan portable seven day space temperature and relative humidity recorders, as indicated, together with adequate charts.

Y52 - VIBRATION ISOLATION MOUNTINGS

1010 DESIGN INTENT:

- Supply equipment indicated to ensure that vibration from equipment is not transmitted to building, other supporting structure, pipework or ductwork.

1020 SPRING ANTI VIBRATION MOUNTINGS:

- Select spring mounts with an overload capacity of 50%, for metal springs the outside diameter should be at least 75% of operating height. Permanently identify individual mounts with their load capacity.

1040 LOCKING FACILITY:

- Where indicated, provide lockable levelling device.

2000 PRODUCTS/MATERIALS

2010A SYNTHETIC MATERIAL CONFIGURED MAT MOUNTINGS:

- Provide configured mat mountings manufactured from neoprene or composite fibre/synthetic rubber.
- Where mats are stacked, bond 1mm steel sheet thickness between each pad without filling voids.

2010B NATURAL RUBBER CONFIGURED MAT MOUNTINGS:

- Provide configured mat mountings manufactured from natural rubber.
- Where mats are stacked, bond 1mm steel sheet thickness between each pad without filling voids.

2010C HIGH TEMPERATURE CONFIGURED MAT MOUNTINGS:

- Provide configured mat mountings manufactured from high temperature synthetic rubber.
- Where mats are stacked, bond 1mm steel sheet thickness between each pad without filling voids.

2010D RESILIENT MAT MOUNTINGS:

- Provide a minimum of 20mm resilient mat and sheet of 1.6 mm steel for incorporation in cast in situ base, unless otherwise shown on Drawings.

2010E PAD MOUNTINGS:

- Provide pad mountings manufactured from composite synthetic rubber.

2020A SYNTHETIC RUBBER TURRET COMPRESSION MOUNTINGS:

- Provide turret compression mountings fabricated from synthetic rubber between two steel plates.
- Protect the metal from corrosion by painting and fix friction pads to top and bottom. Provide bolt holes to allow fixing.

2020B NEOPRENE TURRET COMPRESSION MOUNTINGS:

- Provide turret compression mountings fabricated from neoprene between two steel plates.
- Protect the metal from corrosion by painting and fix friction pads to top and bottom. Provide bolt holes to allow fixing.

2030 SPRING COMPRESSION MOUNTINGS:

- Provide spring compression mountings comprising high strength low stress helical spring capped with steel pressure plate, on resilient base pad, mounted on pre-drilled base for bolting down, and enclosed with cap. Protect metal from corrosion.

2040 CAPTIVE SPRING MOUNTINGS:

- Provide captive spring mountings comprising high strength low stress helical spring designed to achieve horizontal and vertical snubbing.
- Mount spring on pre-drilled base plate for bolting down and protect against corrosion. Supply complete with levelling screw.

2050# TURRET COMPRESSION HANGERS:

- Design and construct hanger box from steel (minimum thickness 1.6mm) complete with hole for suspension rod and enlarged lower hole for drop rod to equipment.

2060 SPRING COMPRESSION HANGERS:

- Provide spring compression hangers comprising high strength low stress helical spring capped with steel pressure plate, on resilient base pad, mounted within hanger box.
- Design and construct hanger box from steel (minimum thickness 1.6mm) complete with hole for suspension rod and enlarged lower hole for drop rod to equipment.

2070A SYNTHETIC RUBBER HANGERS, COMBINED TURRET/SPRING COMPRESSION:

- Provide turret/spring compression hangers with turret fabricated from synthetic rubber and high strength low stress helical spring capped with steel pressure plate, on resilient base pad, incorporated within hanger box.
- Design and construc hanger box from steel (minimum thickness 1.6mm) complete with hole for suspension rod and enlarged lower hole for drop rod to equipment.

2070B NEOPRENE HANGERS, COMBINED TURRET/SPRING COMPRESSION:

- Provide turret/spring compression hangers with turret fabricated from neoprene and high strength low stress helical spring capped with steel pressure plate, on resilient base pad, incorporated within hanger box.
- Design and construct hanger box from steel (minimum thickness 1.6mm) complete with hole for suspension rod and enlarged lower hole for drop rod to equipment.

2080 HORIZONTALLY RESTRAINED SPRING MOUNTINGS:

- Provide horizontally restrained spring mountings comprising high strength low stress helical spring capped with steel pressure plate, on resilient base pad, mounted within hanger box.
- Design and construct hanger box from steel (minimum thickness 1.6mm) complete with holes for installing across connection. In addition supply synthetic rubber or neoprene snubber as a horizontal buffer.

2090A CONCRETE/STEEL FORMWORK INERTIA BASES:

- Provide purpose built inertia bases constructed using welded steel frame formwork containing concrete reinforced with 12mm minimum diameter bars at 100mm maximum centres, 35mm above the bottom of the base; and mounted on spring compression mountings.

2090B WELDED STEEL FRAME INERTIA BASES:

- Provide purpose built inertia bases constructed using welded steel frame mounted on spring compression mountings.

2100 VIBRATION ISOLATION HOSES:

- Provide flexible hose couplings for connecting pipework comprising nylon fabric or steel mesh carcass with waterproof cover and internal lining of material to suit fluid conveyed, temperatures and pressures indicated.

2110A NATURAL CORKWOOD PIPEWORK NOISE VIBRATION ISOLATION:

- Incorporate within pipework support ring purpose made isolators manufactured from natural corkwood of density 160 kg/cubic metre, impregnated with fungicide, individually bound with steel strip not more than half depth of isolator.

2110B RECONSTITUTED CORKWOOD PIPEWORK NOISE VIBRATION ISOLATION:

- Incorporate within pipework support ring purpose made isolators manufactured from resin bonded reconstituted soft corkwood granules, of density 100 kg/cubic metres.

2110C RUBBER MATTING PIPEWORK NOISE VIBRATION ISOLATION:

- Incorporate within pipework support ring purpose made isolators manufactured from rubber matting.

2120A SPONGE FOAM PIPE WALL AND RISER SEALS:

- Provide pipe sleeves, minimum length 300mm, with minimum 25mm dense sponge foam lining bonded internally.

2120B MINERAL FIBRE PACKING PIPE WALL AND RISER SEALS:

- Provide pipe sleeves, minimum length 300mm, with minimum 52mm mineral fibre packing lining bonded internally.

3000 WORKMANSHIP

3040 HORIZONTALLY RESTRAINED SPRING MOUNTINGS:

- Ensure snubbers for limiting excessive movement are installed out of contact during normal operation.

Y54 - IDENTIFICATION - MECHANICAL

1010 REQUIREMENTS:

- Identify all pipework, ductwork, equipment, appliances and ancillaries comprising the various systems.

1020 NEW SYSTEMS:

- Comprehensively label and colour code throughout works as indicated.

1040 COLOURS:

- As indicated to colour ranges given in BS 381C and BS 4800.

1045 PERFORMANCE AND DURABILITY:

- Ensure durability of identification for safety purposes is to BS ISO 17398.

2000 PRODUCTS/MATERIALS

2010 PIPEWORK IDENTIFICATION:

- Standards - Colour code and label to BS 1710.
- Primary Identification
    - Apply colour bands, 300mm wide, to each pipe at least
        - Once in every room or enclosed area.
        - At intervals not exceeding fifteen metres.
        - At every junction.
        - At every valve.
        - At every inspection and access position into service shafts, false ceilings, bulkheads etc.
- Secondary Identification
    - Apply colour bands, 50mm wide, and superimpose a legend identifying circuit, direction of fluid or gas flow, nominal pipe bore and, where appropriate, fluid or gas pressure.
- Legends
    - Apply to colour bands by transfers of an approved type.

2020 DUCTWORK IDENTIFICATION:

- Standards
    - Generally colour code and label to BESA DW/144.
- Primary Identification

- Apply colour bands, 300mm wide, to each duct at least
- Once in every room or enclosed area.
- At intervals not exceeding fifteen metres.
- At every junction.
- At every damper.
- At every inspection and access position into service shafts, false ceilings, bulkheads etc.

- Secondary Identification
  - For ducts with longest side or diameter up to and including 225mm. Paint colour bands 50mm wide and superimpose legends.
  - For ducts with longest side or diameter over 225mm. Paint or apply transfers to identification triangles, or triangular plates. Superimpose or incorporate legends.
- Triangular Plates
  - Attach to buckle bands or stool pieces and fix to ducting, with apex indicating direction of airflow. Submit details of plates and fixings for approval before painting and marking. Use equilateral triangle of side 150mm minimum.
- Legends
  - Apply transfers of an approved type to colour bands or triangles or triangular plates. Identify floor and space served, associated equipment reference and direction of airflow.

2030# PLANT AND EQUIPMENT IDENTIFICATION:

- Standards
  - Identify each item of equipment by name and, where appropriate, by agreed reference characters. Provide colour identification as called for in work sections and, in all cases, colour fire fighting equipment red.
- Identification Colours
  - Use primary and secondary identification colours of associated system.
- Plates
  - Use rectangular metal or laminated plastic, securely fixed to each item of equipment.
- Legends
  - Engrave plates with an approved text. Incorporate operating duty of equipment where this is not incorporated in other labelling.

2035 GRAPHICAL SYMBOLS FOR USE ON EQUIPMENT IN ACCORDANCE WITH BS EN 80416:

- Graphical symbols for use on equipment to be created and applied in accordance with BS EN 80416-1, BS EN 80416-2, BS EN 80416-3.

2040 VALVE AND COCK IDENTIFICATION:

- Standards
  - Identify each valve, cock, stop valve, air vent, drain cock etc. with disc engraved with numerical reference. Except where exposed in occupied areas.

- Identification Colours
    - Use primary and secondary identification colours of associated system for painted or self colour discs.
- Discs
    - Securely attach metal or laminated plastic discs, minimum diameter 35mm, to each item.
- Legends
    - Engrave discs with permanent characters, minimum height 6mm.
- Incorporate in operating instructions relating to regulating valves and flow measuring equipment, details of flow rate, pressure differential and setting, as appropriate.

2070 AIR VOLUME REGULATING AND CONTROL DAMPER IDENTIFICATION:

- Standards
    - Identify each regulating and control damper. Except where exposed in occupied areas. On ductwork dampers, clearly indicate commissioning set point.
- Identification colours
    - Use primary and secondary identification colours of associated system for painted or self colour discs.
- Discs
    - Securely attach metal or laminated plastic discs, minimum diameter 35mm, to each item.
- Legends
    - Engrave discs with permanent characters, minimum height 6mm.

2080 INSTRUMENT IDENTIFICATION:

- Standards
    - Identify each instrument by name and, where appropriate, by agreed reference characters.
- Plates
    - Use rectangular metal or laminated plastic, securely fixed to each instrument.
- Legends
    - Engrave plates with an approved text.

2090 DANGER AND WARNING NOTICES:

- Hazardous Systems
    - Colour code and label hazardous systems and equipment to requirements of Health and Safety Executive Guidance Notes.

2100# SYSTEM IDENTIFICATION INSTALLATION CHARTS:

- System Schematics
    - Supply and fix a referenced schematic diagram (or diagrams) of all systems as installed, including equipment and ancillary schedules. Show scheduled information on diagram.
    - Identify all items by appropriate reference characters.
- Control Schematics
    - Supply and fix a referenced schematic diagram (or diagrams) of all control systems as installed, including equipment and ancillary schedules. Show scheduled information on diagram.
    - Identify all items by appropriate reference characters.
- Location
    - Fix in each boiler house, calorifier room, plant room or equipment room.

SECTION Y60A - RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes boxes and raceways including conduits, wireways, and related installations and accessories necessary to support and protect cables, feeders, sub-feeders, branch circuit wiring and wiring of low current systems, communications and signal cables.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Regulations and Standards: Conduits, wireways, cable trays and fittings shall be designed, constructed and installed to give safe installation and reliable mechanical protection for wires and cables in accordance with the Regulations. Standards of products shall be as specified.

120.000 SYSTEM DESCRIPTION

120.010 RIGID HEAVY GAUGE STEEL CONDUIT

A. Material: Heavy gauge drawn and welded steel, threaded at both ends, to BS 4568-1 , with class 4 protection to BS 4568-1, zinc coated inside and outside by hot-dip process or sherardizing.

B. Fittings Generally: Threaded type, galvanized or cadmium plated malleable cast iron for conduits to BS standards and galvanized steel or die cast for conduits. Fittings used in corrosive atmospheres shall be specially treated.

C. Locknuts for securing conduit to metal enclosure shall be heavy hexagonal or castellated pattern, for fastening.

D. Bushings for terminating conduits shall be smooth rounded brass rings.

E. Miscellaneous fittings including reducers, chase nipples, three piece unions, split couplings and plugs shall be standard fittings designed and manufactured for the particular application.

120.020 RIGID INTERMEDIATE METAL CONDUIT

A. Intermediate Metal Conduit (IMC): rigid high grade mild strip welded steel, hot dip galvanized over the entire length including factory made treads after cutting with organic corrosion resistant polymer inside coating.

B. IMC Fittings Generally: threaded fittings and connectors and terminations with rigid coupling, concrete tight where required, and with red lead coated threads where site cut. Factory made bands shall be provided where site bending is not possible.

C. Corrosion Resistance: conduits used in corrosive atmospheres shall be copper silicon alloy or PVC coated IMC conduits and highly resistant to corrosion.

120.030 ELECTRICAL METAL TUBING

A. Electrical Metallic Tubing (EMT): welded steel, non-threaded type, galvanized externally and protected internally with corrosion resistant enamel.

B. EMT Fittings Generally: thread-less pressure type, galvanized or cadmium plated malleable cast iron. Fittings used in corrosive atmospheres shall be specially treated. Factory made bends shall be provided where site bending is not possible.

C. Corrosion Resistance: conduits used in corrosive atmospheres shall be made of aluminum or PVC coated EMT conduits and highly resistant to corrosion.

© Copyright protected

120.040 FLEXIBLE STEEL CONDUIT

A. Material: Steel, cold rolled and annealed, non-threaded type, formed from continuous length of helically wound and interlocked strip steel, with fused zinc coating on inside and outside, and to IEC 61386.

B. Liquid-tight flexible conduit shall be used in indoor wet areas and shall have PVC jacket extruded over core.

C. Flexible steel conduits used outdoors shall be liquid tight, stainless steel grade 316, to UL360.

D. Fittings Generally: Threadless, hinged clamp type, galvanized or cadmium plated malleable cast iron. Fittings used in corrosive atmospheres shall be specially treated.

E. Straight Connectors: One piece body, female end, having hinged clamp and deep slotted machine screws for securing to conduit, male end having thread and locknut.

F. Angle connectors of 45 or 90 degree and terminal connectors shall be as specified for straight connectors, except that body shall be two-piece with removable upper section.

120.050 RIGID PVC-U CONDUIT

A. Material: Rigid unplasticized polyvinyl chloride (PVC-U) with high temperature resistance, flame retardant, non-hygroscopic and non-porous, to BS 4607, IEC 61386-1 and IEC 61386-21 or DIN 49016, heavy grade, classification code 4421, compression force 1250 N for conduits embedded in concrete and very heavy grade, classification code 5521, compression force 4000N for conduit exposed and / or concealed above false ceiling, IEC 61386-21, DIN 49016-1 or other equal and approved standards conforming to IEC 60423.

B. Fittings Generally: Unbreakable, non-inflammable, self extinguishing, heavy moulded plastic. Expansion couplings shall be telescoping double tube type, with at least two inner water-tight neoprene rings.

C. Assembly: Conduits, boxes and accessories shall be assembled by cementing, using manufacturer's recommended products and appropriate connectors or spouts. Where no spouts are available use smooth bore male PVC bushes and sockets.

120.060 FLEXIBLE PVC-U CONDUIT

A. Material: flexible unplasticized polyvinyl chloride (PVC-U), flame retardant, heat resistant, non-hygroscopic, high resistance to impact, ribbed on circumference for flexibility to IEC 61386-1, classification code 3321, compression force 750 N or other equal and approved standards.

B. Fittings Generally: unbreakable, non-inflammable, self extinguishing, heavy moulded plastic. Expansion couplings shall be telescoping double tube type, with at least two inner water-tight neoprene rings.

120.070 STEEL CONDUIT ACCESSORIES

A. Sleeves Through Outside Walls / Water Tanks: Cast iron, with end and intermediate integral flanges, and internal diameter larger than diameter of through-conduit. Length shall correspond to wall thickness. Space between sleeve and conduit shall be packed with backer rod/oakum to within 50 mm of both faces of wall, remainder of sleeve packed with plastic compound or lead, held in place by heavy escutcheon plates bolted at both ends to flanged ends of sleeve. Alternatively, sleeves shall be O.Z/Gedney, Type WSK or other equal and approved, with cable or conduit bolted pressure sealing components.

B. Sleeves Through Indoor Walls / Slabs: Similar to above but with cast iron or rigid heavy gauge galvanized steel and plain ends.

C. Supports and Hangers: Galvanized malleable cast iron straps or structural steel sections with hot dip galvanized bolts and nuts.

D. Expansion Joint for Embedded Steel Conduits - Type A: Watertight, flexible conduit with end fittings to receive fixed conduits. Length shall allow movement within range of joint and shall not be less than 20 times diameter of conduit. Conduit shall be covered with thick rubber tubing with 5

© Copyright protected

mm minimum gap all around tube. Bonding jumper with earth clamp shall electrically connect both sides of joint. Fitting shall be O.Z/Gedney, Type DX or other equal and approved.

E. Expansion Joint for Exposed Steel Conduits - Type B: Sleeve with fittings to permit telescoping of one conduit into sleeve. Movable conduit shall be fitted with watertight bushing. Joint shall be weatherproof, of galvanized malleable iron or steel. Bonding jumper with earth clamp shall electrically connect both sides of joint. Expansion fitting shall be O.Z/Gedney, Type DXX or other equal and approved.

F. Expansion Joint for Exposed Steel Conduits - Type C: PVC sheathed flexible steel conduit terminating in pull boxes and securely fixed on each side of structural expansion joint. Bonding jumper shall electrically connect both sides of joint.

G. Tags: 50 mm diameter steel with indented lettering, rust inhibiting treatment and baked enamel finish.

120.080 WIRING AND CABLE TRUNKING

A. Components shall include wire way base, clip-on covers, couplings, end plates, wall flanges, panel to trunking rubber grommets, elbows, tees, adaptor plates and necessary hangers, supports and accessories.

B. Steel Trunking: To BS EN 50085-1 and BS EN 50085-2-1, galvanized sheet steel, minimum 1.5 mm thick, protected internally and externally with corrosion resistant finish such as zinc or cadmium with top coat of enamel. Return edge shall be provided for body. Cover fixing with simple arrangement. Stamped marking on lid and body by manufacturer. The galvanized sheet steel shall comply with BS EN 10143.

C. PVC Trunking: to BS 4678 part 4 high impact, heavy duty, self-extinguishing, rigid PVC with grooved double locking action of the clip-on cover. Design shall be approved by Engineer before ordering materials. Trunking shall be capable of receiving functional slot-in hangers and demountable separators to segregate wiring systems as needed.

D. Sizes: As required to accommodate number of conductors permitted by the Regulations and/or as shown on the Drawings. Sizing shall ensure 25 percent spare capacity.

120.090 WEATHERPROOF WIRING AND CABLE TRUNKING

A. Type: hot-dip galvanized sheet steel trunking of 1.5 mm thickness (minimum) with 1 mm thick cover to BS EN 50085-1 and BS EN 50085-2 for trunking and ISO 1461 for galvanizing and rated IP 54 to IEC 60529.

B. Construction: Trunking shall have outwardly turned flanges to receive cover, and internal sleeve coupling between sections, permitting cutting of trunking on site.

C. Gaskets: Neoprene bonded cork gaskets shall be fitted throughout, between any two attached surfaces.

D. Screws: Removable flanged covers shall be secured with galvanized steel holding screws.

120.100 SKIRTING TRUNKING

A. Type: Comprising wireway base, snap-on cover, couplings, end plates, wall flanges, elbows, tees, adapters, if required, and necessary clamps, hangers, supports and accessories. Wires and cables shall laid from front and held in place by clamps.

B. Steel Skirting Trunking: Sheet steel, 1.5 mm minimum thickness, protected internally and externally with corrosion resistant finish such as zinc or cadmium with top coat of enamel.

C. Aluminium Skirting Trunking: The raceway and all system components must be UL Listed in full compliance with their standard for surface metal raceways and fittings (UL-5). All extrusions shall be 6063-T5 aluminum alloy, with nominal wall thickness of 1.99mm throughout. The surface finish shall be satin, anodized #204 Type clear, Class R1 Mil-Spec with minimum anodized finish of 10mm.

© Copyright protected

D. UPVC Skirting Trunking: High impact resistant, flame retardant UPVC (unplasticized polyvinyl chloride) to BS 476-6, BS 476-12 and BS 4678-4. Trunking shall be certified by approved Fire Laboratories.

E. Type: The raceway shall be a two-piece design with a base and snap-on cover. The base shall be furnished in 3m lengths and the cover sections shall be furnished in 1.5m lengths. The overall dimensions of assembled raceway shall be as shown on Drawings.

F. Trunking shall be partitioned continuously into compartments for separate circuits through extruded dividers separating the raceway into compartments.

G. The cover shall fit onto all compartments to allow access to only one compartment at a time.

H. The compartments and their separate covers must be available to handle both power and communications wiring.

I. Fittings: A full complement of fittings for the raceway shall be available. The available fittings should include, but not be limited to the following: flat, internal and external elbows, tee and cross fittings, wire clips, couplings for joining sections of raceway, grounding adapters as an NEC approved secondary grounding method, and transition connectors to conduits.

J. Device Covers: Device cover plates for mounting the following commercially available devices must be available: single devices, 40mm dia. socket, other rectangular faced devices and modular voice and data jacks.

K. Devices and Accessories: The raceway manufacturer will provide a complete line of connectivity outlets and modular inserts for socket outlets, Unshielded Twisted Pair, Shielded Twisted Pair, Fiber Optic, Coaxial and other cabling types with faceplates and bezels to facilitate mounting.

L. Dimensions: as shown on the Drawings and as required to accommodate specified wiring devices

120.110 PREWIRED PLUG-IN LIGHTING TRUNKING (HEAVY DUTY)

A. Type: overhead supported and prewired, supplied complete with 13 A, 3-pin special non-standard socket outlet for each luminaire, at spacing required and shown on the Drawings. Lengths of sections shall be determined by centers at which support brackets shall be mounted. Expansion shall be taken up by expansion fittings, and spacing of sections where applicable, and as recommended by the manufacturer.

B. Construction: 1.5 mm (16 b.g.) thick rigid mild steel sheet, with flanged cross-section to withstand loads up to 180 lbs (vertical/horizontal) with negligible deflection when supported at 4.0 m, and finished in stove enameled grey. Socket outlets shall be earth bonded. Purpose made support brackets shall be provided at regular spacing. Connecting set between sections (lengths) shall provide a stiffening joint and access into trunking through top plate. Flexible shall be provided between trunking sections to enable trunking to be turned in the horizontal plane for negotiating bends or curves.

C. Wiring and Plugs: each trunking length shall be wired with five single-core, 4 mm^2 PVC cables for alternate 3-phase, neutral and earth distribution, extended at least 150 mm beyond each end for easy field wiring between sections, and supplied with one 30 A connector block per length. Plugs shall be fused. End cable adapter on header shall be provided at each connection to a branch circuit.

D. Lighting Fitting Suspension: underside of trunking shall be formed in a continuous edge from which lighting fittings shall be suspended at two points, each by bolted hooks with locking screws to prevent accidental unhooking of fixture.

120.120 PLUG-IN OVERHEAD LIGHTING TRUNKING (LIGHT DUTY)

A. Regulations: Trunking shall conform to the National Electrical Code for overhead distribution of lighting circuits and low current circuits.

B. Components comprise wireway base, snap-on covers, couplings, end plates, wall flanges, panel to wireway rubber grommet, elbows, tees, adaptor plates and necessary hangers and supports.

C. Construction: 1 mm (0.04 inch) thick, galvanized steel, gray enameled (ANSI-61 gray). Sizes shall be selected to comply with the NEC and provide at least 25% space for future wiring.

© Copyright protected

D. Laterals shall be supplied with 13 A, 230 V grounding socket outlets spaced to correspond with equipment layout and wired to correspond with control requirements shown on the Drawings.

120.130 OUTLET BOXES, GENERAL

A. Wiring devices back boxes and conduits pull boxes shall comply with BS 4662 / IEC 60670. Conduit circular pull boxes shall comply with BS 4607 / IEC 61386. Conduit junction boxes shall comply with IEC 60670-22. Floor boxes shall comply with IEC 60670-23.

B. Surface or recessed boxes shall be suitable for type of related conduit or cable system. Shapes and sizes of boxes shall be of compatible standards as switches and socket outlets specified under Division V Section "Wiring Devices", and lighting fixtures selected and of various types and mounting methods required.

C. Unused openings in outlet boxes shall be closed with molded caps or knock-out closers manufactured for the purpose.

D. Floor outlets and plates shall be water-tight and impact resistant.

120.130 METALIC OUTLET BOXES

E. Recessed and Concealed Boxes: Galvanized pressed steel, with knock-outs for easy field installation. Special boxes shall be punched as required on Site.

F. Exposed Surface Mounted Boxes: Galvanized cast iron with threaded hubs. As an alternative, UL listed boxes may be provided.

G. Outdoor Surface or Recessed Boxes: Galvanized cast iron with threaded hubs and PVC gaskets to ensure water tightness and with stainless steel or non-ferrous, corrosion resistant screws. As an alternative, UL listed boxes may be provided.

H. Floor Boxes - Type A: Watertight, cast iron or cast metal alloy with corrosion resistant finish, adjustable mounting, standard duty, round or square, factory drilled and tapped for required conduit sizes, and with brass cover and flange with brushed finish free from markings other than required for mounting screws.

I. Floor Boxes - Type B: non-standard size, flush floor mounted, cast metal alloy, with watertight neoprene gasket and hinged cover for each service. Box to be ready with factory drilled and tapped conduit entries and adjustable mounting fittings. Metal barriers shall separate services for power and low current.

J. Flame-Proof Boxes: Malleable iron or cast iron, with gas threaded hubs, special covers with silicon rubber gaskets, gas tight, and water-tight. Boxes shall comply with the Regulations for explosive areas.

K. Allow enough space for floor boxes lids to allow for the required finishing similar to the adjacent areas and in coordination with the ID/Engineer and Drawings.

120.140 MOLDED PLASTIC OUTLET BOXES

A. Type: Boxes and covers used with PVC conduit systems shall be heavy gauge pressure molded plastic, minimum 2 mm thick, self extinguishing, with softening point not less than 85 deg. C. Boxes shall have provision for securely terminating conduits and shall be manufacturer's standard for required application.

B. Fittings: Boxes shall have brass inset threads to receive cover screws and for mounting devices or accessories, push-fit brass earth terminals, and steel insert clips to provide additional support for pendants or for heat conduction. Neoprene gaskets shall be provided for weatherproof installations.

C. Molded plastic outlet boxes shall not be used outdoors.

120.150 FLUSH OUTLET BOXES

A. Factory designed, with accessories necessary to accommodate specific outlets shown on the Drawings or cable outlets as required for signal or control services, with cord-grip nipples. Finishes shall follow the corresponding application area.

© Copyright protected

120.160 TERMINAL COLORING AND LABELING

A. Phase identification shall be marked in an approved manner on cable boxes, tail ends and single core cables and at all connecting points. Cable boxes shall be marked with stamped brass labels indicating the purpose of the supply where such supply is not obvious.

120.170 TERMINAL BOXES

A. The outer case of terminal boxes shall be constructed of steel sheet or weather resistant reinforced plastic subject to Engineer's approval and fitted with one or more hinged covers provided with fasteners and padlocking facilities. The boxes shall be of IP56 for outdoor installations and IP51 for indoor installations.

B. The case shall be adequately ventilated also dust and vermin proof. Removable gland plates shall be provided at the top and bottom. They shall be supplied complete with suitable insulating material capable of withstanding the climatic conditions and test voltages specified herein where the glands are required to be insulated from the terminal boxes. If the width of the box necessitates the provision of 2 hinged front covers they shall close on to a center post which shall be removable to facilitate cable termination. The depth of the outer case shall be not less than 200 mm unless otherwise approved by the Engineer.

C. The outer cases shall be treated before painting to prevent corrosion and shall be finished in glossy enamel to an approved color externally and white internally. Where terminal boxes are required for installation outdoors or in damp situations, they shall be of water tight construction and galvanized.

D. Terminal boards shall comprise banks of rail mounted, screw clamp, spring loaded insertion, solder lug or stud type terminals as required to suit the design and duty of the cables to be terminated, arranged in pairs horizontally and grouped in vertical formation to provide a rigid assembly. Each pair of terminals shall be connected together at the base with a fixed or plug type link as specified. Insulating high temperature material of self-extinguishing or resistant to flame propagation and substantially non-hygroscopic type shall be molded around the base of the screws or studs, links connecting pairs of screws or studs or plug sockets to prevent exposure of live metal at the back of the terminal boards and to secure the terminals against rotation and displacement.

E. Stud type terminal boards shall have screws or studs of 5 mm dia. for phosphor bronze or stainless steel, and 6 mm dia. for high tensile brass, unless otherwise approved. They shall be complete with the appropriate clamps, springs, nuts, locknuts and washers.

F. Terminal boards shall be complete with approved means for securing the wires, identification ferrules, insulating barriers between pairs of terminals and removable transparent non-inflammable terminal covers fitted with marker strips for identifying the terminals. All nuts, washers, links and other components provided for securing the wires shall be electro-tinned. Springs shall be aged and shall withstand corrosion.

G. The clearance between adjacent terminal boards and from the sides of the case shall not be less than 100 mm. The minimum clearance between terminal boards and the top and bottom of the case shall be 150 mm.

H. All terminal boxes and boards shall meet the associated cable site tests.

120.180 OPTICAL-FIBER-CABLE PATHWAYS AND FITTINGS: INNERDUCT

A. Innerduct for Outdoor use (OSP):

1. Suitable for use typically within a duct bank system for the support of telecommunications fiber optic cables.
2. Continuously extruded corrugated flexible non-metallic pipe smooth from inside, fabricated from HDPE (High Density Polyethylene), or equivalent.
3. Measured Pull tape: pre-lubricated, woven polyester, low friction, and high abrasion resistant yarn with a minimum average tensile strength of 1250 lbs. for 50mm and smaller conduits and 1800 lbs. for conduits larger than 50mm.
4. Inner diameter: 2-inch, 3-inch and 4-inch or as shown on Drawings.

© Copyright protected

5. Detectable innerduct: manufactured with a solid copper, polyvinyl color coated conductor 1.0 mm diameter minimum for tracing and rated for a minimum of 6 amps and 600 volts. Conductor shall be placed in the sidewall edge fold of the innerduct sleeve.
6. Provide any accessory products related to the innerduct assembly system required to provide a complete and functional system, as intended by the Engineer and manufacturer, including, but not limited to: Innerduct fittings conduit plugs and penetration sealing materials.

B. Innerduct for indoor use (ISP):

1. Suitable for use typically within a riser system or backbone conduit, and within plenum spaces, such as above ceiling or within an access floor, for the support of telecommunications fiber optic cables
2. Comply with UL 2024 for flame propagation and smoke density values for use in air handling applications.
3. Continuously extruded corrugated flexible non-metallic pipe smooth from inside.
4. Measured Pull tape: pre-lubricated, woven polyester, low friction, and high abrasion resistant yarn with a minimum average tensile strength of 1250 lbs. for 50mm and smaller conduits and 1800 lbs. for conduits larger than 50mm.
5. Inner diameter: 2-inch, 3-inch and 4-inch or as shown on Drawings.
6. Provide any accessory products related to the innerduct assembly system required to provide a complete and functional system, as intended by the Engineer and manufacturer, including, but not limited to: Innerduct fittings conduit plugs and penetration sealing materials.

PART 1 REFERENCES

100.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

110.000 RELATED SECTIONS

A. Division P Section " Fire Stopping Systems "

B. Division V Section "Basic Electrical Materials and Methods" for raceways and box supports.

C. Division V Section "Wiring Devices" for devices installed in boxes and for floor-box service fittings.

PART 2 PRODUCTS AND WORKMANSHIP

200.000 MATERIALS

200.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Steel Conduits:

a) Thomas & Betts
b) Cable Tek Inc.
c) Swift/Legrand
d) Allied Tube
e) Barton Eng'g
f) Walsall G.E.C.
g) Panasonic
h) International Metal Hose
i) Wheatland Tube

2. Flexible Steel Conduits:

a) Halex (USA)

© Copyright protected

b) Electri-Flex Co.
c) AFC

3. PVC Conduits and Fittings:

a) Dietzel-Univolt
b) EGA Tubes/M.K./Honeywell
c) Marshall Tufflex
d) Comat
e) Interplast
f) Clipsal

4. Accessories and Fittings:

a) Hubbell
b) O.Z./Gedney
c) Steel City

Same manufacturer as conduit or other approved, and to the satisfaction of Engineer.

5. Prewired Plug-In Lighting Trunking (Heavy Duty)

a) Legrand Salamndre , of pre-designed sections (lengths) to meet modular construction on site.

6. Plug-In Overhead Lighting Trunking (Light Duty)

a) Wiremold/Legrand

7. Metallic Outlet Boxes

a) Hubbell
b) O.Z./Gedney
c) Steel City

8. Moulded Plastic Outlet Boxes

a) Egatube/M.K./Honeywell
b) M.K./Honeywell

200.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

210.000 QUALITY MANAGEMENT

210.010 QUALITY ASSURANCE

A. All products shall carry permanent marking by manufacturer.

B. All materials shall be stored in covered areas and protected from dust and dampness.

210.020 COORDINATION

A. Coordinate layout and installation of raceways and boxes with other construction elements to ensure adequate headroom, working clearance, and access.

220.000 SUBMITTALS

A. Product Data: Submit data for approval including, but not limited to, manufacturers' catalogues with specifications of raceways including conduits, trunking, boxes, etc. and related accessories

B. Point-wise compliance statement to the specifications, duly signed by the manufacturer/ manufacture’s authorized representative and the contractor.

C. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

© Copyright protected

1. Exact routing of conduits, trunking etc. with indication of boxes, accessories and expansion joints, size and type of conduits and boxes.
2. Typical assembly details of installation of trunking, trays etc.
3. Construction details of pull boxes.
4. Typical installation details including connection of conduits to metal enclosure, connection of flexible conduits, vapour-tight installations in cold rooms, weatherproof installations outdoors etc. and earthing connections.
5. For prewired installations, submit drawings for approval showing the complete layout of all products that make up the complete system for each floor prior to the installation of raceway lengths, device type (power and data), locations and circuits identified.

D. Samples of each type of raceway, box, and accessory.

E. As-Built (Record) Drawings: At Project close-out, submit Record Drawings of installed electrical raceways and boxes, in accordance with requirements of the Specification, Division 01.

230.000 EXECUTION

230.010 EXAMINATION

A. Examine surfaces to receive raceways and boxes for compliance with installation tolerances and other conditions affecting performance of raceway installation. Do not proceed with installation until unsatisfactory conditions have been corrected.

230.020 CONDUIT, WIREWAYS, AND BOXES, GENERAL

A. Use: Light and power circuits, communications, signal and low current systems wiring shall be drawn inside conduits or wireways up to the various electric power consuming equipment as shown on the Drawings. Circuits are allowed to run in cable trays or cable baskets where there is sufficient space above ceiling as required in Division Y Section "Cable Trays for Electrical Systems".

B. Separate conduits and wireway installations shall be used for medium voltage cables, low voltage feeders and sub-feeders, normal light and power circuits, emergency light and power circuits and communication, signal and other low current systems wiring. Cables of different voltages shall not be mixed within the same conduit or wireway as per the regulations.

C. Boxes: Pull, and splice boxes of ample capacity shall be provided as indicated or required. Boxes shall remain permanently accessible.

D. Exposed Outlet Boxes: Securely fasten to wall with machine screws to permanent inserts or lead anchors.

E. Recessed Outlet Boxes: Make neat openings, to the satisfaction of Engineer, allowing for thickness of finishings, and use extension rings if required. Repair damaged finishings to original condition before installation of fittings or plates.

F. Boxes Mounting Heights and Location: As specified under Section "Wiring Devices", and as shown on drawings.

G. Boxes: Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.

H. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.

I. Tools and accessories for forming and installing conduit and wireway systems shall be purpose made for the particular application and used in accordance with manufacturers' instructions.

J. Fixing: Conduits and wireway installations shall be concealed as much as possible.

K. Sizes of conduits and wireways, not shown on the Drawings, shall be selected in accordance with the Regulations and in relation to the number and size of conductors and the space factor as recommended by the regulations. Minimum outer diameter of conduit for all applications shall be 25 mm, unless otherwise shown on the Drawings.

© Copyright protected

L. Spare capacity shall not be less than 25 percent for all raceways.

M. Mechanical Continuity: Conduits and wireways shall be effectively joined together and connected to electrical boxes, fittings and cabinets to provide firm mechanical assembly. Earthing jumpers shall be installed on steel conduits where required to ensure effective electrical continuity irrespective of whether a separate protective earth conductor is required or not.

N. Metal conduits and enclosures shall be mechanically fastened, and to be connected to electrical boxes, fittings and cabinets to form low electrical resistance continuity and firm mechanical assembly.

O. Dissimilar Metals: Use of dissimilar metals shall be avoided throughout the system to eliminate possibility of electrolysis. Where dissimilar metals are in contact, treat surfaces with corrosion inhibiting compound before assembling.

P. Miscellaneous fittings such as reducers, chase nipples, 3 – piece unions, split couplings and plugs that have been specifically designed and manufactured for their particular application shall be installed as necessary.

Q. Conduits shall be tested with a mandrel. Conduits that reject a mandrel shall be replaced. Restore conduit and surrounding surfaces to original condition.

R. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.

S. No more than one wire is permitted to be terminated at one terminal.

T. Labeling of raceways and boxes; size of letters and color of labels, marking and references shall be as per the relevant standard regulations. Expansion coupling and fittings are to be installed near expansion joints.

230.030 CONDUITS AND WIREWAYS APPLICATIONS AND INSTALLATION, GENERAL

A. Conduits and wireways installations shall be as described below, unless otherwise shown on the drawings or described in the particular section of the Specification.

B. Rigid heavy gauge steel conduit or intermediate metal conduit (IMC) shall be used for medium voltage cables & low voltage feeders installation where installed in non-accessible false ceiling areas, indoor damp / wet areas (e.g. kitchen, laundry, boiler rooms, etc.), outdoor installations and explosion-proof installations in hazardous areas.

C. Electrical Metallic Tubing (EMT) shall be used for exposed installations over false ceilings when the false ceiling is used as a return plenum.

D. Electrical Metallic Tubing (EMT) shall be used for exposed and above false ceiling wiring installations used in conjunction with exit and escape route lighting/central battery circuits, fire alarm & security installations.

E. Electrical Metallic Tubing (EMT) shall be used for all installations in elevator machine rooms and shafts, electrical equipment rooms, mechanical rooms, parking floors, kitchen, laundry and solid waste rooms.

F. Electrical Metallic Tubing (EMT) shall be used for concealed installations in dry / gypsum board walls.

G. Electrical Metallic Tubing (EMT) shall be used for exposed installations in car park areas.

H. Conduit termination in sheet metal enclosures shall be fastened by lockouts, and terminate with bushing. Install locknuts inside and outside enclosure.

I. Rigid PVC-U conduit shall be used for lighting and power circuits, low current, communication and signal system wiring, where embedded in concrete, masonry, underfloor, except where otherwise shown on the Drawings or described in the particular section of the specification.

J. Rigid PVC-U conduit shall be used above false ceilings for lighting and power circuits, low current, communication and signal system wiring, when the false ceiling is not used as return plenum – and

© Copyright protected

in furred walls. Use flexible PVC-U conduits from outlet boxes to fixtures in conjunction with the use of PVC-U conduits.

K. Flexible conduit of same material as corresponding conduit system shall be used for connection to motors, vibrating and non-rigidly fixed equipment and to fixtures installed in false ceilings.

L. Equipment requiring fixed connection or heavy electric power shall be supplied by means of flexible cord housed in metallic conduit from suitable disconnect switch, mounted adjacent to the equipment on the wall.

M. Flexible steel conduit shall be used in movable partitions and from outlet boxes to fixture over false ceilings when used as a return plenum. Conduits shall be liquid tight in damp areas.

N. Liquid-tight flexible steel galvanized conduit shall be used in one or more of the following conditions:

1. Exterior location.
2. Moist or humid atmospheres where condensate can be expected to accumulate.
3. Corrosive atmosphere.
4. Subjected to water spray or dripping oil, water or grease.

O. Exposure to Damage: Conduit considered to be subject to undue risk of damage by shock or corrosion shall be brought to the attention of the Engineer. Copper silicone alloy tubes may be used in corrosive atmospheres.

P. Crossing: Conduits shall not cross pipe shafts, vents or openings.

Q. Clearances: Install conduits at least, 150 mm clear of and preferably above pipes of other non-electrical services. (Hot water pipes, etc.). Wherever possible, install horizontal conduit and wireways runs above water and steam piping.

R. Sleeves: Obtain approval for positioning sleeves where conduits pass through reinforced concrete. Additional opening may be allowed in finished slabs, but shall be drilled. Fix sleeves rigidly to maintain position and alignment during construction work.

S. Waterproof Construction: Conduits shall not cross waterproof construction unless permitted by Engineer. Specially designed and approved fittings shall be used.

T. Expansion Fittings: Provide in each conduit and wireways run every 30 meters, or wherever structural expansion joints are crossed.

U. Make good all holes for conduits passing through walls, floors and ceilings with cement or similar fire-resisting material to full thickness.

V. Bends: Conduit runs between outlet and outlet, fitting and fitting or outlet and fitting shall not contain more than the equivalent of 2 quarter bends (180 degree total).

W. Bending shall be made without damaging conduit or tubing and without reducing internal diameter. Methods of field bending shall be approved.

X. Cut ends shall be reamed to remove burrs and sharp edges.

Y. Conduits entering cold stores shall be made vapour tight, so that vapour from outside cannot enter conduit.

Z. Draining: Arrange conduits so that condensed moisture can drain to screwed plug at lowest point.

AA. Before wiring, conduits shall be swabbed through. Do not draw cables into any section of system until conduit and draw boxes are fixed in position, and the raceway installation is completed.

BB. Capping: Conduits shall be properly capped until wiring conductors are drawn in.

CC. Conduit and fittings installed outdoors shall be watertight and highly resistant to corrosion. Use appropriate fittings, threaded and hubbed boxes, gaskets with screw on covers and the like.

DD. Terminations: Do not terminate or fasten rigid conduits to motor frame or base.

EE. Length and radius of flexible conduit used for motors and vibrating equipment shall permit bending of feeder cables without damage to conductor or insulation.

© Copyright protected

FF. Flexible conduit for slide rail mounted motor shall have sufficient slack to allow for movement of motor over entire slide rail length.

GG. Pulling Wire: Install 3 mm galvanized stranded steel wire or equivalent strength cord with wooden blocks fastened at ends, in empty service conduits (power, low current and signal).

HH. Standard elbows shall be used for conduit sizes over 40 mm. For smaller sizes, field bends may be used provided no damage occurs to conduit.

II. Tags: Fit to conduits entering or leaving floors, walls or ceilings for identification of conduit and circuits. Tags are also to be placed at suitable intervals throughout the system.

JJ. Non – ferrous conduit shall be installed for circuits operating above 60 Hz.

230.040 STEEL CONDUITS

A. Termination: Conduit entering sheet metal enclosure or outlet boxes, when not terminated in a threaded hub, shall be securely held in place by two lock-nuts, placed inside and outside enclosure, and terminated with an insulating bushing.

B. Running Threads: Do not use running threads at joints and terminations, but use 3-piece unions or split couplings.

C. Additional threaded cuts on galvanized steel conduits shall be painted with zinc based coating resistant to corrosion.

D. Damage to protective coating of conduits shall be repaired to original degree of protection.

E. Outdoor Mounted Steel Conduit: Apply anti-corrosion coating of zinc-chromate based paint and two weather resistant finish coats of enamel, of approved colour, or other equal and approved coating.

F. Galvanized conduit run in screed shall be painted with heavy coat of emulsified bitumen.

G. Galvanized steel conduits buried in ground or placed in wet or damp locations shall be coated with two heavy coats of hot bitumen. Conduits shall be covered by at least 600 mm of earth if buried in planting soil and by 300 mm if under walkway.

H. Plugs: Use hardwood or threaded iron plugs for blanking ends of steel conduit not used.

230.050 PVC CONDUITS

A. Coupling of conduit and/or termination into spouted fittings shall be made watertight and permanent using special cement.

B. Termination: Connect conduits terminating in switchgear, fuseboards, trunking, adaptable boxes or other non-spouted enclosures etc. with smooth bore male PVC bushes and sockets.

C. Ends of conduit and conduit fittings shall be cleaned and jointed using PVC cement recommended by manufacturer.

D. Semi-Permanent Adhesive: Use in joints requiring expansion couplers.

E. Bends: Conduits not exceeding 25 mm diameter may be cold bent using bending springs. Conduits over 25 mm shall be hot bent by an approved method.

230.060 EMBEDDED CONDUITS

A. Conduits In Concrete Slabs: Place conduits parallel or at right angles to main reinforcing steel, between bottom reinforcing and top reinforcing steel. Fasten conduits to reinforcing steel by positive wire, fasteners at the proper distance from the concrete face. Embedded conduit diameter shall not exceed 1/3 of slab thickness. Special cases shall be referred to Engineer.

B. Conduits In Partitions or Side Walls: Horizontal or cross runs shall be avoided.

C. Pull-boxes shall not be used except for concealed installations above false ceiling at accessible locations. If unavoidable, pull-boxes may be approved if located inconspicuously.

© Copyright protected

D. Conduits in floor of beds on grade: Encase in concrete, minimum thickness 50 mm or to thickness allowed by architectural detail.

E. PVC conduits in reinforced concrete structures are generally to be installed after placing reinforcement and before concreting, if protected against damage, or shall be placed in grooves formed in the concrete, if approved.

230.070 EXPOSED CONDUITS

A. Conduits on walls shall be run neatly, horizontally or vertically.

B. Supports: Use approved clamps, hangers or clips fastened by machine screws to expansion sleeves in inserts or to lead anchors.

C. Spacing of clamps or clips for supporting steel conduits shall not be greater than:

	Conduit Size mm	Maximum Spacing of Supports metres
1.	20	3.00
2.	25	3.60
3.	32-38	4.25
4.	50-63	5.00
5.	75 and larger	6.00

D. Spacing of clamps or clips for supporting PVC conduits shall not be greater than:

	Conduit Size mm	Maximum Spacing of Supports metres
1.	20	0.60
2.	25-50	0.75
3.	63-75	0.90
4.	90-125	1.00
5.	150	1.25

E. Bends and Fittings: Firmly fasten conduit at each side of bends and within 900 mm of each outlet box, junction box, cabinet or fitting.

F. Outlets: Do not run more than the permissible numbers of conduits to any surface wall outlet.

G. Exposed conduit work shall be installed so as not to interfere with ceiling inserts, lights or ventilation ducts or outlets.

230.080 CABLE TRUNKING

A. Installation: Secure trunking of all sizes at intervals not exceeding 1200 mm. Joints shall not overhang a fixing by more than 500 mm.

B. Trunking passing through walls and ceilings shall have the cover fixed solidly for 25 mm either side of walls and for 150 mm either side of floors and ceilings.

C. Trunking passing through fire barrier walls shall be provided with approved fire stopping barrier inside the trunking.

D. Vertical sections of trunking over 900 mm long shall have staggered insulated tie-off studs to support weight of cables.

E. Cabling Provisions: Separation of power, low current and control circuits shall be by two channel trunking or by barriers inserted in trunking before installation of cables. Cable retaining straps shall be provided at not more than 600 mm centers. Openings in front of trunking shall facilitate drawing-in cables.

© Copyright protected

F. Coupling: Trunking parts shall be mechanically and electrically coupled without causing abrasion to wiring.

G. Connection of trunking to conduits shall be through circular boxes.

H. Earthing: Do not use metal trunking as earth continuity conductor. Provide protective conductor in accordance with Division Y Section "Earthing and Bonding" of the Specification.

230.090 PATHWAYS FOR OPTICAL-FIBER AND COMMUNICATIONS CABLE

A. Install pathways, metallic and nonmetallic, rigid and flexible, as follows:

1. Comply with EN 50174-1 and EN 50174-2.
2. 20-mm (3/4-Inch) Trade Size and Smaller: Install pathways in maximum lengths of 15 m (50 feet).
3. 25-mm (1-Inch) Trade Size and Larger: Install pathways in maximum lengths of 23 m (75 feet).
4. Install with a maximum of two 90-degree bends or equivalent for each length of pathway. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.
5. The inside radius of a bend in conduit shall be at least 6 times the internal conduit diameter.
6. Bends in the conduit shall not contain any kinks or other discontinuities that may have a detrimental effect on the cable sheath during cable pulling operations.

230.100 LABELING

A. All metal conduits and metal trunking shall be labeled with type of service, using approved color and lettering labels, fixed at specified distances as specified in Division V Section “Basic Electrical Material and Methods”.

230.110 UNDERGROUND DUCTS

A. Lay and assemble ducts in accordance with Division V Section "Underground Ducts and Raceways for Electrical Systems".

230.120 PROTECTION

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure coatings and finishes are without damage or deterioration at the time of Substantial Completion.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
2. Repair damage to PVC or paint finishes with matching touchup coating recommended by manufacturer.

230.130 CLEANING

A. On completion of installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finish, including chips, scratches, and abrasions.

Y61A - MEDIUM-VOLTAGE CABLES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes cables and related splices, terminations, and accessories for medium-voltage electrical distribution systems above 1000V rating.

110.000 DESIGN PARAMETERS

110.010 PROJECT/SITE CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Employer or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer at least 2 days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.

110.020 REFERENCE STANDARDS

A. Standards: Cables shall comply with IEC or other equally approved Standards, and shall bear the mark of identification of the Standards to which they are manufactured. Cables not having this identification will be rejected.

120.000 SYSTEM DESCRIPTION

120.010 MV CABLE

A. Three Core MV Cable, 8.7/15 (17.5) kV, XLPE insulated, for use on systems with 15 kV, shall comply with IEC 60502 & IEC 60332-3-24, and have the following characteristics:

1. Conductor: Copper or Aluminum as shown on the drawings, circular, stranded and compacted.
2. Conductor Screen: Extruded semi-conducting layer.
3. Insulation: Extruded cross-linked polyethylene (XLPE), nominal 4.5mm thick.
4. Insulation Screen Part: Non-metallic directly applied extruded semi-conducting material, readily strippable.
5. Metallic Part: Layer of copper tape applied with 30% overlap, copper wire or combination of both, with equivalent cross sectional area of 35 mm^2 as a minimum, DC resistance of the screen shall be measured on the complete cable and the resistance value corrected to 20 deg. C in accordance with IEC 60228 and shall not exceed the relevant value of BS 6622.
6. Filling and Bedding: Extruded PVC to form compact circular bedding.
7. Armor where required on the drawings: Single layer of round galvanized steel wire or double galvanized steel tape as shown on the drawings.
8. Outer Sheath: Extruded PVC (color red) type ST2 to IEC 60502, flame retardant to IEC 60332-3-24
9. Medium voltage cables shall be color coded using colored tape applied under the metallic shield or otherwise identified as required by the regulations and as follows:

    a) Phase colors shall be red, yellow, blue or use color coding in accordance with local regulations and standards.

10. If Low Smoke Zero Halogen (LS0H) cable is required on the drawings, bedding and outer sheath shall be made of LS0H material to IEC 61034 for low smoke emission, IEC 60754-1 for halogen acid gas content and IEC 60754-2 for degree of acidity of evolved gas.
11. Embossing: Electric cable, manufacturer name, number of cores and size, type (e.g. CU/XLPE/SWA/PVC), voltage rating (e.g. 8.7/15 (17.5) kV), manufacturer standards, special

© Copyright protected

characteristics (e.g. FR to IEC 60332-3-24, LS0H to IEC 61034, IEC 60754-1 and 2 as specified or required on the drawings).

12. Short-circuit: 8 kA (minimum) for one second rating for 95 mm^2 Aluminum cables, 11 kA (minimum) for one second rating for 120 mm^2 Aluminum cables, 14 kA (minimum) for one second rating for 150 mm^2 Aluminum cables, 17 kA (minimum) for one second rating for 185 mm2 Aluminum cables, 22 kA (minimum) for one second for 240 mm^2 Aluminum cables, 28 kA (minimum) for one second rating for 300 mm^2 Aluminum cables, 13 kA (minimum) for one second rating for 95 mm^2 Copper cables, 17 kA (minimum) for one second rating for 120 mm^2 Copper cables, 21.4 kA (minimum) for one second rating for 150 mm^2 Copper cables, 26.4 kA (minimum) for one second rating for 185 mm^2 Copper cables, 34 kA (minimum) for one second rating for 240 mm^2 Copper cables and 42 kA (minimum) for one second for 300 mm2 Copper cables.

B. Single Core MV Cable 8.7/15 (17.5), XLPE - insulated, for use on systems with 15 kV, shall comply with IEC 60502 & IEC 60332-3-24, and have the following characteristics:

1. Conductor: Copper or Aluminum as shown on the drawings, circular, stranded and compacted.
2. Conductor Screen : Extruded semi-conducting layer.
3. Insulation: Extruded cross-linked polyethylene (XLPE), nominal 4.5 mm thick.
4. Copper Screen: Layer of copper wires with copper tape applied in opposite direction bedding, with equivalent cross sectional area of 35 mm2 as a minimum, DC resistance of the screen shall be measured on the complete cable and the resistance value corrected to 20 deg. C in accordance with IEC 60228 and shall not exceed the relevant value of BS 6622. Inner tape covering and separation sheath of extruded PVC.
5. Armored cable, where required or shown on the Drawings, shall have single layer of aluminum wire or two layers of aluminum tape between bedding and over-sheath.
6. Outer Sheath: Extruded PVC (color red) type ST2 to IEC 60502, flame retardant to IEC 60332-3-24.
7. If Low Smoke Zero Halogen (LS0H) cable is required on the drawings, bedding and outer sheath shall be made of LS0H material to IEC 61034 for low smoke emission, IEC 60754-1 for halogen acid gas content and IEC 60754-2 for degree of acidity of evolved gas.
8. Embossing: Electric cable, manufacturer name, number of cores and size, type, voltage rating (e.g. 8.7/15 (17.5) kV), manufacturer standards, special characteristics (e.g. FR to IEC 60332-3-24, LS0H to IEC 61034, IEC 60754-1 and 2 as specified or required on the drawings).
9. Short-circuit: 8 kA (minimum) for one second rating for 95 mm^2 Aluminum cables, 11 kA (minimum) for one second rating for 120 mm^2 Aluminum cables, 14 kA (minimum) for one second rating for 150 mm^2 Aluminum cables, 17 kA (minimum) for one second rating for 185 mm2 Aluminum cables, 22 kA (minimum) for one second for 240 mm^2 Aluminum cables, 28 kA (minimum) for one second rating for 300 mm^2 Aluminum cables, 37 kA (minimum) for one second rating for 400 mm^2 Aluminum cables 13 kA (minimum) for one second rating for 95 mm^2 Copper cables, 17 kA (minimum) for one second rating for 120 mm^2 Copper cables, 21.4 (minimum) for one second rating for 150 mm^2 Copper cables, 26.4 kA (minimum) for one second rating for 185 mm^2 Copper cables, 34 kA (minimum) for one second rating for 240 mm^2 Copper cables, 42 kA (minimum) for one second for 300 mm^2 Copper cables, 57 kA (minimum) for one second rating for 400 mm^2 Copper cables, 71 kA (minimum) for one second rating for 5000 mm^2 Copper cables and 90 kA (minimum) for one second rating for 630 mm^2 Copper cables.

C. Single or multi core cables installed in cable culvert / tunnels shall be anti-termite and anti-rodent type through providing the outer sheath with organic, non-toxic, anti-termite and anti-rodent agent forming 1.5% of sheath weight.

120.020 CABLE TERMINATION AND SPLICE CONNECTORS

A. Type: Cable termination and splice connectors shall comply with class A to IEC 61238-1 and tested in accordance with IEC 61442 and IEC 60502-4 or class I to IEEE 48 for termination, IEEE 404 for splices, IEC 60137 and BS EN 50181 or IEEE 386 for elbow termination connectors.

B. Termination and splicing kits shall be either heat shrinkable or cold shrinkable type.

C. Kits shall include stress control filler and tube, extruded leakage insulating mastic between cable and shield ground braid, seal and outer non tracking tubes. Non tracking skirts shall be provided for

© Copyright protected

installation in outdoor or wet areas. Kits shall be suitable for cable size and include necessary termination lugs and sleeves.

D. Stress control and stress grading wherever necessary in the terminations shall be by means of semiconducting heat shrinkable tubing.

E. Connectors shall be compression, barrel crimped type.

F. Connectors for copper conductors shall be made of electrolytic copper.

G. Connectors for aluminum conductors shall be made of aluminum alloy of purity not less than 99.5%.

H. All termination and splice connectors specified above shall be tin plated with minimum thickness of 5 microns for copper material and 7 microns for aluminum material. Aluminum connectors shall incorporate neutral grease to avoid aluminum oxidation

I. Termination connectors for aluminum-copper termination shall consist of barrel made of aluminum alloy of purity not less than 99.5% and palm made of forged copper connected using a friction stir welding.

J. Splice connectors for aluminum-copper termination shall consist of two barrels, one is made of electrolytic copper and the other is made of aluminum alloy of purity not less than 99.5% connected using a friction stir welding.

K. Splice connectors shall have a central stop to divide the connector into two equal parts to facilitate the correct cable positioning.

L. Connectors shall be as recommended by manufacturer, to render joints equal to cable in characteristics, in terms of insulation, stress distribution and water-tightness. Materials and methods of jointing shall be approved before confirmation of order.

M. Elbow type terminator shall be used for connection to load break switch / ring main unit with covering boot/bushing as applicable.

N. Connector insulation: Connectors shall be insulated using proper material including insulated sleeves, boots, bushing… etc. as applicable.

O. Termination kits for VFD cables shall be approved for use with VFD cables and shall include necessary earthing clamps / straps for conductor and cable EMI shields and 6-legs break out boot to enclose all the 3-phase conductors and 3-earth conductors.

P. All components of lugs and connectors shall be clearly marked with the manufacturer's name, die number, cable / conductor size, number of crimps and position.

120.030 CABLE CLEATS

A. Cable cleats shall be classified, tested and certified according to IEC 61914.

B. Cleats shall be made of Aluminum, withstand temperature range -5° C - +60° C, classified as "Very heavy" (20 J impact energy at 400mm height as minimum) for their resistance to impact and shall withstand electromechanical forces for more than one short circuit. Cleat short circuit rating for both RMS and Peak values shall exceed the design short circuit level at project site.

C. Cleats shall be trefoil type for single core cables and round type for multi core cables, selected to suit the installed cable(s) outer diameter and shall be provided with low smoke zero halogen pad/liner for cable mounting and protection.

D. Cable cleat edges shall be free of sharp edges, burrs and cracks and shall not cause any damage to the cable sheath in the event of short circuit.

E. Cleats shall be suitable for support to racks, trays or ladders using single or double bolt fixation along with necessary fixation accessories.

F. All cleats shall be clearly marked with the manufacturer's name, product identification or type and cable outer diameter range.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods" for cable and termination supports.
2. Division V Section "Basic Electrical Materials and Methods" for cable markers.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Medium Voltage Cables:

a) B.I.C.C.
b) Nexans
c) Prysmian
d) The Okonite Co.
e) Draka
f) Amer Cable
g) Bahra Cables

2. Cable Connectors:

a) Raychem
b) 3M
c) B.I.C.C.
d) Nexans
e) Prysmian
f) Klauke

3. Cable Cleats:

a) Cooper B-Line
b) Ellis

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced and certified cable splicer to install, splice, and terminate medium-voltage cable.

B. Current carrying capacities of conductors have been determined in accordance with the Regulations for specified type of insulation and expected conditions of installation. No change will be accepted in specified type of insulation unless warranted by special conditions and approved by the Engineer.

© Copyright protected

Check various loads and current carrying capacities and report any discrepancies or insufficiency of sizes indicated to Engineer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle medium-voltage cables as per the Manufacturer’s instructions.

310.030 FACTORY ACCEPTANCE TESTS

A. Factory acceptance tests of medium voltage cables under this Contract are subject to be witnessed by the Engineer for locally manufactured cables. Witness test shall include complete routine and sample tests to IEC 60502-2 and additional DC resistance of the screen test on all cables to be witnessed. Impulse test shall be included in the witness unless manufacturer’s facility is not equipped for such a test. Test procedure and program shall be submitted for approval prior to test conduction. Allow for test expenses including business class transportation and hotel accommodation as necessary for two persons from the Engineer’s/ Employer’s side.

310.040 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match products installed in the project:

1. MV VFD Cables: adequate length for at least two drives.
2. Submarine Cables: adequate length for two motors.
3. Other special imported cables with very long delivery time.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval including, but not limited to, the following:

1. Constructional details, standards to which cables comply, current carrying capacities, de-rating factors for grouping and temperature.
2. Manufacturer's catalogue cuts.
3. Dimensional and electrical characteristics.
4. Manufacturer's drawings showing the outline of the lugs and sleeve connectors together with all pertinent dimensions. Any variation in these dimensions due to manufacturing tolerances shall be indicated.

B. Samples of each cable and, if requested by the Engineer, other accessories.

C. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact routing layouts, showing coordination between various trades.
2. Details of supports and fixings for trays and cables.
3. Details of connections to transformers, switchgear, etc.
4. Details of terminations, splices and tapings where permitted, glands and bushings at enclosures.

D. Certificate of Origin: For each lot of cable supplied, provide a certificate of origin issued by manufacturer stating origin, date of manufacture, composition, Standards to which it complies and test certificates. All test certificates shall comply with the test requirements of the relevant standard to which the cable is manufactured.

E. Cable Jointing Qualifications: Submit details of the proposed cable jointers qualifications prior to work commencing on site.

F. Tests and Certificates: Submit complete certified manufacturer's type test records for cables and accessories in accordance with the Standards.

G. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer’s authorized representative and the contractor.

H. Qualification Data: For firms and persons specified in "Quality Assurance" Article.

I. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

© Copyright protected

J. Product Test Reports: Indicate compliance of cables and accessories with requirements based on comprehensive testing of current products.

K. Maintenance Data: For cables and accessories to include in the maintenance manuals specified in Division 1.

1. Include periodic tests of cables in service.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine raceways to receive medium-voltage cables for compliance with requirements for installation tolerances and other conditions affecting performance of cables. Do not proceed with installation until unsatisfactory conditions have been corrected.

330.020 INSTALLATION

A. Install cables as indicated, according to manufacturer's written instructions.

B. Clamps: Where cables are fixed to supporting structures, approved galvanized cast steel clamps (or nonmagnetic clamps for single core cables) shall be used at distances not exceeding 20 diameters unless otherwise recommended by the clamp manufacturer through certification document from the manufacturer substantiated with necessary test certificate and / or calculations.

C. Cables Fixation on Cable Ladders: Use trefoil cleats for fixation on cable ladders for all single core cables in trefoil arrangement, trefoil cleats shall be used for all horizontal and vertical installations whether on racks, ladders, etc. For multi core cables, cleats shall be used for vertical installation on cable racks, ladders, etc. Spacing between cable cleats for horizontal, vertical and bend installations shall not exceed 450 mm unless otherwise recommended by the cleats manufacturer through certification document from the manufacturer substantiated with necessary test certificate and / or calculations.

D. Pull Conductors: Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

E. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceways. Do not use rope hitches for pulling attachment to cable.

F. Install exposed cables, parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

G. Support cables according to Division V Section "Basic Electrical Materials and Methods."

H. Install direct-buried cables on leveled and tamped 75-mm bed of clean sand at bottom of trench. Separate cables crossing other cables or piping from those items by a minimum of 100 mm of tamped earth. Install permanent markers at ends of cable runs, changes in direction, and buried splices.

I. Install "buried cable" warning tape 305 mm above cables.

J. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by the longest route from entry to exit and support cables at intervals adequate to prevent sag.

K. Seal around cables passing through fire-rated elements using approved fire-stopping material according to Division P Section " Fire Stopping Systems ".

L. Identify cables according to Division V Section "Basic Electrical Materials and Methods."

330.030 CABLE JOINTING AND TERMINATING

A. Through joints will not be allowed in feeder cables where adequate manufacturer's lengths are available. Where a joint is necessary, it has to be made inside boxes, handholes or manholes.

© Copyright protected

B. Recommendations: Through joints and terminations shall be carried out strictly in accordance with cable manufacturer's recommendations, and made with correct specified materials, boxes, tapes, compounds or mixtures, stress cones, glands and bonds as applicable.

C. Jointing: Qualifications of operatives shall be submitted to Engineer prior to work commencing on site. Joints shall be filled with epoxy resin after taping unless contrary to cable manufacturer's recommendations. Sample site constructed cable terminations and through-joints shall be submitted to the Engineer prior to commencing work on site. Samples shall be constructed in the presence of the Engineer and shall be available for test and inspection in accordance with manufacturer's recommendations.

D. Cutting tools for jointing and terminating cables shall be purpose made, to prevent damage to insulation in general, and to cable shielding of MV cables.

E. Cleaning of lacquer on conductors shall be by use of 'Scotch Brite' sponge and white spirit or equal approved.

F. Tighten electrical connectors and terminals including screws and bolts, in accordance with manufacturers published torque-tightening values. Where manufacturer’s torquing requirements are not indicated, tighten connectors and terminals to comply with international standards.

330.040 FIELD QUALITY CONTROL

A. Cable tests shall be carried out in accordance with the requirements of the Regulations and Standards.

B. Test Equipment: Provide megger testers of various ranges as applicable, and HV test equipment as necessary for testing MV installations. Use 5000 V megger on MV installations for initial checks.

C. Testing: On installation of medium-voltage cables and before electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. MV Cable Testing: Provide cable test set with D.C. output voltage and ampere range sufficient to test MV cables. Cables shall be laid in position (trench or duct bank), jointed where applicable, but left uncovered, with ends free of equipment and clear of ground.
2. MV Cable Testing: D.C. test voltage shall be applied between core under test and the screen in steps, pausing one minute or more each step (first step being the A.C. RMS rated voltage of the cable, followed by two equal steps) up to maximum test voltage. At each step, and for the last 5-15 minutes duration at maximum test voltage, the ammeter (normally a micro-ammeter) shall be monitored closely and recorded. If, except as voltage is increased, the current starts to increase, test shall be stopped and the installation inspected and tested for the fault.
3. MV Cable Testing: Each cable/core shall be tested independently. Maximum D.C. test voltage for grounded neutral system shall be 3 times rated A.C. rms voltage of cable.
4. MV Cable Testing: Alternative test shall apply A.C. rms voltage up to 1.5 times A.C. rms rating of cable (26 kV for 17.5 kV cable and 54 kV for 36 kV cable), applied for 15 minutes, by an approved A.C. test set. Readings shall be within same range and in accordance with IEC 60502.

D. Correct malfunctioning cables and accessories at Project site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units and retest.

330.050 PROTECTION

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, to prevent entrance of moisture into the cables and to ensure medium-voltage cables are without damage or deterioration at the time of Substantial Completion.

END OF SECTION Y61A

© Copyright protected

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes low voltage (LV) feeder cables, branch circuit wiring, control and signal cables, termination, jointing and splicing.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Wires and cables shall comply with IEC or other equally approved standards and shall bear the mark of identification of the Standards to which they are manufactured. Wires and cables not having this identification will be rejected.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL

A. Conductors: Unless otherwise specified or shown on the Drawings, cables and other feeders shall have copper conductors. Cable conductors shall be stranded for sections 2.5 mm2 and above,, annealed, electrolytic copper conductors based on IEC 60228 Class 2 for low voltage cables and class 5 to IEC 60228 for flexible cables. Signal and control cables shall have solid conductors unless otherwise specified. Flexible cords shall have finely stranded conductors. Conductors of single-core cables 25-mm^2 and above shall be compacted. Multi-core cables 35-mm^2 and above shall be sectorial shape.

B. Conductor sizes shall be metric and as shown on the Drawings. Conductors with cross-sectional area smaller than specified will not be accepted.

C. Low voltage cables, cable terminations and building wiring insulation shall be color coded or otherwise identified as required by the Regulations and as follows:

1. Neutral shall be blue.
2. Protective earth shall be green/yellow striped.
3. Phase colors shall be brown, black, grey or use color coding in accordance with local regulations and standards.

D. Maintain color coding throughout installation. Phase-conductors for which outer jacket is not color-coded shall have engraved alphanumeric mark (L1, L2, L3) or color coded heat-shrinkable sleeves.

E. Buried Cables: Cables buried directly in the ground shall be armored type, unless otherwise indicated in particular Sections of the Specification or on the Drawings.

F. Water tight cables shall be used for buried cables in high water content soil where indicated on the drawings shall be provided with water blocking swellable tape above insulation as longitudinal water barrier, PE laminated aluminum foil longitudinally applied with suitable overlap as radial water barrier and an external outer sheath made of extruded black medium density polyethylene compound. As an alternative, subject to Engineer’s approval, tree retardant cross linked polyethylene (XLPE/TR) to ASTM D6097 insulated cables with an external outer sheath made of extruded black medium density polyethylene compound can be used.

G. Outdoor cables exposed to sunlight shall be provided with ultraviolet resistant PVC sheath having 2.5% black carbon content.

© Copyright protected

120.020 LV WIRES AND CABLES

A. Single Core PVC Insulated Non-Sheathed Cables (Protective Earth Cable): Single conductor cables used as protective earth shall have annealed copper conductors, compacted, generally with concentric strands and insulated with flame retardant insulation to IEC 60332-1, moisture and heat resistant PVC/E to IEC 60227-1 and IEC 60227-3, suitable for wet locations and with conductor temperature of 70 deg. C. Cable shall have harmonized cable code H07V-R for stranded cables and H07V-K for flexible conductors for fixed installations to BS EN 50525-2-31 and shall be marked in accordance with BS EN 50525-1. Wires and cables shall be 450/750 V grade.

B. Single Core Low Smoke Zero Halogen Cross Linked (LS0H-XL) Insulated Non-Sheathed Cables (Building Wires): Unless otherwise specified, single conductor cables for wiring installed in trunking in air plenum areas shall have annealed copper conductors, compacted, generally with concentric strands and insulated with moisture and heat resistant LS0H-XL material type EI 5 to BS EN 50363-5 and with conductor temperature of 90 deg. C. Cable shall have flame retardant insulation to IEC 60332-1. Cable shall have harmonized cable code H07Z-R for stranded cables and H07Z-K for flexible conductors for fixed installations to BS EN 50525-3-41 and shall be marked in accordance with BS EN 50525-1. Cable shall comply with IEC 61034 and IEC 60754. Wires and cables shall be 450/750 V grade.

C. Multi-Core PVC Insulated Cables (0.6/1 kV): To have annealed, copper conductors, compacted, insulated with PVC/A to IEC 60502-1, moisture and heat resistant, suitable for wet locations and conductor temperatures of 70 deg. C, laid up, bedded with suitable filler and sheathed with flame retardant PVC/ST2. Armored cables shall have single layer of galvanized steel wire armor with flame retardant PVC/ST2 over-sheath. Cables shall comply with IEC 60332-3, and IEC 60811.

D. Single Core XLPE Insulated Feeder Cables (0.6/1 kV): Single-core circular stranded, annealed copper conductors, compacted, insulated with moisture and heat resistant cross-linked polyethylene (XLPE), suitable for wet locations and conductor temperatures of 90 deg. C. and flame retardant PVC/ST2 over-sheath. Armored cables shall have taped bedding, single wire aluminum armor and flame retardant PVC/ST2 over-sheath. Cables shall comply with IEC 60502-1, IEC 60332-3, and IEC 60811.

E. Multi-Core XLPE Insulated Feeder Cables (0.6/1 kV): Multicore annealed copper conductors, compacted, XLPE insulated, for conductor temperature of 90 deg. C, laid up and bedded with suitable non-hygroscopic material compatible with the insulation and flame retardant PVC/ST2 over-sheathed, color black. Armored cables shall have single layer of galvanized steel wire applied helically over extruded flame retardant PVC/ST2 bedding (which may be an integral part of filling) and over-sheathed with flame retardant PVC/ST2, color black. Cables shall comply with IEC 60502-1, IEC 60332-3, and IEC 60811.

F. Multi-Core Dual Shielded XLPE Insulated Feeder Cables (minimum 0.6/1 kV) for Variable Frequency Drives (VFD): To have stranded copper conductors, class 5 to IEC 60228, compacted, adequately thick XLPE insulated, for conductor temperature of 90 deg. C. An overall tinned copper braided screen in conjunction with an aluminium/polymer tape shield shall be provided to achieve transfer impedance not exceeding 100 mOhm/m in the frequency range up to 100 MHz calculated in accordance with IEC 61196-1 or ANSI/NEMA WC 61. Cable shall have a flame retardant PVC/ST2 or LS0H over-sheath as shown on the drawings, LS0H over-sheath shall comply with IEC 61034 for low smoke emission, IEC 60754-1 for halogen acid gas content and IEC 60754-2 for degree of acidity of evolved gas, color black. Each feeder shall be provided with 3 nos. symmetrically arranged grounding conductors except for feeders less than 16 mm2 which shall be four core having the fourth core acting as a ground conductor. Cables shall be used with variable frequency drive applications. Cable length shall not exceed 40 m unless proper common mode, (dv/dt), or sinus filters are specified in the VFD, or as otherwise recommended by the manufacturer and approved by the Engineer. Cables shall comply with IEC 60092 or IEEE 1580, IEC 60502-1, IEC 60332-3, and IEC 60811.

G. VFD Cables Feeding Life Safety Equipment (Such as smoke / pressurization fans, etc.): Class 2 to IEC 60228, fire resistant type to IEC 60331-21 with LS0H over sheath to IEC 61034 for low smoke emission, IEC 60754-1 for halogen acid gas content and IEC 60754-2 for degree of acidity of evolved gas.

© Copyright protected

H. Low Smoke Zero Halogen (LS0H) Cables: 600/1000 V grade, copper conductor, compacted, insulated with extruded material to IEC 61034 for low smoke emission, IEC 60754-1 for halogen acid gas content and IEC 60754-2 for degree of acidity of evolved gas. Cores and cross sectional area shall be as shown on the Drawings. Phases shall be color coded in conformity with the Standards, and overall cable sheath shall be extruded black LS0H material. Cables shall comply with IEC 60332-3.

I. Single Core Low Smoke Zero Halogen Cross Linked (LS0H-XL) Insulated Non-Sheathed Cables (Protective Earth Cables): Single conductor cables used as protective earth shall have annealed copper conductors, compacted, generally with concentric strands and insulated with moisture and heat resistant LS0H-XL material type EI 5 to BS EN 50363-5 and with conductor temperature of 90 deg. C. Cable shall have flame retardant insulation to IEC 60332-1. Cable shall have harmonized cable code H07Z-R for stranded cables and H07Z-K for flexible conductors for fixed installations to BS EN 50525-3-41 and shall be marked in accordance with BS EN 50525-1. Cable shall comply with IEC 61034 and IEC 60754. Wires and cables shall be 450/750 V grade.

J. Flexible cable for connection to appliances, window fans, pendants etc. shall be 300/500 V grade to IEC 60227-5, class 5 to IEC 60228, three or four core, with tinned finely stranded copper wires, heat resistant with PVC/E insulation and PVC/ST10 sheath. As an alternative, EPR insulation, twisted and sheathed with Chlorosulphonated Polyethylene (CSP) compound and with strengthening cord may be used.

K. Fire resistant LS0H Cable (abbreviated as FR1 on the drawings, similar to Prysmian - Type FP 100, or approved equal): Single core stranded plain annealed copper conductors to IEC 60228, fire resistant insulation category CWZ to BS 6387 for sizes up to 6 mm2, PH120 classified to BS EN 50200, and 120 minutes rating when tested in accordance with BS 8434-2 when tested in 20 mm rigid steel conduit and Low Smoke Zero Halogen (LS0H) composite sheath to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall comply with BS EN 50363 and rated 450/750 V, capable of accepting voltage surges up to 5 kV, operating conductor temperature of 90 deg. C. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath . Cable shall be used as branch circuits installed in steel conduits for use in central battery system, smoke curtains and other similar loads where shown on the drawings.

L. Fire resistant LS0H Cable (abbreviated as FR2 on the drawings, similar to Prysmian - Type FP 300, or approved equal): Multi core solid or stranded plain annealed copper conductors to IEC 60228 (in sizes up to 16 mm2), dual layer insulation with fire resistant tape primary insulation layer and XLPE secondary insulation layer, category CWZ to BS 6387, complying with BS EN 50363, LS0H composite sheath with tinned earth continuity conductor/drain wire to IEC 61034 and IEC 60754. Cable shall comply with IEC 60331 for fire resistant characteristics at an enhanced temperature of 950 deg. C. and shall comply with IEC 60332-1-2 for flame retardant properties. Cable shall be rated 600/1000 V, capable of accepting voltage surges up to 5 kV, operating conductor temperature of 90 deg. C. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath. Cable shall be installed in steel conduits for use in main incoming cable in central battery system and other life safety equipment where shown on the drawings.

M. Fire resistant LS0H Cable (abbreviated as FR3 on the drawings, similar to Prysmian - Type FP 200 Gold, or approved equal) : Multi core solid or stranded plain annealed copper conductors to IEC 60228 (in sizes up to 4 mm2), fire resistant insulation, galvanized steel wire armored, category CWZ to BS 6387, PH60 classified to BS EN 50200, and 30 minutes rating when tested with additional water spray in accordance BS EN 50200 Annex E and complying with BS EN 50363, laminated aluminum screen and LS0H composite sheath with tinned earth continuity conductor/drain wire to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall be rated 300/500 V, capable of accepting voltage surges up to 5 kV, operating conductor temperature of 70 deg. C. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath. Cable shall be used for fire alarm, voice evacuation installations, branch circuits in central battery system and other loads requiring category 1 circuits in accordance with BS 8519 including buildings with evacuation time not exceeding 30 minutes unless otherwise specified under fire alarm section and where shown on the drawings.

N. Fire resistant LS0H Cable (abbreviated as FR4 on the drawings, similar to Prysmian - Type FP Plus, or approved equal) : Multi core plain annealed copper conductors to IEC 60228 (in sizes up to 4

© Copyright protected

mm2), fire resistant insulation, galvanized steel wire armored, category CWZ to BS 6387, PH 120 classified to BS EN 50200, and 120 minutes rating when tested in accordance with BS 8434-2 and complying with BS EN 50363, laminated aluminum screen bonded to the sheath and LS0H composite sheath with tinned earth continuity conductor/drain wire to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall be rated 300/500 V, capable of accepting voltage surges up to 5 kV, operating conductor temperature of 70 deg. C. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath. Cable shall be used for fire alarm, voice evacuation installations, emergency voice communication systems, branch circuits in central battery system and other loads requiring category 2&3 circuits in accordance with BS 8519 including buildings with evacuation time higher than 30 minutes, such as high assembly and high rise buildings unless otherwise specified under fire alarm section and where shown on the drawings.

O. Fire resistant LS0H Cable 600/1000 V, (abbreviated as FR5 on the drawings, similar to Prysmian - Type FP-400, or approved equal): Multi core plain copper stranded circular or shaped conductor (sizes up to 400mm^2) complying with IEC 60228 with fire resistant insulation category CWZ to BS 6387, category F2 to BS 7846, PH60 classified to BS EN 50200 and 30 minutes rating when tested with additional water spray in accordance with BS EN 50200 Annex E and complying with BS EN 50363 operating conductor temperature 90ºC, single galvanized steel wire armour and extruded low smoke zero halogen (LS0H) over sheath wire to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath. Cable shall be used for feeders of the fire pumps, smoke and pressurizing fans, fire fighting elevators and other firefighting and life safety loads requiring category 1 circuits in accordance with BS 8519 including buildings with evacuation time not exceeding 30 minutes and where shown on the drawings.

P. Fire resistant LS0H Cable 600/1000 V, (abbreviated as FR6 on the drawings, similar to Prysmian - Type FP-600S, or approved equal): Multi core plain copper stranded circular or shaped conductor (sizes up to 400 mm^2) complying with IEC 60228 with fire resistant insulation category F120 to BS 7846 and tested in accordance with BS 8491 and complying with BS EN 50363 operating conductor temperature 90ºC, single galvanized steel wire armour and extruded low smoke zero halogen (LS0H) over sheath wire to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath . Cable shall be used for feeders of the fire pumps, smoke and pressurizing fans, fire fighting elevators and other firefighting and life safety loads requiring category 2&3 circuits in accordance with BS 8519 including buildings with evacuation time higher than 30 minutes, such as high assembly and high rise buildings and where shown on the drawings.

Q. Fire resistant LS0H Cable (abbreviated as FRE on the drawings, similar to Prysmian - Type FP 100, or approved equal): Single core stranded plain annealed copper conductors to IEC 60228, fire resistant insulation to IEC 60331 and Low Smoke Zero Halogen (LS0H) composite sheath to IEC 61034 and IEC 60754. Cable shall comply with IEC 60332-1 & 3 (category C) for flame retardant properties. Cable shall comply with BS EN 50363 and rated 450/750 V for sizes up to 10 mm2 and 600/100 V for sizes greater than 10mm2, capable of accepting voltage surges up to 5 kV, operating conductor temperature of 90 deg. C. Cable shall be LPCB and BASEC certified, audited and marked by embossing on cable sheath. Cable shall have green/yellow striped color and shall be used as earth conductor for fire resistant feeders.

120.030 CONTROL AND SIGNAL CABLES

A. Multi-Core PVC Insulated Control Cables: 0.6/1 kV rating, solid 1.5 mm2, 2.5 mm2 or stranded 4 mm2 plain circular copper conductors, with heat resistive PVC/A to IEC 60502-1, rated for 70 deg. C, of 7, 12, 19, 24, 30 or 37 cores. Cores shall be laid up together and filled with non-hygroscopic material, and covered with copper wire or tape screen and over sheathed with flame retardant PVC/ST1, to form compact and circular cable for use in switchgear, control gear and generally for control of power and lighting systems. Armored cable shall have extruded PVC bedding which may be an integral part of the filling, galvanized steel wire armoring, and over-sheath of flame retardant PVC/ST1 to IEC 60502-1 and IEC 60332-1, color black. Core identification shall be white printed numbers 1, 2, 3 etc. over black insulation.

© Copyright protected

B. Cables for life safety and fire fighting systems shall be certified to have passed IEC 60331 fire resistance and IEC 60332-1 flame retardance and reduced flame propagation to category CWZ of BS 6387.

C. PE insulated control and signal cables, for use on data systems, shall be generally 300 V rating, polyethylene insulated, color-coded, tinned copper conductors (0.6-mm diameter), twisted together into pairs. Multi-pair core assembly shall be covered with binder tape, spirally wound 0.075-mm bare copper shielding tape and provided with drain wire and overall PVC sheath.

D. Control and signal cables, enclosed in conduit and raceways with power cables, shall be insulated for same voltage grade.

E. Multi core PVC insulated cables (300/500 V) annealed copper conductors, solid conductors, up to 4 mm^2 unless otherwise indicated, insulated with moisture and heat resistant PVC/C to IEC 60227 and with over sheath of flame redundant PVC type ST1 to IEC 60227 and IEC 60332-1.

120.040 TERMINATION AND SPLICE CONNECTORS (LV POWER)

A. Connector terminations and splices shall be of class A to IEC 61238-1.

B. Connectors shall be compression, barrel crimped type.

C. Connectors for copper conductors shall be made of electrolytic copper.

D. Connectors for aluminum conductors shall be made of aluminum alloy of purity not less than 99.5%.

E. All termination and splice connectors specified above shall be tin plated with minimum thickness of 5 microns for copper material and 7 microns for aluminum material. Aluminum connectors shall incorporate neutral grease to avoid aluminum oxidation

F. Termination connectors for aluminum-copper termination shall consist of barrel made of aluminum alloy of purity not less than 99.5% and palm made of forged copper connected using a friction stir welding.

G. Splice connectors for aluminum-copper termination shall consist of two barrels, one is made of electrolytic copper and the other is made of aluminum alloy of purity not less than 99.5% connected using a friction stir welding.

H. Splice connectors shall have a central stop to divide the connector into two equal parts to facilitate the correct cable positioning.

I. Connectors shall be as recommended by manufacturer, to render joints equal to cable in characteristics, in terms of insulation, stress distribution and water-tightness. Materials and methods of jointing shall be approved before confirmation of order.

J. Connectors shall be suitable for cable size used.

K. Connector - Type A-1: Heat shrinkable or cold shrinkable for making T-taps and splices on conductors used in external lighting fittings connections.

L. Connector - Type A-2: Pressure indent type, for terminating or making T-taps and splices on conductors 10 mm2 and smaller. Connector shall be non-ferrous copper alloy applied to conductor by mechanical crimping pressure, with vinyl insulating sleeves or phenolic insulating covers.

M. Connector - Type A-3: Bolted pressure split type for terminating or making T-taps and splices on conductors 16 mm2 and larger. Connector shall be cast non-ferrous copper alloy applied to conductor by clamping with minimum of two screws and provided with phenolic insulating cover.

N. Connector - Type B-1: Pre-insulated, spring type, for branch circuit and fixture wiring. Connector shall be steel encased spring with shell, insulated with vinyl cap and skirt.

O. All components of lugs and connectors shall be clearly marked with the manufacturer’s name, die number, cable / conductor size, number of crimps and position.

120.050 CABLE GLANDS

A. Cable glands shall comply with BS 6121-1, BS 6121-5 and IEC 62444.

© Copyright protected

B. Cable glands used with unarmored cables shall be made of brass, type A2 to BS 6121-5, with mechanical retention Type B to IEC 62444, impact resistance category 8 to IEC 62444 and an environmental seal to the cable outer sheath. Glands shall be deluge protected, with IP66 degree of protection to IEC 60529.

C. Cable glands used with single steel wire armored cables shall be made of brass, type CW to BS 6121-5, with mechanical retention Type D to IEC 62444, impact resistance category 8 to IEC 62444, connection to protective earth category B to IEC 62444 and shall be capable of passing an earth fault current, earth tag to IEC 62444 and an environmental seal to the cable outer sheath. Glands shall have IP66 degree of protection to IEC 60529.

D. Cable glands used with steel tape or wire braid armor shall have similar characteristics as specified in paragraph 120.050 C except gland type which shall be CX instead of CW to BS 6121-5.

E. Cable glands used with single steel wire armored cables where sprinkler / water mist firefighting systems are used shall be made of brass, type E1W to BS 6121-5, with mechanical retention class B to IEC 62444, impact resistance category 8 to IEC 62444, electrical continuity via armor wire termination category B to IEC 62444, earth tag to IEC 62444 and an environmental seal to the cable inner and outer sheaths. Glands shall be deluge protected, with IP66 degree of protection to IEC 60529.

F. Cable glands used with steel tape or wire braid armor shall have similar characteristics as specified in paragraph 120.050 E except gland type which shall be E1X instead of E1W to BS 6121-5.

G. Cable glands for use in explosive hazardous areas shall be flame proof with protection Ex d to IEC 60079-1 and have same applicable characteristics according to cable type as above.

H. Stainless steel grade 316 cable glands shall be used in installations in chemical and extremely corrosive areas and where stainless steel enclosures are used. Glands shall have same applicable characteristics according to cable type as above.

I. Aluminum cable glands shall be used for cables with aluminum wire armor. Glands shall have same applicable characteristics according to cable type as above.

J. Cable glands used with LS0H or fire resistant cables shall be of the applicable type as stated above and provided with low smoke fume shroud.

K. Cable glands used for outdoor terminations shall be of the applicable type as stated above and provided with non-deteriorating, UV stabilized seal and shroud.

L. Cable glands shall be suitable for cable size used.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Low Voltage Cables:

a) B.I.C.C.
b) Nexans
c) Prysmian
d) Lapp Kabel
e) General Cables
f) Belden
g) The Okonite Co.
h) Draka
i) Bahra Cables
j) Ducab

2. Low Voltage Variable Frequency Drive Cables:

a) Lapp Kabel
b) Nexans
c) Prysmian
d) Leoni
e) Belden
f) General Cables

3. Low Voltage Fire Resistant Cables:

a) Prysmian
b) Nexans
c) Bahra Cables
d) Ducab
e) Draka

4. Cable Connectors:

a) Raychem
b) 3M
c) B.I.C.C.
d) Nexans
e) Prysmian
f) Klauke

5. Cable Glands:

a) CMP
b) Hawke
c) Stahl
d) Thomas & Betts
e) Prysmian

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

© Copyright protected

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced and certified cable splicer to install, splice and terminate low-voltage cables.

B. Current carrying capacities of conductors have been determined in accordance with the Regulations for specified type of insulation and expected conditions of installation. No change will be accepted in specified type of insulation unless warranted by special conditions and approved by Engineer. Check various loads and current carrying capacities and report any discrepancies or insufficiency of sizes indicated to Engineer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle wires and cables as per Manufacturer’s instructions.

310.030 COORDINATION

A. Coordinate layout and installation of cables with other installations.

B. Revise locations and elevations from those indicated, as required to suit field conditions and as approved by Engineer.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval including, but not limited to, the following:

1. Constructional details, standards to which cables comply, current carrying capacities, de-rating factors for grouping and temperature.
2. Manufacturer's catalogue cuts.
3. Dimensional and electrical characteristics.
4. Manufacturer's drawings showing the outline of the lugs and sleeve connectors together with all pertinent dimensions. Any variation in these dimensions due to manufacturing tolerances shall be indicated.

B. Samples of each cable and wire and, if requested by Engineer, other accessories.

C. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact routing layouts, sections and profiles of trays, feeder, sub-feeder cables and branch circuits, with indication of any equipment to show and verify coordination between various trades.
2. Cable sizing calculation including current carrying capacities, de-rating factors for grouping and temperature and voltage drop calculations.
3. Details of supports and fixings for buses, trays and cables.
4. Details of connections to transformers, switchboards, panelboards etc.
5. Details of terminations, splices and tapings where permitted, glands and bushings at enclosures.
6. Number and size of conductors in conduit for all branch circuits in accordance with final conduit routing.
7. Cable schedule including cable reference, originating and terminating points’ references along with feeder data showing load current and cumulative voltage drop at feeder end.
8. Cable terminations (and joints, if any) schedule.

D. Certificate of Origin: For each lot of cable supplied, provide a certificate of origin issued by manufacturer stating origin, date of manufacture, composition, standards to which it complies and test certificates. All test certificates shall comply with the test requirements of the relevant standard to which the cable is manufactured.

E. Tests and Certificates: Submit complete certified manufacturer's type test records for cables and accessories in accordance with the Standards.

© Copyright protected

F. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

G. Cable Jointing Qualifications: Submit details of the proposed cable jointers qualifications prior to work commencing on site.

H. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

I. As-Built (Record) Drawings: At Project Close-Out, submit, certified by Consultant, Record Drawings of installed electrical systems, indicating all existing services and those installed, in accordance with requirements of the Specification.

J. Routine tests at factory: All cables shall be subjected to factory routine test prior to shipment as required by the relevant standard. Routine test certificates shall be properly numbered and submitted with shipment.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine raceways and building finishes receiving wires and cables for compliance with requirements for installation tolerances and other conditions affecting performance of wires and cables. Do not proceed with installation until unsatisfactory conditions have been corrected.

B. Before pulling wires in conduit check that inside of conduit (and raceway in general) is free of burrs and is dry and clean.

330.020 INSTALLATION

A. General

1. General: Building wires and cables shall be installed in conduit, trunking or ducts indoors and in conduit outdoors, unless otherwise shown the Drawings.
2. Circuits: Unless otherwise shown on the Drawings, final branch circuit wiring shall be run inside trunking or conduits, D.C. wiring shall be run in separate conduits from A.C. wiring, and emergency lighting and power circuits shall be run in separate conduits from normal circuits.
3. Branch circuit work originating from light and power panelboards shall be arranged as shown on the Drawings. Loads on various phases of panelboards shall be balanced. Ensure that the lighting load and other loads are balanced with a difference of not more than 10% between the phases.
4. Control cables may be fixed to racks, installed directly on cable trays or pulled in conduit and trunking indoors, and in underground ducts or in conduit outdoors.
5. Bunching of wires in raceways shall be in accordance with raceway filling factors permitted by the Regulations.
6. Lubricants shall be used for pulling wire or cable if character of pull would otherwise damage conductors, insulation or jacket. Lubricants shall be approved by the Engineer.
7. Pull conductors into raceways simultaneously where more than one is being installed in the same raceway.
8. Support: Cables and wires pulled inside very high conduit risers shall be supported at upper end of risers and at intermediate points by split rubber grommets to relieve any stresses on conductors, where required.
9. Wiring at Outlets: Leave a slack of at least 200mm at each outlet.
10. Extra Length: At every branch circuit outlet and pull-box, every cable passing through shall be left slack to allow inspection and for connections to be made. Cables terminating in outlet boxes shall be left with at least 250-mm extra length for terminations.
11. Joints or taps in wires and cables, if permitted, shall be permanently accessible or made only in boxes or cabinet gutters.
12. Insulating covers shall be applied to prevent exposure of bare cable connections.
13. Switch legs for local wall switches shall have distinctive color, selected as complementary to cable color coding used in the project.

© Copyright protected

14. Terminations: Conductors of wires and cables up to 6 mm2 for copper conductors and up to 10 mm^2 for aluminum conductors shall be tightly twisted and where possible doubled back before being clamped with set screws. Where two or more wires are looped into same terminal these conductors shall be tightly twisted together before inserting into terminals. As an alternative, fork / ring, compression / twisting type connectors may be used for cable termination. In no case bare conductor shall be allowed to project beyond any insulated shrouding or mounting of a line terminal. Cables sizes 10 mm2 and larger for copper conductors and 16 mm2 and larger for aluminum conductors shall terminate in compression lug connectors.
15. Cable on cable racks, in cable trays and upon emerging from conduits shall be formed to avoid bearing against edges of trays, racks, conduits or their supports upon entering or leaving trays, racks or conduits. Cables in horizontal runs in trays shall be tied by 3mm nylon cord to the cable trays. Sequence of cables transversely in trays shall avoid unnecessary crossing of other cables when some of the cables make turns into lateral trays, or upon entering or leaving a run of tray.
16. Tagging: Tag main and feeder cables in pull-boxes, wireways and wiring gutters of panelboards or distribution cabinets. Tags shall identify cable or circuit number and conductor size in accordance with the Schedules.
17. Tagging: Where two or more circuits are run to or through a control device, outlet box or ceiling junction box, each circuit shall be tagged as a guide in making connections.

B. FEEDER AND SUB-FEEDER INSTALLATION (0.6/1 KV)

1. Cables generally shall be run through duct-banks, shafts or special recesses, clamped to steel racks or cable trays. Cables run through ventilation shafts shall be LS0H type or installed in steel conduits.
2. Fixing: Single cables above suspended ceilings or in concealed spaces shall be fixed directly to walls or ceilings but must be accessible. Where two or more cables are run in parallel, they shall be fixed on galvanized steel perforated trays or on other approved special cable supporting and protecting arrangement.
3. Clamps: Where cables are fixed to steel trays or supporting structures, approved galvanized cast steel clamps (or nonmagnetic clamps for single core cables) shall be used at distances not exceeding 20 diameters.
4. Joints or splices will not be accepted on main and sub-feeders. Cables shall be supplied in lengths sufficient for straight-through un-jointed termination to termination pull.
5. Directly buried cables crossing under roads, pipe banks or other services, shall be laid in heavy duty PVC duct banks. In no case are cables to be directly buried in concrete, in masonry or in floor finishing.
6. Buried cables liable to mechanical damage shall be drawn through PVC conduit or asbestos cement pipe. If steel conduit is used, all three-phase conductors, neutral and protective earth circuits shall be in the same conduit.
7. Exposure to Heat: Route wires and cables to prevent exposure to excessive heat or to corrosive agents. If such condition is unavoidable, cables shall be type designed for particular condition.
8. Insulating covers shall be applied to prevent exposure of bare cable connections. Insulating cover shall be purpose made and shall provide minimum insulation level equal to that of conductor insulation.
9. Glands for various single-core and multi-core cables shall be purpose made and suitable for rigid mounting to equipment enclosure.
10. Seal around cables penetrating fire-rated elements using approved fire-stopping material according to Division P Section " Fire Stopping Systems ".
11. Identify wires and cables according to Division V Section "Basic Electrical Materials and Methods."

C. CABLE CONNECTIONS, JOINTING AND TERMINATIONS

1. Through joints will not be allowed in feeder cables where adequate manufacturer's lengths are available. Where a joint is necessary, it has to be made inside boxes, handholes or manholes.
2. Recommendations: Through joints and terminations shall be carried out strictly in accordance with cable manufacturer's recommendations, and made with correct specified materials, boxes, tapes, compounds or mixtures, stress cones, glands and bonds as applicable.
3. Jointing: Joints shall be filled with epoxy resin after taping unless contrary to cable manufacturer's recommendations. Sample site constructed cable terminations and through-joints shall be submitted prior to commencing work on site. Samples shall be constructed in the

© Copyright protected

presence of the Engineer and shall be available for test and inspection in accordance with manufacturer's recommendations.

4. Cutting tools for jointing and terminating cables shall be purpose made, to prevent damage to insulation in general.
5. Cleaning of lacquer on conductors shall be by use of 'Scotch Brite' sponge and white spirit or equal approved.
6. Tighten electrical connectors and terminals including screws and bolts, in accordance with manufacturers published torque-tightening values. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with international standards.

D. FIELD QUALITY CONTROL

1. Cable tests shall be carried out in accordance with the requirements of the Regulations and Standards.
2. Test Equipment: Provide megger testers of various ranges as applicable. Use 500 V megger on installations with nominal voltage up to 500 V, and 1000 V megger on installations with nominal voltage over 500 V up to 1000 V.
3. Insulation resistance for LV power and lighting installations shall be carried out in accordance with BS 7671 ("The IEE wiring Regulations").
4. Insulation resistance for control and signal cables shall be minimum 10000 Megohm-km for PE insulated cables and 100 Megohm-km for PVC insulated cables, all measured core-core and core-earth, in accordance with the Regulations.
5. Prior to energization of circuitry, check installed wires and cables with megohm meter to determine insulation resistance levels to ensure requirements are fulfilled.
6. Prior to energization, test wires and cables for electrical continuity and for short-circuits.
7. Subsequent to wire and cable hook-ups, energize circuitry and demonstrate functioning in accordance with requirements. Where necessary, correct malfunctioning units, and then retest to demonstrate compliance.

Y62A - ENCLOSED BUS ASSEMBLIES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes busway assemblies and fittings.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards: Comply with the following standards:

1. IEC 61439-1 and IEC 61439-6.
2. IEC 60529.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REUIREMENTS

A. Busway shall be Plug-in type for tap off applications and feeder type for non tapped straight runs and direct connections between equipment, as applicable and / or shown on the Drawings, indoor, complete with manufacturer's recommended fittings and accessories where indicated and as required for a complete, functioning and safe installation .

B. Busway shall include bus bars, electrical insulators, enclosures, switchboard flange, elbows, offsets, cable tap boxes, transformer flange connections with flexible copper braid link, generator flange connection with flexible copper braid link and vibration absorber, power take-off sections, busway reducers with built-in circuit breaker, phase transposition, expansion joints, end closures, supports, and other components and accessories needed to form complete systems.

C. Ratings: three phase with voltage and current ratings and requirements for neutral and ground conductors as indicated and specified.

D. Busway Conductor Material: hard drawn Copper with not less than 98 percent conductivity .

E. Busways: tin plated for copper and insulated over entire length, with flame retardant 130 deg C class epoxy insulation.

F. Hot Spot Temperature Rise: not to exceed limits specified in the Standards which the busway is designed to at any point in the busway when busway is operated at rated load current and system frequency.

G. Current Densities of Busway Conductors: Rated current carrying capacities of the Busway shall not exceed the following:

1. 2.5A/mm2 for copper conductors rated below 2000A and 2.25A/mm2 for copper conductors rated 2000A and above.
2. 1.75A/mm^2 for aluminum conductors rated below 2000A and 1.55A/mm^2 for Aluminum conductors rated 2000A and above.

The above densities are at the temperature specified in the Standards which the busway is designed to and shall be derated at the site maximum ambient temperature conditions.

120.020 BUSWAY (225 TO 5000A)

© Copyright protected

A. Type: Indoor, 600 V grade L-N, 3-phase, 4-wire (3P+N) for feeder busway from transformer to switchboard and 5-wire (3P+N+E) for other feeder type busways and for all plug in type busways, insulated, totally enclosed, non-ventilated and of compact design to provide degree of protection of IP65 to IEC 60529, with ratings as shown on the Drawings at site maximum ambient temperature conditions. Where indoor busway is partially running through outdoor / wet areas, these portions shall be IP65 rated. Neutral shall be fully sized as per the phase conductor, unless double neutral is required on the Drawings while internal earth bar shall be half sized the phase conductor without considering the contribution of the enclosure as earthing means. Short-circuit capacity shall be certified by an approved third party and shall be at least equal to the value at the upstream point of connection or as shown on the Drawings, whichever is greater, for 1 second.

B. Construction: Prefabricated, insulated flat copper conductors with purity not less than 98%, with minimum 2.5 mm extruded aluminum housing, totally enclosed, non-ventilated, sandwich type. Housing shall be bonderized inside and outside and finished with gray baked electrostatic paint, unless otherwise proposed by the supplier and approved by Engineer. Busbars shall be provided with extra insulation between busbars and housing along the full length. Joints between sections shall have special insulation, flanged and pressure bolted, easily dismantled and giving equally strong mechanical connection to busway sections. Any section of the busway shall be removable without disturbing adjacent sections. The busbar joint shall be of an approved type assembly, to maintain proper pressure over a large contact area.

C. Conductor joints for one modular length to the next shall be silver plated for Aluminum conductor busways and plated and arranged in joint stacks incorporating busway conductors, and each joint stack shall be arranged for tightening with a single bolt. Joint design shall be such that any length or fitting of a run may be removed without disturbing the connecting lengths.

D. Reactance: Busway shall be specially built and assembled to provide low reactance.

E. Accessories: Busway shall be complete with necessary factory made adaptor boxes, junction boxes, bends, expansion connections, fittings, fire barriers etc. as may be required to provide complete system between terminal points indicated on the Drawings. Fixing and mounting materials shall be galvanized steel. For vertically mounted busways, spring suspension type hangers shall be used for equalizing weight of trunking between all supports.

F. Cable Tap Boxes: Busways connected to cables at either ends or at plug-ins shall be provided with cable tap boxes to connect electrical cable to the busway distribution system.

G. Terminal adaptors or chambers shall be factory made. Coordinated components at both ends shall match equipment connected thereto. Connections shall be made with insulated copper bars of equivalent sections and of exact shapes to fit and be fixed with bolts and spring washers. The contractor is responsible for coordination between the two manufacturers.

H. Busway shall be ordered from the country of origin with proper lengths and shapes. Busway cutting on site is not acceptable.

I. Plug-In Openings: five, dead-front, hinged cover openings per side of each 3 m (10 ft) length of busway. Openings shall be useable simultaneously.

J. Phase Transposition: Busways intended to change the relative positions of the phase conductors in order to balance the inductive reactances or to transpose the phases shall be provided with phase transposition unit.

120.030 PLUG-IN DEVICES AND BUSWAY REDUCERS

A. General: Compatible with the connected busway and of types as indicated. Plug-in devices and reducers shall be equipped with spring reinforced contact fingers arranged so they will not make contact with busways during plug insertion until the device housing is positively earthed to the busway. Plug-in devices and reducers shall be locked in position mechanically and make positive earthing contact before to the power connection when in the fully inserted position. Safety interlocks (releasable) shall be provided on busway plugs and reducers having "on" and "off" positions to prevent insertion or removal of unit when the circuit breaker is in the closed position, prevent opening the cover when the circuit breaker is in the closed position and to prevent closing the circuit

© Copyright protected

breaker when the cover is opened. Alignment tabs shall be provided to prevent the plug-in device or reducer from being installed 180° out of position. Mounting hardware shall be captive on bus plug housing.

B. Plug-in units (tap off units) shall be of rating shown on the Drawings, and comprise circuit breaker made by same manufacturer of the busway, unless otherwise approved by the Engineer, complete with stabs, stab shields and earthing stab. No cables are permitted for connection of the breaker to the busway stabs. Circuit breakers shall be as specified in Division Y Section "Panelboards".

C. Busway reducers shall be provided where shown on the Drawings and with the rating shown on the Drawings, and comprise circuit breaker made by same manufacturer of the busway, unless otherwise approved by the Engineer, complete with stabs, stab shields and earthing stab. No cables are permitted for connection of the breaker to the busway stabs. Circuit breakers shall be as specified in Division Y Section "Switchboards".

120.040 SUPPORTS AND ACCESSORIES

A. General: as recommended by busway manufacturer and conforming to Division V Section "Basic Electrical Materials and Methods".

B. Spring Mounted Vertical Riser Supports: Adjustable for leveling and spring tension and arranged to permit relative movement between floor and busway.

C. Rigid Floor Supports: Adjustable for leveling.

D. Expansion Section: Capacity and conductor provisions same as adjacent busway section. Arranged to absorb expansion and contraction of bus bars and housing.

E. Fasteners to connect busway supports to the building structure as follows:

1. Expansion Anchors: Carbon steel wedge or sleeve type.
2. Toggle Bolts: All steel spring head type.
3. Powder Driven Threaded Studs: Heat treated steel, designed specifically for the intended service.

120.050 FIRE STOPPING

A. General: Materials approved for fire ratings consistent with penetrated barriers. Refer to Division V Section "Basic Electrical Materials and Methods" and Division P Section "Fire Stopping Systems ".

B. Wall and Floor Flanges: Sheet steel, 2 mm (12-gage) minimum thickness close fitting to busway arranged to close the wall or floor opening at the busway penetration.

C. Two-Part Sealant: Formed-in-place sealant matching the type used during the fire resistance in building penetrations test in accordance with IEC 61439-6..

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division Y Section "Low Voltage Electrical Power Conductors and Cables" for bus drop cables.
3. Division Y Section "Switchboards" for busway termination provisions.
4. Division V Section "Medium Voltage Transformers" for busway termination provisions.
5. Division W Section "Surge Protective Devices ".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. EATON / Cutler-Hammer.
2. G. E.
3. Siemens / Sentron Busway
4. Schneider Electric / SquareD
5. Power Bar (PB)
6. LS

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Source Limitations: Obtain enclosed bus-assembly components and fittings through one source from a single manufacturer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver, store, and handle bus assemblies according to Manufacturer's instructions.

310.030 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

310.040 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match product installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Plug-in Units: 2 percent of installed units, but not less than one unit of each type installed.
2. Hookstick operator for plug-in units.

320.000 SUBMITTALS

A. Technical Data: Include electrical ratings, dimensions, mounting position, mounting method, vertical supports, materials, firestops, and weatherstops for each component.

B. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

C. Shop Drawings: Detail fabrication and installation of enclosed bus assemblies including plans, elevations, sections, component details, and attachments to other construction elements. Detail connections to switchboards, transformers, panel boards and other electrical equipment. Detail supports and connections to building.

D. Coordination and Construction Drawings: Include floor plans and sections to show enclosed bus-assembly layouts and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.

E. Type Test Certificates: Submit to verify compliance of the system with the relevant Standards.

F. Supporting System: Submit the following:

© Copyright protected

1. Detail supporting system, including anchorages and attachments to structure and to supported equipment.

G. As-Built (Record) Drawings: At Project close-out, submit Record Drawings of installed enclosed bus assemblies, in accordance with requirements of the Specification, Division A.

H. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

I. Operation and Maintenance Data: For enclosed bus assemblies to include in emergency, operation, and maintenance manuals and to the satisfaction of the Employer's requirements.

330.000 EXECUTION

330.010 PROJECT CONDITIONS

A. Field Measurements: Verify existing dimensions by field measurements. Verify clearances and locate obstructions within manufacturing and installation tolerances of enclosed bus assemblies.

B. Products shall be suitably rated for Project conditions.

330.020 COORDINATION

A. Coordinate layout and installation of busway with other installations.

1. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Engineer.

330.030 INSTALLATION

A. Install busways and accessories as indicated and in compliance with applicable requirements of applicable codes/regulations. Conform to manufacturer's written instructions except where more stringent requirements apply.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in the approved applicable standards. Tighten joints again after bus assemblies have been energized for 30 days.

C. Install expansion fittings at locations where bus assembly crosses building expansion joints. Install at other locations so distance between expansion fittings does not exceed 90 percent of manufacturer's recommended distance between fittings for the type and material of busway installed.

D. Fire Stops: Install fire stops where busway penetrates fire rated walls and floors. Seal between busway and opening and around opening with sealant or sealing mortar having fire rating not less than that of the penetrated wall or floor. Comply with Division P Section "Fire Stopping Systems ".

E. Weather Seal: Install integral weather seal where busway penetrates exterior wall or roof. Provide appropriate flange and seal around openings to make weather tight.

F. Floor Penetrations: Provide a minimum 100 mm (4-inch-high) curb around busway penetrations of floors to prevent water from spills and leaks from contacting busway.

G. Support busway from the building structure independently from other suspended items.

1. Conform to manufacturer's recommendations for selection, spacing, and installation of supports.
2. Strength of each support including fastenings to the structure shall be adequate to support busway load multiplied by a safety factor of three or 90 kg (200 lb), whichever is greater.
3. Support bus assembly to prevent twisting from eccentric loading.
4. Support bus assembly with not less than 10-mm steel rods for horizontal installations and with spring supports for vertical installations, unless otherwise by the Manufacturer and approved by the Engineer. Modify supports after completion to eliminate strains and stresses on bus bars and housings.

© Copyright protected

5. Fasten supports securely to building structure according to Division V Section "Basic Electrical Materials and Methods."

H. Fastening Supports: Unless otherwise indicated, fasten supports securely to the building structure as specified in Division V Section "Basic Electrical Materials and Methods".

I. Support at Connections to Equipment: Where busways connect to equipment, provide flanged fittings fastened to the busway and to the equipment. Support the busway separately. Do not carry the weight of the busway on the equipment enclosure.

J. Coordinate bus-assembly terminations to equipment enclosures to ensure proper phasing, connection, and closure.

330.040 EARTHING

A. Provide electrical bonding and equipment earthing connections for busways as indicated and specified in Division Y Section "Earthing and Bonding".

B. Tighten bonding and earthing connections to comply with tightening torques specified in applicable Standard or to assure permanent and effective earthing.

330.050 FIELD QUALITY CONTROL

A. Test busway runs prior to energizing as follows and provide written report of tests.

1. Phasing: verify that proper phase relationships exist between source, busway, and connected equipment using phase rotation meter and verifying phase continuity from source to equipment.
2. Insulation Resistance: measure IR for all busway components with 1000 Volt d.c. megohmmeter and compare in report with manufacturer's stated acceptable values. Measure each phase to phase and each phase to earth. Any reading should be better than 100 megohm.

B. Energize busway and demonstrate functioning in accordance with requirements.

C. Test Failures: Correct deficiencies identified by tests and make ready for retest. Verify that equipment meets the specified requirements.

330.060 CLEANING AND FINISH REPAIR

A. Upon completion of installation of busways, remove burrs, dirt, and construction debris and repair damaged finish including chips, scratches and abrasions.

B. Galvanized Finish: repair damage using a zinc-rich paint recommended by the manufacturer.

C. Paint Finish: repair damage using matching touch-up coating recommended by the manufacturer.

330.070 ADJUSTMENT

A. Align busway runs vertically and horizontally to eliminate sags and twists. Provide support stiffeners at locations where indicated and where there is excessive movement.

B. Check bus plug circuit breaker trip settings against connected loads and revise as required to conform to recommended values.

330.080 PROTECTION

A. Provide final protection to ensure that moisture does not enter bus assembly.

330.090 DEMONSTRATION

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

SECTION Y64 - CABLE TRAYS FOR ELECTRICAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes cable trays, cable ladders and related installations and accessories necessary to support and protect cables, feeders, sub-feeders, branch circuit wiring and wiring of low current systems, communications and signal cables. Supporting accessories shall include but not limited to necessary carriage bolts with nut below head, roofing bolts with nut, channel withstanding threaded rod, wall bracket, uni-strut, fish plate, washers, etc.

110.000 DESIGN PARAMETERS

110.010 PROJECT/SITE CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by the Employer or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated.

1. Notify Engineer not less than 2 days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.

110.020 REFERENCE STANDARDS

A. Comply with the following standards:

1. IEC 61537.
2. ISO 1461.
3. ISO 12944-2.

120.000 SYSTEM DESCRIPTION

120.010 CABLE TRAYS AND LADDERS

A. Cable trays and ladders shall comply with IEC 61537.

B. Cable trays shall meet Class C requirements for perforation free area as per IEC 61537 as a minimum.

C. Cable ladders shall meet Class Y requirements for free base area as per IEC 61537 as a minimum.

D. Components: To include cable trays or ladders (as shown on the Drawings), bends, elbows, tees, couplings and plates, rubber grommets, hangers, bracket supports and other system accessories required for safety and protection of the cable installations. All fittings and accessories shall be purpose made from the manufacturer. Field fabricated fittings and accessories are not acceptable.

E. Trays: Provide to carry the maximum load of cables with a factor of safety 300% or 90 kg concentrated load whichever is more stringent.

F. Trays: Heavy gauge perforated sheet steel, heavy duty, hot-dip galvanized after manufacture, minimum 1.5 mm thickness for cable trays up to 300 mm width and 2 mm thickness for cable trays exceeding 300 mm width, with sides not less than 60 mm depth for cable trays up to 300 mm width, 85 mm depth for cable trays exceeding 300 mm width and up to 600 mm width and 110 mm depth for cable trays exceeding 600 mm width with outwards return flanges, unless otherwise recommended by manufacturer and approved by the Engineer. Fittings shall be made of the same material as tray. Covers, where shown on the Drawings, shall be minimum 1.0 mm thick for cable trays up to 600 mm width and 1.5 mm thick for cable trays exceeding 600 mm width and shall be

© Copyright protected

made of sheet steel hot-dip galvanized after manufacture, snap-on or bolt type, forming a rigid assembly with the tray.

G. Trays Perforation: Cable trays perforation size and direction shall be properly designed to suit cable ties or cleats to be used for cable fixation. Contractor shall submit method of cable fixation for Engineer's approval prior to installation.

H. Ladders: Hot-dip galvanized after manufacture, fabricated from 2 mm mild carbon steel. Ladder side channels shall be minimum 125 x 22 mm, strengthened by reinforcing inserts for torsional rigidity. Rungs shall be slotted to take cable cleats or ties and conduit clamps. Rungs shall be minimum 50 x 25 mm channels, spaced at 300 mm centers.

I. Fully controlled, stringent pretreatment process including, alkaline de-greasing, rinsing, pickling, fluxing and drying shall be carried out before hot dip galvanizing.

J. Galvanizing shall be in accordance with ISO 1461, applied after fabrication with local coat thickness of 45 µm (local coating mass of 325 g/m2) and mean coat thickness of 55 µm (mean coating mass of 395 g/m2).

K. Cable trays / ladders installed in corrosive atmosphere shall be provided with powder coating over hot dip galvanization of high chemical resistant polyster / epoxy to meet the requirements of the below classification. High bonding between the galvanizing and the paint finish shall be certified by the manufacturer with a guaranteed life of 20 years.

1. For installations in outdoor industrial areas and coastal areas with moderate salinity and indoor in swimming pools, chemical plants, coastal ship and boatyards; use galvanization and powder coating in compliance with corrosion risk category C4 to ISO 12944-2.
2. For installations in outdoor industrial areas with high humidity and aggressive atmosphere and in indoor areas with almost permanent condensation and with high pollution; use galvanization and powder coating in compliance with corrosion risk category C5-I to ISO 12944-2.

L. Bolts and Screws: Cadmium plated or electrolytically galvanized.

M. Sizes: Trays and ladders shall be standard metric sizes, 150, 300, 450, 600 and 900 mm wide, and at least 3 m length of section. Size of tray or ladder shall be determined by number and sizes of cables in accordance with the Regulations and / or as shown on the Drawings. Tray or ladder shall have strength and rigidity to provide support for cables contained within. Deflection between supports shall comply with IEC 61537 requirements.

N. Earthing connector for trays or ladders shall be provided on each coupling between adjacent sections.

O. Products shall be provided with stamped markings by manufacturers.

P. Cable trays and ladders shall be provided with galvanized ventilated sunshade covers when installed in outdoor locations. Sun shade and fixings shall be from the same manufacturer of cable tray/ladder.

Q. Finish of the cable trays/ladders used outdoors shall be certified to be UV stabilized.

120.020 WIRE-BASKET CABLE TRAYS

A. Description:

1. Configuration:

a) Wires are formed into a standard (50-by-100-mm) wire mesh pattern with intersecting wires welded together. Mesh sections must have at least one bottom longitudinal wire along entire length of section.
b) Utilize the appropriate under floor or overhead basket-type cable tray components and fittings when applicable.

B. Materials: High-strength-steel longitudinal wires with no bends.

C. Safety Provisions:

1. Wire ends along wire-basket sides (flanges) rounded during manufacturing to maintain integrity of cables and installer safety.

© Copyright protected

2. The cable tray system shall include all continuous grounding hardware components.
3. Consider exposure rating of cable tray components for all installation environments including air handling (plenum) spaces, extreme, harsh, indoor or outdoor areas.

D. Sizes:

1. Straight sections shall be furnished in standard 3000-mm lengths.
2. Select cable tray width and depth parameters to maintain a final fill capacity of no greater than fill capacity stated Division W Sections.
3. Available dimensions:

a) Wire-Basket Depth: 25-mm usable loading depth by 100 mm and 300 mm wide.
b) Wire-Basket Depth: 50-mm usable loading depth by 100 mm,150 mm,200 mm,300 mm,450 mm and 600 mm wide.
c) Wire-Basket Depth: 100-mm usable loading depth by 200 mm,300 mm,450 mm and 600 mm wide.
d) Wire-Basket Depth: 150-mm usable loading depth by 200 mm,300 mm,450 mm and600 mm wide.

E. Connector Assemblies: Bolt welded to plate shaped to fit around adjoining tray wires and mating plate. Mechanically joins adjacent tray wires to splice sections together or to create horizontal fittings.

F. Connector Assembly Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

G. Hardware and Fasteners: A full complement of fittings for the cable tray shall be available including, but not limited to 45 and 90 degree flat elbows, vertical inside and outside elbows, tee fittings, couplings for joining sections of the tray, hangers, end blanks, and all other components necessary to make the system workable. The fittings and accessories shall be of compatible material and color.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

1. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

1. Division P Section "Fire Stopping Systems" for fire stopping materials and installation requirements.
2. Division V Section "Basic Electrical Materials and Methods" for cable tray / ladder supports not specified in this Section.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. B-Line Systems, Inc.
2. Thomas & Betts
3. Swifts
4. Wibe

B. Locally manufactured cable trays / ladders are acceptable subject to compliance with design requirements.

© Copyright protected

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Source Limitations: Obtain cable trays and components through one source from a single manufacturer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Materials shall not be stored in damp and open environment and shall be stored in covered places only.

310.030 COORDINATION

A. Coordinate layout and installation of cable tray / ladder with other installations to ensure clear access to the cable trays to facilitate maintenance, checking and further pulling of cables.

   1. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Engineer.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval including, but not limited to, the following:

   1. Manufacturers' catalogues with specifications of cable trays / ladders and related accessories.
   2. Samples of each type of tray / ladder and accessory.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

   1. Detail fabrication and installation of cable tray / ladder, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, fittings and earthing connections.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer/ manufacturer’s authorized representative and the contractor.

D. Approved Third Party Test Certificates: Submit to verify compliance with the IEC 61537, as applicable.

E. Coordination Drawings: Include floor plans and sections drawn to scale. Include scaled cable tray / ladder layout and relationships between components and adjacent structural and mechanical elements.

F. Design Calculations: Submit design calculations to verify the following:

   1. Loading capacities for supports.
   2. Perforation base area for cable trays according to the specified Class.
   3. Free base area for cable ladders according to the specified Class.

G. Factory Test: Submit Factory tests including safe working load, deflection tests and measurement of steel and galvanization thicknesses.

H. Maintenance Data: For cable trays to be included in the maintenance manuals specified in Division 01.

I. As-Built (Record) Drawings: At Project close-out, submit Record Drawings of installed cable trays in accordance with requirements of the Specification, Division 01.

© Copyright protected

330.000 EXECUTION

330.010 INSTALLATION

A. Install cable tray / ladder level and supporting system according to manufacturer's written instructions, Coordination Drawings, original design, and referenced standards.

B. Spare capacity shall be 25 % for vertical installations and 15% for horizontal installations.

C. Each run shall be completed before installation of cables. Submit calculations taking into consideration the maximum cables load on cable trays with a factor of safety 300%.

D. Remove burrs and sharp edges from cable trays / ladders. Fix trays / ladders using approved suspension rods or uni-struts or angle brackets at spacing not exceeding 1.5 m and as per the approved supports calculations.

E. Cables Fixation: Secure cables to tray / ladder with purpose made straps, cleats or saddles as specified in Division Y Section "Low Voltage Electrical Power Conductors and Cables" and Division Y Section "Medium Voltage Cables". Cable cleats and ties shall be correctly sized and tightened to secure the cable without indenting the insulation sheath.

F. Cables Arrangement: Arrange cables in one layer only, with minimum spacing of one diameter of the larger of the two adjacent cables or of a trefoil formation of single core cable circuit, unless otherwise shown on the Drawings.

G. Cables Bending Radius: Cables installation on trays / ladders shall ensure that the minimum cable bending radius as recommended by the manufacturer is not violated.

H. Fasten cable tray / ladder supports securely to building structure as specified in Division V Section "Basic Electrical Materials and Methods," unless otherwise indicated.

   1. Design supports, including fastenings to the structure, to carry the total load of cables and trays multiplied by a safety factor of 3. Submit calculations for approval.

I. Cables Installation on Trays / Ladders: Use necessary rollers and pulleys at proper spacing for installation of large and long run cables. Pulleys / rollers shall be fixed to structural elements and not cable trays / ladders. Necessary pulling tools such as basket grips or pulling eyes shall be used with a proper force and speed to ensure not exceeding the manufacturer’s recommended maximum cable pulling tension.

J. Make connections to equipment with flanged fittings fastened to cable tray / ladder and to equipment. Support cable tray / ladder independently of fittings. Do not carry weight of cable tray / ladder on equipment enclosure.

K. Install expansion connectors where cable tray / ladder crosses a building expansion joint and in cable tray / ladder runs that exceed 39 m, unless otherwise calculated by the manufacturer and approved by the Engineer considering a maximum movement of 25 mm.

L. Make cable tray / ladder connections, changes in direction and elevation using standard fittings. Fittings shall be properly curved / designed to satisfy the minimum bending radius requirements and avoid sharp edges / corners.

M. Locate cable tray / ladder above piping, unless accessibility to cable tray / ladder is required or unless otherwise indicated.

N. Seal penetrations through fire zones or smoke barriers as specified in Division P Section "Fire Stopping Systems."

O. If cable trays / ladders are sized for future cables, furnish necessary provisions for penetrations with capped sleeves for future cables through fire-rated partitions, or use "repairable" fire stopping-penetration sealing material.

P. Workspace: Install cable trays / ladders with sufficient space to permit access for installing cables. Minimum clearance of 250 mm shall be maintained between top of tray / ladder and ceiling, beams and other services and between tray / ladders in multi-tier formation.

© Copyright protected

Q. Tray / ladders shall not carry conductors of different systems, such as power, communications and data processing, or different insulation levels, such as 600V, 5000V, and 20,000 V. Branch circuit cables can run on cable trays / ladders where there is sufficient space above false ceiling.

R. Install covers after installation of cable is completed.

S. Labeling of trays shall be provided at every change in direction and at every 12 meters on straight runs. Size of letters and color of labels, marking and references shall be as per the relevant standard regulations.

T. Cable trays/ladders shall not be installed in lengths below water/sewage pipes.

U. Electrical continuity strips / links shall be provided by the manufacturer of the tray/ladder.

330.020 CONNECTIONS

A. Ground cable trays / ladders according to manufacturer's instructions.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values.

330.030 WARNING SIGNS

A. After installation of cable trays / ladders is completed, install warning signs in visible locations on or near cable trays / ladders.

330.040 FIELD QUALITY CONTROL

A. Perform the following tests and inspections in coordination with the contractor as proper and applicable:

1. Visually inspect cable insulation for damage. Correct sharp corners, protrusions in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
2. Verify that the number, size, and voltage of cables in cable trays meet specification and the approved Shop Drawings requirements. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.
3. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
4. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
5. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and re-torque in suspect areas.
6. Verify that no corroded units are present.
7. Check for improperly sized or installed bonding jumpers.
8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.

B. Grounding: Do not use metal trays / ladders as earth continuity conductor. Connect trays / ladders by flexible tinned copper straps to nearest bare earthing conductor and at maximum 30-m spacing.

C. Anchorage: Test pullout resistance for toggle bolts and powder-driven threaded studs for each type and size of anchorage material.

1. Furnish equipment, including jacks, jigs, fixtures, and calibrated indicating scales, required for reliable testing.
2. Obtain Engineer's approval before transmitting loads to the structure. Test to 90 percent of rated proof load for fastener.

D. Replace malfunctioning units and retest until satisfactory results are achieved.

© Copyright protected

E. Prepare test and inspection method for Engineer's approval. Submit test reports after completion on site.

330.050 CLEANING

A. On completion of cable tray / ladder installation, including fittings, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes, including chips, scratches, and abrasions.

330.060 PROTECTION

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer that ensure cable tray / ladder is without damage or deterioration at the time of Substantial Completion.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray / ladder manufacturer.
2. Repair damage to PVC or paint finishes with matching touchup coating recommended by cable tray / ladder manufacturer.

END OF SECTION Y64

Y65 - UNDERFLOOR RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Description of Work: Raceways including wireways and related installations and accessories necessary to support and protect feeders, branch circuit wiring and wiring of low current systems, communications and signal cables.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Standards:

1. Comply with related BS Standards.

120.000 SYSTEM DESCRIPTION

120.010 UNDERFLOOR TRUNKING

A. Type: For installation in floor screed, laid on unfinished concrete floor, secured and grouted flush with screed.

B. Material: 3.3 m lengths of 2 mm thick (14 gauge) galvanized sheet steel, protected by corrosion resistant coating on inside and outside surfaces. Single, double or triple systems, as required, are to be as shown on the Drawings. Dimensions are to be as indicated.

C. Openings: Ducts are to have 32 mm openings spaced at 600 mm with screw plugs for receiving initial or future installation of outlet boxes. Screw plugs are to be replaced by brass ferrules, inserted and securely fastened by crimping tool, for installation of pedestal type outlet boxes.

D. Fittings: Ducts are to be supplied with approved standard manufacturer's fittings, couplings, adjustable duct supports, duct to conduit adapters, horizontal 45 and 90 degree bends, vertical 90 degree bends, terminal bushings to cabinets, cross-unders, offsets, plugs, ferrules and complete set of tools for installation and maintenance after installation.

E. Junction Boxes: Flush, cast iron, or galvanized sheet steel or die-cast metal protected by corrosion resistant coating and suitable for double or triple duct systems, as required, and shown on the Drawings. Openings are to be provided for ducts and conduits. Interior of boxes is to be partitioned for two or three services; completely isolating each duct system and providing straight cross-junctions. Leveling and anchoring of boxes is to be by adjusting screws at four corners. Flush cover plates are to form smooth surface with flooring.

F. Flush Outlet Boxes: Factory designed, with accessories necessary to accommodate specific outlets shown on the Drawings or cable outlets as required for signal or control services, with cord-grip nipples.

G. Supports are to be capable of adjustment for height and arranged for maintenance of alignment and spacing of raceways during concreting.

H. Recessed Service Fittings: Modular fittings that match with preset inserts and include covers/ receptacles, outlets and associated device plates to provide service indicated at each location. Covers are to be flush with floor and have a recess to match floor finish and level with the area. Boxes' covers are to be firmly held in place and non-rocking. Coordinate with architectural designs and materials approved for finishes and for electrical devices. Internally mounted receptacle / outlets are to be as shown on drawings.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division H and E Sections related to Precast Concrete-Plant Cast for precast concrete units used as cellular concrete floor raceway.
2. Division G Section " Metal Profiled Sheet Decking " for cellular metal floor raceway.
3. Division Z Section "Preservative And Fire Retardant Treatment" for fireproofing cellular metal floor raceway.
4. Division V Section "Basic Electrical Materials and Methods".
5. Division V Section "Wiring Devices" for receptacles installed in service fittings.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Dietzel-Univolt
2. EGA Tube/M.K./Honeywell
3. Schneider Electric
4. Schneider Electric / Square D Co.
5. Thomas & Betts Corp.
6. Wiremold/Legrand
7. Wirenold/Legrand Walker
8. Ackerman

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Source Limitations: Obtain underfloor raceway components through one source from a single manufacturer.

320.000 SUBMITTALS

A. Technical Data: Submit data for approval including, but not limited to, the following:

1. Manufacturers' catalogues with specifications of raceways and related accessories.
2. Samples of each type of raceway and accessory.

3. Samples: Service fittings and flush outlet covers with required finish, for approval.

B. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact routing with indication of boxes, accessories and expansion joints, size and type of boxes.
2. Typical assembly details of installation etc.

© Copyright protected

3. Construction details of pull boxes.
4. Typical installation details including connection enclosure, connection of flexible conduits, and earthing connections.
5. For prewired installations, submit drawings for approval showing the complete layout of all products that make up the complete system for each floor prior to the installation of raceway with the lengths, device type (power and data), locations and circuits identified.

C. Coordination Drawings: Include floor plans and sections drawn to scale. Identify components and accessories such as expansion-joint assemblies, straight raceway lengths, inserts, outlets, and fittings. Show underfloor raceway layout, connections between raceway elements, and relationships between components and adjacent structural elements.

D. Record (As-Built) Documents: Show dimensioned locations of underfloor raceways, junction boxes, and preset and after-set inserts. Include locations, types, and circuiting of service-outlet fittings.

E. Maintenance Data: For underfloor raceways to include in maintenance manuals specified in Division A.

1. Include detailed manufacturer's written instructions on locating preset inserts and on installing after-set inserts.

330.000 EXECUTION

330.010 COORDINATION

A. Coordinate layout and installation of underfloor raceway products with structural work, including slab reinforcement, and with floor finish work.

1. Coordinate height of preset inserts, junction boxes, access units, and raceways with depth of concrete slab and floor fill.
2. Coordinate thickening of slabs where required for adequate encasement of raceway components.
3. Coordinate exposed components with floor-covering materials to ensure fittings and trim are suitable for floor-covering material furnished.
4. Revise locations from those indicated as required to suit field conditions and ensure functioning layout, and as approved by Engineer.

330.020 EXAMINATION

A. Examine substrate for compliance with requirements for installation tolerances and other conditions affecting performance of underfloor raceways. Do not proceed with installation until unsatisfactory conditions have been corrected.

330.030 INSTALLATION

A. Install underfloor raceways as indicated on the Drawings, in compliance with the Specification and according to manufacturer's written instructions.

B. Install raceways aligned and leveled and, unless otherwise indicated, parallel or perpendicular to building walls.

C. Arrange supports to attain proper elevation, alignment, and spacing of raceways. Install supports securely at ends and at intervals not to exceed 1500 mm to prevent movement during concrete pour.

D. Seal raceways, cells, and inserts to prevent water, concrete, or foreign matter from entering raceways before and during pouring slab or placing fill. Provide tape or sealing compound at joints as recommended by raceway manufacturer.

E. Remove burrs, sharp edges, dents, and mechanical defects.

F. Cap or plug boxes, openings, and open raceway ends.

© Copyright protected

G. Junction Boxes: Install tops level and flush with finished floor. Install blank closure plates or plugs to close unused junction-box openings. Install boxes in place with grout to prevent movement during construction. Install supports, couplings and locking and grounding devices with screws tightened in accordance with raceway manufacturer's torquing values. Remove burs, which may cause damage to insulation. Place top covers in inverted position to prevent damage to surface of cover.

H. Install devices and service fittings at points of use indicated.

1. Cut; hole saw, and drill slab and raceways to allow wiring installation.

I. Install markers at each cell to identify service. Install markers flush at screed line before pouring slab or placing fill. Extend marker with grommeted screw when floor covering is placed. Do not extend through carpet. Install markers at inserts adjacent to junction boxes, on both sides of permanent walls, and at end of each raceway run. Use slotted-head screw to identify electrical power and Phillips-head screw to identify telephone.

330.040 CONNECTIONS

A. Ground underfloor raceways and components.

1. Tighten connectors and terminals according to manufacturer's published torque-tightening values.

330.050 CLEANING

A. After installation, clean underfloor raceways, including outlet fittings and devices, and inspect exposed finish.

330.060 ADJUSTING

A. Level raceway components with finished slab and make adjustments for floor finishes.

© Copyright protected

Y66 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes underground conduits and ducts, duct banks, pull boxes and handholes, manholes, and other underground utility structures.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Comply with specified Standards.

110.020 PROJECT/SITE CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Employer or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated.

1. Notify Engineer not less than 2 days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL SYSTEM DESCRIPTION

A. Underground Ducts for Electrical Utility Service: UPVC encased in concrete.

B. Underground Ducts for Electrical Feeders: Direct-buried UPVC conduit.

C. Underground Ducts for Electrical Branch Circuits: UPVC conduit encased in concrete.

D. Underground Ducts for Telephone Utility Service: UPVC utility duct encased in concrete.

E. Underground Ducts for Communication Circuits: UPVC underground conduit encased in concrete.

F. Manholes: Underground, precast concrete utility structures.

G. Manholes: Cast-in-place concrete.

120.020 UNPLASTICIZED POLYVINYL CHLORIDE (UPVC) DUCTS

A. UPVC Ducts for Outdoor Power and Lighting Cable Installations: Non-sparking type, suitable for direct burial in ground, Class B to BS 3506, supplied in standard 6 m lengths, with one end of each length tapered.

1. Nominal Size: As shown on Drawings.
2. Minimum Wall Thickness: 3.4 mm for 100-mm ducts; 4.5 mm for 150-mm ducts.

B. Duct Supports: Rigid UPVC spacers selected to provide minimum duct spacings and concrete cover depths indicated, while supporting ducts during concreting.

C. Duct Sealing Compound: Non-hardening, safe for human skin contact, not deleterious to cable insulation, and workable at temperatures as low as 1 deg. C. Capable of withstanding temperature of 149 deg. C without slump and of adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

120.030 COVERS FOR MANHOLES AND HANDHOLES

A. Frames and Covers: EN 124, checkered cast iron or cast steel, recessed type, and of suitable duty for the particular application. Machine cover-to-frame bearing surfaces

© Copyright protected

1. Covers: Cast-in legend "ELECTRIC" or "TELEPHONE" as appropriate..

120.040 COMPOSITE CONSTRUCTION

A. Concrete: Comply with Division 03 Section "Cast-in-Place Concrete" for concrete and reinforcement.

B. Concrete Envelope: For duct banks for power distribution systems and outdoor lighting cable installations crossing water, gas and sewage mains, under roadways and where required or shown on the Drawings, is to be 21 MPa, 28-day, compressive-strength reinforced concrete using sulfate-resisting Portland cement. Reinforcement is to consist of 12-mm diameter longitudinal bars at approximately 300-mm centers along bottom and sides of duct bank with 10-mm diameter U-shaped transversal bars at 400-mm centers. Extend concrete envelope at least 300 mm beyond each side of crossing, etc.

C. Cable Manholes and Handholes: 21 MPa, 28-day, compressive strength reinforced concrete using sulfate-resisting Portland cement, with approved waterproof membrane on external surfaces, and with cable supports where necessary, pull-eyes, and drain pit and drain pipe as required. Dimensions and reinforcement are to be as shown on the Drawings or in accordance with approved standard details shown on shop and construction drawings.

120.050 PULL BOXES

A. Cast-Metal Boxes: Cast aluminum, sized as indicated, with outside flanges and recessed, gasketed cover for flush mounting. Nonskid finish on cover.

B. Fiberglass Boxes: Molded fiberglass, sized as indicated, with 150-mm square cable entrance at each side and weatherproof cover with nonskid finish.

C. Cover Legend: "ELECTRIC."

120.060 UNDERGROUND, PRECAST CONCRETE UTILITY STRUCTURES

A. Precast Units: Interlocking, mating sections, complete with accessory items, hardware, and features as indicated. Include concrete knockout panels for conduit entrance and sleeve for ground rod.

B. Design structure according to details on Drawings.

C. Structural Design Loading: Heavy traffic.

D. Covers: Recess on cover accepts finish material in landscaped and paved areas.

E. Joint Sealant: Continuous extrusion of asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground water level at grade.

120.070 CONSTRUCTION MATERIALS

A. Waterproofing: Comply with Division J Section " Waterproofing."

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Division D Section "Excavating and Filling" for excavation, backfill, and related items for ducts, manholes, and handholes.

B. Division E Section " Accessories Cast Into In Situ Concrete " for concrete requirements.

C. Division J Section " Waterproofing".

© Copyright protected

D. Division V Section "Basic Electrical Materials and Methods".

E. Division Y Section "Earthing and Bonding" for ground rods at manholes.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Comply with specified Standards.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver ducts to Project site with ends capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

B. Store precast concrete units at Project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

C. Lift and support precast concrete units only at designated lifting or supporting points.

310.030 COORDINATION

A. Coordinate layout and installation of ducts, manholes, and handholes with final arrangement of other utilities as determined in the field.

B. Coordinate elevations of duct and duct-bank entrances into manholes and handholes with final profiles of conduits as determined by coordination with other utilities and underground obstructions. Revise locations and elevations from those indicated as required to suit field conditions and to ensure duct runs drain to manholes and handholes, and as approved by Engineer.

320.000 SUBMITTALS

A. Product Data: For metal accessories for manholes and handholes, conduits and ducts, duct-bank materials, and miscellaneous components.

B. Shop Drawings: Show details and design calculations for precast manholes and handholes, including reinforcing steel. Include Shop Drawings prepared by registered professional structural engineer, as indicated by seal on Shop Drawings.

C. Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures. Include plans and sections drawn to scale.

D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

E. Record (as-Built) Documents: Show dimensioned locations of underground ducts, handholes, and manholes.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine substrates, areas, and conditions to receive ducts and utility structures for compliance with requirements for installation tolerances and other conditions affecting performance of underground ducts and utility structures. Do not proceed with installation until unsatisfactory conditions have been corrected.

© Copyright protected

330.020 EARTHWORK

A. Excavation and Backfill: Comply with Division D Section "Excavating And Filling " but do not use heavy-duty, hydraulic-operated, compaction equipment.

B. Trenches: Width is to be as small as practicable with sides vertical. Remove mud, rock projections, boulders and hard spots from trench bottom and trim level. Inform the Engineer in advance to give him reasonable opportunity to inspect trench for each section of the work.

C. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

D. Restore all areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Perform according to Division Q Section " Landscape Maintenance."

E. Restore Disturbed Pavement. Refer to Division A Section "Cutting and Patching."

330.030 DIRECTLY BURIED UPVC CABLE DUCTS

A. Lay and join ducts to required line and level on sand bed, cover with sand and backfill trench to ground level with excavated soil, free from stones and other debris, well compacted in layers not exceeding 300 mm thick.

B. Lay approved concrete tiles to fully cover cable duct, extending minimum 50 mm beyond sides of duct and placed 300 mm below ground level.

C. Provide warning tape or galvanized steel mesh along duct runs at a depth 200 mm below ground level.

330.040 UNDERGROUND CABLE DUCT ASSEMBLIES

A. Install duct as indicated, according to manufacturer's written instructions.

B. Form duct assembly to required line and level, using duct supports spaced to prevent sagging of ducts and breaking of couplings and watertight seals, and secured with cords (not tie wires) where necessary.

C. Slope: Pitch ducts a minimum of 1:300 (preferably 1% slope) to drain toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between 2 manholes to drain in both directions.

D. Join ducts using waterproof cement, to manufacturer's recommendations, to give waterproof and sand-proof joint with at least 80 mm overlap.

E. Provide 3 mm galvanized steel wire inside empty ducts, for future pulling of cables, extending 1 m beyond duct banks at both ends and securely fixed to wooden bungs sealing the duct.

F. Concrete-Encased Ducts: Support on plastic separators coordinated with duct size and required duct spacing, and install according to the following:

1. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts, and secure separators to the earth and to ducts to prevent floating during concreting. Do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
2. Concreting: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not use power-driven agitating equipment unless specifically designed for duct-bank application. Pour each run of envelope between manholes or other terminations in one continuous operation. When more than 1 pour is necessary, terminate each pour in a vertical plane and install 19-mm reinforcing rod dowels extending 450 mm into the concrete on both sides of joint near the corners of the envelope.
3. Reinforcement: Reinforce duct banks where they cross disturbed-earth and where indicated.
4. Forms: Use the walls of the trench to form the side walls of the duct bank where the soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
5. Minimum Clearances between Ducts: 75 mm between ducts and exterior envelope wall, 50 mm between ducts for like services, and 100 mm between power and signal ducts.

© Copyright protected

G. Sealing: Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs.

330.050 ENDS OF DUCTS

A. Ducts ending in cable manholes or handholes are to be neatly cut and reamed and set behind chamfered precast concrete duct end blocks or terminated with appropriate bell-mouth bushing set in concrete wall. Ducts not ending in cable manholes or handholes are to be properly capped.

B. Sealing Ends Of Ducts: Completely seal conduits and ducts, active or spare, at entry into buildings or manholes, with approved plastic moulds or wooden bungs to prevent entry of rodents, gas and vapor.

330.060 SLEEVES OR DUCTS IN EQUIPMENT FOUNDATIONS

A. Provide sleeves or ducts in equipment foundations, whether or not shown on Drawings, in accordance with approved shop and construction drawings or as instructed by the Engineer. Obtain approval of sleeve or duct installation prior to pouring concrete.

330.070 UNDERGROUND UTILITY STRUCTURE INSTALLATION

A. Drainage: Install drains in bottom of units. Coordinate with drainage provisions indicated.

B. Waterproofing: Apply waterproofing to exterior surfaces of units after concrete has cured at least 3 days. Apply according to Division J Section ‘’Waterproofing’’. After ducts have been connected and grouted, and before backfilling, waterproof joints and connections and touch up abrasions and scars. Waterproof exterior of manhole and handhole chimneys after brick mortar has cured at least 3 days.

C. Cast-in-Place, Underground Structure Installation: Comply with applicable requirements of Division E Section " Accessories Cast Into In Situ Concrete."

1. Finish interior surfaces with a smooth troweled finish.

D. Precast Concrete, Underground Structure Installation: Install as indicated, according to manufacturer's written instructions.

1. Install units level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances.
2. Support units on a level bed of crushed stone or gravel, graded from the 25-mm sieve to the 4.75-mm sieve and compacted to the same density as adjacent undisturbed earth.

330.080 FIELD QUALITY CONTROL

A. Inspection of Duct Systems: Inspect directly buried ducts and underground duct assemblies in the presence of the Engineer, before backfilling or concreting. Steel mandrel or other approved device, diameter equal to 90% of inside diameter of duct and 500 mm long, is to be pulled through entire run of duct and is to pass through without getting stuck. Ducts, which do not allow mandrel to be pulled through, are to be repaired or replaced to the satisfaction of the Engineer.

B. Testing: Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.

C. Correct installations where possible and retest to demonstrate compliance. Remove and replace defective products and retest.

330.090 CLEANING

A. Clean ducts with stiff bristle brush pulled through each duct prior to pulling in cables. Pull brush through full length of ducts. Use round-bristle brush with a diameter 12 mm larger than the ID of duct.

B. Clean internal surfaces of manholes, including sump. Remove foreign material.

© Copyright protected

© Copyright protected

Y71A - SWITCHBOARDS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes Main Distribution Board(s) work for low voltage (LV) distribution, ancillary mounting frames, fittings, cable termination accessories and supports.

B. Connection to BMS system, including interface elements such as relays, transducers, etc. as detailed in Division W Specification Sections BMS schedules and /or shown on the Drawings.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Codes and Standards: Comply with the latest issue of:

1. IEC 61439-1 & IEC 61439-2: Low Voltage Switchgear and Control Gear Assemblies.
2. IEC 60947-1: Low Voltage Switchgear and Control Gear: Part 1: General Rules.
3. IEC 60947-2: Low Voltage Switchgear and Control Gear: Part 2: Circuit Breakers.
4. Relevant IEC Standard for other components, where not otherwise specified.

110.020 PROJECT/SITE CONDITIONS

A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving main distribution boards into place.

B. Existing Utilities: Do not interrupt utilities serving facilities occupied by Employer or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer not less than seven days in advance of proposed utility interruptions. Identify extent and duration of utility interruptions.
2. Indicate method of providing temporary utilities.

C. Environmental Limitations: Rate equipment for continuous operation under the following, unless otherwise indicated:

1. Ambient Temperature: Not exceeding 40 deg C.
2. Altitude: Not exceeding 2000 m.

100.020 DEFINITIONS AND ABBREVIATIONS

D. MDB: Main distribution board.

E. CT: Current Transformer.

F. VT: Voltage Transformer.

G. EMI: Electromagnetic interference.

H. RMS: Root mean square.

I. The following terms used on the Drawings and in the Specification are synonymous and may be used interchangeably: "Switchboard" and "Main Distribution Board".

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REQUIREMENTS

A. Generally: Main distribution boards shall be dead-front type, metal enclosed, multi-cubicle, floor mounted, free standing, with 1000V rated insulation voltage, 600 V rated operational voltage, and with 12 kV impulse withstand voltage, with fixed or draw-out switchgear, manually or manually

© Copyright protected

and electrically operated, as shown on the Drawings, with matching vertical sections to form a continuous integral and rigid structure. Outgoing sections shall be of equal width.

A. Generally: Coordinate with Building Management System (BMS) supplier and provide all necessary interfaces, relays, transducers, etc, necessary for the functions specified in the BMS schedules and/or shown on the Drawings.

B. General Construction: Rigidly framed and bolted, with Electro-galvanized sheet steel enclosures, phosphatized, primed with rust inhibiting primer and finished with thermal polymerized polyester epoxy powder coating, gray colour (RAL 7035 ANSI 61) or standard manufacturer's colour subject to Engineer's approval. Switchgear shall be vermin, dust and rodent proof, IP 31 protection to IEC 60529 for indoor installations and IP 54 protection for installations in wet areas and IP55 degree of protection for outdoor installations, with adequate lifting means and base-frames and capable of being moved into position and directly bolted to floor without additional sills. For ratings up to 3200A, enclosures shall have mechanical impact resistance of IK10 to IEC 62262 for enclosures protection degree IP 54 and higher, and IK08 to IEC 62262 for enclosures protection degree lower than IP 54. Test certificates for mechanical impact shall be submitted for approval; otherwise enclosure thickness shall not be less than 1.5mm. For rating larger than 3200A, enclosures shall have minimum thickness of 2mm.

C. Ventilation: Compartments shall be ventilated, by approved methods complying with the Standards.

D. Main Distribution Boards shall have a short circuit withstand current of the rating shown on the Drawings for 1 sec.

E. Fastenings between structural members shall be bolted.

F. Extension of structure and busbars shall be possible at either end of switchboard for form 3 and form 4 type switchboards.

G. Arrangement shall permit incoming and outgoing busbars and cables to enter enclosure as indicated on the Drawings and connect at respective terminals without inconvenience to installation or maintenance.

H. Removing Circuit Breakers: Suitable arrangements and equipment shall be provided for extracting, lifting and unloading switchgear from enclosures as appropriate for type of switchgear.

I. Spare and space positions are defined as follows:

    1. Spare position: Fully equipped enclosure with switchgear
    2. Space position: Fully equipped enclosure ready to receive switchgear.

J. Busbars: Site rated to same rating of main circuit breaker frame size as a minimum unless otherwise shown on drawings, and braced for a symmetrical rms short-circuit duty as specified. Busbars shall be copper, of sufficient size to limit temperature rise to allowable equipment temperature ratings, and not exceeding IEC 61439-1&-2 limits. Connections and buswork shall be bolted with compatible hardware material as per manufacturer's recommendations and shall be accessible for inspection and maintenance. Contact surfaces shall be properly tin or Electro-silver plated as necessary.

K. Connections from busbar to switching element shall be rated to carry full continuous current rating of switching element frame as a minimum, unless otherwise shown on drawings.

L. Main horizontal busbars and vertical distribution busbars shall be insulated unless bare busbars are recommended by the manufacturer and used in the type test.

M. Full size neutral shall be continuous through all sections. Neutral bus shall be insulated and separate from earth bus and connected to it with removable links, at every bus section. Links shall be of the same cross-section of the earth bus.

N. Earth bus shall extend full length of board, firmly fixed to each section in accordance with the Regulations and Standards, complete with two main earthing lugs (one at each end), and required number of feeder protective earth connectors.

O. Earth bus shall be half size of phase buses, unless otherwise indicated on drawings.

P. Switchboard Type: Switchboard(s) shall be of the following type(s):

© Copyright protected

1. Form 3b.
1. Incoming: Withdrawable type – Air Circuit Breaker (ACB).
2. Tie: Withdrawable type - ACB.
3. Outgoing: Fixed type Moulded Case Circuit Breaker (MCCB) for ratings up to 1250A and Withdrawable type ACB for ratings greater than 1250A.

Q. Withdrawable metal enclosed circuit breaker section shall consist of compartmented unit(s), stationary part with rear busbar and cable connection compartments and front draw-out circuit breaker assembly. Partitions between sections shall be bolted steel plate and partitions between compartments shall be tough solid insulating removable bolted barriers. Each unit shall have hinged lockable front door with grip-handle and door mounted instrumentation.

R. Drawout circuit breaker assembly shall have disconnecting contacts, wheels and interlocks to prevent connecting or disconnecting circuit breaker unless in the open position, and to prevent closing circuit breaker while racking into any of the three positions (connect, test, disconnect). Racking mechanism and rail assembly shall be approved worm and lever mechanism. It shall be possible to close the unit door with breaker in any of the three positions and when removed. External position indicator shall be provided. Fixed disconnecting primary contacts shall be accessible and replaceable from front and shall be silver plated copper. Moving primary disconnect contacts shall consist of self-aligning, silver plated, spring pressure, finger-cluster, copper contact fitted on line and load studs of circuit breaker.

S. Fixed main circuit breaker section shall individually accommodate main circuit breaker, main cable entry with terminal fitting assembly and metering compartment. Where placed against a wall, accessibility shall be possible from front and sides or only from front of section.

T. Pull Sections: An additional cable pull section shall be provided, depending on actual configuration shown on the Drawing, and subject to Engineer’s approval.

U. Where busway is used as an incoming or outgoing feeder of the switchboard, the switchboard manufacturer shall provide all necessary accessories as recommended by the busway manufacturer such as adaptor box for the switchboard to be able to accept the busway flange. The contractor is responsible for coordination between the two manufacturers.

V. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

W. Form 1 and form 2 switchboards shall be front accessible, unless otherwise indicated on the Drawings; front, rear or front and rear aligned as recommended by the manufacturer and approved by the Engineer, fixed group mounted MCCB distribution sections, with all devices removable from the front and mounted on a panelboard type base. Construction shall allow all connections and maintenance to be made without rear access. Cables shall be accommodated in extra wide vertical gutters. Sides, top and rear shall be covered with removable screw-on plates having formed edges all around. Front plates shall be sectionalized and removable, covered by trims, and secured by self-tapping screws.

X. Form 3 and form 4 switchboards shall be front and rear accessible unless otherwise indicated on the Drawings; front, rear or front and rear aligned as recommended by the manufacturer and approved by the Engineer, individually mounted fixed MCCB or ACB distribution sections, with compartmentalized construction, consisting of front modular circuit breaker compartments, busbar system compartments and rear cable termination compartments unless otherwise recommended by the manufacturer and approved by the Engineer, with insulating barriers between front compartments and busbar compartments and between rear compartments and busbar compartment (removable for maintenance). MCCBs shall be closely coupled to busbars (to minimize chances of bus-side faults), and to rear cable terminals, through compatibly frame-sized insulated connectors. MCCB modules shall be covered on the front, by recessed frame-type bolted covers, 1.5 mm minimum thickness, to protect circuit breaker handles. Top, sides and rear shall be covered with removable screw-on plates having formed edges all around.

Y. The switchboard shall be designed to minimize the risks associated with the propagation of an internal arc fault of 85 kA for 0.3 sec as a minimum. Switchboard shall be tested in accordance with IEC 61641 for internal arc protection.

© Copyright protected

Z. THDi and THDv at the main distribution board section of each transformer (Point of Common Coupling) shall not exceed 10% with 8% individual harmonic order and 5% with 3% individual harmonic order respectively. Necessary supporting calculations based on actual nonlinear loads including VFD, UPS, lighting ballasts, etc. and all other linear loads on the same transformer shall be submitted for Engineer's approval. In case the specified harmonic limits cannot be achieved, the contractor is responsible for achieving the specified limits by providing necessary filters on MDB bus. Adopted solution shall be submitted for Engineer's approval prior to implementation.

AA. All main distribution boards shall be equipped with combined Class I + II surge protective devices as specified under Division W Section " Surge Protective Devices ". SPDs along with their fused-disconnect switch shall be integrated within or adjacent to the MDB's enclosure.

BB. Interface with Generator Synchronization Panel: emergency main distribution board (EMDB) of parallel generators are to be provided with necessary interfaces for connection to the generator synchronization panel. The outgoing circuit breakers of the EMDB are to be provided with electrical motor operators to allow for automatic ON/OFF operation of circuit breakers in accordance with a logic control program at the central control and monitoring management system, such as for load shedding.

CC. Digital multifunctional display unit (MFDU): shall be provided on the main incoming sections of the MDBs. Unit shall be microprocessor based and providing complete electrical metering (kW, kWh, kVA, kVar, power factor, frequency, current per phase, single and composite phase voltage, etc.). Communication to the PMU shall be via a recognized communication protocol. In addition to the above MFDU, 3 analog voltmeters and 3 analog ammeters shall be provided in all MDBs.

120.020 AIR-BREAK METAL ENCLOSED CIRCUIT BREAKER (ACBS)

A. Type: Enclosed in steel structure, air ventilated, air break, for normal operation at maximum temperature within enclosure at point of application, tested to approved standards, manually operated for normal functions, and automatically tripped under over-current conditions. Trip power shall be derived from main power circuit, with sufficient tripping energy to reliably trip circuit breaker. Fixed mounted circuit breaker shall be rear connected.

A. Construction: Manually or manually and electrically operated, as shown on the Drawings, with two-step, spring charged, stored energy mechanism, quick-make, quick-break type, electrically and mechanically trip-free, to prevent maintaining circuit breaker closed against over-current condition whether under manual or automatic operation. Electrically operated circuit breakers shall have integrally mounted, spring charging motor mechanism automatically recharged upon closing. Both manually or manually and electrically operated circuit breakers shall have mechanical built-in charging lever and shall include open and close direct acting push buttons. Stored energy provision shall allow open/close/open sequence of operation without use of external energy. Circuit breaker shall have arc-quenching device on each pole and replaceable arcing contacts.

B. Control Power: For electrically charged circuit breaker and/or for shunt trip device, where required, control power shall be 110V or 120V AC as recommended by the manufacturer obtained from in-built MDB control power transformer connected and fused on line-side of circuit breaker. Where shunt trip and/or under voltage release are required, a sufficient capacitor trip device to cover any temporary loss or excessive drop of supply voltage shall be provided.

C. Rating: 4-pole, with continuous current rating (frame size) as shown on the Drawings, ranging between 1600 A and 5000 A (1600, 2000, 2500, 3000, 4000 and 5000 A), fully rated (100%) for service under worst site conditions. Breakers shall be rated for a symmetrical rms service short-circuit breaking capacity as shown on the Drawings, to IEC 60947-2 sequence II (rated service short-circuit breaking capacity) at specified voltage and frequency, meeting IEC 60947-2, sequence I, II, III and IV tests (for circuit breakers of utilization category B), tested in an enclosure substantially the same as the enclosure in which they shall be installed.

D. Trip Unit: Totally enclosed, programmable, solid state device, interchangeable for compatible frame sizes, pluggable into front of circuit breaker, tamper-proof and with transparent, sealable cover. Trip unit shall measure sinusoidal and non–sinusoidal current wave forms (fundamental to thirteenth harmonic) by continuously sampling each phase through out every cycle. Trip unit shall be direct

© Copyright protected

acting trip device, current transformer operated, with flux transfer shunt trip that requires no external power. It shall have adjustable current setting (0.5 - 1.0 times trip unit rating) with adjustable long-time delay up to 24 seconds, short-time pick-up and short-time delay, earth-fault pick-up and time delay instantaneous over current pickup. Current setting range shall be by means of replaceable trip-units within the maximum frame size rating. Once removed, circuit breaker shall remain in the trip-free position. Earth-fault trip shall be adjustable, range 10% to 60% of normal current rating of the circuit breaker and a maximum of 1200A, with adjustable time delay between 0.1 and 0.5 seconds. Short time delay shall be adjustable in steps, 2 - 9 times current setting, with adjustable time delay having maximum delay of up to 0.4 seconds. Instantaneous trip shall be adjustable in steps at least 2 – 13 times the trip unit rating. Over-ride protection shall allow full sensitivity up to interrupting capacity of circuit breaker. Slight difference in setting ranges according to manufacturers standard products may be accepted subject to Engineer's approval.

E. Trip Unit Status Display: Shall indicate in words the status of normal breaker operation, long time over current pick up, instantaneous time over current trip, short time over current trip, ground fault trip. Unit shall have integral resetable counter to count long time, short time, instantaneous and ground fault trips.

F. Position Indicators: Positive with trip indication target. Target indicator shall be mechanical and shall give indication even when control power has been lost.

G. Trip unit shall have inputs from conventional potential transformers for every phase. Current sensors transformers for every phase. Current sensors shall be encased in epoxy filled plastic housing to protect against damage and moisture and shall be integrally mounted in breakers.

H. Neutral current transformer: Provide on the neutral conductor of each main, tie or outgoing circuit having earth fault protection, located after the link connecting neutral and earth busbars from load side. Rating and characteristics of the neutral current transformer shall be suitable for proper operation of the earth fault protection system.

I. Circuit breaker accessories shall include the following:

1. Padlocking or keylocking provisions for all positions (disconnected, test, connected, closing blocking, open)
2. Overload, short-circuit, and ground fault trip LEDS
3. Trip indicator and reset button
4. Operations counter.
5. On/off pilot lights.
6. Shunt-trip coil and closing solenoid for remote control.
7. Bell alarm for remote overcurrent trip indication.

J. Auxiliary Contacts: Include N.O. and N.C. contacts on switchgear as required for remote monitoring and control, plus 2 N.O. and 2 N.C. spare contacts.

K. Electrical Interlock: If electrical interlock is required between power air circuit breakers (as shown on the drawings), the mechanical closing button of the circuit breaker shall be disabled in the connect position and an additional electrical push button shall be provided for the closing of the circuit breaker through the breaker's shunt close coil. The electrical interlock shall be provided on both shunt trip and close coils of the circuit breaker in order to perform simultaneous tripping and inhibit closing functions on the interlocked breaker.

120.030 MOLDED CASE CIRCUIT BREAKERS (MCCBS)

A. Type: Tested to approved standards, , totally enclosed, molded case, constructed from high quality, high temperature resistant, tropicalized, molded insulating materials, for normal operation at maximum temperature within enclosures at point of application, and provided with front operated single toggle type handle mechanism for manual operation of main contacts in addition to automatic operation under over-current conditions. Multi-pole breakers shall have common integral trip bar for simultaneous operation of all poles. Ampere rating shall be clearly visible. All terminals shall be box lug or clamp type with set screws, suitable for copper or aluminum conductors.

A. MCCBs shall be 160 A minimum frame size, unless otherwise shown on the drawings.

© Copyright protected

B. MCCBs generally shall be thermal-magnetic type for ratings below 250 A frame size, unless otherwise shown on the Drawings. MCCBs 250 A and larger shall be electronic solid-state trip type. All circuit breakers shall be 3-pole unless otherwise shown on drawings.

C. Thermal magnetic circuit breaker trip units: shall have bi-metallic inverse time delay over-current element for small overloads and instantaneous magnetic over-current trip element for operation under short-circuit conditions on each pole. Circuit breakers rated 150/160 A shall have adjustable instantaneous trips.

D. Electronic trip circuit breakers shall have solid state trip units with long time delay setting range at least between 0.5 and 1.0 times maximum trip rating with adjustable time delay up to 24 seconds, short time delay range 3 to 10 times maximum trip rating with maximum clearing time of 0.2 seconds, and instantaneous protection adjustable from 5 to 10 times continuous rating. Solid state trip units shall be insensitive to changes in ambient temperature between -20 and +55 deg. C. Earth fault protection shall be provided or built into trip unit where specified or shown on drawings, and shall be adjustable between 0.2 and 0.6 normal phase current pick-up with maximum time delay of 0.2 seconds, and shall be suitable for connection to external current sensor. Push-to-trip button shall be provided on cover for testing the trip unit. Short time over current protection is only required for circuit breakers 630A and above.

E. Deration: Thermal and electronic over-current trips shall be ambient temperature derated at specified ambient temperature. In case of adjustable thermal settings, range of adjustment shall not exceed maximum trip rating shown on the Drawings. MCCB shall not be derated if the space where the switch boards are installed is air-conditioned.

F. Switching Mechanism: Quick-make, quick-break type, with positive trip-free operation so that contacts cannot be held closed against excess currents under manual or automatic operation. Contacts shall be non-welding silver alloy with approved arc-quenching devices of metallic grid construction.

G. Trip current rating (amps) indicates nominal maximum rating at which overload element is set to operate.

H. MCCBs: MCCBs frames rated 800 A and above shall have utilization category B (with an intended short time withstand capability), and shall have rated service short circuit breaking capacities (sequence II) with suitably selected frame sizes and trip ranges to meet the electrical requirements at the distribution panelboard location and schedules shown on the drawings, with declared ratings as percentage (100%, 75% or 50%) of the ultimate ratings as quoted by the circuit breaker manufacturer marked on the circuit breaker rating plate. MCCBs frames up to 630 A shall have utilization category A with rated ultimate short circuit breaking capacity (sequence III) to meet the electrical requirements at the switchboards locations.

I. Tripped Position: When tripped automatically by over current condition, operating mechanism of circuit breaker shall assume an intermediate position clearly indicated by the handle between on and off positions.

J. Interchangeable Trips: Thermal magnetic circuit breakers of 150/160 A frame size shall have interchangeable trip units.

K. Sealing: Non-interchangeable trip circuit breakers shall have sealed covers. Circuit breakers with interchangeable trips shall have trip unit covers sealed to prevent tampering.

L. Accessories: Circuit breaker design shall allow addition of open / close electrical motor operator, control and interlocking functions, under-voltage release, shunt-trip coils, alarm and auxiliary switches, padlocking devices, key-lock devices, and the like.

120.040 METERING INSTRUMENTS

A. Generally: Instruments shall be housed in enameled, square, metal cases for flush installation. Scales and markings shall be protected and sealed. Accuracy of instruments shall be within 2% unless otherwise specified.

A. Voltmeters: Moving iron type, with center zero adjuster, range 1.25 times nominal system voltage, 90 degree angle, size 76 x 76 mm.

© Copyright protected

B. Voltmeter Selector Switch: 7-position rotary type.

C. Ammeters: Moving iron type, with center zero adjuster, range 2 times nominal circuit amperage, 90 degree angle, size 76 x 76 mm.

D. Provide ammeters and pilot lights for each phase.

E. Provide p.f. meter moving iron type with center zero adjuster, size 76 x76mm.

F. Current Transformer (CT): Indoor dry type, rated secondary current 5 A. Rated primary current, core size and accuracy shall be determined in accordance with nominal current of plant protected, short-circuit level and burden.

G. Voltage Transformer (VT): Provide where required, complete with primary and secondary fuses and disconnecting device.

120.050 DIGITAL METERING UNITS

A. Metering unit shall be provided on the incoming and outgoing feeders having the following functions for each phase:

1. Voltage.
2. Current.
3. Frequency.
4. Energy.
5. Total power.
6. Peak power demand.

A. The metering unit shall be provided by adequate interface link with the BMS system.

120.060 DIGITAL VOLTAGE RELAY

A. This unit shall be provided on the incoming and coupler section to perform the following functions, for connection to the automatic transfer system and monitoring by BMS system:

1. Over-voltage (adjustable from 90 to 120%, with time delay adjustable from 0.5-5 Sec).
2. Under-voltage (adjustable from 75 to 95%, with time delay adjustable from 0.5-5 Sec).
3. Phase Voltage unbalance (detect voltage unbalances over 10%).
4. Phase reversal.

120.070 WIRING

A. Arrangement: Wiring shall be modularly and neatly arranged on master terminal boards with suitable numbering strips and appropriate cartridge type fuses where required.

A. Connections shall be made at front of terminal board and with no live metal exposed.

B. Metal cases of instruments, control switches, relays etc. shall be connected, by bare copper conductors not less than 2.5 mm2 section, to nearest earthing bar.

C. Control Wiring: Copper, PVC insulated, 85 deg. C, 600 V grade, and PVC sheathed for multi-core cables. Finely stranded copper conductor, silicon rubber insulated cables shall be used in proximity to higher temperature components and as flexible cable.

D. Ferrules: Wires shall be fitted with numbered ferrules of approved type at each termination.

120.080 MISCELLANEOUS

A. Anti-condensation heaters with disconnect switch and pilot lamp shall be provided in switchboard, controlled by thermostat and/or hygrostat.

A. Schematic and wiring diagram shall be provided suitably located within each cubicle.

© Copyright protected

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Related Sections include the following:

1. Division V Section "Basic Electrical Materials and Methods".
2. Division Y Section " Earthing And Bonding ".
3. Division Y Section "Low Voltage Electrical Power Conductors And Cables".
4. Division W Section " Surge Protective Devices ".
5. Division W Section " Central Control / Building Management ".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. ABB
2. Cutler – Hammer / Eaton Corp.
3. G.E.
4. Schneider Electric
5. Siemens
6. Schneider Electric / Square D

A. Locally assembled products by one of the above approved manufacturers are acceptable subject to compliance with design requirements and adequacy of reference list and quality control of the local factory.

100.030 PRODUCTS

B. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer with minimum five years of successful installation experience on projects utilizing main distribution boards units similar to those required for this project.

B. Manufacturer Qualification: A firm regularly engaged in the manufacture of main distribution boards, of types, sizes, and capacities required, and whose products have been in satisfactory use in similar service for not less than five years.

C. Compliance with Local Requirements: Comply with applicable local regulations/code requirements of authorities having jurisdiction. These will have precedence over other codes/standards nominated for the project, unless otherwise approved in writing.

D. Product Selection for Restricted Space: Drawings indicate maximum dimensions for main distribution boards, including clearances between main distribution boards, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

© Copyright protected

100.040 DELIVERY, STORAGE AND HANDLING

A. Deliver in sections of lengths that can be moved past obstructions in delivery path.

B. Deliver, store, and handle materials, components, and equipment as per Manufacturer's instructions.

100.050 COORDINATION

C. Coordinate layout and installation of main distribution boards and components with other construction and electrical work, including conduit, piping, equipment, adjacent surfaces, raceways, electrical boxes and fittings, and cabling/wiring work. Maintain required workspace clearances and required clearances for equipment access doors and panels.

D. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division E Section " Accessories Cast Into In Situ Concrete."

100.060 WARRANTY

E. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

100.070 SPARE PARTS AND EXTRA MATERIAL

F. Spare Parts: Provide manufacturer's recommended spare parts for emergency replacement and/or one year's maintenance including, but not limited to, the following:

1. One set of fixed and moving contacts for every type of replaceable (consumable) contact set.
2. One operating motor and/or coil for each type of electrically operated circuit breaker.
3. Two sets of each type of indicating lights, fuses, LEDs, control switches, and similar devices subject to failure or breakage at any time.

G. Tools and Instruments: Provide tools and instruments required for normal routine inspection and maintenance and testing of circuit breakers and protective devices as appropriate for type of switchgear supplied.

320.000 SUBMITTALS

A. Product Data: Submit for approval detailed description of main distribution boards including all components supported by manufacturer's catalogues, indicating compliance with the Standards specified under "Quality Assurance" Article, equipment characteristics, details of construction, operating data, dimensions and weights etc. Give details of miscellaneous items including incoming and outgoing feeder terminal arrangement, connections at busbars, isolating, earthing, interlocks, control devices, indicating and metering instruments etc. Boards shall be factory assembled and tested and shipped as complete package (s).

A. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Plans and elevations with indication of built-on equipment, exact dimensions, and weights.
2. Arrangement of boards inside rooms allocated, indicating spaces and clearances.
3. Arrangement of equipment inside board.
4. One-line diagram of power system showing current ratings of switchgear and busbars and types and locations of protective gear (relays, instruments, CTs, VTs etc.)
5. Schematics and wiring diagrams of control circuits. Differentiate between manufacturer-installed and field-installed wiring.
6. Foundation details and grouting holes installation details.
7. Arrangement of incoming and outgoing feeders, terminal fittings, instruments, busbar connections etc.
8. Utility Company's metering provisions with indication of approval by utility company.

© Copyright protected

B. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

C. Technical Literature: Submit the following for approval prior to placing orders for equipment manufacture:

1. Schedule of circuit breakers application, indicating type, range, features and characteristics, short- circuit ratings, time-current curves etc.
2. Method of setting of protective devices for overload, short-circuit and earth-fault currents as coordinated with upstream and downstream systems based on specific coordination curves of protective devices used and specific calculated prospective short-circuit currents at various points.
3. Test methods on site and references, including testing equipment for microprocessor controlled trip units.

D. Qualification Data: For firms and persons specified in "Quality Assurance" Article. Provide evidence of applicable registration or certification.

E. Tests and Certificates: Submit complete certified manufacturer's type and routine test records, in accordance with the Standards specified in "Quality assurance" Article.

F. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

G. Manufacturer's field service report.

H. Maintenance Data: For main distribution boards and components to include in maintenance manuals specified in Division 01. In addition to requirements specified in Division 01 include the following:

1. Routine maintenance requirements for main distribution boards and all installed components.
2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
3. Time-current curves, including selectable ranges for each type of overcurrent protective device.

I. Coordination Study: Submit coordination study along with setting of protective devices for overload, short-circuit and earth-fault currents as coordinated with upstream and downstream systems based on specific coordination curves of protective devices used and specific calculated prospective short-circuit currents at various points.

330.000 EXECUTION

330.010 EXAMINATION

A. Examine elements and surfaces to receive main distribution boards for compliance with installation tolerances and other conditions affecting performance. Notify Engineer in writing of conditions detrimental to proper completion of the work.

A. Proceed with installation only after unsatisfactory conditions have been corrected.

330.020 INSTALLATION

A. Install main distribution boards as indicated, in accordance with manufacturer's written instructions, and with recognized industry practices; complying with applicable requirements of applicable standards or codes approved.

A. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and equipment manufacturers' drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.

© Copyright protected

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from main distribution board units and components.

C. Cable Trenches: Ensure that trench construction and covers provided for installation of power and control cables are in accordance with approved shop and construction drawings.

D. Built-in Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which shall be built into concrete foundations, bases, cable trenches or building structure are provided as and when required and that they are properly installed.

E. Equipment: Install on concrete bases etc., and assemble completely plumb and level, before grouting in holding-down bolts.

F. Supports and Terminations: Install all incoming and outgoing cable supports, cable ends and termination fittings required for power and control cables.

G. Relays: Set in accordance with manufacturer's instructions and in accordance with an approved scheme.

H. Make Good damage painted surfaces, clean and apply rust-inhibiting prime coat and two finishing coats of approved enamel upon delivery of equipment to site, or as required by Engineer.

I. Operating Instructions: Frame and mount the printed basic operating instructions for main distribution boards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of main distribution boards.

330.030 FACTORY ACCEPTANCE TEST

A. Factory acceptance tests of equipment under this Contract are subject to be witnessed by the Engineer for locally assembled equipment. Witness test shall include complete routine and function testing on all units to be witnessed. Test procedure and program shall be submitted for approval prior to test conduction. Allow for test expenses including business class transportation and hotel accommodation as necessary for two persons from the Engineer's/ Employer's side.

330.040 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division V Section "Basic Electrical Materials and Methods."

A. Main Distribution Board Nameplates: Label each main distribution board compartment with engraved metal or laminated-plastic nameplate mounted with corrosion-resistant screws.

330.050 CONNECTIONS

A. Install equipment-grounding connections for main distribution boards with ground continuity to main electrical ground bus.

A. Tighten electrical connectors and terminals, including screws and bolts, according to manufacturer's published torque-tightening values and / or recommendations. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

330.060 FIELD QUALITY CONTROL

A. Equipment: Inspect equipment upon delivery to Site and report any damage to Engineer.

A. Switchgear: Inspect and check switchgear for completeness, component ratings, types, sizes, and wiring connections. Check phasing of busbars, contacts and clearances.

B. Prior to energization of circuitry, check all accessible connections to manufacturer's torque tightening specification.

C. Tests: After installation and before hand-over, carry out all visual and mechanical inspection and electrical tests required by the governing codes and any other tests the Engineer may require to check compliance of installation with the Specification, including, but not limited to, the following.

© Copyright protected

Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

1. Insulation resistance tests for each main distribution board bus, component, connecting supply, feeder, and control circuit.
2. Continuity tests of each circuit.
3. Operational tests.

D. Main and Control Circuits: Using 1000 V megger (2000 Megohm range), check insulation resistance between phases, between phases and earth/enclosure and between neutral and earth.

E. Primary Injection Tests: Provide portable test equipment to test time-delay characteristics of circuit breakers by simulating an overload or fault condition. Measure and record all test results and ambient conditions and compare with manufacturer's data.

F. Instantaneous Trip Elements: Test by high current primary injection, using high-current primary injection test-sets and reports all readings.

G. Routine Tests on Site: Carry out on every main distribution board in accordance with the Standard specified (IEC 61439-1 and IEC 61439-2) for FBAs assembled from standardized components outside the works of the manufacturer. Routine tests are also to be carried out on every FBA, delivered to site, if requested by Engineer.

330.070 CLEANING

A. On completion of installation, inspect interior and exterior of main distribution boards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

330.080 ADJUSTING

A. Set field-adjustable switches and circuit breaker trip ranges.

330.090 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

Y71B - PANELBOARDS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. Panelboards for distribution and sub-distribution of electric power and for protection of circuits, including fixing and supporting materials and materials for termination of feeders, sub-circuits and branch circuits for the following types:

1. Lighting and appliance branch-circuit panelboards.
2. Distribution panelboards.
3. Feeder pillars for power distribution and external lighting.

B. Connection to BMS system, including interface elements such as relays, transducers, etc. as detailed in Division W Specification Sections BMS schedules and /or shown on the Drawings.

110.000 DESIGN PARAMETERS

110.010 DEFINITIONS AND ABBREVIATIONS

A. MCB: Miniature circuit breaker.

B. MCCB: Molded case circuit breaker.

C. LP, PP, SDP: Final branch circuit panelboards, power panelboards and sub-distribution panelboards respectively, for secondary lighting and power distribution with either miniature circuit breaker (MCB) or molded case circuit breaker (MCCB) protection on sub-feeder or branch circuits, as shown on the Drawings.

D. DP: Distribution panelboards for power distribution with MCCB protection on main incoming and outgoing feeder circuit breakers Type 1 or Type 2.

E. Distribution panelboards or final branch circuit panelboards supplied from emergency source are prefixed with the letter “E” if supplied from emergency source, and with letter “U” if supplied from UPS source. Isolated power panels shall be identified as “IPP”.

F. ELCB: Earth leakage circuit breaker.

G. RMS: Root mean square.

110.020 REFERENCE STANDARDS

A. Comply with

1. IEC 61439-1 & IEC61439-2 "Low Voltage Switchgear and Control Gear Assemblies".
2. IEC 61439-3 "Low Voltage Switchgear and Control Gear Assemblies - Distribution boards intended to be operated by ordinary persons (DBO)".
3. IEC 60947-1 "Low Voltage switchgear and control Gear- General Rules".
4. IEC 60947-2 "Low Voltage switchgear and control gear - circuit breakers".
5. IEC 60947-3 "Low Voltage switchgear and control gear - Switches, disconnectors, switch-disconnectors and fuse-combination units circuit breakers".
6. IEC 60947-4-1 "Low Voltage switchgear and control gear - Contactors and motor-starters — Electromechanical contactors and motor-starters".
7. IEC 60898-1 "Miniature circuit breakers".
8. IEC 61009 "Residual current operated circuit-breakers with integral overcurrent protection for household and similar uses (RCBOs)".
9. Other components where not specified shall comply with the relevant IEC standards.

© Copyright protected

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REQUIREMENTS

A. Rated insulation voltage shall be in accordance with the respective standards.

B. Panelboards shall be totally enclosed, dead front type, protection code IP 31 for indoor installations, IP54 for installations in wet areas and IP 55 for outdoor installations, in accordance with IEC 60529, and shall be factory designed and assembled.

C. Earthing bar shall be half size the phase busbars.

D. Neutral bar shall be sized as the phase bus bars.

E. Protection shall be fully rated throughout the systems.

F. Circuit breakers shall be non-fused type.

G. Circuit Breaker Arrangement: Panelboards shall have one main incoming circuit breaker or switch and the required number of branch circuit breakers, arranged as shown on the schedules, including spare circuit breakers and spaces for future expansion. Three-phase panelboards shall be designed for sequence phase connection of branch circuit devices.

H. Branch Circuit Numbering: On 3-phase panelboard schedules, circuits 1 and 2 shall be connected to brown (BN) phase, 3 and 4 to black (BK) phase, 5 and 6 to grey (GY) phase etc., to conform with branch circuit numbering shown on the drawings.

I. Spare capacity: Provide a minimum of 20% spare circuit breakers capacity for all types of panelboards.

J. Terminal blocks: shall have current and voltage ratings appropriate for the application.

120.020 PANELBOARD ENCLOSURES

A. Type: General purpose type, suitable for relevant ambient conditions, flush or surface mounted as shown on the drawings, comprising box, trim, or trim and door to approved manufacturer's standards and sizes.

B. Construction: Box, trim and doors where required, shall be Electro-galvanized sheet steel of gauges not less than specified and in accordance with the standards. Welded joints shall be galvanized after manufacture. Gutter spaces shall conform to the standards, adequate for the utilized cables/wires subject to the Engineers' approval and in no case less than 100 mm on all sides. Enclosure shall have pre-designed angles or threaded end studs to support and adjust mounting of interior panelboard assembly.

C. Trims shall cover and overlap front shield, covering all terminals and bus compartments, to form a dead front panel. Trims shall be fixed to cabinet/box by quarter-turn clamps engaging flange of box (use of screws engaging holes in flange of box is not acceptable). Screws where used shall be oval-head, countersunk and flush. Trims for flush mounted panelboards shall overlap box and front shields by at least 20 mm. Trims for surface mounted panelboards shall be exactly sized to form flush fit to box.

D. Doors shall have concealed hinges integral with trim, and flush combination cylinder lock and catch. Doors over 1000 mm high shall have vault-type handle and multiple point latch mechanism. Locks shall be keyed alike.

E. Finish: Inner and outer surfaces of cabinet/boxes, trims, doors etc. Shall be cleaned, phosphatized, chrome passivated and treated with final thermosetting epoxy powder modified by polyester resins providing high resistance to mechanical injury, heat, acid and alkali solvents, grease, aging and corrosion and of standard gray color to the approval of Engineer.

F. Directories under glassine, or an approved alternative durable arrangement, shall be provided on inside face of doors, or in metal label holders when trim without doors are specified. Directories shall be typed to identify panelboards and clearly indicate circuit number and description of load.

© Copyright protected

G. Outdoor enclosures shall be heavy duty sheet steel cabinets, suitable for mechanical impact resistance of IK10 to IEC 62262, fully weatherproofed (IP 54), without knockouts, but with removable sealed/gasketed bottom gland plates and gasketed doors.

H. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

120.030 BUSBARS

A. Type: One piece, 98% pure electrolytic copper, tin-plated, based on total maximum operating temperature of 90 deg C at any point of the bus, at full continuous rating. Bolted or clamped contact surfaces shall be properly tin or silver plated as necessary, and shall have maximum current density not exceeding requirements of the approved standards. Aluminum shall not be used for busbars or panelboard parts.

B. Design: Busbars shall be rigidly designed so that branch circuit devices can be removed without disturbing adjacent units or changed without additional machining, drilling or tapping. Busing shall be full size without reduction. Busing and blank plates shall allow installation of future circuit devices, where indicated on the drawings.

C. Main horizontal busbars and vertical distribution busbars shall be insulated unless bare busbars are recommended by the manufacturer and used in the type test.

D. Rating: Busbar rating shall be at least equal to main-circuit breaker frame size. Where no main circuit breaker is required, busbars shall have main lugs or disconnect switch, with nominal rating equal to 1.25 times the up stream circuit breaker trip rating, and as shown on the drawings.

E. Short-circuit Duty: Busbars shall carry at least 125% of the maximum short-circuit level at point of application for one second, without showing any signs of degradation.

F. Terminals and connections shall be anti-turn, solder-less screw-pressure type. Screws and bolts used for making copper/copper connections shall be hard copper alloy with lock washers (riveted bus connections are not acceptable).

G. Neutral bar shall be solid and fully insulated from cabinet or box. One solder-less box type set-screw connector shall be provided for neutral wire of each branch circuit and one bolted clamp-type connector or anti-turn lug with set-screw for main incoming neutral wire. Neutral shall be fully sized and rated as for phase busbars.

H. Earthing bar shall be copper, brazed to panelboard cabinet, with bolted pressure connector for main conductor and one set-screw-type tunnel terminal for each outgoing conductor, to provide secure and reliable contact with all metal parts and enclosure.

120.040 MOULDED CASE CIRCUIT BREAKERS (MCCBS)

A. Type: Tested to approved standards, , totally enclosed, molded case, constructed from high quality, high temperature resistant, tropicalized, molded insulating materials, for normal operation at maximum temperature within enclosures at point of application, and provided with front operated single toggle type handle mechanism for manual operation of main contacts in addition to automatic operation under over-current conditions. Multi-pole breakers shall have common integral trip bar for simultaneous operation of all poles. Ampere rating shall be clearly visible. All terminals shall be box lug or clamp type with set screws, suitable for copper or aluminum conductors.

B. MCCBs shall be 160 A minimum frame size, unless otherwise shown on the drawings.

C. Circuit Breaker Trip Units: Unless otherwise specified or shown on the drawings, moulded case circuit breakers of final branch circuit panel boards (LPs), power panel boards (PPs) and sub-distribution panel boards (SDPs) shall be thermal magnetic type, while moulded case ciruit breakers of distribution panel boards (DPs) shall be thermal magnetic for frame sizes up to 160 amperes and electronic type for higher frame sizes.

D. Thermal magnetic circuit breaker trip units: shall have bi-metallic inverse time delay over-current element for small overloads and instantaneous magnetic over-current trip element for operation under short-circuit conditions on each pole. Circuit breakers rated 150/160 A shall have adjustable instantaneous trips.

© Copyright protected

E. Deration: Thermal and Electronic over-current trips shall be ambient temperature derated at specified ambient conditions and corresponding temperature within the enclosures. MCCB shall not be derated if the space where the panels are installed is air-conditioned.

F. Electronic trips units, applicable to circuit breakers 250 A frame size and larger, shall be solid state with long time delay settings between 0.5 and 1.0 times maximum trip rating, short time delay range of 3 to 10 times maximum trip rating with a maximum clearing time of 0.2 seconds, and instantaneous protection adjustable from 5 to 10 times continuous rating. Solid state trip units shall be insensitive to changes in ambient temperature between -20 and +55 deg C. Earth fault protection shall be built into trip unit where specified, and shall be suitable for connection to external current sensor. Push-to-trip button shall be provided on cover for testing the trip unit. Short time over current protection is only required for circuit breakers 630A and above.

G. Switching Mechanism: Quick-make, quick-break type, with positive trip-free operation so that contacts cannot be held closed against excess currents under manual or automatic operation. Contacts shall be non-welding silver alloy with approved arc-quenching devices of metallic grid construction.

H. Trip current rating (amps) indicates nominal maximum rating at which overload element is set to operate.

I. MCCBs for LPs, PPs, SDPs, DPs Type 2 and feeder pillars: Comply with IEC 60947-2 test sequences I, II, utilization category A, and shall have rated ultimate short circuit breaking capacities (sequence III) to meet the electrical requirements at the panelboard location, with preferred ratings in accordance with following tables.

J. MCCBs for DP Type 1: MCCBs frames rated 800 A and above shall have utilization category B (with an intended short time withstand capability), and shall have rated service short circuit breaking capacities (sequence II) with suitably selected frame sizes and trip ranges to meet the electrical requirements at the distribution panelboard location and schedules shown on the drawings, with declared ratings as percentage (100%, 75% or 50%) of the ultimate ratings as quoted by the circuit breaker manufacturer marked on the circuit breaker rating plate. MCCBs frames up to 630 A shall have utilization category A with rated ultimate short circuit breaking capacity (sequence III) to meet the electrical requirements at the panel boards locations with preferred ratings in accordance with the below tables.

K. Frame size is defined as maximum continuous current rating of circuit breaker which corresponds with its maximum trip range listed below and which shall be related to minimum acceptable short-circuit interrupting ratings, based on fully rated interrupting duties: normal duty (N), high break (H), or current limiting (L), as specified.

L. Frame sizes are generally to be selected with minimum interrupting capacities at specified voltages and rated frequency, in accordance with the following table:

Trip range frame size(amperes)	Minimum Symm. rms rated breaking capacity (ultimate in kA)			Rating volts(A.C.)
	N	H	L	
Thermal-magnetic				
15-100 or 160 (1,2p)	18	-	-	230
15-100 or 160 (2,3,4p)	18	-	-	400
15-160 (2,3,4p)	35	60	100	400
Electronic				
100-250 (2,3,4p)	35	60	150	400
160-400 (3,4p)	35	60	150	400
250-630 (3,4p)	40	60	150	400
320-800 (3,4p)	50	60	150	400
500-1250 (3,4p)	50	70	150	400

© Copyright protected

M. Tripped Position: When tripped automatically by over-current condition, operating mechanism of circuit breaker shall assume an intermediate position clearly indicated by the handle between on and off positions.

N. Interchangeable Trips: Thermal-magnetic trip circuit breakers of 150/160 A frame size shall have interchangeable trip units.

O. Sealing: Circuit breakers with non-interchangeable trip units shall be sealed. Circuit breakers with interchangeable trip units shall have trip unit covers sealed to prevent tampering.

P. Accessories: Circuit breakers shall be designed to accommodate standard attachments including shunt-trip, under-voltage release, combined auxiliary and alarm switches, and open / close electrical motor operator to any circuit breaker of rating (frame size) 100 A and over. Padlocking devices shall be provided, where shown on the Drawings.

Q. Residual current operated circuit-breakers with integral overcurrent protection (RCBOs) type A to IEC 61009 are provided as add-on or built-in earth leakage accessories, where required and as shown on the Drawings. Protection against earth fault current, in addition to over-current and short-circuit protection, shall be in accordance with the Regulations. Trip current sensitivity on breakers for branch circuits shall be as shown on the Drawings, and for main breakers ratings shall be as shown on the Drawings. Circuit breakers shall include current transformer with tripping coil assembly, test button and trip free mechanism to ensure circuit breaker cannot be held closed against earth faults.

R. Current Limiting Circuit Breakers: Molded case type without fusible elements. When operating within current limiting range, the I^2t of let-through current shall be less than 1/2 cycle wave of symmetrical protective short-circuit current as compatible with breaker construction.

S. Current limiting circuit breakers shall have, on each pole, adjustable inverse time-delay over-current characteristics for overload protection and instantaneous trip for short-circuit protection. Operation of main contacts shall be based on Electro-magnetic repulsion forces between contacts created by fault current. Ratings are specified at rated voltage for an rms value of prospective short-circuit current.

120.050 MOLDED CASE SWITCHES (MCSS)

A. Molded Case Switch: Similar to circuit breakers but without overload/short circuit protection. Short time rating of switches shall not be less than twelve times the maximum rated operational current for 1 second. Switches shall comply with IEC 60947-3. Switches shall have utilization category AC-22B to IEC 60947-3.

120.060 MINIATURE CIRCUIT BREAKERS (MCBS)

A. Type: Thermal magnetic non-adjustable type, tested in accordance with IEC 60898-1.

B. Minimum short-circuit breaking capacities to IEC 60898-1shall be as follows:

1. 6 - 125A MCB :

10 or 15 kA at 220/240 - 380/415 V A.C.

C. Construction: MCBs shall be tropicalized for operation at ambient temperatures up to 70 degree C within panelboard enclosure and humidity up to 95%, and shall be constructed from high quality, high temperature, molded insulating materials. Guaranteed duties and characteristics shall be submitted for temperatures at and above 40 deg C.

D. MCBs and combination devices shall be modular, of unified profile and suitable for mounting either to a standard din rail, or a plug-in system.

E. Operation: Under overload conditions, thermal tripping shall provide close protection of insulated conductors. Under short-circuit conditions, magnetic trip shall operate at 5 - 10 times normal rated current (Curve C). Magnetic operation shall be in the current limiting region and opening time shall not exceed 5 milliseconds.

F. Ratings: Preferred rated currents shall be 6, 10, 15, 20, 25, 30, 40, 50, 60, 80, 100 and 125 A, calibrated at 40deg.c, available as 1, 2, 3 and 4-pole circuit breakers. De-rating above 40 deg C shall not exceed 1% per deg C and loading shall not exceed 70% of circuit breaker rating.

© Copyright protected

G. Residual current devices for earth leakage protective circuit breakers shall be add-on devices, or built-in and integral with the standard circuit breaker. Non-adjustable sensitivities of 30 mA, 100 mA and 300 mA shall be available for all ratings of 2-pole and 4-pole circuit breakers.

H. Auxiliaries where shown on the drawings, shall include alarm switch, auxiliary switch, shunt trip, under voltage trip and similar units which shall be modular additions to the circuit breakers.

120.070 DISTRIBUTION PANELBOARDS (DP)

A. DP Type 1: Form 2b to IEC 61439-1&-2, and have a minimum rated insulation voltage of 750V and with 8 kV impulse withstand voltage, free standing , with doors (unless otherwise shown on the Drawings), suitable for ratings of main breaker and busbars ranging from 630 A to 1250 A, 3-phase, 4-wire (or 3-wire where specifically indicated), suitably and orderly arranged for any selected combination of branch MCCBs ranging from 150/160 A to 1250 A frame size and short-circuit interrupting ratings as shown on the Drawings. Circuit breakers smaller than 250 A frame size, where indicated, may be grouped on an integral sub-assembly mounted to main chassis.

B. DP Type 2: Form 2a to IEC 61439-1&-2, and have a minimum rated insulation voltage of 690V and with 8 kV impulse withstand voltage. Panelboard shall be recessed or surface mounted type, as shown on the Drawings, complete with trim and door, adjustable trim fixation for flush panels, and with ratings of main circuit breaker and busbars up to 400 A, 3-phase, 4-wire, with 2 or 3-pole branch circuit breakers, 100 A or 150/160 A or 250 A frame size.

C. Circuit breakers for DP's shall be fitted with a plug-in base type of modular construction complete with its accessories; non draw-out type.

D. Construction: Sheet steel, for cabinet/box; suitable for mechanical impact resistance of IK10 to IEC 62262 for enclosures protection degree IP54 and higher and IK08 to IEC 62262 for enclosures protection degree lower than IP54. Test certificates for mechanical impact shall be submitted for approval; otherwise enclosure thickness shall not be less than 1.5mm. Fronts shall be single or twin covers to shield circuit breakers, terminals and live ends.

E. All distribution panelboards shall be equipped with Class II surge protective devices as specified under Division W Section "Surge Protective Devices ". SPDs along with their fused-disconnect switch shall be integrated within or adjacent to the DP's enclosure.

F. Interior of panelboard shall be pan assembly consisting of galvanized sheet steel chassis , folded, flanged and reinforced, with busbars vertically arranged and mounted on molded insulators.

G. Molded insulators shall have minimum temperature rating of 130 deg C and insulation grade of 3.5 kV for one minute.

H. Circuit breakers shall be mounted in twin arrangement (except for larger circuit breakers) and bolted rigidly to copper cross and center bus connectors.

I. Metering Instruments: Instruments shall be housed in enameled, square, metal cases for flush installation. Scales and markings shall be protected and sealed. Accuracy of instruments shall be within 2% unless otherwise specified.

1. Voltmeters: Moving iron type, with center zero adjuster, range 1.25 times nominal system voltage, 90 degree angle, size 76 x 76 mm.
2. Voltmeter Selector Switch: 7-position rotary type.
3. Ammeters: Moving iron type, with center zero adjuster, range 2 times nominal circuit amperage, 90 degree angle, size 76 x 76 mm.
4. Ammeter Selector Switch: 4-position rotary type.
5. Provide ammeters and pilot lights for each phase.
6. Current Transformer (CT): Indoor dry type, rated secondary current 5 A. Rated primary current, core size and accuracy shall be determined in accordance with nominal current of plant protected, short-circuit level and burden.
7. Voltage Transformer (VT): Provide where required, complete with primary and secondary fuses and disconnecting device.

© Copyright protected

120.080 FINAL BRANCH CIRCUIT, POWER AND SUB-DISTRIBUTION PANELBOARDS - GENERALLY

A. Arrangement: Comprise set of homogeneous branch circuit breakers with unified profile and base, and one main circuit breaker or switch as shown on drawings. Single and multi-pole circuit breakers or other devices shall occupy modular spaces. Accommodation of contactors and split-bus arrangement or other devices shall not change regularity of standard box width.

B. Indoor Enclosure: Sheet steel, minimum 0.8 mm thick for box/cabinet and minimum 1.5 mm thick for front shield, trim and door. Fixings for flush trim shall be adjustable to allow for mis-alignment between box and wall surface. Wiring spaces (gutters) shall be at least 100 mm wide. Larger gutters shall be provided where tap-off insulated split connectors are required. Knockouts shall be provided in top or bottom of enclosures and shall provide a neat and uniform conduit/cable terminal arrangement.

C. Contactors: 2 or 3-pole, Electro-magnetic type, class AC 5a for discharge lamps, class AC 5b for tungsten halogen lamps and class AC 3 for motors to IEC 60947-4, and rated not less than overload setting of protective device upstream. Contacts shall be double break, silver cadmium plated, having self-cleaning wiping action. Control shall be provided by phase-neutral (maximum 230 V) split-coil, for on/off activation by local and/or by remote direct-wired, on/off push buttons. Contactor shall be mechanically latched. Control circuit shall be fused. Auxiliaries shall include local pilot light, parallel remote indicating circuit, 2 N.O. and 2 N.C. auxiliary contacts.

D. All final branch circuits feeding sensitive electronic equipment such as: electronic equipment and telecom racks shall be equipped with class III surge protective devices as specified under Division W Section "Surge Protective Devices ". SPDs along with their fused-disconnect switch shall be integrated within the panelboard’s enclosure.

120.090 FINAL BRANCH CIRCUIT, POWER AND SUBDISTRIBUTION PANELBOARDS - TYPE MCCB

A. Type: Rated insulation voltage rating 690V as a minimum. single-phase and neutral (SPN) or 3-phase and neutral (TPN), with bolted 1, 2, or 3-pole MCCBs on branch circuits and 2, 3 or 4-pole MCCB on main incoming.

B. Branch circuit breakers shall be 1, 2 or 3-pole, rated 100 A frame size, with trip ratings between 15 A and 100 A, and compatible ICs, selected from normal (N), high-break (H) or current-limiting (L) range.

C. Main incoming circuit breaker shall be 100 A or 160 A frame size as shown on the drawings, with trip ratings and fully rated non-current limiting ICs of normal (N) or high-break (H) ranges, with or without residual current device (RCBO) as indicated on the Drawings.

D. Assembly: Busbars shall be rigidly fixed on molded insulators to back pan in vertical arrangement. Branch circuit breakers shall be bolted in twin arrangement to rigid copper cross and center bus connectors. Back pan assembly shall be removable and fixed to four threaded studs integral with cabinet.

120.100 FINAL BRANCH PANELBOARDS - TYPE MCB

A. Type: Rated insulation voltage rating of 500V as a minimum.

B. Internal Assembly: Comprise removable back plate or back pan of rigid construction, attached to enclosure by four captive screws through keyhole fixings, and provided with DIN rails in horizontal arrangement for SPN panels and in vertical arrangement for TPN panels. Assembly shall be complete with neutral terminal block, earthing bar and one piece insulated bolt-on/comb-type phase busbar. Busbars shall be single-phase or 3-phase with spade connectors for fixing by tightening a single screw on circuit breaker. Insulation shall be high thermal rating, capable of carrying maximum short-circuit current for one second without overheating beyond acceptable limits required by the Standards. Panelboards shall comply with IEC 61439-3.

C. Internal Assembly: Comprise removable back plate or back pan of rigid construction, attached to enclosure by four captive screws through keyhole fixings, and provided with busbars in horizontal arrangement for SPN panels and in vertical arrangement for TPN panels. Assembly shall be

© Copyright protected

complete with neutral terminal block, earthing bar and one-piece insulated phase busbar. Busbars shall be single-phase or 3-phase with spade connectors for fixing by tightening a single screw on circuit breaker. Insulation shall be high thermal rating, capable of carrying maximum short-circuit current for one second without overheating beyond acceptable limits required by the Standards.

D. SPN type panelboards shall be suitable for 240 V maximum service voltage, single-phase and neutral, with MCBs on branch circuits and main incoming.

E. SPN type main circuit breaker shall be double-pole MCB, with or without earth leakage device (RCBO), as shown on the Schedules.

F. Single-pole and double-pole MCBs for 240 V service, shall have trip ratings between 6 A and 125 A, with ICs as required in the Schedules.

G. TPN type panelboards shall be suitable for up to 415 V A.C. maximum service voltage, 3-phase and neutral, with MCBs on branch circuits and 3 or 4-pole MCCB or MCS main incoming, as shown in the Schedules or on the Drawings.

H. Triple-pole branch circuit breakers shall have trip ratings between 6 A and 125 A, with IC as required in the Schedules.

I. TPN type panelboard main circuit breakers shall be MCCB or MCS as shown on the drawings, 100A or 160A frame size as shown on the Drawings, with trip range from 32 A to 160A, normal (N) or high-break (H) duty with/without RCBO as shown on the Drawings.

J. Short-circuit Rating: TPN panelboards may only have integrated equipment (series) short-circuit ratings in accordance with clause paragraph F of Article 120.010 "GENERAL REQUIREMENTS" hereof.

120.110 FINAL BRANCH CIRCUIT PANELBOARDS; SPLIT-BUS MCCB/MCB TYPES

A. Assembly shall be as specified for MCB or MCCB type of branch circuit panelboard, but with split-bus arrangement, part of which is controlled by in-built submain circuit breaker or circuit breaker and contactor for group control of a number of branch circuits. Panelboard shall have main circuit breaker for protection and isolation.

120.120 FEEDER PILLARS FOR POWER DISTRIBUTION AND EXTERNAL LIGHTING

A. Low voltage feeder pillars shall comply with IEC 61439-1 and IEC 61439-5.

B. Type: Rated insulation voltage rating 690V as a minimum. 3-phase and neutral (TPN), with bolted 1, or 3-pole MCCBs on outgoings and 3-pole MCCB on main incoming.

C. Construction: the feeder pillar shall be totally enclosed, dead front type, fully self-contained, dust-proof, weather proof and suitable for mounting outdoors exposed to dust, rain and sunlight with IP55 degree of protection to IEC 60529.

D. Cabinets: Reinforced free standing structure with high mechanical impact resistance IK10 to IEC 62262, manufactured from 2 mm nominal thickness galvanized sheet steel, electrostatically powder coated and corrosion resistant internally and externally. Feeder pillars shall be provided with bolted reinforcement corner construction and shall be of the dwarf type with a bolting down root for mounting on a pre-formed concrete base suitable for all incoming and outgoing cables from below ground level directly buried or in a duct system. Feeder pillars shall have suitable extension cable box for cable entry from below. Cabinets shall have two hinged lockable opening doors to provide full front access to the cabinet and shall be sized according to the equipment being installed. The roof of the cabinet shall be slanted and shall have water drip edges.

E. Lighting Contactors: 2 or 3-pole, Electro-magnetic type, class AC 5a for discharge lamps or AC 5b for tungsten halogen lamps to IEC 60947-4, and rated not less than the frame size of the upstream protective device. Contacts shall be double break, silver cadmium plated, having self-cleaning wiping action. Control shall be provided by phase-neutral (maximum 230 V) split-coil, for on/off activation by local and/or by remote direct-wired, on/off push buttons. Contactor shall be mechanically latched. Control circuit shall be fused. Auxiliaries shall include local pilot light, parallel remote indicating circuit, 2 N.O. and 2 N.C. auxiliary contacts.

© Copyright protected

F. Internal Cabling: PVC/PVC single core 600/1000 volt grade with copper conductors and rated as required taking into account manufacturers recommended temperature and bunching derating factors. All internal wiring shall be suitably laced or clipped.

G. Control: LV panel circuits serving the street and outdoor lighting shall be supplied through triple pole contactors which shall be photo-electric, timer controlled along with BMS control, where shown on the Drawings. The contactors shall be operated through either timer or photoelectric cell or remote signal from BMS. An over-ride facility shall be provided for maintenance.

H. The photo-electric relays shall be solid state, with single-pole, double-throw dry contacts rated to operate connected relay or contactor coils or microprocessor input, with light level monitoring ranging from 0 to 37000 lux, with an adjustment for turn-on/turn-off levels and with time delay to prevent false operation. Relays shall have weathertight housing, resistant to high temperatures and equipped with sun-glare shield and ice preventer. Relays shall be adjusted to switch on lights when the daylight illumination reduces to 70 lux, unless otherwise required by the Engineer.

I. Timers shall be solid-state programmable units with alphanumeric display and have the following features:

1. Astronomic dial.
2. Two contacts, rated 30-A unless otherwise indicated.
3. Two pilot-duty contacts, rated 2-A unless otherwise indicated.

J. Feeder pillars shall have a 50 mm x 6 mm full length high conductivity copper main earth bar for grounding purposes complete with test.

K. A distribution diagram shall be permanently fixed to the inside of the door showing all circuit connections, MCCB ratings, cable sizes and references, etc.

L. Feeder pillars shall be vandal proof and secured against unauthorized access by means of wedge locks protected by brass plugs and operated by a special key as approved by the Engineer or as required by the local authority.

M. Feeder pillars' final finish and final color shall be approved by the Engineer and shall have color similar to that of power distribution boards.

N. Feeder pillars used for external lighting or combined external lighting and power distribution shall have single or multi split bus arrangement as shown on the Drawings with uncontrolled bus section to provide necessary power supply through single pole MCCBs for internal lighting, socket outlets and lighting control system.

O. Feeder pillars used for external lighting shall be provided with compact fluorescent lamp for integrated internal inspection lighting with wire guard and adequate cord length and two weather proof socket outlets type R05 as specified in Division W Section "Surge Protective Devices".

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division A Specification Sections, apply to this Section.

210.000 RELATED SECTIONS

A. Division V Section "Basic Electrical Materials and Methods".

B. Division V Section "Surge Protective Devices ".

C. Division W Section "Central Control / Building Management ".

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Cutler-Hammer/Eaton Corp.
2. General Electric Co
3. Schneider Electric
4. Siemens - ITE
5. Schneider Electric / Square D Co.
6. ABB

B. Locally assembled products by one of the above approved manufacturers are acceptable subject to compliance with design requirements and adequacy of reference list and quality control of the local factory.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 COORDINATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, and encumbrances to workspace clearance requirements.

310.020 SCHEDULES

A. Schedules shown on drawings indicate the designation and required type of panelboard using the following criteria:

1. Type of construction (MCB or MCCB), referring to type of branch circuit breakers.
2. Voltage, number of phases and wires.
3. Branch circuit breaker trip rating and wire size.
4. Main circuit breaker trip rating and frame size (maximum continuous rating) for MCCB and MCB.
5. Short-circuit interrupting capacity (IC) in kA.
6. Special arrangement or provisions.

310.030 WARRANTY

A. Manufacturer’s Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

310.040 FACTORY ACCEPTANCE TEST

A. Factory acceptance tests of equipment under this Contract are subject to be witnessed by the Engineer for locally assembled equipment. Witness test shall include complete routine and function testing on all units to be witnessed. Test procedure and program shall be submitted for approval prior to test conduction. Allow for test expenses including business class transportation and hotel accommodation as necessary for two persons from the Engineer’s/ Employer’s side.

© Copyright protected

320.000 SUBMITTALS

A. Equipment Data: Submit data for approval including, but not limited to, the following:

1. Manufacturers' catalogues indicating specific equipment selected.
2. Types of panelboards and circuit breaker characteristics including duties and deration at specified ambient conditions and corresponding temperatures within the enclosures, MCB shall not be derated if the space where the panels are installed is air-conditioned.
3. Dimensions of panels and specific contents of each panelboard.
4. Integrated equipment tabulations for coordinated short- circuit series combinations of circuit breakers.

B. Tests and Certificates: Submit complete certified manufacturer's type test and routine test records in accordance with the Standards.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer’s authorized representative and the contractor.

D. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact composition of each panelboard, indicating busbar rating, frame and trip ratings of circuit breakers.
2. Typical installation details of panelboards, indicating main feeder and branch circuit conduit connections, terminal provisions, tags, labels, mounting methods and materials used.

E. Coordination Study: Submit coordination study along with setting of protective devices for overload, short-circuit and earth-fault currents as coordinated with upstream and downstream systems based on specific coordination curves of protective devices used and specific calculated prospective short-circuit currents at various points.

F. Details of Electrical Closets: Submit details to verify clearances, spaces and ventilation of the installation of proposed equipment, prior to starting construction.

G. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

H. Panelboard Schedules: For installation in panelboards submit final versions after load balancing.

I. Maintenance Data: For panelboards and components to include in maintenance manuals specified in Division 01 and to the satisfaction of the Employer’s requirements. In addition to requirements specified in Division 01 include the following:

1. Manufacturer's written instructions for testing and adjusting over-current protective devices.
2. Time-current curves, including selectable ranges for each type of over-current protective device.

330.000 EXECUTION

330.010 INSTALLATION

A. Fixing Generally:

1. Align, level and securely fasten panelboards to structure.
2. Fix surface mounted outdoor panelboards at least 25mm from wall ensuring supporting members do not prevent flow of air.
3. Do not use connecting conduits to support panelboards.
4. Close unused openings in panelboard cabinets.

B. Panelboard Interiors: Do not install in cabinets until all conduit connections to cabinet have been completed.

© Copyright protected

C. Wiring Inside Panelboards: Neatly arranged, accessible and strapped to prevent tension on circuit breaker terminals. Tap-off connections shall be split and bolted type, fully insulated.

D. Trim: Fix plumb and square prior to painting. Fix trim for flush mounted cabinets flush with wall surface finish.

E. Mounting Heights: Top of trim 1880 mm above finished floor, unless otherwise indicated.

F. Mounting: Plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish.

G. Circuit Directory: Create a directory to indicate installed circuit loads after balancing panelboard loads. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

H. Protection: Treat concealed surfaces of recessed cabinets with heavy field application of waterproof compound prior to installation.

I. Install filler plates in unused spaces.

J. Provision for Future Circuits at Flush Panelboards: if asked by the engineer, stub four empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four empty conduits into raised floor space or below slab not on grade.

330.020 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division V Section "Basic Electrical Materials and Methods".

B. Panelboard Nameplates: Label each panelboard with engraved metal or laminated-plastic nameplate mounted with corrosion-resistant screws.

330.030 CONNECTIONS

A. Install equipment-grounding connections for panelboards with ground continuity to main electrical ground bus.

B. Tighten electrical connectors and terminals, including screws and bolts, according to manufacturer’s published torque-tightening values and / or recommendations. If manufacturer’s torque values are not indicated, use those specified in applicable Standards.

330.040 FIELD QUALITY CONTROL

A. Generally: Carry out all tests, required by the governing codes and by the Engineer, on panelboards after installation, to verify compliance with the specifications and standards. Inspect conditions within panelboards and verify insulation conditions by use of a megger.

B. Circuit Breakers: Tests shall include operation of every circuit breaker manually. Check automatic operation of selected circuit breakers, as required by Engineer, by applying necessary short-circuit, overload and earth leakage current for tripping circuit breaker as applicable and compare with manufacturer's data/characteristic curves. Measure and report ambient temperature inside enclosure.

C. Insulation Check Tests: Carry out insulation tests on all busbars, between phases and between phases and earth/cabinet, and between neutral and earth. Record all readings, using 500 V megger for equipment on 240 V systems, and 1000 V megger for equipment on systems up to 600 V, for 1-minute, with circuit breakers in open position.

D. Routine tests on site shall be carried out, in accordance with the Standards, on all panelboards assembled from standardized components of the manufacturer outside the works of the manufacturer.

E. Prepare for acceptance tests as follows:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

© Copyright protected

F. Testing: After installing panelboards and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

330.050 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

330.060 ADJUSTING

A. Set field-adjustable switches and circuit breaker trip ranges.

330.070 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

Y75 - POWER FACTOR CORRECTION CAPACITORS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes automatic power factor correction equipment rated 600 V and less.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Comply with the following Standards:

1. IEC 60831-1&-2, and IEC 60931-1&-2.
2. IEC 61921.
3. IEC 61439.
4. IEC 60076-6.

120.000 SYSTEM DESCRIPTION

120.010 CAPACITORS, GENERAL

A. Construction: Multiple capacitor cells or elements, factory wired in three-phase groups and mounted in metal enclosures.

B. Capacitor Cells: Dry, metallized-dielectric, self-healing type. Each cell shall be encapsulated in thermosetting resin inside plastic container.

C. Capacitors shall comply with IEC 60831, with an internal loss factor not exceeding 0.5 x 10(-3) (a consumption of about 0.5 watts per kVAR).

D. Cell Rupture Protection: Pressure-sensitive circuit interrupter for each cell.

E. Capacitor-Bank Fuses: Current limiting, non-interchangeable type; factory installed in each phase and located within the equipment enclosure. Features include the following:

1. Interrupting Capacity: 120,000 A, minimum.
2. Fuse Ratings and Characteristics: As recommended by capacitor manufacturer.
3. Fuses shall be provided with a monitoring facility for an immediate tripping after any fuse is blown to prevent single phasing. The monitoring shall reset automatically after the replacement of the blown fuse(s).
4. Neon Indicator Lamp for Each Fuse: Connect to illuminate when fuse has opened, but is still in place, and locate so it is visible from outside the enclosure.

F. Discharge Resistors: Factory installed and wired.

G. Enclosure: Steel or aluminum, arranged to contain the fluid leakage from capacitor cells; factory equipped with mounting brackets suitable for type of mounting indicated. Wherever the capacitor bank is part of the main distribution board and interconnected internally with busbars, the enclosure shall be of the same construction as the approved main distribution board. Enclosure types shall be as follows:

1. Indoor Enclosures: IP 21 to IEC 60529 or as indicated.
2. Outdoor Enclosures: IP 54 to IEC 60529, equipped with watertight conduit connections.

H. Anti Harmonic Reactors shall be provided in series with the capacitors and properly tuned to limit the harmonic currents in order to avoid over loading the capacitors. The reactor rating shall not exceed 7% of the capacitors to be protected.

I. Capacitor rating voltage shall not be less than 470 V at design indicated kVAR rating.

© Copyright protected

120.020 AUTOMATIC POWER FACTOR CORRECTION UNITS

A. Comply with IEC 60831-1,2 and IEC 60931-1,2.

B. Description: Capacitor banks, contactors, controls, and accessories factory installed as indicated on drawings and as close as possible to/or within nominated switchboard requiring PF improvement. Units include a separately mounted current transformer to sense current in the power circuit being corrected and to provide input to unit controls.

C. Performance Requirements: Controls permit selection of a target power factor, adjustable to any value between 0.92 and 0.80 lagging. Controls continuously sense the power factor on circuits being corrected and, when the power factor differs from the target setting for more than 10 seconds, operate a contractor to switch a capacitor bank into or out of the circuit. Contactors are opened or closed as required to bring the corrected circuit power factor closer to the target setting. Switch only one capacitor bank at a time.

D. Controls: Solid-state, microprocessor-based controls, including the following:

1. Undervoltage relay that interrupts capacitor switching and disconnects capacitors for power supply interruptions longer than 15 minutes.
2. "Advance" and "Retard" push buttons on the control panel to permit manually controlled capacitor-bank switching.

E. Contactors: Three pole; rated for the repetitive high-inrush-switching duty in the capacitor application.

F. Buses: Plated copper.

G. Fuses for Protection of Capacitor Banks: Rated to protect contactor, interconnecting wiring, and capacitors.

H. Inductors: Iron-core-type, connected in capacitor circuits; rated to limit switching surges to within contactor ratings.

I. Mechanical Bracing for Current-Carrying Parts: Adequate to withstand the maximum fault current to which they may be exposed.

J. Identification of Energized Capacitor Banks: LED indicating lamps on front panel.

K. Enclosure Access: Hinged door with hand-operated catch. Door is interlocked with controls or main circuit breaker to de-energize capacitors when door is opened.

L. Local Display: LED or liquid-crystal digital type, mounted in door of enclosure.

1. Indicated target and actual power factors.
2. Accuracy: Plus or minus 1 percent.
3. Mounting: Flush or semiflush in unit door.

M. Current Transformer: Type, configuration, and ratio to suit sensing and mounting conditions.

N. Main Circuit Breaker: Operable from outside the enclosure to disconnect the unit.

1. Operating handle can be padlocked.

O. Remote Monitoring Components: Sensors, associated communication modules, and network interface units, matched to and compatible with BMS. Communication module transmits data to remote monitoring devices. Data includes actual corrected power factor.

120.030 FACTORY FINISH

A. Manufacturer's standard enamel over corrosion-resistant treatment or primer coat.

120.040 SOURCE QUALITY CONTROL

A. Factory test power factor correction equipment before shipment. Comply with IEC 60831-1,2 and IEC 60931-1,2 . Include the following:

1. Routine capacitor production tests, including short-time overvoltage, capacitance, leak, and dissipation-factor tests.

© Copyright protected

2. Functional test of all operations, controls, indicators, sensors, and protective devices.

PART 1 REFERENCES

100.000 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 01 Specification Sections, apply to this Section.

110.000 RELATED SECTIONS

A. Division V Section "Basic Electrical Materials and Methods".

PART 2 PRODUCTS AND WORKMANSHIP

200.000 MATERIALS

200.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Schneider Electric.
2. Schneider Electric / Square D.
3. ABB
4. Siemens
5. General Electric Co.; Business Information Center
6. Eaton

200.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

210.000 QUALITY MANAGEMENT

210.010 QUALITY ASSURANCE

A. Compliance with Local Requirements: Comply with applicable local regulations/code requirements of ENDE and Authorities having jurisdiction. This will have precedence over other Codes/Standards nominated for the project, unless otherwise approved in writing.

210.020 COORDINATION

A. Coordinate power factor automatic regulator communication module with BMS data network and with monitoring equipment specified in Division W Section "Central Control / Building Management" for successful transmission and remote readout of remote monitoring data specified in this Section.

210.030 WARRANTY

A. Manufacturer’s Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

© Copyright protected

210.040 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to Employer.

   1. Fuses: 1 for every step of each type and rating, but not less than 3 of each.

220.000 SUBMITTALS

A. Product Data: For each type of product indicated. Include dimensions; shipping, installed, and operating weights of multiple capacitor cells or elements; and data on features, ratings, and performance.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, method of field assembly, components, and location and size of each field connection. Show access and workspace requirements and required clearances.

   1. Wiring Diagrams: Detail internal and interconnecting wiring and differentiate between manufacturer-installed and field-installed wiring.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer/ manufacture's authorized representative and the Contractor.

D. Power factor correction calculations based on the available network data and the expected load requirements for final selection of capacitor bank among steps and the associated detuned reactor.

E. Factory Test Reports: Evidence of product's compliance with specified requirements.

F. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

G. Maintenance Data: For equipment to include in maintenance manuals specified in Division 01. Include the following:

   1. Lists of spare parts and replacement components recommended for storage at Project site.
   2. Detailed instructions covering operation under both normal and abnormal conditions.

230.000 EXECUTION

230.010 INSTALLATION

A. Install freestanding equipment on concrete bases. Cast-in-place concrete is specified in Division 3.

B. Maintain minimum workspace according to manufacturer's written instructions.

C. Connect remote monitoring communication module to electrical power monitoring and control data network through appropriate network interface unit.

230.020 IDENTIFICATION

A. Identify components according to Division V Section "Basic Electrical Materials and Methods."

230.030 FIELD QUALITY CONTROL

A. Inspect automatic power factor correction equipment installation and connections. Report results in writing. Include the following:

   1. Operational Test: After electrical circuits have been energized, connect and observe units to confirm proper operation.
   2. Replace damaged and malfunctioning controls and equipment.

B. Inspection: Perform external and internal inspections of capacitor equipment for damage and for compliance with the Contract Documents and manufacturer's documentation. Check electrical and mechanical bolted connections for required torquing.

© Copyright protected

C. Testing: Perform the following and certify compliance with test parameters:

1. Test insulation resistance between capacitor terminals and case. Follow manufacturer's written instructions or those below:

a) Use test voltages 500 V minimum, for equipment rated 250 V and less, and 1000 V minimum, for equipment rated more than 250 V.
b) Apply test voltage for 60 seconds.
c) Investigate, report, and resolve insulation resistance less than that stated by manufacturer's literature or less than allowable 25 megohms for equipment rated 250 V and less and 100 megohms for equipment rated more than 250 V.
d) Measure capacitance of pole-to-pole capacitor combinations and compare with manufacturer's published values. Report readings, and investigate and resolve discrepancies more than 10 percent of manufacturer's nominal values.
e) Energize circuits and demonstrate electrical operating features of automatic power factor correction units according to manufacturer's written instructions.
f) Verify accuracy of remotely monitored parameters transmitted from automatic power factor correction units by communication module.

D. Correct deficiencies shown by inspections and tests on site where possible, and retest; otherwise, remove and replace with new units and retest.

E. Report of Tests and Inspections: Written record including adjustment settings.

230.040 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean components internally, on completion of installation, according to manufacturer's written instructions.

230.050 ADJUSTING

A. Adjust for optimum automatic power factor correction.

230.060 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

Y76 - TRANSFER SWITCHES

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:

1. Automatic transfer switch with bypass.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Comply with IEC 60947-6.

120.000 SYSTEM DESCRIPTION

120.010 MAINS FAILURE AUTOMATIC TRANSFER SWITCH (ATS)

A. Type: Conforming to IEC 60947-6 and to applicable standards, capable of frequently switching mixed motors and resistive loads with utilization category AC33A to IEC 60947-6-1 or equivalent. Wall or floor mounted, galvanized sheet steel cubicle of equal construction to control cubicle, comprising switching and controls necessary for automatic transfer of power supply from normal source to stand-by source, voltage sensing control relay and time delay relays to signal generator start and stop, auxiliary switches and indicating lights etc. as necessary for the required operation of the system.

B. ATS fed main distribution board / distribution panel shall be class PC with double throw single switch and having rated short time withstand and short circuit making current to IEC 60947-6-1, based on short circuit level of the network at equipment location. As an alternative, two single throw contactors ATS may be used subject to Engineer's approval if obtained from a reputable manufacturer and fulfils the test requirements of class PC to IEC 60947-6-1.

C. ATS fed directly from transformer shall be class CB with two single throw circuit breakers and having rated short time withstand and short circuit making and breaking current to IEC 60947-6-1, based on short circuit level of the network at equipment location.

D. Operation: When voltage and/or frequency of any phase drops below an adjustable setting (80-100%) of normal supply, for an adjustable period of 1 - 300 seconds, power failure relay shall actuate engine starting control. After an adjustable period of 0 - 10 seconds from sensing stabilized rated voltage and frequency of generator at the ATS, (Voltage pick-up adjustable from 85% to 100% nominal), frequency pick-up adjustable from 90% to 100% nominal, the ATS shall transfer to the emergency position. Upon restoration of normal mains supply to above the preset limits, adjustable between 90% and 100% of rated voltage and/or frequency, for an adjustable preset period of 2 - 30 minutes, the ATS shall transfer the load to normal position.

E. Engine Shutdown: Initiate after retransfer of the load to normal source. (Refer to generator set controls upon shut-down).

F. Mechanical and Electrical Interlocks: shall be provided in C.B. type ATS to prevent circuit breakers from being closed simultaneously at any time. Transfer mechanism shall be powered from the source to which the load is being transferred.

G. Utility to utility or two energized sources ATS shall automatically operate as described in clause 120.010 D above except that no generator start signal is required. The ATS shall be provided with a preferred source selector switch marked "source 1", "source 2".

H. ATS dedicated for fire pumps shall meet the requirement of NFPA 20, "Installation of Central Fire Pumps", NFPA 70, "National Electrical Code", listed by the Underwriter Laboratories UL 1008,

© Copyright protected

"Transfer Switch Equipment" for use with electric driven fire pumps, FM approved and shall be as specified under Division Y Section "Pumps".

I. Selector Switches shall be provided as follows:

1. Operating selector switch shall include the following positions:

a) Normal: Generator set is set for automatic operation and the generator set starts if a power outage occurs, as described above.
b) Test: Stimulates a power outage, starts and runs the generating set as Normal position.
c) Stop: Shuts down the generating set and prevents it from starting. This is used when servicing the generator.

2. Another selector switch shall be provided for two positions, "With load" and "Without load" for testing or exercising:

a) "With Load": the generating set shall carry the load during testing or exercising periods.
b) "Without Load": generating set shall start but not assume the load.

J. Pilot Lights shall indicate all ATS positions and sources available.

K. Instruments shall include voltmeter and ammeter with selector switches.

L. Automatic Retransfer: automatic retransfer selector switch marked "AUTO", "MANUAL" shall be provided. On manual position, automatic retransfer is disabled, while it is enabled in the auto position.

M. Circuit Breakers shall be electrically and manually operated non-automatic type, conforming to IEC 60947-2 utilization category B, sequence II (service rating), with two N.O and two N.C spare contacts each.

N. Degree of Protection: ATS shall have an IP31 degree of protection to IEC 60529 for indoor installations, IP54 degree of protection for installations in wet areas and for ATS serving life safety and firefighting equipment and IP55 degree of protection for outdoor installations.

O. Wiring: Moisture and heat resistant, silicon rubber insulated, stranded copper conductors, modularly and neatly arranged on master terminal blocks, with suitable numbering strips and appropriate cartridge type fuses where required. Flexible wiring shall be used on all hinged/draw-out components.

P. Connections shall be made at front insulating terminal blocks with no live metal exposed. Power cables shall terminate on fixed insulated copper connectors suitably sized to receive specified cables. Cable glands and gland plates shall be provided.

Q. Metal Cases of instruments, control switches, relays etc. shall be connected by flexible protective conductors, of not less than 2.5 mm2 section, to nearest earthing bar or terminal.

R. Earthing: Earthing bar shall be provided for connection of protective earthing conductors, using set-screw or bolted anti-turn pressure terminations.

S. Ferrules: Wire ends shall be fitted with numbered ferrules of approved type at each termination.

T. All automatic transfer switches fed directly from transformer shall be equipped at the utility incomer with class I+II surge protective devices as specified under Division W Section " Surge Protective Devices ". SPDs along with their fused-disconnect switch shall be integrated within the ATS's enclosure.

U. All automatic transfer switches fed main distribution board / distribution panel shall be equipped at the utility incomer with class II surge protective devices as specified under Division W Section "Surge Protective Devices ". SPDs along with their fused-disconnect switch shall be integrated within the ATS's enclosure.

V. Provide Manual Bypass Switches to combine manual and automatic transfer operation with a drawout isolation system. Bypass switch shall consist of non-automatic Kirk-key interlocked switches or circuit breakers, fully rated, manually operated and rated for same loads as automatic transfer switch.

© Copyright protected

W. Bypass switch shall provide bypass to either normal or emergency source by use of a selector switch and a permanently mounted external lever, mechanically interlocked to prevent paralleling of sources.

X. An engine start switch shall be provided to allow generator set to be started when bypass is on emergency sources.

Y. Bypass switch shall be of the make-before-break type. A dead source lockout shall prevent any possibility of bypassing the load to an unenergized source.

PART 2 REFERENCES

200.000 RELATED DOCUMENTS

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Asco/Emerson Electric
2. Caterpillar, Inc.; Engine Division.
3. Cummins Corp.
4. Schneider Electric / Square D
5. Kohler Co.
6. Russelectric, Inc.
7. GE/Zenith Controls, Inc.
8. Cutler-Hammer/Eaton Corp.
9. GE/Zenith Controls, Inc.

B. Locally assembled transfer switches meeting the Specification are not acceptable.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Local Representative: Provide evidence that proposed equipment manufacturer has a locally established and authorized organization which can be called upon for professional advice and maintenance as may be required, and which can immediately supply spare parts to support day to day and emergency maintenance requirements. Failure to satisfy the Engineer may disqualify a manufacturer.

© Copyright protected

B. Source Limitations: Obtain automatic transfer switch, bypass/isolation switch and related control panels through one source from a single manufacturer.

310.020 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

320.000 SUBMITTALS

A. Technical Data: Include ratings and dimensioned plans, sections, and elevations showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.

B. Wiring Diagrams: Detail wiring for transfer switches and differentiate between manufacturer-installed and field-installed wiring. Show both power and control wiring.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

D. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.

E. Product Certificates: Signed by manufacturer certifying that products furnished comply with requirements and that switches have been tested for load ratings and short-circuit closing and withstand ratings applicable to units for Project.

F. Field Test Reports: Indicate and interpret test and inspection results for compliance with performance requirements.

G. Maintenance Data: For each type of product to include in maintenance manuals specified in Division 01 and to the satisfaction of the Employer's requirements. Include all features and operating sequences, both automatic and manual. List all factory settings of relays and provide relay setting and calibration instructions, including software, where applicable.

330.000 EXECUTION

330.010 INSTALLATION

A. Floor-Mounted Switch: Level and anchor unit to floor.

B. Identify components according to Division V Section "Basic Electrical Materials and Methods."

330.020 WIRING TO REMOTE COMPONENTS

A. Match type and number of cables and conductors to control and communications requirements of transfer switches as recommended by the manufacturer. Increase raceway sizes at no additional cost to Employer if necessary to accommodate required wiring.

330.030 CONNECTIONS

A. Ground equipment as indicated and as required by the Standards.

330.040 FIELD QUALITY CONTROL

A. Testing: Perform the following field quality-control testing in addition to tests recommended by the manufacturer:

1. Before energizing equipment, after transfer-switch products have been installed:

© Copyright protected

a) Measure insulation resistance phase-to phase and phase-to-ground with insulation-resistance tester. Include control circuits. Use test voltages and procedure recommended by manufacturer. Meet manufacturer's specified minimum resistance.
b) Check for electrical continuity of circuits and for short circuits.
c) Inspect For:
d) Physical damage.
e) Proper installation and connection
f) Integrity of barriers, covers, and safety features.
g) Verify that manual transfer warnings are properly placed.
h) Perform manual transfer operation.

2. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.

a) Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
b) Verify time-delay settings.
c) Verify pickup and dropout voltages by data readout or inspection of control settings.
d) Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
e) Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown sequence.

B. Coordinate tests with tests of generator plant and run them concurrently.

C. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.

330.050 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean equipment internally, on completion of installation, according to manufacturer's written instructions.

330.060 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

Y80 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes complete installations to earth every source of energy and to provide protective earthing and equipotential bonding, based on the TN-S system arrangement, including:

1. Transformer neutral earthing.
2. Main earthing terminals or bars.
3. Exposed conductive parts of electrical equipment.
4. Extraneous conductive parts.
5. Generator neutral earthing.

Earthing requirements specified in this Section may be supplemented by special requirements of systems described in other Sections.

110.000 DESIGN PARAMETERS

110.010 DEFINITIONS AND ABBREVIATIONS

A. The following terms used on the Drawings and in the Specification are equivalent and may be used interchangeably: "earth" and "ground"; "earthing" and "grounding".

B. Earth: Conductive mass of the Earth whose electric potential at any point is conventionally taken as zero.

C. Earth Electrode: Conductor or group of conductors in initial contact with, and providing electrical connection to, Earth.

D. Exposed Conductive Part: Any part which can be readily touched and which is not a live part, but which may become live under fault conditions.

E. Extraneous Conductive Part: Any conductive part not forming part of the electrical installation such as structural metalwork of a building, metallic gas pipes, water pipes, heating tubes etc. and non-electrical apparatus electrically connected to them i.e. radiators, cooking ranges, metal sinks etc. and non-insulating floors and walls.

F. Protective Conductor: Conductor used for some measure of protection against electric shock and intended for connecting together any of the following parts:

1. Exposed conductive parts.
2. Extraneous conductive parts.
3. Earth electrode(s).
4. Main earthing terminal or bar(s).
5. Earthed point of the source(s).
6. Samples of conductors connectors, or any other accessories as requested by the engineers.

G. Electrically Independent Earth Electrodes: Earth electrodes located at such distance from one another that maximum current likely to flow through one of them does not significantly affect the potential of the other(s).

H. Main Earthing Terminal or Bar: The terminal or bar provided for the connection of protective conductors, including equipotential bonding and functional earthing conductors if any to the means of earthing.

I. Equipotential Bonding: Electrical connection to put exposed and extraneous conductive parts at a substantially equal potential.

J. Earthing Conductor: Protective conductor connecting main earthing terminal or bar of an installation to earth electrode or to other means of earthing.

© Copyright protected

110.020 REFERENCE STANDARDS

A. Standards: Carry out work in accordance with the following:

1. IEC 60364-1, IEC 60364-51, IEC 60364-5-55 and IEC 60364-4-41: Electrical Installations in Buildings.
2. Latest edition of the IET Wiring Regulations, BS 7671.
3. BS 7430: Code of Practice for Earthing.
4. TIA J-STD-607-A: Commercial Building Grounding and Bonding Requirements for Telecommunications.

B. Comply with IEC 62305 when interconnecting with lightning protection system.

120.000 SYSTEM DESCRIPTION

120.010 GENERAL REQUIREMENTS

A. Component parts of earthing system are to include the following:

1. Earth electrode (rods, tapes etc.)
2. Main earthing terminals or bars.
3. Earthing conductors.
4. Protective conductors.
5. Equipotential bonding conductors.
6. Electrically independent earth electrodes for special systems.
7. Accessories and termination fittings, bonding, welding kits and other materials.

B. Provide a common earth termination network for all services, consisting of bonding earthing networks of all individual services. The resistance to earth should, in this case be the lowest value needed for any of the individual services. Combined resistance to ground of the whole network is not to exceed 1 Ohms.

C. Ground Electrode: Provide one or a combination of the following arrangements as necessary and/or shown on the drawings:

1. Earth electrode is to consist of one or more earth rods, interconnected by buried earthing tape or cable; distance between two rods is not to be less than twice the length of one rod driven depth.
2. Ring type earth electrode consisting of earthing conductors, in a closed loop, buried in exterior wall foundations underneath the water-proofing, or alternatively buried at a depth of 0.5 m and a distance of about 1 m around external walls, or as shown on the Drawings. Connect all earthing conductors to this ring. Insulated connection flags into the building, of same material as earthing conductors, at locations specified in point (F) underneath are to terminate into bolt-type earth points (studs) or test- links for connection of main earth bar(s). Additional earth rods connecting with the earth ring are to be provided, as necessary, to bring down earth electrode resistance to the specified value.
3. Alternative Earth Electrode: other types of earth electrode may be used, after approval, including:

a) Cast iron pipes with special surround material
b) Copper plate(s)
c) Tape mats (strips).

D. Main earthing bar is to be provided at point of service entrance or medium voltage, transformer, generator, low voltage, low current, and mechanical distribution rooms; as described in the Specification or shown on the Drawings. Connect all earthing conductors, protective conductors and bonding conductors to the main earthing bar. Provide two insulated main earthing conductors, one at each end of the bar, connected via testing joints to the earth electrode at two separate earth pits. Conductor is to be sized to carry maximum earth fault current of system at point of application with final conductor temperature not exceeding 160 deg. C for at 1 second for medium voltage systems and 0.4 seconds for low voltage systems. Main earthing conductors are to be minimum 120 mm2 or as shown on drawings.

© Copyright protected

E. Testing joints (test links) are to be provided, in an accessible position, on each main earthing conductor, between earthing terminal or bar and earth electrode.

F. Protective conductors are to be separate for each circuit. Where protective conductor is common to several circuits, cross-sectional area of protective conductor is to be the largest of the conductor sizes.

1. Selection of sizes is to be in accordance with Table 54.7 of IET Wiring Regulations (BS 7671).

G. Protective conductors are not to be formed by conduit, trunking, ducting or the like. Where armored cable is specified and armor is steel, it may be used as a protective conductor, if approved and if not otherwise shown on the Drawings.

H. Continuity of Protective Conductors: Series connection of protective conductor from one piece of equipment to another is not permitted. Extraneous and exposed conductive parts of equipment are not to be used as protective conductors, but are to be connected by bolted clamp type connectors and/or brazing to continuous protective conductors which are to be insulated by molded materials.

I. Ensure by calculation that Earth Fault Loop Impedance values for final circuits are to satisfy the requirements of BS 7671 regulations.

J. Supplementary Equipotential Bonding: Connect all extraneous conductive parts of the building such as metallic water pipes, drain pipes, other service pipes and ducting, metallic conduit and raceways, cable trays and cable armor to nearest earthing terminals by equipotential bonding conductors. Cross-section of protective bonding conductor shall not be less than half of the protective conductor connected to respective earthing terminal with a minimum of 4-mm2.

K. Main Equipotential Bonding: Main incoming and outgoing water pipes and any other metallic service pipes are to be connected by main equipotential bonding conductors to main earth terminal or bar. Bonding connections are to be as short as practicable between point of entry/exit of services and main earthing bar. Where meters are installed, bonding is to be made on the premise side of the meter. Cross-sections of conductors are not to be less than half that of the earthing conductor connected thereto, and minimum 6 mm2.

L. Identification: Connection of every earthing conductor to earthing electrode and every bonding conductor to extraneous conducting parts is to be labeled in accordance with the Regulations, as follows:

1. SAFETY ELECTRICAL CONNECTION - DO NOT REMOVE.

M. Identification: Protective and earthing conductors are to be identified by combination of green-and-yellow colors of insulation or by painting bar conductors with these colors, as approved.

N. Identification: Source earthing conductor (or neutral earthing conductor) is to be identified along its entire length by continuous black insulation labeled 'neutral earthing'.

120.020 GROUNDING CONDUCTORS

A. Buried Earth Conductors: Bare annealed copper strip conductors 30 x 4 mm, or annealed stranded copper conductors 120 mm2 cross-section, unless otherwise indicated on drawings.

B. Earthing Conductors: Insulated or bare copper conductor as described in 2.2 (F).

C. Protective Conductors: Single core stranded annealed copper, PVC insulated cables, having rated insulation grade compatible with circuit protected, or to be a conductor forming part of a multi-core cable, color coded.

D. Protective Bonding Conductors: Bare copper strip conductor, annealed stranded copper cable or flexible strap (flexible braid) of cross-sectional area as described in Article "General Requirements" hereof.

E. Power Systems (transformer, medium voltage switchgear, generator, and main distribution board) Main Earthing Bar: Consisting of hard drawn copper bar, 50 x 6 mm, unless otherwise indicated on drawings. Earth bar is to be labeled 'Main Earth Bar' and is to be drilled, for connection of conductors, at a spacing not less than 75 mm, and is to be supplied with copper alloy bolts, nuts and washers and wall mounting insulators.

© Copyright protected

F. Telecommunication Systems Main Earthing Bar: similar to above but with minimum dimensions 100 x 6 mm for the main grounding busbar of the main telecommunication room, and 50 x6 mm for equipment rooms grounding busbars.

120.030 CONNECTOR PRODUCTS AND EARTHING ACCESSORIES

A. Copper or copper alloy, purpose made, of approved design, compatible with points of connection, and of adequate cross-section and current carrying capacity.

B. Bolted Connectors and Clamps: Bolted-pressure-type connectors and clamps, or compression type. Bolts, nuts and washers are to be high quality phosphor bronze or copper silicon alloys.

C. Welded Connectors: Exothermic-welded type, in kit form, and selected per manufacturer's written instructions.

120.040 GROUNDING ELECTRODES

A. Ground Rod: 16-mm diameter high strength, low carbon steel core of high tensile strength (600 N/mm2), with 99.99% pure electrolytic copper molecularly bonded into steel core, 0.25 mm minimum thickness. Driving head is to be high strength steel. Couplings are to be long length silicon bronze, internally threaded. Threads are to be rolled onto rod to ensure uniform layers of copper and strength. Earth rod is to be complete with couplings, head and bolted connector of sufficient size, and number of bolted clamps to connect all cables terminated thereto.

1. Minimum Length of Rod: 2.5 m, extendible as necessary to obtain required earth resistance.

B. Earth Pit: Precast, square or circular section concrete handhole (minimum 450 mm internal diameter), with concrete cover, and extending to about 150 mm below top of earth rod. Earth pit is to be provided for each earth rod where connected to an earthing conductor. Cover is to have inset brass plate with inscription 'Earth Pit - Do Not Remove'.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. BICC
2. Copperweld
3. Furse
4. Wallis

© Copyright protected

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has specialized in installing earthing systems similar in material, design and extent to those indicated for this Project and whose work has resulted in installations with a record of successful in-service performance.

320.000 SUBMITTALS

A. Product Data: Prior to ordering materials, submit data for approval including, but not limited to, manufacturer's catalogues for each type of product indicated including the following:

1. Ground rods.
2. Connecting clamps.
3. Earthing conductors, protective conductors, and bonding conductors.
4. Connectors and other accessories.
5. Exothermic welding kits and tools.

B. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects/engineers and owners, and other information specified or required by Engineer.

1. Field Test Reports: Submit written test reports to include the following:

1) Test procedures used and test conditions.
2) Test results that comply with requirements.
3) Results of failed tests and corrective action taken to achieve test results that comply with requirements.

C. Shop and Construction Drawings: Submit drawings for approval including, but not limited to, the following:

1. Exact location of earth pits, rods and details of installation and connections.
2. Exact routing of buried earthing conductors with indication of cross-section, depth of laying and covering.
3. Cross sectional area of all earthing, protective and bonding conductors.
4. Layout and details of earthing provisions at substations, generator rooms, switchgear, distribution panelboards etc., indicating fittings used, insulation, plates and marking, passage and routing of earthing conductors, conduit, sleeves, grooves, niches etc., giving sizes and dimensions of component parts.

D. Records: Submit the following:

1. Scaled drawings, as-installed, showing actual layout and specification of all components of earthing system.
2. Nature of soil and any special earth arrangements etc.
3. Date and particulars of soil conditioning method and agents if used.

E. Samples: Submit samples of conductors, as requested by Engineer.

330.000 EXECUTION

330.010 TRANSFORMER SUBSTATION EARTHING

A. Medium Voltage (MV) switchgear is to have a separate main earthing bar connected to MV switchgear room earth bar by two insulated earthing conductors not less than 120mm2 for LSC2A type switchgear, and 120mm2 for LSC2B, unless otherwise shown on drawings.

© Copyright protected

B. LV switchgear (main distribution board) is to have separate main earthing bar connected to LV room earth bar by two insulated earthing conductors not less than 120 mm2, unless otherwise shown on drawings.

C. Transformer room is to have a separate MV main earthing bar, to which the transformer earthing terminal is to be connected by insulated copper earthing conductor not less than 120mm2, unless otherwise shown on drawings.

D. Transformer neutral (star point) is to be connected by insulated earthing conductor (color black) to transformer room MV main earthing bar. Neutral earthing conductor is to be sized for maximum earth fault current for 1 second with final conductor temperature not exceeding 160 deg. C or sized not less than 120 mm^2 for transformer ratings below 500 kVA and 300 mm^2 for higher ratings unless otherwise indicated on drawings. Where a neutral is directly connected to earth electrode, an insulated disconnecting device is to be provided at the transformer.

E. Lightning arresters are to be directly connected to earth electrode, following the shortest path. Each lightning arrester is to be connected at a dedicated earth rod, unless otherwise shown on drawings.

330.020 EARTHING OF MAIN DISTRIBUTION BOARDS, PANELBOARDS, LIGHTING INSTALLATIONS AND WIRING ACCESSORIES

A. For earthing of main distribution boards, refer to item 3.1 (C).

B. Distribution, lighting and power panelboards are to be connected by protective conductors run together with incoming feeder cable, connecting earth terminals in panelboards with respective main distribution board earthing bar.

C. Socket outlets are to be earthed by protective conductor looped around with the branch circuit and connected to earth terminal within socket outlet box and to which socket outlet terminal is to be connected.

D. Final Ring Sub-Circuits: Protective conductor of every final ring sub-circuit is to be in the form of a ring having both ends connected to earth terminal at origin of circuit in panelboard.

E. Lighting fixtures and other exposed conductive parts of electrical installations, such as switches, heaters, air conditioning units etc. are to be connected by protective earth conductors to earthing terminals of respective panelboards.

330.030 GENERATOR PLANT EARTHING

A. Generator room is to have a separate main earthing bar, to which the generator neutral (star point) is to be connected by insulated earthing conductor through the neutral earthing link or device. Neutral earthing conductor is to be suitably sized to carry maximum earth fault current for time it takes the system protection to operate with final conductor temperature not exceeding 160 deg. C, but not less than 120 mm2 for generator ratings below 500 kVA and 300 mm2 for higher ratings, unless otherwise shown on the drawings.

B. Generator earthing terminal is to be connected to the generator room main earthing bar by insulated copper conductor of cross section not less than 120 mm2, unless otherwise shown on the drawings.

C. Switchgear (ATS) and Control Gear: Earthing terminals or bars of switchgear and control gear are to be connected by separate protective conductors to respective normal and emergency main distribution board earth bars.

D. Extraneous conductive parts including steel frames, battery racks, day-tank, pumps and piping are to be connected by bare copper earthing conductors to main earth bar in compliance with bonding regulations.

330.040 MECHANICAL PLANT ROOMS AND FIXED MACHINERY

A. Mechanical room is to have separate earthing bar(s) or loop conveniently located, and connected by earthing conductors to exposed conductive parts of motor control centre at its earthing bar, and to motors, switches and other electrical equipment etc. at their earthing terminals, using copper conductor with half size of the protective earth conductor and not less than 6 mm^2, , unless otherwise indicated on drawings. Conductors are to be securely fixed, recessed in floor grooves or niches, or

© Copyright protected

fixed to walls by appropriate staples. Earth bar or loop is to be securely fixed to building wall with copper or brass saddles.

B. Earthing bar (40 x 4 mm) is to be connected by two insulated earthing conductors, one at each end of the bar, through testing joints to the earth electrode at two separate earth pits, or to the main LV earth bar. Earthing conductors are to be minimum 70 mm2 or as shown on drawings.

C. Motor and other equipment earth terminals are to be connected also by protective earth conductors of each branch circuit to earth terminal/bar at motor control centre, panel or distribution unit.

330.050 ROAD LIGHTING

A. Earthing Cables: separate protective earthing cables for lighting column circuits are to be run with power circuit, terminated at LV supply position in lighting control panel and looped into column earthing terminals. The last column is to be bonded via an earthing bolt to a single 14 mm diameter copper covered steel rod, 2.5 m long, driven into ground adjacent to column. Bonding is to be 16 mm2 stranded bare copper conductor, unless otherwise indicated on drawings.

B. Connections between rods and earthing conductors are to be made by the Cadweld process producing a fused joint. Bolted connections may be used for connection to removable items of equipment only.

330.060 SIGNAL AND COMMUNICATION SYSTEMS

A. Signal and communication systems room is to have separate earthing bar conveniently located, and connected by two insulated earthing conductors, one at each end of the bar, through testing joints to the earth electrode at two separate earth pits, or to the main LV earth bar. Earthing conductors are to be minimum 70 mm2 or as shown on drawings.

B. For telephone, alarm, voice and data, and other communication systems, provide 16mm2 minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location, unless otherwise indicated on drawings or recommended by system provider.

330.070 INSTALLATION

A. Continuity: Ensure that complete earthing system is electrically continuous and mechanically secure.

B. Earth Rods: While siting earth rods, ensure that resistance areas associated with individual rods do not overlap. Earth rods are to be located at a distance greater than 1 m horizontally from foundations of buildings. Where rock is encountered, a hole of sufficient size is to be drilled before lowering the rod. Conductive filler such as Marconite or Bentonite or equal filler that will not corrode, is to be provided around the rod.

C. Buried earthing conductors are to be laid at a depth not less than 0.5 m from ground surface .

D. Earthing conductors are to follow shortest path between earth rods and main earthing terminals or bars, and are to run in PVC conduit (duct) fastened to building structure by approved supports and extending 0.2 m above level, and are to be protected against mechanical damage and corrosion.

E. Protective Conductors: Separate protective conductors, which are not part of a cable, are to be fixed on same support or drawn into same conduit as circuit conductors.

F. Protective Bonding: Remove any non-conductive paint, enamel or similar coating at threads, contact points and surfaces and ensure that bonding is made by fittings designed to make secure bonds.

330.080 CONNECTIONS

A. Protection against Corrosion: Protect bolted connections against corrosion either by filling with Vaseline or coating with a special anti-corrosion compound and proper capping.

B. Connections: Earth connections are to be readily accessible. If inaccessible earth connection is permitted, approved exothermic welding or brazing technique is to be employed.

© Copyright protected

C. Connections: Where earth connections between dissimilar metals must be made, use bimetallic fittings and protect by coating with moisture resisting bituminous paint or compound, or by wrapping with protective tape to exclude moisture.

D. Exothermic-Welded Connections: Comply with manufacturer's written instructions. Welds that are puffed up or that show convex surfaces indicating improper cleaning are not acceptable.

E. Tighten screws and bolts for grounding and bonding connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

330.090 FIELD QUALITY CONTROL

A. Combined resistance of earth electrodes is to be measured during dry season and checked against specified resistance.

B. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Engineer promptly and include recommendations to reduce ground resistance.

C. Electrical continuity of all earthing and protective conductors including main and supplementary equipotential bonding conductors is to be checked.

D. Earth fault loop impedance of all circuits is to be measured and checked against calculated impedance figures.

E. Operation of residual current protective devices is to be checked.

330.100 GRADING AND PLANTING

A. Restore surface features, including vegetation, at areas disturbed by Work of this Section. Reestablish original grades, unless otherwise indicated. If sod has been removed, replace it as soon as possible after backfilling is completed. Restore areas disturbed by trenching, storing of dirt, cable laying, and other activities to their original condition. Include application of topsoil, fertilizer, lime, seed, sod, sprig, and mulch. Comply with the relevant Landscape Sections. Maintain restored surfaces. Restore disturbed paving as indicated.

Y90 - FIXING TO BUILDING FABRIC

1010 PREPARATION:

- Mark-out, set-out and firmly fix all equipment, components and necessary brackets and supports.

1020 MANUFACTURER'S DRAWINGS:

- Use manufacturer's drawings and templates for purposes of marking and setting out.

1030 FIXINGS:

- Ensure structure and fixings are suitable for items to be fixed.

1040 LOADING DETAILS:

- Provide loading details for all fixing types.

1050 BUILDING-IN BY OTHERS:

- Provide all necessary assistance to enable any item of building-in type to be built in by others.

1060 SIZE OF FIXING:

- Use largest size of bolt, screw or other fixing permitted by diameter of hole in item to be fixed.

1070 GREASING OF FIXINGS:

- Ensure all bolts, screws or other fixings used are greased or lubricated in accordance with manufacturer's instructions.

2000 PRODUCTS/MATERIALS

2010 STANDARDS:

- Ensure that fixings such as expanding anchors are tested for tensile loading in accordance with BS 5080-1.

2020 PLUGS:

- Use plugs of suitable size and length for fixings. Use plastic, fibrous or soft metal non-deteriorating plugs to suit application. Do not use wood plugs.
- Ensure that when screw is in place, threaded length is in plug. Ensure plugs used for screw fixing are set-in to correct depth prior to final tightening.

2030 SCREWS:

- Use screws to BS 1210. Generally use sheradised steel wood screws for fixing to concrete, brickwork or blockwork.
- In damp or exposed situations use greased brass wood screws.

2080 NON-PENETRATIVE SUPPORT SYSTEMS FOR ROOF MOUNTED EQUIPMENT:

- Obtain approval prior to using non-penetrative support systems for roof mounted equipment.

3000 WORKMANSHIP

3010 DRILLING:

- Drill holes squarely. Use drills of requisite size and depth, and appropriate to fabric. Do not flame-cut holes in metal work.

3050 FIXING TO TIMBER RAILS:

- Fix equipment, brackets and supports by drilling hole through timber rail and fixing with bolt, back plate, washer and loose nut.

3060A FIXING TO HOLLOW STUD/TILE/BLOCK WALLS:

- Fix equipment, brackets and supports where there is access at rear of wall, by drilling hole through wall and fixing with bolt, back-plate, washer and loose nut.
- Fix equipment, brackets and supports where there is no access at rear of wall, drill hole and use screw anchor type fixing or gravity type toggle fixing.

3070A FIXING TO CONCRETE, BRICKWORK OR BLOCKWORK:

- Fix equipment, brackets and supports using wood screws in plugs or, as appropriate, drill holes and fix using steel bolts of grouted bolt type or expanding bolt type fixing.

3080A FIXING TO METALWORK:

- Fix equipment, brackets and supports by drilling holes and fixing using set screws or bolts complete with washers, shakeproof washers and loose nuts.

3090A FIXING TO STRUCTURAL STEELWORK AND CONCRETE STRUCTURES:

- Provide manufacturer's information on recommended fixing. Obtain approval for any fixing to structure steel work and concrete structures.
- Generally use proprietary fixings to structural steelwork and concrete structures.
- Obtain approval to cut holes in structural steelwork or concrete structures or weld to structural steelwork.

Y91 - PAINTING AND ANTI-CORROSION TREATMENTS

1010 GENERAL REQUIREMENTS:

- Ensure, where particular methods of finish and painting are not specified, the following requirements are met.
- Protect all metal work, plant, equipment, pipelines, ductlines, ancillaries, brackets and supports against corrosion and oxidization.
- Provide ferrous metals, machined or otherwise with protective coatings at manufacturer's works.
- Ensure all items requiring on-site decorative finishes are provided primed to suit base material and required finish.

1020 DAMAGED FINISHES:

- Following delivery to site, storage on-site and installation make good any damage to finishes, by cleaning, degreasing and re-furbishing.

2000 PRODUCTS/MATERIALS

2010A PAINT MATERIALS:

- Use the following materials as appropriate
    - Solvent borne priming paint to BS 7956 for bare woodwork.
    - Red Oxide priming paint for bare iron and steelwork.
    - Zinc Chromate priming paint for bare ferrous and non-ferrous metals.
    - Calcium Plumbate priming paint to BS 3698 for galvanized steel or composite wood/metal components.
    - Undercoat paint for previously primed or painted surfaces before the application of finishing coats.
    - Gloss finishing paint for previously primed or painted/undercoated surfaces.
    - Epoxy resin paint for specialist coatings requiring resistance to acids, alkalis, oils, solvents, abrasion or high humidity.
    - Aluminium paint to BS 388 for structural steelwork, storage vessels, heated metallic surfaces and similar applications where moisture and heat resistant properties are required.
    - Cold galvanizing paint for making good damage to previously galvanized surfaces and protection to galvanized materials modified during installation.
    - Zinc-rich metallic to BS 4652 for bare iron and steelwork where electrical conductivity has to be assured.
    - Black tar-based paint to BS 1070 for moisture resistant protection to metal surfaces where decorating appearance is not important.
    - Bitumen based coatings for cold application to BS 3416 protection to iron and steel, particularly pipelines and fittings for use in contact with potable water.
    - Bitumen based coatings for cold application to BS 6949 not to be used in contact with potable water.

2020 PAINT QUALITY:

- Ensure paints used are of quality and type to suit application and that:-
  - primers have good adhesion, covering power, rust-inhibiting and grain filling properties.
  - gloss finishing paints are of machine finish grade having high adhesion and high resistance to solvents, mineral oils, cutting oils, detergents, chipping and impact damage.

3000 WORKMANSHIP

3020 WEATHER AND OTHER CONDITIONS:

- Do not apply paints where weather, temperature, humidity or other conditions may have a damaging effect upon finish or paint.

3030# CLEANING:

- Ensure metal surfaces are thoroughly cleaned, all mill and weld scale removed and finally degreased.
- Clean steel surfaces in accordance with BS EN ISO 8503.
- Prepare surfaces for painting in accordance with BS EN ISO 4618.

3030A CLEANING AND PREPARING STEEL SURFACES FOR PAINTING:

- Ensure metal surfaces are thoroughly cleaned, all mill and weld scale removed and finally degreased. Clean steel surfaces in accordance with BS EN ISO 8503 and prepare surfaces for painting in accordance with BS EN ISO 4618.

3030B CLEANING AND PREPARING SURFACES FOR PAINTING:

- Ensure metal surfaces are thoroughly cleaned, all mill and weld scale removed and finally degreased.
- Prepare surfaces for painting in accordance with BS EN ISO 4618.

3040 APPLICATION OFF-SITE:

- Wherever possible ensure paint finishes applied by component manufacturers are spray applied.

3050 APPLICATION:

- Apply paint evenly and ensure finish shows no excessive brush marks, grinning, runs, sagging, ropiness or other application defects.

3060 COLD GALVANIZING:

- Repair damage to galvanized components due to installation process, i.e. following cutting, drilling or welding, by applying 2 no. substantial coats of cold galvanizing paint.

3070 PROTECTION OF BRIGHT MACHINE PARTS:

- Apply a protective coating to all bright machined parts before despatch from works.
- Do not remove protective coatings unless required for installation, testing or commissioning purposes and in such cases reinstate upon completion.
- Repair any damaged protective coating or bright machined part, or where necessary replace damaged component.
- Use and apply metal coatings in accordance with manufacturer's instructions.
- Complete where possible all welding, drilling, bending and other work before metal coating.

Y92 - MOTOR DRIVES - ELECTRIC

1010 STANDARDS:

- Supply and install motors in accordance with BS EN 50347, for dimensional requirements of general purpose 3-phase induction motors, relevant parts of BS EN 60034, BS EN 62262 and BS 4999 as appropriate; and local supply authority regulations.
- Electrical equipment intended for use in potentially hazardous areas / explosive atmospheres to comply with relevant parts of BS EN 60079 and be tested, certified and marked that the equipment is fit for its intended purpose and that adequate information is supplied with it to ensure that it can be used safely.

1040# SURGE SUPPRESSORS:

- Refer to Section W57 for surge suppressors.

1050A MANUFACTURER FITTED TRANSIENT SURGE SUPPRESSORS:

- Supply built-in transient surge suppressors across the starter contactor coils. Fitted by manufacturer.

1050B INSTALLER FITTED TRANSIENT SURGE SUPPRESSORS:

- Supply external transient surge suppressors across the starter contactor coils. Fitted by installer.

2000 PRODUCTS/MATERIALS:

2010A STANDARD OPERATING CONDITIONS:

- Ensure motors, starters and ancillary equipment are suitable for operation at full capacity at heights above sea level not exceeding 1000m, with air cooling at an average temperature over 24 hours not exceeding 35°C dry bulb with maximum conditions of 40°C dry bulb and 50 per cent RH.

2010B NON STANDARD OPERATING CONDITIONS:

- Ensure motors, starters and ancillary equipment are suitable for operation at full capacity at heights above sea level above 1000m, with conditions exceeding 40°C, and up to 50°C dry bulb and 50 per cent RH.

2020 MOTORS - GENERAL:

- Standard
    - Use motors which conform to BS EN 60034, as applicable, which operate at lowest possible speed, compatible with performance requirements.
    - Terminal markings and direction of rotation to be in accordance with BS EN 60034-8
    - Provide isolation during repair and maintenance work in accordance with BS EN 62626-1

- Comply with EC Regulation 640/2009 and amendment EU Regulation 4/2014 with regard to ecodesign requirements for electric motors.
- Electrical supply to BS EN 60038
    - Motors 0.746 kW (1 HP) and Larger: Three phase.
    - Motors smaller than 0.746 (1 HP): Single phase.
- Ratings
    - Select maximum continuous rating (MCR) such that driven machine operates at correct speed or speeds at design duty.
- When running continuously at design rated duty, the temperature of the motor parts is within limits defined in BS EN 60034-1
- When provided with excess motor current (over-load) protection of thermal overcurrent release type, ensure operation is within tolerances of tripping as defined in BS EN 60947-4-1.
- Insulation
    - Single phase motor
        - Use motors with Class 130 to BS EN 60085 insulation, unless indicated otherwise.
    - Three phase motor
        - Use motors with Class 155 to BS EN 60085 insulation, with Class B temperature rise as defined in BS EN 60034-1, unless recommended otherwise by manufacturer and approved by Engineer for specific applications such as: overhead cranes or submersible pumps, where Class 180 to BS EN 60085 insulation is to be used, with Class F temperature rise as defined in BS EN 60034-1
- Ventilation enclosure
    - Low Voltage Motors' Enclosure: Totally enclosed, fan-cooled type (TEFC) to IC 411 to IEC 60034-6 as applicable, unless otherwise indicated or recommended by manufacturer and approved by the Engineer.
    - Medium Voltage Motors' Enclosures: Totally enclosed, air to air cooled (TEAAC) to IC 611 to IEC 60034-6 as applicable or totally enclosed, water to air cooled (TEWAC) to IC 817 to IEC 60034-6 as applicable. Enclosure type shall be as recommended by manufacturer and approved by the Engineer, unless otherwise indicated.
- Conduit entry
    - Fit motor bodies with conduit entry terminal box or cable gland as required, and to suit type and size of cable being terminated.
- Comply with BS EN 60034-5 and BS EN 62262 to achieve the specified degrees of protection classification provided by the integral design.

2025A MOTOR EFFICIENCY:

- Supply an IE2 motor with a minimum efficiency compliant with BS EN 60034-30-1 as shown in the table below:

IE2 Motor Efficiency Limits (%) for 50 Hz: figures taken from BS EN 60034-30-1 Table 5				
Rated Power (kW)	No. of Poles/Synchronous Speed (RPM)			
	2/3000	4/1500	6/1000	8/750

0.12	53.6	59.1	50.6	39.8
0.18	60.4	64.7	56.6	45.9
0.20	61.9	65.9	58.2	47.4
0.25	64.8	68.5	61.6	50.6
0.37	69.5	72.7	67.6	56.1
0.40	70.4	73.5	68.8	57.2
0.55	74.1	77.1	73.1	61.7
0.75	77.4	79.6	75.9	66.2
1.1	79.6	81.4	78.1	70.8
1.5	81.3	82.8	79.8	74.1
2.2	83.2	84.3	81.8	77.6
3	84.6	85.5	83.3	80.0
4	85.8	86.6	84.6	81.9
5.5	87.0	87.7	86.0	83.8

2030 SLIDE RAILS:

- Fit motors on slide rails or other suitable means of adjustment to facilitate correct alignment and belt tension.

2040 PLINTHS:

- Where plinths are built in by others, provide all necessary assistance and information.

2060# MOTORS - OVER TEMPERATURE PROTECTION:

- Thermistors
  - Fit positive temperature coefficient thermistors to BS EN 60034-11. Provide a minimum of 3PTC thermistors in each motor with 2 ends terminated in motor terminal box clearly and permanently marked.
  - For motors rated between 30kW and 75kW provide a single thermistor in each phase.
- Provide control unit to BS EN 60034 to motors fitted with thermistors.
- Interconnect control unit with thermistors and starter to trip starter when one or all of thermistors detect overheating.

2060A MOTORS - OVER TEMPERATURE PROTECTION, THERMISTORS:

- Fit positive temperature coefficient thermistors to BS EN 60034-11. Provide a minimum of 3 PTC thermistors in each motor with 2 ends terminated in motor terminal box clearly and permanently marked.
  - For motors rated between 30kW and 75kW provide a single thermistor in each phase.
- Provide control unit to BS EN 60034 to motors fitted with thermistors. Interconnect control unit with thermistors and starter to trip starter when one or all of thermistors detect overheating.

2070A INDIRECT DRIVES WITH TOOTHED BELTS:

- Belts

- Use toothed wedge belts to BS 3790. Provide at least two matched belts for any drive, of anti-static type and rated to transmit full machine power with one belt removed.

- Pulleys
  - Construct pulleys from approved materials and statically balance. Lock close limit bores by keys fitting into machinery shaft keyway.
- Pulley adjustment
  - Adjust pulley to give alignment and correct belt tension.

2070B INDIRECT DRIVES WITH FLAT BELTS:

- Belts
  - Use flat wedge belts to BS 3790. Provide at least two matched belts for any drive, of anti-static type and rated to transmit full machine power with one belt removed.
- Pulleys
  - Construct pulleys from approved materials and statically balance. Lock close limit bores by keys fitting into machinery shaft keyway.
- Pulley adjustment
  - Adjust pulley to give alignment and correct belt tension.

2080# DIRECT COUPLED DRIVES:

- Use an extended motor shaft coupled to machine.
- Use a flexible coupling connecting driving and driven shafts, incorporate suitable arrangements for aligning the two shafts.
- Mount motors on a substantial mild steel bed plate fixed to machine casing
  - Separately supported.
  - Supported entirely from the machine casing.

2080A DIRECT LONG COUPLED DRIVES:

- Use an extended motor shaft coupled to machine or a flexible coupling connecting driving and driven shafts, incorporate suitable arrangements for aligning the two shafts.
- Mount motors on a substantial mild steel bed plate fixed to machine casing separately supported or supported entirely from the machine casing.

2090# GUARDS:

- Totally protect drives and couplings. Fit purpose made guards around all exposed or otherwise accessible drive shafts, pulleys, V-belts or couplings.
- Ensure guards comply with national or local safety codes, Acts and Bylaws and incorporate following features:
  - Construction to BS EN ISO 12100 and generally of galvanized steel wire mesh
  - Stiffening within the guards to ensure rigidity and freedom from vibration
  - Allowance for prime mover adjustment during belt tensioning procedures
  - Temporary access to all shafts for use of Tachometer

2090A GUARDS:

- Totally protect drives and couplings. Fit purpose made guards around all exposed or otherwise accessible drive shafts, pulleys, V-belts or couplings.
- Ensure guards comply with national or local safety codes, Acts and Bylaws and incorporate following features
    - Construction to BS EN ISO 12100 and generally of galvanized steel wire mesh
    - Stiffening within the guards to ensure rigidity and freedom from vibration
    - Allowance for prime mover adjustment during belt tensioning procedures
    - Temporary access to all shafts for use of Tachometer

2100# MOTOR MOUNTING CLASSIFICATION:

- Standard - BS EN 60034-7
    - Code I classification - IM.
        - Alpha code.
            - B.
            - V.

Y92A - MOTOR-CONTROL CENTERS

PART 1 SYSTEM OBJECTIVES

100.000 PERFORMANCE OBJECTIVES

100.010 SUMMARY

A. This Section includes motor control centers and panels for use on ac circuits rated 600 V and less. It includes a Connection to BMS system, including interface elements such as relays, transducers, etc. as detailed in the mechanical specifications, BMS schedules and/or shown on drawings.

110.000 DESIGN PARAMETERS

110.010 REFERENCE STANDARDS

A. Comply with the Following Standards:

1. IEC 61439-1.
2. IEC 61439-2.
3. IEC 60204.

120.000 SYSTEM DESCRIPTION

120.010 VARIABLE FREQUENCY DRIVE

A. Furnish complete variable frequency drives as specified herein for the fans and pumps designated to be variable speed. All standards and optional features shall be included within the VFD enclosure, unless otherwise specified. VFD enclosure shall be IP 21 and IP 54 to IEC 60529 with inlet air filters. Drive shall be mounted on a floor stand.

B. VFD shall be provided for motor starting and speed control where specified or shown on electrical or mechanical drawings.

C. VFD shall convert three-phase, 50 hertz utility power to adjustable voltage and frequency, three phase power for stepless motor speed control from 10% to 100% of the motor's 50 hertz speed. Input voltage shall be as specified on the drawing schedules.

D. VFD shall include a converter and an inverter section. The converter section shall convert fixed frequency and voltage AC utility power to DC voltage. All VFDs shall include input line reactors or an isolation transformer as required. The inverter section of the VFD shall invert the DC voltage into a quality output waveform, with adjustable voltage and frequency for stepless motor speed control. The VFD shall maintain a constant V/Hz ratio. The VFD and options shall be tested to IEC 60947-4-1.

E. Power line noise shall be limited to a voltage distortion factor and line notch as defined in IEC 61000 as follows:

1. For motors with full load current below 16 A, comply with IEC 61000-3-2, and as a minimum use 6-pulse rectifier with DC buffer.
2. For motors with full load current below 75 A, comply with IEC 61000-3-4, and as a minimum use 6-pulse rectifier with 3% AC line reactor and DC buffer.
3. For motors with full load current exceeding 75 A and up to 450 A, comply with IEC 61000-3-4, and as a minimum use 6-pulse rectifier with 5% AC line reactor and DC buffer.
4. For motors with full load current exceeding 450 A, comply with IEC 61000-3-4, and as a minimum use 12-pulse rectifier with two secondaries galvanic isolating transformer to provide the necessary phase shift and 5% AC line reactor and DC buffer; as an alternative, active front end technique with LCL filter may be used.

F. The VFD shall comply with EMC directive and standard IEC 61800-3 category C2 (1st environment), the VFD shall include EMC filter.

© Copyright protected

G. Motor noise as a result of the VFD shall be limited to 3 dB over across the line operation measured at 1 meter from the motor's centerline.

H. VFD's full load amp rating shall meet or exceed NFPA 70, NEC Table 430-250.

I. Protective Features shall include the following:

1. Individual motor overload protection for each motor controlled.
2. Protection against input power under-voltage (for non-emergency motors only), over-voltage, and phase loss.
3. Protection against output current overload and instantaneous over-current.
4. Protection against over-temperature within the VFD enclosure.
5. Protection against over-voltage on the DC bus.
6. Thermistor motor protection relay interface.
7. Protect VFD from sustained power of phase loss. Under-voltage trip activates automatically when line voltage drops more than 10 percent below rated input voltage.
8. Automatically reset faults due to under-voltage, over-voltage, phase loss, or over-temperature.
9. Protection against output short circuit and motor winding shorting to case faults.
10. Status lights or digital display for indication of individual fault conditions.
11. Controller capable of operating without a motor or any other equipment connected to the drive output to facilitate start-up and troubleshooting.
12. Input line reactors shall be provided to minimize harmonics introduced to the AC line and to provide additional protection to AC line transients.

J. Interface Features for the VFD will include:

1. Door mounted Hand/Off/Auto selector switch to start and stop the VFD. In the Auto position, the VFD will start/stop from the controller. In the Hand position, the VFD will run regardless of the remote contact position.
2. Manual speed control capability.
3. Local/Remote selector switch. In the Remote position, motor speed is determined by the follower signal. In the local position, motor speed is determined by the manual speed control.
4. Power/On light to indicate that the VFD has tripped on a fault condition.
5. Digital meter with selector switch to indicate percent speed and percent load.
6. A set of form-C dry contacts, to indicate when the VFD is in the Run mode.
7. A set of form-C dry contacts, to indicate when the VFD is in the Fault mode.
8. A 0 to 10 V output signal to vary in direct proportion to the controller's speed.
9. VFD to have terminal strip and N.C. safety contacts such as freezstats, smoke alarms, etc. VFD to safety shut down in drive or bypass mode when contacts open.

K. Adjustments will include the following:

1. Maximum speed, adjustable 15 to 100 percent base speed.
2. Acceleration time, adjustable 3 to 60 seconds.
3. Deceleration time, adjustable 3 to 60 seconds with override circuit to prevent nuisance trips if decal time is set too short.
4. Current limit, adjustable 0 to 105 percent.
5. Overload trip set point.
6. Offset and gain to condition the input speed signal.

L. Service conditions will cover:

1. Ambient temperature, 0 to 50 deg C.
2. 0 to 95 percent relative humidity, non-condensing.
3. Elevation to 1,000 meters without derating.
4. AC line voltage variation, -10 to +10 percent of nominal.

M. Control interface: VFD shall be equipped with field-bus module for remote control, monitor and display VFD status and alarms from the BMS. Coordinate with BMS for the interface protocol to be adapted and provide the necessary adapter modules accordingly.

© Copyright protected

120.020 STARTERS

A. Starters for three phase motors to be magnetic type to automatically disconnect motor from power supply in case of supply failure, excessive voltage drop, overcurrent and lack of balance in phases. Overload trips to be provided for three phases.

B. Motor Data: Obtain from equipment supplier before ordering any motor starter, or check motor nameplate for full load current rating and allowable temperature rise in order to select proper overload thermal element for motor starter.

C. Short circuit protection device fitted to starter to be independent of controller and overload protection.

D. Control voltage for starters and control circuits shall not exceed 110 V.

E. Step Down Control Circuit Transformers: Two winding isolating type.

F. Control Circuit Protection: Use high rupturing capacity fuses or circuit breakers.

G. Auxiliary supply for controls other than from main power circuit, to be effectively isolated by auxiliary contacts on main isolator.

H. Control devices on starters to be as follows unless otherwise indicated or required by driven equipment: start stop push buttons, one red pilot light for "running", one green pilot light for "stopped", one amber pilot light for overload trip, and one reset push button.

I. All motors shall be protected with overload protection class 10 to IEC 60947-4-1, unless otherwise required by the motor manufacturer.

J. Starter type A for single phase motors not exceeding 1/2 HP to be surface or flush mounted, manual two pole toggle type, for non reversing across the line starting, fitted with one overload element.

K. Starter type B for three phase motors not exceeding 10 HP to be direct on line, non reversing, magnetic type, with manual reset, 3 pole overload relay and under voltage protection (for non-emergency motors only), unless otherwise required by local regulations or shown on drawings.

L. Starter type C for three phase motors over 10 HP, but not exceeding 50 HP, to be automatic star delta magnetic non reversing type, with 3 pole overload relay and under voltage protection (for non-emergency motors only), unless otherwise required by local regulations or shown on drawings.

M. Starter type D for three phase motors over 50 HP to be multiple step auto transformer non reversing magnetic type, with 3 pole overload relay, under voltage protection (for non-emergency motors only), unless otherwise required by local regulations or shown on drawings.

N. Electronic Solid State Reduced Voltage Motor Soft Starter shall be provided where specified or shown on the electrical or mechanical Drawings. Soft Starter shall be UL listed, consisting of silicon controlled rectifier (SCR) based power section, digital logic board and paralleling bypass contractor to provide smooth, stepless acceleration for AC, 3-phase, 400V, 50 Hz induction motors. Soft starter shall be provided for soft starting of motors where required on drawings. The minimum peak inverse voltage rating of the SCR's to be 1500 V. Contactor shall be rated for full voltage across the line motor starting duty. Starter enclosure shall be IP 52 protection for indoor installation and IP 55 for installations in wet and outdoor areas and provided with necessary ventilation fans. Where shown on the drawings or indicated in the motor center schedules, starter shall be incorporated within motor control center. The starter shall provide the following protections and adjustments:

1. Adjustable electronic overload.
2. Overhead protection for the starter.
3. Phase sequence protection.
4. Phase loss/unbalance protection.
5. Under-voltage protection (For Non-Emergency motors only).
6. Ramp time.
7. Initial torque.
8. Start current limit.
9. Motor full load current.
10. Starter shall comprise molded case motor circuit protector (with magnetic trip only) for short circuit protection. Starter shall be rated for 125% of the continuous current rating of the motor.

© Copyright protected

Short circuit rating of start shall be at least 110% of the short circuit level at starter location, or as shown on the electrical drawings or indicated in the motor control center schedules. Soft starters for pumps shall comprise smooth soft facility for linear voltage deceleration with adjustable deceleration time.

O. Individually mounted starters to be totally enclosed in sheet steel enclosure with baked enamel finish. Design shall suit location and application. It shall be impossible to open enclosure door unless isolator is in open position.

P. Nameplates: Starters and controls to have engraved nameplates identifying system or defining its function.

Q. Contactors: Comply with IEC 60947-4, utilization category AC3, and be 3-phase, 3-pole, magnetic type, 600 V rating, capable of interrupting at least ten times rated current inductive or non-inductive loads under normal service conditions and shall have replaceable main arcing contacts and arc quenching devices. Contactors shall withstand, without welding or burning of contacts, an inrush current of 20 times normal rating for 4 seconds upon closing and shall be capable of closing on the heaviest short-circuit of the system and withstand the short-circuit for period required by upstream short-circuit protective device to operate. Three N.O. and three N.C. spare contacts shall be provided on each contactor.

R. Starter Co-Ordination: Motor starter devices shall be of type 2 co-ordination to IEC 60947-4-1. For variable frequency drives, fast acting semiconducting fuse category gR to IEC 60269-4 or approved equal shall be provided in case type 2 coordination cannot be achieved, to limit the let-through energy.

S. Fuses shall be provided with a monitoring facility for an immediate tripping after any fuse is blown to prevent single phasing. The monitoring shall reset automatically after the replacement of the blown fuse(s).

120.030 SWITCH DISCONNECTORS

A. Switch Disconnectors: non fusible, single throw type, with AC-23 utilization category to IEC 60947-3 for AC motors, housed in separate metallic enclosure, with arc quenching devices on each pole capable of interrupting at least six times its rated current. They shall simultaneously interrupt power supply to all line conductors, any neutral and control circuits.

B. Isolating Switches for single phase fractional horsepower motors to be double pole, dolly operated type, rated 15/20 A at 250 V AC, quick make, quick break, with silver alloy contacts, flush or surface mounted to suit application.

C. Operating Mechanism to be quick make quick break type, with external operating handle mechanically interlocked with enclosure cover to necessitate disconnecting switch to be in OFF position for access to inside of enclosure. Means shall be provided for by passing interlocks. Position of isolating switch shall be clearly indicated on cover.

D. Enclosure to be general purpose type, unless otherwise indicated or required, with provision for locking operating handle in OPEN and CLOSED positions.

E. Enclosures where indicated or required by location to be weatherproof totally sealed water and dustproof type.

120.040 COMBINATION STARTER SWITCH DISCONNECTOR

A. Components to comprise magnetic starter switch disconnector and short circuit protection devices required by the Standards, in approved sheet metal enclosure to suit application.

B. Switch Disconnector Operating Mechanism: Quick make, quick break, with external operating handle mechanically interlocked with enclosure cover necessitating disconnecting switch to be in OFF position for access to inside of enclosure. Means shall be provided for by passing interlocks. Position of isolating switch to be clearly indicated on cover.

C. Short circuit protection gear shall be HRC fused cartridges or molded case circuit breakers of appropriate current rupturing capacity. Switch disconnectors are not required if circuit breakers are

© Copyright protected

used for the short circuit protection. In this case the circuit breaker will perform the disconnection function.

D. Operation of circuit breaker to be possible from outside of enclosure. Position of breaker ON/OFF/TRIPPED to be clearly indicated by position of handle.

120.050 PUSH BUTTONS

A. Push buttons to be one unit momentary contact START/STOP with normally open or normally closed contacts as required by wiring diagrams and with lockout attachments. Heads to be color-coded and STOP button to be protected. Push buttons controlling one piece of equipment to be housed in separate enclosure.

120.060 RELAYS

A. Relays to be multi-pole with normally open or normally closed contacts, electrically operated at 110 V maximum, and magnetically held. Contacts to be double break silvered type, interchangeable from normally open to normally closed without additional parts. Relays shall be rated at 10 A, 600 V.

120.070 CIRCUIT PROTECTORS AND SWITCHES / CIRCUIT BREAKERS

A. Circuit Breakers to give positive trip free operation on abnormal overloads, with quick make quick break contacts under both manual and automatic operation. Stationary and movable contacts to be non welding silver alloy adequately protected with effective and rapid arc interruption.

B. Motor Circuit Protector: Molded case, magnetic break type with adjustable instantaneous setting suitable for motor protection.

C. Molded Case Switch: Similar to circuit breakers but without overload/short circuit protection. Short time rating of switches shall not be less than twelve times the maximum rated operational current for 1 second. Switches shall comply with IEC 60947-3. Switches shall have utilization category AC-23B to IEC 60947-3.

D. Branch Circuit Breakers to be 160 A minimum frame size, unless otherwise shown on the drawings.

E. Circuit Breakers And Motor Circuit Protectors shall be in compliance with IEC 60947-2, utilization category B (for frame ratings 800A and above), utilization category A (for ratings up to 630A), sequence II (service capacity) for motor control centers and sequence III (ultimate capacity) for motor control panels and combination starters unless otherwise indicated on the drawings.

F. Electronic Trip Unit: circuit breaker electronic trip unit shall be provided with adjustable long time, short time and instantaneous current setting. In addition adjustable earth fault protection shall be provided on trip units for main incoming circuit breakers.

G. Main incoming breakers/switches to be equipped to provide earth fault phase failure and phase sequence protection through shunt trip coil. Earth fault detection and interruption to be time coordinated with those of main incoming breaker on main distribution board.

H. Molded Case Circuit Breaker (MCCB) for ratings up to 1250A and Air Circuit Breaker (ACB) for ratings greater than 1250A.

I. Multiple Pole Breakers to have single handle mechanism. Each pole to have inverse time delay thermal overcurrent trip element and magnetic instantaneous overcurrent trip element for simultaneous tripping of all poles.

J. Trip Elements to be ambient temperature compensated type.

120.080 MOTOR CONTROL CENTER (MCC)

A. Type: Totally enclosed, free-standing sectionalized type, modular, compartmented suitable for frame ratings of main circuit breaker and busbars of 630 A or above, form 3b to IEC 61439-1 & -2 with separate withdrawable section for each motor starter and separate fixed section for main incoming breaker / switch and each outgoing feeder circuit breaker. Sections to be designed to allow other sections to be easily added or removed.

© Copyright protected

B. General Construction: Rigidly framed and bolted, with Electro-galvanized sheet steel enclosures, phosphatized, primed with rust inhibiting primer and finished with thermal polymerized polyester epoxy powder coating, gray color (RAL 7035 ANSI 61) to approval. Motor control center shall be vermin, dust and rodent proof, IP 31 protection to IEC 60529 for indoor installations, IP 54 protection for installations in wet areas (e.g. pump rooms) and for motor control centers serving life safety and firefighting equipment and IP 55 protection for outdoor installations, with adequate lifting means and base-frames and capable of being moved into position and directly bolted to floor without additional sills. For ratings up to 3200A, enclosures shall have mechanical impact resistance of IK10 to IEC 62262 for enclosures protection degree IP 54 and higher, and IK08 to IEC 62262 for enclosures protection degree lower than IP 54. Test certificates for mechanical impact shall be submitted for approval; otherwise enclosure thickness shall not be less than 1.5mm. For ratings larger than 3200A, enclosures shall have minimum thickness of 2mm. Fronts shall be single or twin covers to shield circuit breakers, terminals and live ends.

C. Components: Motor control center shall include the following:

1. Main incoming circuit breaker or isolating switch as shown on the Drawings for terminating incoming supply cables and isolating the busbar system.
2. Main copper horizontal full-length busbars.
3. Branch copper vertical full height busbars.
4. Neutral copper busbar rated at half capacity of main busbar and distributed throughout whole motor control center.
5. Earth copper busbars minimum 25 x 6 mm extending full length of motor control center.
6. Digital multimeter unit with necessary current transformers at incoming feeder(s) as specified under Division Y Section “Switchboards”.
7. Starters, circuit breakers, push buttons, indicating lights, switches, relays, contactors and accessories as shown on the Drawings.
8. Interconnecting and interlock wiring.

D. Wiring: Motor control centers shall have factory wired terminal block, in compliance with IEC standard.

E. Busbars: Site rated to same rating of main circuit breaker frame size as a minimum unless otherwise shown on drawings, and braced for a symmetrical rms short-circuit duty as specified. Busbars shall be copper, of sufficient size to limit temperature rise to allowable equipment temperature ratings, and not exceeding IEC 61439-1&-2 limits. Connections and buswork shall be bolted with compatible hardware material as per manufacturer’s recommendations and shall be accessible for inspection and maintenance. Contact surfaces shall be properly tin or Electro-silver plated as necessary.

F. Connections from busbar to switching element and starter shall be rated to carry full continuous current rating of switching element frame as a minimum, unless otherwise shown on drawings.

G. Main horizontal busbars and vertical distribution busbars shall be insulated unless bare busbars are recommended by the manufacturer and used in the type test.

H. The motor control center shall be designed to minimize the risks associated with the propagation of an internal arc fault of 85 kA for 0.3 sec as a minimum. Motor control center shall be tested in accordance with IEC 61641 for internal arc protection.

I. All motor control centers fed from MDB shall be equipped with Class II surge protective devices as specified under Division W Section “Surge Protective Devices”. SPDs along with their fused-disconnect switch shall be integrated within or adjacent to the MCC’s enclosure.

J. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

K. Compartment doors to be interlocked so that isolators or breakers must be in OFF position before door can be opened.

L. Spare Positions: Fully equipped cells, ready for connection to motors, shall be provided in adequate number.

M. Space Positions: Fully equipped cells ready to receive control unit shall be provided in adequate number. Space positions to have blank cover plates.

© Copyright protected

N. Starters, switches, other components and electrical devices to be clearly labeled in English as to number and function, with incised letters on black Bakelite with white laminated core. Labels to be permanently fixed under each component.

O. Incoming line connections to be made with solderless, terminal four bolt type clamps.

P. Labels: Starters, switches, electrical devices and accessories to be clearly labeled in English as to function and number. Labels to be permanently fixed under each component.

Q. Schematic and wiring diagrams to be firmly fixed within motor control center, showing each component and cross- referenced with component labels.

R. Submit for approval electrical schematic diagram of whole installation suggested layout of motor control center, interior wiring details and complete technical literature on all proposed components, prior to fabrication or purchase.

120.090 MOTOR CONTROL PANELS (MCP)

A. Type: Wall mounted or unit mounted, lockable type, IP 31 for indoor installation and IP 54 for installation in wet areas and for motor control panels serving life safety and firefighting equipment and IP 55 for outdoor installations, with ratings of main breaker and busbars up to 400A, form 2a to IEC 61439-1 & -2.

B. Construction: hot-dip galvanized steel sheet, finished with one coat etch primer and one coat stove enamel internally and externally for cabinet/box; suitable for mechanical impact resistance of IK10 to IEC 62262 for enclosures protection degree IP 54 and higher and IK08 to IEC 62262 for enclosures protection degree lower than IP 54. Test certificates for mechanical impact shall be submitted for approval; otherwise enclosure thickness shall not be less than 1.5mm.

C. Components: Motor control panel shall include the following:

1. Main incoming circuit breaker or isolating switch as shown on the Drawings for terminating incoming supply cables and isolating the busbar system.
2. Copper main and branch busbars.
3. Neutral copper busbar rated at half capacity of main busbar.
4. Earth copper busbars rated at half capacity of main busbar.
5. Digital multimeter unit with necessary current transformers at incoming feeder(s) as specified under Division Y Section “Switchboards”.
6. Starters, circuit breakers, push buttons, indicating lights, switches, relays, contactors and accessories as shown on the Drawings.
7. Interconnecting and interlock wiring.

D. Wiring: Motor control panel shall have factory wired terminal block, in compliance with IEC standard.

E. Busbars: Site rated to same rating of main circuit breaker frame size as a minimum unless otherwise shown on drawings, and braced for a symmetrical rms short-circuit duty as specified. Busbars shall be copper, of sufficient size to limit temperature rise to allowable equipment temperature ratings, and not exceeding IEC 61439-1&-2 limits. Connections and buswork shall be bolted with compatible hardware material as per manufacturer’s recommendations and shall be accessible for inspection and maintenance. Contact surfaces shall be properly tin or Electro-silver plated as necessary.

F. Connections from busbar to switching element and starter shall be rated to carry full continuous current rating of switching element frame as a minimum, unless otherwise shown on drawings.

G. Main horizontal busbars and vertical distribution busbars shall be insulated unless bare busbars are recommended by the manufacturer and used in the type test.

H. All motor control panels shall be equipped with Class II surge protective devices as specified under Division W Section “Surge Protective Devices”. SPDs along with their fused-disconnect switch shall be integrated within or adjacent to the MCP’s enclosure.

I. Where single core cables are used, top / bottom cable entry plates shall be made of bakelite or Aluminum with adequate thickness and rigidity to support cables.

© Copyright protected

J. Components: Panels shall contain necessary breakers, starters, push button switches, selector switches, relays, indicating lights, interconnecting and interlock wiring and all devices and accessories required for automatic or manual operation of equipment as specified under equipment concerned.

K. Labels: Starters, switches, electrical devices and accessories to be clearly labeled in English as to function and number. Labels to be permanently fixed under each component.

L. Schematic and wiring diagrams to be mounted in permanent approved manner on inside of panel door. Diagrams shall show each component cross referenced with component labels.

120.100 CONTROL SWITCHES

A. Float Switch: Level operated, heavy duty, bracket mounted type, suitable for application in open tanks, complete with 178 mm spun copper float, brass rod, two stops, floor mounting stand, lever and counterweight. Switch to have oil tight and dust tight enclosure and 2 pole double throw silver contacts that open on liquid rise.

B. Pressure Switch: Industrial, heavy-duty bellows actuated type, suitable for water service, with contacts to close on falling pressure. Range to be 0.1 to 8 kg/cm2. Switch to be good for 1720 kPa operating pressure and to have 6 mm pipe tap bottom connection. It shall have oil tight and dust tight enclosure, single pole double throw contacts and setting adjustment.

C. Low Suction Pressure Switch: Industrial, sensitive, low range, diaphragm actuated type, suitable for water service, with range of 2 to 20 kPa of falling pressure, preset at factory to 3 kPa. Switch to be good for 690 kPa operating pressure and to have 6 mm pipe tap bottom connection. It shall have oil tight and dust tight enclosure, single pole double throw contacts, range adjustment knob, sealing cap and range locking nut.

PART 3 PRODUCTS AND WORKMANSHIP

300.000 MATERIALS

300.010 MANUFACTURERS

A. Approved Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:

1. Rockwell Automation/Allen-Bradley Co.
2. Cutler Hammer/Eaton Corp.
3. General Electric
4. Moeller/Eaton corp.
5. Schneider Electric
6. Siemens
7. Schneider Electric / Square D Co.
8. ABB

B. Locally assembled products by one of the above approved manufacturers are acceptable subject to compliance with design requirements and adequacy of reference list and quality control of the local factory.

300.020 PRODUCTS

A. Products: Subject to compliance with requirements, provide one of the products indicated for each designation as shown on plans.

310.000 QUALITY MANAGEMENT

310.010 QUALITY ASSURANCE

A. Source Limitations: Obtain motor control devices through one source from a single manufacturer.

310.020 DELIVERY, STORAGE AND HANDLING

A. Deliver in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.

B. Deliver, store, and handle materials, components, and equipment as per Manufacturer's instructions.

310.030 COORDINATION

A. Coordinate features of controllers and accessory devices with pilot devices and control circuits to which they connect.

B. Coordinate features, accessories, and functions of each motor controller with the ratings and characteristics of the supply circuit, the motor, the required control sequence, and the duty cycle of the motor and load.

310.040 WARRANTY

A. Manufacturer's Warranty: Submit a written warranty signed by the manufacturer agreeing to repair, restore or replace any defective equipment specified in this section during the specified warranty period

1. Warranty Period: 1 year from date of Substantial Completion.

310.050 FACTORY ACCEPTANCE TEST

A. Factory acceptance tests of equipment under this Contract are subject to be witnessed by the Engineer for locally assembled equipment. Witness test shall include complete routine and function testing on all units to be witnessed. Test procedure and program shall be submitted for approval

© Copyright protected

prior to test conduction. Allow for test expenses including business class transportation and hotel accommodation as necessary for two persons from the Engineer's/ Employer's side.

310.060 SPARE PARTS AND EXTRA MATERIAL

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Spare Indicating Lights: Furnish 6 of each type required.
2. Control Fuses: Furnish 10% of the total quantity of each rating used, with a minimum of one per type.
3. VFD Drives: For VFDs 50 HP and less, furnish one unit of each frame for quantities greater than five drives per frame, unless drives are provided with built-in manual bypass.

320.000 SUBMITTALS

A. Technical Data: Include dimensions, ratings and data on features and components.

B. For Variable Frequency Drives: Submit manufacturer's performance data including dimensional drawings, customer connection drawings, power circuit diagrams, installation and maintenance manuals, warranty description, VFDs FLA rating, certification agency file numbers and catalogue information.

C. Point-wise compliance statement to the specifications, duly signed by the manufacturer / manufacturer's authorized representative and the contractor.

D. Shop and Installation Drawings: Submit for each motor control center, and prior to ordering materials and equipment, specified in this Section. Include dimensioned plans, elevations, and component lists. Show ratings, including short time and short-circuit ratings, and horizontal and vertical bus ampacities.

1. Complete technical schedule of features, characteristics, ratings, and factory settings on all motor starters, motor protection relays, sensing units, control accessories, etc.
2. Instructional details of equipment, particularly motor control centers and panels.
3. Installation details of motor control centers and panels and of control and sensing accessories.
4. Exact routing of power and control cables, wiring and conduits.
5. Feeder termination details at motor control centers, starters, motors, isolating switches, control and sensing accessories etc.
6. Wiring Diagrams: Interconnecting wiring diagrams (of all power and control circuits) pertinent to class and type specified for motor control center. Schematic diagram of each type of controller unit indicated.
7. Wiring Diagrams: Submit for approval detailed control wiring diagrams and a list of control equipment with descriptive literature.
8. Free hand field wiring diagrams or sketches will not be accepted.
9. Factory certified routine test certificates to be submitted with each product delivered on site.

E. Maintenance Data: For products to include in the maintenance manuals specified in Division 01.

F. Submit certified protection relay coordination settings for review, along with certified "As-built" connection drawings, before energization of equipment.

G. As-built (Record) Drawings: At project close-out, submit certified record drawings of installed electrical motor control centers, in accordance with requirements of the specifications, Division 01.

H. Tests and Certificates: Submit complete certified manufacturer's type test and routine test records in accordance with the Standards.

330.000 EXECUTION

330.010 INSTALLATION

A. Install motor control centers according to manufacturer's written instructions.

© Copyright protected

B. Anchor each motor control center assembly to steel-channel sills arranged and sized according to manufacturer's written instructions. Attach by tack welding or bolting. Level and grout sills flush with motor control center mounting surface.

C. Install motor control centers on concrete housekeeping bases conforming to Division E Section “Accessories Cast Into In Situ Concrete."

D. Fuses: Install fuses in each fusible switch as indicated.

E. Power and Control Wiring: Run in separate conduits unless otherwise specified.

F. Rigid conduits shall not terminate in nor be fastened to a motor frame or base.

G. Flexible conduits to be used at motor connections. Allow sufficient slack to permit motor to slide over adjustable length of motor base.

H. Flexible Conduits: Length and radius to be sufficient to permit bending of feeder cables without damage to conductor or its insulation.

I. Flexible Conduits: Do not use in place of rigid conduits except at motor connections, unless otherwise specified.

J. Support conduit with conduit supports in an adequate approved manner.

K. Conduits shall not cross pipe or vent shafts, ducts or openings. They shall be run a minimum 100 mm away from pipes of non-electrical services.

L. Conduits: Install so that moisture can drain to lowest point. Provide screw plug at all low points for draining.

330.020 APPLICATIONS

A. Select features of each motor controller to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; duty cycle of motor, drive, and load; and configuration of pilot device and control circuit affecting controller functions.

B. Select horsepower rating of controllers to suit motor controlled.

C. Push-Button Stations: In covers of magnetic controllers for manually started motors where indicated, start contact connected in parallel with sealing auxiliary contact for low-voltage protection.

D. Hand-off-automatic Selector Switches: In covers of manual and magnetic controllers of motors started and stopped by automatic controls or interlocks with other equipment.

330.030 IDENTIFICATION

A. Identify field-installed wiring and components and provide warning signs according to Division V Section "Basic Electrical Materials and Methods."

B. Operating Instructions: Frame printed operating instructions for motor control centers, including control sequences, and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of motor control centers.

C. Starters: Fix detailed wiring diagram inside enclosure cover to clearly indicate circuits.

D. Starters: Identify control and power wires either by distinctive colored insulation, engraved tags or other approved method.

330.040 CONTROL WIRING INSTALLATION

A. Bundle, train, and support wiring in enclosures.

B. Protect circuits with high rupturing capacity fuses or circuit breakers. Auxiliary supply for controls other than from main power circuit, to be effectively isolated by auxiliary contacts on main isolator.

C. Connect hand-off-automatic switch and other automatic control devices according to an indicated wiring diagram or one that is manufacturer approved, where available.

© Copyright protected

1. Connect selector switches to bypass only the manual and automatic control devices that have no safety functions when switch is in the hand position.
2. Connect selector switches with motor control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor-overload protectors.

330.050 EARTHING

A. Earth motors by connecting green insulated conductor from earthing bushing in starter to motor frame. Run earth conductor together with circuit wiring and terminate in motor terminal box, provided earth terminal in box is connected to motor frame. If this is not feasible, extend earth conductor through insulated bushed opening in terminal box and connect to motor base.

B. Earth equipment by connecting non-current carrying metal parts of system to earth source. Non-currents carrying metal parts include conduits, cable trays, outlet boxes, cabinets, enclosures, doors, grilles, and barriers protecting or shielding electrical equipment from direct access.

330.060 CONNECTIONS

A. Tighten motor control center bus joint, electrical connector, and terminal bolts according to manufacturer's published torque-tightening values.

330.070 FIELD QUALITY CONTROL

A. Testing: After installing motor control center and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. Procedures: Perform recommended visual and mechanical inspection and electrical test. Certify compliance with test parameters.
2. Remove and replace malfunctioning units with new units, and retest.

B. Circuit Breakers: Co-ordinate earth fault detection and interruption with those of main incoming breaker on main distribution panel.

C. Pressure Switches: Test after installation to ensure dependable operation and correct setting.

D. Low Suction Pressure Switches: Test after installation to ensure dependable operation and correct setting

330.080 CLEANING

A. Inspect interior and exterior of motor control centers. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish. Clean devices internally, using methods and materials recommended by manufacturer.

330.090 DEMONSTRATION AND TRAINING

A. Train Employer's maintenance personnel to adjust, operate, and maintain the system installation. Refer to Division A Section "Demonstration and Training and Closeout Procedures."

© Copyright protected

SECTION Y95 – SCADA FOR ELECTRICAL POWER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Particular Conditions and Division 01 Specification Sections, apply to this Section.

B. All the requirements presented in this Specification "SCADA for Electrical Power Systems" shall be complimentary to and shall apply to the following Specification Sections except where a particular Specification Section calls for otherwise. In this case, the individual Specification Section shall have precedence.

1.2 SUMMARY

A. Section includes a state-of the-art Supervisory Control And Data Acquisition (SCADA) for Electrical Power Systems automation at the Airport Project to achieve efficient supervision, control and operation of the following electrical network components:

1. Medium Voltage 11kV Switchgear.
2. Medium Voltage 11kV Main Ring Units.
3. 11/0.4kV Distribution transformers.
4. Low Voltage Main Distribution Boards.

B. The Supervisory Control And Data Acquisition (SCADA) functions comprise:

1. Local and remote operation of the LV and MV switchgear.
2. Acquisition of switchgear information and power system measurements.
3. Power quality analysis.
4. Handling of events and alarms.

C. A complete SCADA installation shall be provided comprising the following components as well as all material and services required for a complete and fully operational electrical power systems automation system in line with these Specifications:

1. Expansions and modifications of the existing SCADA Software.
2. Expansions and modifications of the existing Operator Workstations.
3. Expansions and modifications of the existing Web access Workstations (Clients).
4. Expansions and modifications of the existing System Servers.
5. Controllers RTU's/PLC's.
6. Interlocking, control relays, and similar components.
7. Human Machine Interface (HMI).
8. Power supplies and UPS.
9. Racks/Cabinets, Cubicles, Consoles.
10. System Cables.
11. Communication system including fiber optic network cabling, switches, gateways, software as well as all other accessories or equipment necessary to implement the required communication and interfaces.

D. Related Sections

1. Section - Basic Electrical Materials and Methods.
2. Section - Grounding and Bonding for Electrical Systems.

3. Section - Raceways And Boxes For Electrical Systems
4. Section - Cable Trays for Electrical Systems
5. Section - Underground Ducts and Raceways for Electrical Systems.
6. Section - Medium-Voltage Transformers.
7. Section - Medium-Voltage Ring Main Units.
8. Section - Static Uninterruptible Power Supply.
9. Section - Surge Protection for Low-Voltage Electrical Power Circuits.
10. Section – Common Clauses for Structured Cabling.
11. Section - Identification for Communications Systems.
12. Section - Communications Equipment Room Fittings.
13. Section - Communications Backbone Cabling.
14. Section - Communications Horizontal Cabling.
15. Section - Data Communications.
16. Section – Computers & Related Peripherals.
17. Section - Master Clock System (MCS).

E. Servers and related ancillaries shall comply with:
1. Division 27, Section “Computers & Related Peripherals”.

F. Workstations and related ancillaries shall comply with:
1. Division 27, Section “Computers & Related Peripherals”.

1.3 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. The publications listed below form a part of this specification. The publications are referred to in the text by basic designation only.

C. Specific reference in specifications to codes, rules, regulations, standards, manufacturer’s instructions, or requirements of regulatory agencies shall mean reference to the latest printed edition of each.

D. Conflicts

1. Should an instance occur in this Specification or on the Drawings in which material or construction methods called for is less than minimum requirement of the reference standards, immediately inform the Engineer in writing. Consequent to Engineer's approval, supply the materials and perform the work as though called for to minimum code standards.

E. Codes and Standards: All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

1. IEC 61850, Communication Networks and Systems in Substations.

2. IEC 60870, Telecontrol equipment and systems.

a. Part 5-101: Transmission protocols - Companion standard for basic telecontrol tasks
b. Part 5-104: Transmission protocols - Network access for IEC 60870-5-101 using standard transport profiles.
c. Part 6: Telecontrol protocols compatible with ISO standards and ITU-T recommendations.

3. IEC 61131, Programmable Controllers.

4. Electrical equipment, devices and components shall comply with the requirements of EMC:

    a. EN 61000-6-2, Electromagnetic compatibility (EMC). Generic standards. Immunity for industrial environments.
    b. EN 61000-6-4, Electromagnetic compatibility (EMC). Generic standards. Emission for industrial environments.

5. Information Technology equipment, devices and components shall comply with the requirements of:

    a. EN 55022, Information technology equipment. Radio disturbance characteristics. Limits and methods of measurement.
    b. EN 55024, Information technology equipment. Immunity characteristics. Limits and methods of measurement.

6. Code of Federal Regulations

    a. 47 CFR - Telecommunication, Chapter I - Federal Communications Commission, Part 15 - "Radio Frequency Devices."

7. All electrical works shall comply with DEWA Specifications and Regulations including but not limited to “Regulations for Electrical Installations”. Refer also to Section “Basic Electrical Materials and Methods”.

8. System Data Communications Network:

    a. Comply with the latest issue of several material and test standards, which have been developed and published by Institute of Electrical and Electronics Engineers (IEEE) for data communications industry, but not limited to:
        1) 802.1 – LAN/MAN Bridging and Management,
        2) 802.2 – Logical Link Control Group,
        3) 802.3 – Carrier Sense Multiple Access/Collision Detection Access Methods (Ethernet),
        4) 802.6 – Metropolitan Area Networking Group,
        5) 802.7 – Broadband Technical Advisory Group,
        6) 802.8 – Optic Fiber Technical Advisory Group,
        7) 802.9 – Integrated Voice and Data LAN Working Group,
        8) 802.10 – LAN Security Working Group,
        9) 802.11 – Carrier Sense Multiple Access/Collision Avoidance Access Methods (Wireless LAN’s),
        10) 802.12 – Fast Ethernet.

    b. IEEE 610.12, IEEE Standard Glossary of Software Engineering Terminology.

    c. Comply with the latest issue of several material and test standards, which have been developed and published by Network Equipment Building System (NEBS). Level 1, Level 2, and Level 3 are applicable to this Section:
        1) SR-3580: NEBS: Criteria Levels.
        2) GR-63-Core: NEBS: Physical Protection.
        3) GR-1089-Core: NEBS: EMC and Electronic Safety.
        4) GR-3160: Data Centers.

    d. Internet Engineering Task Force (IETF).

    e. International Organization for Standardization (ISO).

    f. Comply with the latest issue of material and test standard(s), which have been developed and published by Dubai Airports:

1) DA-ICTU-STD-004, Dubai Airports, Information & Communication Technology Unit, ICT Physical Infrastructure Standard.
2) DA-ICTU-STD-005, Dubai Airports, Information & Communication Technology Unit, Dubai International CAN Standard.

F. Local regulations and standards, where enforced and relevant, are to have precedence over the Standards.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Definitions

1. GOOSE (Generic Object Oriented Substation Events) messaging is a mechanism defined by the IEC 61850 for the fast transmission of substation events, such as commands, alarms, indications, as messages. A single GOOSE message sent by an IED can be received and used by several receivers. GOOSE is used for example for tripping of switchgear, starting of disturbance recorder, providing position indication for interlocking. With GOOSE, one device (sender) publishes information, only the subscriber devices are receiving it. The reaction of each receiver depends on its configuration and functionality. GOOSE improves interoperability between vendors since it helps integrate IED's that are IEC 61850 compliant.

2. IED Intelligent Electronic Device, such as a PLC, protection relay or an RTU. In the context of this Specification, refers to devices that communicate by a serial protocol to the main RTU at a substation. IEDs do not communicate directly to the SCADA master station.

3. SCADA: Supervisory Control and Data Acquisition, an industrial computer system that monitors and controls a process. In the case of the transmission and distribution elements of electrical utilities, SCADA will monitor substations, transformers and other electrical assets. SCADA is used to gather and analyze real-time data. SCADA will allow for trending, graphic display, alarm tracking and reporting of data.

B. Abbreviations

1.	AI:	Analog Input
2.	AO:	Analog Output
3.	BCU:	Bay Control Unit.
4.	CPU:	Central Processing Unit
5.	DI:	Digital Input
6.	DO:	Digital Output
7.	FAS:	Fire Alarm System.
8.	GOOSE:	Generic Object Oriented Substation Event.
9.	GTI:	Guarantee Time of Intervention.
10.	GTR:	Guarantee Time of Resolution.
11.	HMI:	Human-Machine Interface
12.	ICCP:	Inter-Control Center Communication Protocol
13.	I/O:	Input and/or Output
14.	IED:	Intelligent Electronic Device.
15.	IP:	Internet Protocol.
16.	LAN:	Local Area Network.
17.	LSZH/LSOH:	Low Smoke Zero Halogen.
18.	MCS:	Master Clock System.
19.	MTTR:	Mean Time To Repair.
20.	MTBF:	Mean Time Between Failures.
21.	Node:	A network connection point. Examples include a PLC, PC, Operator Interface Terminal, Switch, Server, etc.
22.	NTP:	Network Time Protocol.
23.	PLC:	Programmable Logic Controller.

24. RTU: Remote Terminal Unit.
25. SA: Substation Automation (also denoted as SCS).
26. SCADA: Supervisory Control and Data Acquisition.
27. SCS: Substation Control System.
28. SLA: Service Level Agreement.
29. SoE: Sequence of Events.
30. SNMP: Simple Network Management Protocol.
31. UPS: Uninterruptible Power Supply.
32. ISP: Inside Plant
33. LOMMF: Laser Optimized Multimode Fiber
34. LSZH/LS0H: Low Smoke Zero Halogen
35. OSP: Outside Plant
36. SMF: Single-mode Fiber

1.5 SCOPE OF WORK

A. The Contractor shall provide, based on these specifications and design drawings, the final design and construction documents and all equipment, software, material, labor and services required to construct and install **SCADA** including, but not limited to:

1. All design services, drawings and specifications, equipment, software, materials, labor and services, not specifically mentioned or shown, which may be necessary to complete the design and installation of the **SCADA**.
2. Proposal to upgrade the specified systems to the latest technology available, so as to bring the specified items to the prevailing technology at the time of construction as detailed in Article "Quality Assurance" of this Specification.
3. Hardware as specified for the system and any hardware that is specific to the Contractor's proposed system.
4. Software application and any other software that may be required to make the system fully operational as specified including the provision of network management software, IP addresses, setup and configuration and any other required configuration.
5. Installation and setup of the system hardware and software as specified.
6. Coordination with the Service Providers of interfaced systems.
7. Integration of the **SCADA** with other systems and in coordination with the Employer.
8. Delivery of the "**Schedule of Control Points**".
9. Final connection of hardware to power, infrastructure termination and patch cords connecting system equipment to the data outlets and other network communication equipment.
10. Documentation: Licenses, Shop drawings, Specifications, As-built drawings, user's manual, operation and maintenance manuals, test reports, etc.
11. Provide list of manufacturer's recommended spare parts (along with current unit prices) for all major components in the system for two (2) years fault-free operation.
12. Provide list of manufacturer's recommended test equipment and tools (along with current unit prices) required for system maintenance.
13. Test plan.
14. System testing and commissioning.
15. System roll-out.
16. System warranty as specified herein.
17. Training as specified herein.
18. Maintenance and support as specified herein.
19. Supply the licenses for all software, programs and modules provided for the works including those developed and modified by the Contractor. The appropriate licenses supplied by the Contractor shall enable the Employer to use, modify, and develop the software, programs and modules for the works supplied under this Contract.

B. Systems Integration

1. In addition to the above scope, a Contractor handling systems integration works shall:
   a. Coordinate all integrated systems installation with the overall design.

b. Provide all additional studies to align works with other trades requirements.
c. Be in charge of the systems integration and migration of existing interfaces, as applicable.
d. Be in charge of coordination and systems integration with new systems.
e. Identify and report all required configurations for integrated applications and systems.
f. Provide and implement a proper coordination mechanism agreed upon and accepted by the end users during Project execution.
g. Provide and implement a clear execution plan for the new configurations and/or upgrades required on the integrated systems.
h. Provide documentation and submittals in compliance with Contract Documents.
i. Propose an integration strategy including a test plan philosophy, methodology and assumptions.
j. Provide for all interfaces interface control documents (ICD) signed by all involved system providers for approval to implement the described functionality.
k. Provide a fully functional test lab facility with simulation of the proposed facilities.
l. Provide all active and passive components required to perform integration within the test lab.
m. Provide a fully functional virtual environment including all necessary hardware and software to run the production of all virtualized systems.
n. Provide all additional studies in case of changes due to other systems modification related to architectural needs.
o. Be in charge of coordinating with other systems to ensure that modifications do not impact other systems and if that happens, be in charge of additional study to coordinate and propose a solution to the Engineer for final approval.
p. Carry out full coordination with the concerned parties of Local Authorities and other Contractors prior to commencing work and throughout that process.
q. Be responsible to replace and make operational all damaged equipment/accessories at his own expense, if any, which are part of ongoing contracts or other contracts, while carrying out the above specified works.
r. Provide gateways to achieve the necessary interface in-between systems along the Project Data Network. Any equipment shall have to be provided and is deemed included in the scope of work whether specifically mentioned or not, in order to ensure proper and functional integration as intended, and enable proper transfer of information in-between the systems as specified.

1.6 PRODUCTS AND WORK BY OTHERS

A. The Employer may separately purchase and/or provide certain equipment and miscellaneous items that will be installed during the course of the installation process. Such items may not be indicated in the documents. Contractor shall coordinate with the Employer and his Suppliers when considering:
1. Structured communications system cabling, termination, identification and testing.
2. Provision and installation of phone systems, computer hardware, virtual servers platform, racks/cabinets and related networking software and equipment.
3. Active communication and data processing equipment.
4. Fiber optic cabling infrastructure.
5. Provision and installation of a Virtualized Servers Environment.
6. Provision and installation of UPS in communications rooms.
7. Communications grounding busbars and grounding wires connecting to the main building earth electrode system.
8. Dedicated power panels, ground busbars, circuits, floor boxes and utility outlets.
9. Installation and finishing of plywood backboards.
10. Building mechanical ductwork, cooling/heating system and environmental control sensors.
11. Communications and electrical pathway devices both indoors and outdoors such as underground ductbanks, manholes, handholes, cable trays, conduits, conduit sleeves, and penetrations in walls and floors.

B. Accordingly, Contractor shall:
   1. Meet jointly with representatives of above systems, Contractors, Operators, Engineer and Employer to exchange information and agree on details of project implementation, equipment arrangements and interface, etc.
   2. Record agreements reached in meetings and distribute record to participants.
   3. Adjust arrangements and locations of equipment in technical rooms to accommodate and optimize arrangement and ensure necessary interface with other systems.
   4. Coordinate with the other Contractors whose deliveries are necessary for the correct operation of the **SCADA** including but not limited to the Electrical Power Systems.

1.7 CONFIDENTIALITY

A. The Contractor shall respect and protect the privacy and confidentiality of the Employer, his employees, processes, products, and intellectual property to the extent necessary, consistent with the legal responsibilities of the Employer policies.

B. Contractor shall sign a non-disclosure agreement and abide by the requirements to keep confidential all information concerning bid documents and this Project.

1.8 SUBMITTALS

A. The Contractor shall not perform any part of the work requiring submittal and review of shop drawings, product data or samples until Engineer/Employer has approved the respective submittal. Such work shall be in accordance with approved submittals:

   1. Product data: For each type of product.

   2. Shop Drawings.

   3. Wiring diagrams to show typical wiring schematics.

   4. System Operation: Include:

      a. System Architecture and performance requirements.
      b. Inter-connectivity patching of all network devices
      c. Human Machine Interface (HMI) design for all categories of users.
      d. Software Architecture and justification (e.g.: off-the-shelf and specific software, etc.).

B. Submittals shall comply with Division 01 requirements including but not limited to Sections “Submittal Procedures”, “Closeout Procedures” and “Record (As-Built) Documents”.

C. Product Certificates: signed by manufacturers of equipment and /or software certifying that furnished products comply with contract requirements.

D. Manufacturer’s Endorsement
   1. Contractor shall submit Manufacturer’s technical validation and endorsement of the design documentation and implementation.

E. Contractor shall deliver signed Warranty.

   1. Comprehensive cost structure according to committed GTI, GTR and MTBF.
   2. Maintenance stock dimensioning.
   3. Distinguish maintenance during and after Warranty period.
   4. Teams' organizations (distinguish local and remote teams, give associated manpower).
   5. Hardware repairs and software patch support procedures.

F. Testing Plan:

1. The Contractor shall provide Test Plan elaborating the testing methodologies and schedule to be applied throughout various stages of the work. This shall also include the plan for integrated tests for interface with other systems. The Contractor shall submit the Test Plan for approval by the Employer.

G. Field quality-control reports.

1. Field Test Reports: Contractor shall submit the required Field Test Reports in the format and media specified, upon completion of testing the installed system.

a. The Contractor shall test the **SCADA** after installation to ensure functionality and performance meet industry approved guidelines.

b. The Contractor shall provide and supply all necessary technical and skilled manpower, tools, test equipment, materials and transportation required for performing system and components testing.

c. Indicate and interpret test results for compliance with performance requirements.

H. Cable Pulling Plan: The Contractor shall submit a cable pulling plan, as follows:

1. Indicate the installed backbone conduit layout in schematic format, including junction boxes and distances between junction boxes.
2. Indicate contents of each conduit.
3. Indicate the cable pulling calculations, conduit fill ratios and actual cable runs and tensions.
4. Include detail and schedule showing the construction sequence of communications rooms.
5. Installation of cabling shall not commence prior to approval of the pulling plan and calculations by the Engineer.

I. Splice Plan: The Contractor shall submit shop drawings indicating the intended cable splice points, mounting method and equipment list.

J. Cable Testing Plan: The Contractor shall provide a test plan for media testing as described in "Field Quality Control" Article of this Section prior to beginning cable testing.

K. Cable Testing Reports: The Contractor shall submit cable test reports in accordance with "Field Quality Control" Article of this Section.

1. Cable Testing Reports: Submit cable test reports of performed tests as follows:

a. The tests shall clearly demonstrate that the media and its components fully comply with the requirements specified herein.

b. Three sets of electronic and hardcopy versions of test reports shall be submitted together and clearly identified with cable identification.

c. Cable inventory data shall be submitted for all fiber and copper cabling and termination equipment. Submit data electronically on CD-ROM, listing products furnished, including:

1) Manufacturer's name.
2) Manufacturer's part numbers.
3) Cable numbers.
4) Location and riser assignments.

2. Testing Equipment

a. The contractor shall deliver calibration certificates of testing equipment indicating that equipment calibration meets the appropriate levels by a qualified testing agency and that equipment has been calibrated at least once in the year prior to the testing date.

L. Product data: For each type of product.

1. Factory Tests: All equipment and cables shall be tested at Manufacturer premises, and test certificates, shall be submitted to Engineer before shipping and delivery to site.

2. Hardware including storage, computation, processor needs, operating system, display, etc. as specified for the system and any hardware that is specific to the Contractor system.

a. Submit catalogue cut-sheets /Datasheets that include manufacturer, trade name, and complete model number for each product specified. Model number shall be marked with an arrow or underlined to indicate exact selection.
b. Identify applicable specification section reference for each product performance for each component specified for approval prior to purchase and installation.
c. Submit point-by-point compliance statement to the specification, with necessary supporting documents.
d. For each product, include manufacturer's installation instructions.
e. Equipment Datasheets to include as a minimum the following:
1) Product performance and features,
2) Electrical and Environmental requirements (power supply, temperature, humidity, etc.),
3) Software and hardware releases roadmap for the next two years,
4) Troubleshooting guide,
5) Standard tests passed and results,
6) Product certificates,
7) Product compatibility matrix with other Manufacturers/Vendors.
8) Specify type of testing: in operation or in laboratory.
9) MTBF.

3. Provide a detailed Bill of Materials along with descriptive literature identifying components.

4. Drawings of equipment to be supplied shall include, as a minimum: overall dimension details for each panel, cubicle, console, etc., including internal and external arrangements and door mounted man machine interface with nameplate designations. Wiring diagrams of equipment including field device connections shall be included and specific installation/wiring requirements identified.

5. Operational Description shall include the principal functions/capabilities of the Operator workstations and PLC/ RTU as provided and configured or programmed. Include a description of system communications.

M. Software Architecture Design Document:

1. Comprehensive documentation of the expanded/modified software: a comprehensive description of all software applications and any other software that may be required to make the system fully operational as specified including the provision of network management software, IP addresses, setup and configuration and any other required configuration.

a. A software document shall be furnished for each expanded/modified software or program in the SCADA System.
b. Warranty information shall be supplied for each software or program in the System.

c. Software License information shall be submitted for each expanded/modified software or program in the system, indicating the number of licenses provided for each type of program or software and validation of the license.
d. System performance data such as mean time between failures (MTBF) and mean time to repair (MTTR) based on manufacturers' published and proven data and the Contractor's experiences with systems of a similar nature.

2. The expanded/modified Software Architecture Design document shall include, but not be limited:

a. The top-level design of the SCADA proposed software.
b. A complete description of support, interface, diagnostic, and general I/O software.
c. An inventory of major software packages, including third party, provided. A separate summary shall be provided for each major system component.
d. Illustration of the flow of data from field data acquisition to polling by the SCADA system to alarming to historical logging.
e. A description of the historical data collection subsystem, including table usage and data storage rates
   1) Polling Process, including anticipated scan rates
   2) Data consolidation techniques for use in RTU
   3) Peer to Peer data flow
   4) Hard Drive Storage space required for each software component
   5) Memory requirements (RAM) for each software component.

3. Management software datasheets to include at least the following information:

a. Product performance and existing features,
b. Known limitations (number of network elements managed, number of administrators, number of clients, size of the database, etc.),
c. Hardware requirements (storage, computation, processor needs, operating system, display, etc.),
d. Features and software releases for the next two years,
e. Standardized tests passed and results and available product certificates,
f. Product compatibility matrix with other Manufacturers/Vendors (specify level of testing in operation, lab test, declarative or theoretical).

N. Shop Drawings

1. Shop drawings submittals to cover as minimum plan views and elevations of all work to be installed.

a. Submit for approval diagrams showing layout of network components, schematic diagrams, wiring diagrams, etc.
b. Include data on electrical and physical characteristics of network components, network management system, etc.
c. Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
d. System Configuration as proposed with specific reference to "interoperability":
e. Include racks/ cabinets dimensions and weights required to house the system equipment
f. Include drawings for the Servers, consoles and peripheral I/O devices.
g. Show installation arrangements for all provided equipment, mounting and anchoring details, conduit entries into cabinets, and SCADA electrical power supply distribution conduit and wiring. Include data sheets and/or catalog cuts for mounting devices, anchors, wire, and other installation materials.

2. Block Diagram: Show interconnections between components specified in this Section and devices furnished. Indicate data communication paths and identify networks, data buses,

data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.

a. Include fiber optic cabling, network switches, routers, fiber patch panels and other network components.
b. Include servers, Workstations, Remote Terminal Units, transceivers, media converters, RTU's and PLC's.
c. Description of switch setup and programming to accomplish Ethernet configuration shown on the drawings.
d. Description of IP addressing scheme
e. Labeling of all components on the block diagrams.
f. Assignment of each component with a unique device identifier.
g. Show lists, ID, label and locations for all major system components.
h. Show details of interface where the facilities existing hardware interfaces with the new network

3. Wiring Diagrams: Detail specific wiring to suit Project. Coordinate nomenclature and presentation with a block diagram, and differentiate between manufacturer-installed and field-installed wiring.

4. The Contractor shall make any corrections required by the Employer or Engineer, file with him two corrected copies and furnish other similar copies as may be needed. The Engineer's approval of such drawings or schedules shall not relieve the Contractor from responsibility for deviations from drawings or specifications, unless he has in writing called the Engineer's attention to such deviations at the time of submission, nor shall it relieve him from responsibility for errors of any sort in shop drawings or schedules.

O. Calculations

1. Based on the SCADA hardware power requirements provide load calculations that will be used for planning power distribution across existing UPS systems.

P. System Graphics:

1. Provide system schematics in an approved CAD format indicating the location of monitoring and control points. Coordinate with the Electrical Contractor.

Q. Qualifications

1. The Contractor shall provide the appropriate documentation to comply with the requirements described in Paragraph "Quality Assurance", included with, and at the time of, bid submission.

R. Closeout Submittals (Record Documents):

1. The Contractor shall submit Record Documents for products and systems including but not limited to:
   a. Schematic network diagrams.
   b. Parts lists.
   c. Software and Firmware Operational Documentation:
      1) Software operating and upgrade manuals.
      2) Program Software Backup: On magnetic media or compact disk, complete with data files.
      3) Printout of software application and graphic screens.
      4) All programming and source code shall be considered as a work for hire and shall be the property of the Employer upon completion of the project.

   d. Network devices inventory.
   e. Device configuration details.

f. Device port assignments.
g. IP addressing schedule.
h. VLAN addressing schedule.
i. Layer 2 and Layer 3 protocol configurations.
j. Layer 3 routing paths.
k. Software CD's with license information.
l. Recommended list of spare parts and components to be stocked at Project site.
m. Test Reports.
n. Training Manuals.
o. Warranties.
p. Record (As-Built) Drawings.

2. Record (As-Built) drawings shall include the components and cable numbers labeled in accordance with Section "Identification for Communications Systems".

a. Utilize normal recognized drafting procedures that match Division 01 requirements.

b. Graphical symbols and component identification on detail drawings should use commonly understood, unique and unambiguous symbols (an example of such a system is IEC 60617) - to the approval of the Engineer.

c. The As-Built drawings shall incorporate all changes made to the project identified in, but not limited to, addenda, change notices, site instructions or deviations resulting from site conditions.

S. Operations and Maintenance Manuals to include:

1. Internal and interconnecting wiring and control diagrams with data to explain detailed operation and control of the equipment.
2. A control sequence describing start-up, operation, and shutdown.
3. Description of the function of each principal item of equipment.
4. Installation and maintenance instructions.
5. Safety precautions.
6. Diagrams and illustrations.
7. Testing methods.
8. Performance data.
9. Pictorial "exploded" parts list with part numbers, list of special tools and instruments indicating sources of supply, recommended spare parts, and name of servicing organization.
10. List of qualified permanent servicing organizations for support of the equipment and system, including addresses and certified qualifications.
11. System Maintenance
    a. Routine/Preventative Maintenance Schedule.
    b. Troubleshooting Guide.
    c. Breakdown Maintenance Instructions.

1.9 QUALITY ASSURANCE

A. Materials and Equipment
1. Materials and equipment shall conform to the latest issue of referenced industry standards, publications, or regulations referenced in this Section, as applicable.
2. Materials and equipment shall comply with applicable local regulations and code requirements of Authorities Having Jurisdiction. These shall have precedence over other codes and standards indicated, unless otherwise approved by the Employer, in writing.

3. Source Limitation:

a. All SCADA expanded/modified Software shall be from a single manufacturer who shall assume responsibility for the system components and for their compatibility.

b. For each category of (hardware) technology used for the SCADA infrastructure, obtain system components from one leading manufacturer who shall assume responsibility for the system components and for their compatibility.

4. Materials and equipment shall be new and shall meet or exceed the latest published specification of the manufacturer in all respects.

a. These specifications represent the prevailing technology at the time of design. However, during construction, and because the technology may be rapidly evolving, the Contractor is required to propose an upgrade of the specified systems to the latest technology available, so as to bring the specified items to the prevailing technology at the time of construction.

b. It is the Contractor's responsibility to amend, as deemed necessary, any other systems affected by the upgraded submission so as to allow for the complete and proper functionality of all submitted state-of-the-art systems, equipment and relevant products.

c. All necessary additional works that result from the upgraded materials, systems, equipment and the ancillary works are to be proposed and detailed in the shop drawings.

d. The Contractor's proposals must allow in the shop drawings for physical space, electrical/mechanical support, network connectivity and other incidental items required for the installation of the proposed updated systems and equipment.

e. The Employer shall review the proposal and shall decide whether or not such substitutions will be appropriate and prices shall be adjusted to reflect increase or decrease in cost to Employer. The cost of any change to the converged network system, the infrastructure cabling or physical plant design due to such changes shall be included in the presented cost revision prior to Employer acceptance.

5. Equipment Country of Origin
   a. Equipment Country of Origin (manufacturing country) shall be indicated in the proposal at time of bid submission. Refer to Division 01, Section "Product Requirements".

B. Manufacturer Qualifications
   1. A firm specializing in providing SCADA systems based on the IEC 61850 and IEC 60870 series Standards, similar to those indicated for this Project and with a record of successful in-service performance for at least five years prior to commencing the corresponding work for the Project .
   2. Manufacturer's systems shall be, as often as possible, a standard "off-the-shelf" package utilizing the latest hardware and software technology. Any major system development effort necessary to meet specified requirements is unacceptable. Even if this system is a new concept, it should not require huge development and shall be based on existing and proven technologies.
   3. Manufacturer or factory-authorized agency shall maintain a service center capable of providing training, parts, and emergency maintenance and repairs for overall system at Project site with a response time as detailed under "MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD" Article of this Section.

C. Contractor's Qualifications
   1. Contractor with documented experience in the installation of SCADA systems based on the IEC 61850 and IEC 60870 series Standards with a minimum of 2 projects successfully executed. All projects must be of comparable size and complexity to that of this Project and

they must be verifiable and completed within the last 5 years prior to commencing the corresponding work for the Project.

2. The installer shall have at least one supervisory employee possessing a certification from the manufacturer or another recognized organization or institution, providing formal training in the implementation, configuration/programming and system diagnosis for the specified equipment.
3. The Contractor shall designate a full-time Project Manager who shall be responsible for system coordination and project scheduling, testing and commissioning and preparation of documents related to Record (As-Built Documents) and Operation and Maintenance Manuals. The Employer reserves the right to approve the Contractor's Project Manager.
4. The Contractor shall be authorized by the manufacturer of the components of the system to sell their products and initiate a Warranty service on the same items.
5. By submitting a Tender, the Contractor thereby certifies that he is qualified in all areas pertaining to, either directly or indirectly, the work. In the event the Contractor becomes unable to complete the work in accordance with the Contract Documents, or to the satisfaction of the Employer, it shall be the responsibility of the Contractor to retain the services of the applicable manufacturers' representatives to complete the work in accordance with Project schedule and at no additional cost to the Employer.
6. The Contractor shall ensure compliance with and have a thorough understanding of all local codes and contract conditions pertaining to this Project.
7. Installation team members shall have the following skills:
    a. Good knowledge of operating systems to be able to configure accurately the servers and verify their responses to critical events (power cut, disk crash, etc.).
    b. Good knowledge of database administration to be able to adjust internal parameters (redo log size, index, etc.).
    c. Implementation experience on a Project of similar size and complexity.
8. Works involving integration: Contractor shall provide evidence of previous successful integration with the proposed material made up of a combination of different brands.

1.10 DELIVERY, STORAGE AND HANDLING

A. Comply with Division 01, Section “Product Requirements”.

B. No component of the SCADA – whether software or hardware - is to be delivered to site unless it has undergone successfully Factory Acceptance Testing (FAT).

C. Test fiber optic cables upon receipt at Project site.

1. Test optical fiber cables to determine the continuity of the strands end to end. Use optical loss test set - OLTS .
2. Test optical fiber cables while on reels. Use an optical time domain reflectometer (OTDR) to verify the cable length and locate cable defects, splices, and connector; including the loss value of each. Retain test data and include the record in maintenance data.
3. Refer to, Sections:
    a. “Common Clauses for Structured Cabling”.
    b. “Communications Backbone Cabling”.
    c. “Communications Horizontal Cabling”.

1.11 PROJECT/SITE CONDITIONS

A. Environmental Conditions: Equipment shall be capable of withstanding the project environmental conditions specified under Section “Basic Electrical Materials and Methods” encountered at the installed location without mechanical or electrical damage or degradation of operating capability:

1. Interior, controlled environment.
2. Interior, uncontrolled environment.
3. Exterior environment.

B. Operational Constraints: The **SCADA** System will run 24 hours per day, all the days of the year.

C. Unless otherwise indicated, **25%** spare capacity shall be required at all levels of the **SCADA** System, including the I/O modules.

D. Power Supply

1. Power supply for all products shall be supplied or derived from the voltage system described below, as shown on the Drawings, or as otherwise specified.

2. Nominal characteristics of power supply and distribution system (AC voltage / No. of Phases / Frequency / Earthing system) shall be as per local country standard. For details, refer to Section "Basic Electrical Materials and Methods".

1.12 WARRANTY

A. Special Warranty
1. The **SCADA** System (comprising any associated hardware and software) shall be warranted by the Manufacturer to be free from defects in equipment, software and workmanship for a period defined below in paragraph "Warranty Period".
2. Manufacturer's Warranty: Provide written warranty, signed by the Manufacturer and the Installer agreeing to replace system devices and equipment that fail in materials or workmanship and to provide software patch support and updates within specified warranty period.
3. To maintain the manufacturer's warranties, equipment shall be installed, commissioned and serviced by those installers authorized by said manufacturer to perform those duties. If the Contractor is not authorized, by the said manufacturer, it is his sole responsibility to make the appropriate arrangements and bear all cost and consequences thereof.
4. All manufacturers' equipment warranties shall be activated in the Employer's name and shall commence on the date indicated in paragraph "Warranty Period" below.

B. Experimental Period
1. There shall be an Experimental Period during which the Contractor shall undertake supervision and responsibility for operation of the system under actual site conditions. If any malfunction or degradation in the performance is noted on the system during this period, it shall be attended to immediately.
2. During this period, the Contractor shall fully demonstrate the system performance under actual operation conditions. This demonstration is to confirm, to the satisfaction of the Employer/Engineer, that the system is free of remarks and is ready for taking over.
3. The Experimental Period shall extend over three months and shall start following the certification by the Engineer of the successful testing and commissioning of the system. The Experimental Period shall, each time a malfunction is detected, be extended by three months starting from the certification by the Engineer of the successful testing of the system following the rectification of the malfunction.

C. Taking Over of the System
1. The system shall be considered ready for taking over by the Employer following:
   a. The expiry, with no malfunctions being detected during the last three months, of the Experimental Period (as may be extended), and
   b. The submission by the Contractor, and approval by the Engineer, of the documents and information required from the Contractor for the use, occupation and maintenance of the system in accordance with the Contract (updated as necessary to reflect any rectification(s) introduced during the Experimental Period).

D. Warranty Period
1. The Contractor shall include a statement of warranty on the entire system and on the individual pieces of equipment for two years from the date of taking over of the system.

2. During the Warranty Period, the Contractor shall undertake Maintenance actions as defined in the "MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD" Article below.
3. During the Warranty Period, the Contractor shall provide all equipment, material, software and labor needed to replace or repair defective products without any additional cost to the Contract.
4. Warranty period shall be revised in accordance with Division 01, Section "Product Requirements" depending on Equipment Country of Origin.

1.13 MAINTENANCE AND SUPPORT DURING WARRANTY PERIOD

A. Support
1. The Contractor shall offer a comprehensive explanation of its Service Level Agreement (SLA) policy. The SLA should cover at least the following performance terms:
   a. 99.999% availability. GTI and GTR should be guaranteed accordingly.
   b. Emergency level 24/24, 7/7 phone support shall be available. Distant intervention on system shall be offered.
   c. High-level problem investigation support shall be offered 5/7 during working hours.
   d. Maintenance stocks shall be properly sized by the Contractor in order to match operational quantities replacement needs based on Manufacturers MTBFs for each component within the network.
   e. The MTTR shall not exceed 30 minutes. The MTTR shall include the diagnostic time, active repair/replacement time and the adjustment/testing time on site, but shall exclude the response time.
2. Maintenance service shall include:
   a. Contract lifetime software patching for revealed problems during operations.
   b. Contract lifetime hardware replacements on established malfunctions or weaknesses generating repetitive loss of service quality.
   c. Following receipt of a defective product, Manufacturer shall make reasonable efforts to repair or replace equipment with new ones and return the equipment within a reasonable time not exceeding four working days.

B. Maintenance Service
1. During the Warranty Period, Manufacturer or factory-authorized agency shall maintain a service center capable of providing spare parts and emergency maintenance and repairs for the overall system at Project site 7 days a week and 24 hours a day. Competent personnel shall be dispatched to rectify stoppages at any time during the day or night when being called on by the Employer.
2. The Contractor shall submit a Service-Call Report to be sent to the Employer immediately following every call out, indicating the time of call out visit, cause, remedial action taken and the time that the service was restored.
3. A Maintenance Manpower Plan shall demonstrate the Contractor's committed resource level available for all types of activities to be carried out within the Warranty Period. Such a plan shall be submitted for Approval six months before commencement of the Warranty Period.
4. The Contractor's response time, during the Warranty Period, shall not exceed 1 hour. The response time is defined as the time that elapses between the reporting of a fault and the maintenance personnel arriving at where the faulty equipment is located.
5. During the Warranty Period, the MTTR shall not exceed 30 minutes**.** The MTTR shall include the diagnostic time, active repair/replacement time and the adjustment/testing time on site, but shall exclude the response time.
6. During the Warranty Period, the monthly average of the Repair Time shall be lower than or equal to 6 minutes for each device. This performance will be monitored.
7. The Contractor shall provide at least four inspection visits at six-month interval during the Warranty Period. The Contractor shall submit a Service-Call Report to be sent to the Employer immediately following every inspection visit, indicating the time of call out visit, cause, remedial action taken – if any - and the time that the service was restored.

8. The Contractor shall be responsible for clearing away from the Site all surplus materials, rubbish, temporary works of every kind and leaving Project Site and installation clean and in a workmanlike condition to the satisfaction of the Employer, upon completion of repair, and maintenance works.

C. Maintenance Performance Data
1. Updates
   a. The system will have to be conceived to facilitate the updates that will take place throughout its life. Software update process must be easy, rapid and without risk, and must be reversible.
   b. Update shall be transparent to the user and shall be done without interruption of the service.
   c. Starting with installation of the SCADA system and continuing until 10 years after Final Acceptance, the Contractor, upon authorization from Engineer, shall provide, install, test, and commission updates to the SCADA system software and computer provided software within 15 days from when such updates are announced and released by the manufacturer.
   d. All updates shall be provided which are necessary to maintain the SCADA system in compliance with the Contract Documents, as well as any incremental releases.
2. Corrections
   a. In the event of error, the system shall have, as soon as possible, to store in a file a certain amount of information allowing the correction of this error, e.g. entries in the database, faulty operations of the statistics, etc.
3. The Contractor commits himself to the three (3) main sizing data of maintenance:
   a. Annual number of hours of preventive maintenance.
   b. Annual number of hours of corrective maintenance.
   c. Average Annual cost of spare parts (Average based on ten years).

D. Preventive Maintenance
1. The Contractor shall describe the selected operations for preventive maintenance as planned during daily operation.
2. All preventive maintenance procedures shall minimize disruption of the live system operation. No preventive maintenance procedure shall be allowed to jeopardize the Operators ability to monitor and control system operation. At the Operators option, their maintenance personnel may participate in any preventive maintenance procedure.

E. Curative Maintenance
1. The selected operations shall be chosen to correspond to a significant fraction of the forecasted time devoted to curative maintenance.
2. For each defect incidence, the Contractor shall record:
   a. Equipment identification.
   b. The object of the Maintenance activity.
   c. The type of Maintenance activity (planned or not).
   d. The total man-hours spent for the activity.
   e. The total down-time duration ascribable to the Maintenance activity (transportation time, diagnosis time, repair time, restart time).

1.14 SPARE PARTS AND EXTRA MATERIAL

A. Contractor shall handover manufacturer's recommended spare parts for all major components in the system for two years fault-free operation.

B. The manufacturer shall guarantee the flow and availability of the spare parts without a major design change for at least ten years' period from date of System Acceptance by Employer.

C. Handover manufacturer's test equipment, tools, licensed software, diagnostic software, laptop, interface cables, etc., required for normal routine inspection and maintenance and testing of system components as appropriate for equipment supplied.

PART 2 - PRODUCTS

2.1 STANDARD COMMERCIAL PRODUCTS

A. Refer to Division 01 Section 016000, “Product Requirements”.

2.2 OVERVIEW OF PROPOSED POWER SUPPLY SYSTEM

- Load Categories
- Power Supply Network
- Power Supply Source
- Control and Monitoring

A. Load Categories: The electrical distribution system for the various Airport facilities will be split into four categories listed in decreasing order of priority:

1. Category 1: Emergency (UPS) Loads that cannot tolerate power failure: includes IT and communication systems, emergency lighting and illumination of means of egress.

2. Category 2: Emergency (Life Safety and Critical) Loads: includes Fire pumps, Staircases pressurization fans, Smoke Management System, PLB’s fire fighters elevators, etc.

3. Category 3: Essential Loads: includes central battery system, UPS units (of Category 1 loads), walk-in refrigerators, freezers, etc.

4. Category 4: Normal (Non-essential) Load: fed directly from the DEWA grid: includes chillers, air conditioning, general lighting, conveying systems, etc.

B. Control and Monitoring:

1. A SCADA system is already existing for the supervision and control of the existing 11kV power distribution network, and downstream up to the Main LV Switchboards. The existing SCADA system shall be expanded and modified for the supervision and control of the new 11 kV Substations.

C. SCADA Control Centers:

1. A SCADA system is already existing at the Airport Control Center / Master Station and at JAAC Substation Control Center.

2. The Contractor shall collect the as-built drawings of the existing SCADA system. The Contractor shall expand/modify the existing SCADA system and add necessary equipment as deemed necessary to have a fully operational SCADA system:

2.3 KEY FEATURES

A. Key features of the SCADA shall include but shall not be limited to:

1. Full monitoring, diagnostics and control of designated MV and LV network components:
   a. 11kV Switchgear.
   b. 11kV Main Ring Units.
   c. 11/0.4kV distribution transformers.
   d. Low Voltage Main Distribution Boards.

2. Automatically reconfigure and maintain the distribution network.
3. Reconfigure the MV loop in case of phase earth fault.

4. Data acquisition for metering devices, sensors, and other intelligent electric devices
5. Recording of events, Operator actions and measured values.
6. User-composed measurement groups for displaying real-time and historical trends.
7. Power quality analysis (including harmonics, voltage sags/swells, transients and voltage and current sinusoids).
8. Power quality compliance reporting for international standards (IEC61000 4-30; EN50160)
9. Supervise servers, PLC/HMI/RTU communication links and connected workstations status.
10. Flexible filtering of events, alarms and historical data.
11. Graphical displays of information.
12. Reporting tools with standard report templates.
13. Use open system and standard communication protocols.
14. Interoperability with BCU's and Intelligent Electronic Devices IED's including intelligent digital protection relays and metering system.
15. Dual redundant and hot standby system components support.
16. IP-Networking system for SCADA communication.
17. Web-based secure access.
18. System Security: the system shall provide a comprehensive system security policy to prevent un-authorized access to the system.

B. Network Security

1. Network security should be inherent/built-in at all levels of the network. Steps for securing the network and providing reliable operations consist of, but are not limited to:

    a. Physical Access: Limit and track physical access to all network and server elements.
    b. Virtual Access: Limit, authenticate and track access to every network device and server.
    c. Logical Network Separation: Create subnet boundaries between sub-system networks, servers, control rooms, etc.
    d. Perimeter Security: Enforce a stringent perimeter security strategy, using network filters and firewalls, to limit and track all traffic between the Internet, intranets and user sub-systems, servers and Control Rooms.
    e. Virus Scanning and Host Security: Use a comprehensive virus scanning and server/application security policy.

2. The overall SCADA data communications network shall be dedicated to the SCADA and shall be independent of the Airport Data Communications Network.

C. For details of input/output points to and from major electrical equipment,".

2.4 SYSTEM ARCHITECTURE

A. System architecture shall allow communication between Bay Control Units (BCU's), intelligent electrical devices (IEDs) and the SCADA, including the supervisory servers and consoles.

B. The proposed solution shall utilize the latest standards and technologies, such as IEC 61850 client-server communications, GOOSE messaging, fiber optic networks, and complete redundancy.

C. The SCADA system shall be:
1. scalable to adapt to the planned and potential evolution of the site(s)
2. modular to enhance performance
3. redundant to provide reliability to match requirements
4. able to meet the performance requirements.

D. The SCADA system shall allow for Distributed Architecture to support varied amounts of data points by supporting multiple:
1. I/O servers to maintain high data acquisition performance
2. alarm servers to maintain high alarming performance
3. trend servers to maintain high historical logging performance

E. The SCADA system shall allow for System Redundancy to limit and minimize the impact of any component failure or maintenance. Redundancy shall cover the following components:
   1. primary and standby I/O servers
   2. network: multiple topologies (such as star or self-healing ring) and redundant distribution
   3. serial line: gateway and device dual port attachment
   4. programmable logic controllers (PLCs)

F. Redundancy of the SCADA system components referenced herein shall mean when a component fails for any reason, a “hot” standby unit of identical functionality shall automatically take over and an alarm will annunciate. Transfer shall be “bumpless” so control will continue uninterrupted. “Hot Standby” is a method of redundancy in which the primary and secondary (i.e., backup) systems run simultaneously. The data is mirrored to the secondary system component in real time so that both systems contain identical information.

G. Data Acquisition and Network Topology
   1. A series of standard bays panels shall be interconnected by an open protocol. A bay is a feeder, a transformer, a coupler or a capacitor bank. A standard bay panel contains the IED's needed for the local control and protection of the bay.
   2. Each IED shall have its own integrated Ethernet switch.
   3. Each bay shall have a local/remote switch enabling or disabling the local control.
   4. A Gateway (PLC/RTU Controller with built-in Ethernet switch), shall provide the interface between the substation and the remote SCADA control center using the protocols: IEC 60870-5-101 or IEC 608670-5-104.
   5. Each bay shall have an autonomous behavior, i.e. local control and interlocking, sequence of events, etc. It is to be connected to other bays by logical means for system wide functions, such as interlocking or busbar protection, but can have a downgraded mode with complete protection and control of the local bay. Its functioning shall not be affected by any fault occurring in any of the other bay control units of the station.
   6. An operator interface (HMI), shall provide the local supervision and control of the substation, sequence of events, archiving, printing, etc. It shall be active when the substation is in local mode.
   7. The communication protocol within the Substation shall be IEC 61850 in order to permit 100 Mbps peer-to-peer Ethernet communications over the substation internal dual fiber optic loop: the Substation Control System (SCS).
   8. Additional gateways may be required to interface legacy field bus communicating IED's and the IEC61850 substation bus. The protocols may be serial or TCP/IP versions for IEC 60870-5, DNP3.0 and Modbus.

H. Control Levels
   1. The network architecture shall allow the implementation of different levels of control:
      a. Local (at the IED level)
      b. SCS (at the substation level) and
      c. SCADA (remotely from SCADA Control Center).

2.5 PERFORMANCE REQUIREMENTS

A. The following minimum performance requirements shall be met:
   1. System loading and utilization:
      a. Utilization of any processor
         1) 30% under normal activity state
         2) 70% under high activity state
      b. Utilization of any memory device:
         1) 30% under normal activity state
         2) 70% under high activity state
      c. Utilization of any communication device of network bus:
         1) 40% under normal activity state
         2) 80% under high activity state
   2. Response Times:

a.	Display appearance	< 1 sec
b.	Presentation of binary changes	< 1 sec
c.	Presentation of analog changes	< 2 sec
d.	From order to process output	< 1 sec
e.	From order to update of display	< 2 sec

B. The accuracy for measuring values, from transducer input to the indication on the display of the SCADA system, shall be better than or equal to 1%.

C. The System shall utilize the following Communication Protocols:

1. IEC 61850: for networked communication within the substation (substation automation).
2. IEC 60870-5-101: for remote communication and connection to control center: Standard master/remote SCADA functionality over fixed lines
3. IEC 60870-5-104: for remote communication and connection to control center: Standard master/remote SCADA functionality using TCP/IP over Ethernet.
4. IEC 60870-6 or ICCP (Inter-control center protocol): for all required bidirectional communications functionality for inter-control center communications.

D. The SCADA System functions shall include full support of the following communication protocols:

1. Modbus TCP/IP, including time-stamped data and waveform formats
2. SNMP protocol (v1 and v2)
3. DNP3
4. IEC61850
5. IEC 60870-5-104
6. OPC DA exchange (v1, v2 and v3)
7. OPC AE exchange

2.6 CONTROLLER (PLC/ RTU)

A. The hardware of the Controller shall be based on a flexible, modular, multi-processor architecture, with dual processor (CPU's) including local database, multiple external communication ports using open protocols, process I/O handling. Flexible and expandable input/output (I/O) modules/cards.

B. The design of all hardware shall be such as to ensure satisfactory operation in an electrically hostile environment typical of high voltage electrical installations. In order to prevent incorrect functioning or damage to the equipment when subjected to interference arising from power system switching, fault currents and lightning, all input and output circuits, and power supply circuits shall be provided with isolation and/or immunity to electrical interference. The Contractor shall state how this is achieved and the international standards to which the PLC/ RTU has been tested in this respect.

C. The Contractor shall submit the detailed arrangement specifying the used modules at each Substation / Generator Plant for Engineer's review and approval.

D. Each Controller (PLC/ RTU) shall be of modular type typically consisting of the following modules:
1. Processor module
2. I/O Modules
3. Communication Module
4. Power supply unit

E. Redundant Processor Module:

1. Capable of automatic restart in the event of power failure without loss of functionality or local database. Configuration / parametric set-up data, which may be programmed on site or via download, shall be stored in non-volatile memory that does not rely upon battery support.

2. Readily possible to update the software to alter to extend its functionality.

3. The module shall be provided with the following features as minimum:
   a. Dual (redundant) CPU
   b. Min. 64 MB RAM
   c. Min. 8 MB FLASH
   d. Clock frequency 122 MHz or higher
   e. Two Ethernet ports (RJ45).

4. The dual redundant CPU's shall operate in hot standby configuration mounted in individual chassis (including exclusive power supply modules) and separate cubicles.

F. Input/Output Modules

1. The standard I/O shall include single point, double point, multi-point and pulse counting digital input signals, analogue input signals and command output signals, The I/O modules shall include all interface and protection circuits. It shall be possible to interchange I/O modules without powering down the Controller, i.e. modules shall be 'hot swappable'.

2. All Controller analogue and digital inputs and outputs shall provide 2kV isolation between field circuits and the Controller internal circuitry. Analogue inputs and outputs shall withstand 100 V RMS 50 Hz common mode for 1 minute.

G. Analogue Input Modules

1. Analogue input modules are required for the continuous monitoring of analogue measurements. The analogue inputs can be configurable from a downloadable database.

2. The elementary input data from the analogue I/O (currents and voltages) together with the switchgear status information shall be used to derive by calculation in the Controller the following power system measurements for each circuit:
   a. Voltage (kV)
   b. Current (Amps)
   c. Active Power (kW)
   d. Reactive Power (kVAr)

3. The Controller shall report analogue values when they change by a significant amount for at least a preset period with the reporting value limits and period being user-definable within the downloadable Controller database.

4. It shall be possible to link analogue inputs to the Controller through standard protocols, using other modules.

5. The Controller shall also be able to block an input if it detects the input value is fluctuating excessively. The limits defining the acceptable fluctuation limits shall also be user-definable. The Controller shall automatically unblock input if the behavior of the input returns to within the acceptable limits.

6. Each analogue input shall be terminated with transient voltage protection components. In case of overload, the input circuit shall not sustain any deterioration of its characteristics. Furthermore, an overload present on one of the circuits shall not induce telemetry errors on any other circuit.

H. Digital Input Modules

1. Status and alarm input information is to be supplied from voltage free contacts. These contacts may open or close to register the specified status or alarm. Each input shall be individually software configurable from a downloadable database to register the specified status in either case.

2. The Controller shall provide the interrogation voltage to monitor these contacts. This voltage shall nominally be in the range 24 to 60 V DC and the interrogation circuit current shall typically be in the range 5 to 20 mA.

3. Status changes shall be time tagged to a resolution of 1 milli-seconds. Digital inputs may be either single point, double point or multi-point.

4. The interpretation of states for single or double point inputs shall be configurable. A single point indication shall be represented by a binary digit. Double points shall be represented by a pair of binary digits.

5. A status change or alarm shall only be reported if the input state has changed for longer than a user defined period of time within the downloadable database. This period shall be adjustable for each point from 10 milli-seconds to 300 seconds.

I. Digital Output Modules

1. Digital outputs are required to operate items, either directly or via auxiliary relays, dependent on the load presented by the plant equipment. Outputs shall be provided in the form of interposing relays with normally open voltage free contacts that will form the initiating elements in the above control circuits. It shall be preferable that the interposing relays be located on the digital output modules.

2. Each digital output module shall be configurable between persistent and pulse output modes. In persistent mode, the digital output shall be set to a particular state and remain there until set to the opposite state. In pulse mode, the digital output is set to the energized state for a predefined time. The time, typically 500 milli-seconds shall be user configurable for each pulse mode output within the downloadable database.

J. Communication Modules

1. The Controller shall be able to communicate with the system servers on a main and alternate channel using a variety of open protocols.

2. The Controller shall support IEC 61850 GOOSE messaging.

3. The Controller shall be capable of being remotely accessed over the Project redundant IP data communications network.

4. Downloading information to and uploading from the Controller shall not have a significant impact on the performance of alarm, event reporting or command execution.

5. Several communication media must be offered:
   a. Ethernet through RJ 45 ports.
   b. RS-232
   c. RS485
   d. 20mA current loop
   e. Any other Communication Module required in the Project.

K. Power Supply Modules

1. The Controller shall be powered either from 24 VDC battery backed power supply or from a battery and charger provided under this Contract, as specified below. With this power supply, the Controller shall be capable of operating with supply variations of between +15% and -15% of nominal voltage when subjected to voltage fluctuations.

2. The Controller shall be equipped with two power supply modules, each capable of catering to 100% of the Controller load.

3. Protective Circuit IEC Class/Category: determined by the energy coordination study carried out between Surge Protection Devices (SPDs') installed at different levels of the distribution and communication systems.
   a. Surge suppression and isolation circuits shall protect the Controllers against external electrical disturbances. Over voltage and under voltage protection shall also be provided to prevent Controller internal logic from being damaged and to prevent the Controller internal logic from becoming unstable or to mal-operate due to voltage fluctuations.
   b. Comply with Section "Surge Protection for Low-Voltage Electrical Power Circuits".

L. Terminal Blocks

1. Terminal blocks shall be having provision for disconnection (isolation), with full-depth insulating barriers made from moulded self-extinguishing material.

2. All terminal blocks shall be suitably arranged for easy identification of its usages such as CT (Current Transformer) circuits, PT (Potential Transformer) circuits, analog inputs, status inputs, control outputs, auxiliary power supply circuits, communication signals etc.

3. Terminal blocks for CT circuits shall have feature for CT shorting (on CT side) & disconnection (from load side) to facilitate testing by current injection. Similarly, terminal blocks for PT circuit shall have feature for disconnection to facilitate voltage injection for testing.

4. Terminal blocks shall be appropriately sized and rated for the electrical capacity of the circuit and wire used. No more than two wires shall be connected to any terminal. Required number of terminal blocks shall be provided for common shield termination for each cable.

2.7 HUMAN MACHINE INTERFACE (HMI)

A. Description: Microprocessor-based, self-contained device mounted on the door of the control modules cubicle and arranged to display parameters values. Features include the following:

1. Touch screen Size 10 inch, 800x600 pixels resolution, 64,000 color TFT screen able to display graphics with function keys.

2. Display alarms and events from any Controller and have the ability to manage it from the panel.

3. Selected for status and parameter display by programmable designations.

4. Status and trip rating are to be displayed in addition to parameter values.

5. Nonvolatile memory retains programmed input data indefinitely during power outages.

6. Provided with RAM memory 64 MB minimum and flash memory.

7. The display features, type and size shall satisfy the Employer requirements if any.

2.8 INDUSTRIAL ETHERNET SWITCHES

A. The Contractor shall provide, as deemed necessary, dual Ethernet switches at each Control Room / Network Node with the following minimum requirements:

1. Modular, managed, industrial backbone switch, 19" rack mounted with Layer 3 functionality.
2. Port Type and Quantity: 24 ports of wire speed 10/100/1000 Mbit and802.3af (PoE), and 8 Gigabit SFP slots.
3. SFP Fiber Optic Transceiver Characteristics:
    a. Minimum link budget of 26 dB at 1550 nm
    b. Port Type: 1000BASE-LX
    c. Single Mode (9/125 μm)
    d. Allowable losses:
        1) Splicing losses: 0.3 dB at each splice
        2) Cable attenuation losses: 0.25 dB/Km
        3) Insertion losses: 0.5 dB at each end
        4) Link power penalties: 3.3 dB
4. Power supply unit: Dual power supplies, a hot swappable fan tray with redundant fans, and hot-swappable line cards.
5. Fiber Optic patch panels with their corresponding patch cords interfacing the SCADA system network main dual redundant ring shall be provided by the Contractor at each control room.
6. Management:
    a. Single console port and single IP address to manage all system features
    b. Software configuration management, including local and remote storage
    c. Simple Network Management Protocol (SNMP) Versions 1, 2, and 3 instrumentation, delivering comprehensive in-band management
    d. CLI-based management console to provide detailed out-of-band management
    e. Remote Monitoring (RMON) software agent to support four RMON groups (history, statistics, alarms, and events) for enhanced traffic management, monitoring, and analysis
    f. SPAN ACL filtering
    g. SPAN CPU port
    h. Static IP configuration
    i. Enhanced SNMP MIB support
    j. HTTPS
    k. Time Domain Reflectometry (TDR)
    l. MAC Address Notification
7. Industry Standards:
    a. Ethernet: IEEE 802.3, 10BASE-T
    b. Fast Ethernet: IEEE 802.3u, 100BASE-TX, 100BASE-FX
    c. Gigabit Ethernet: IEEE 802.3z, 802.3ab
    d. IEEE 802.3af PoE
    e. IEEE 802.3 ad LACP
    f. IEEE 802.1d CoS prioritization
    g. IEEE 802.1Q VLAN
    h. IEEE 802.1x user authentication
    i. 1000BASE-SX
    j. 1000BASE-LX/LH
    k. 1000BASE-ZX
    l. RMON I and II standards
8. Diagnostics: LED's, log-file, syslog, signal contact, RMON, port mirroring, topology discovery 802.1AB, disable learning
9. Security: Port security (IP and MAC), SNMP V3. (no encryption). Redundancy functions: Ring structure, MRP (IEC-ring functionality), RSTP 802.1D/w, redundant network/ring coupling, redundant 24 V power supply

10. Services: QoS 8 classes, prioritization (IEEE 802.1D/p), VLAN (IEEE 802.1Q), multicast(IGMP snooping/querier), multicast detection unknown multicast, broadcast limiter, fast aging
11. Routing: Static routing, VRRP router redundancy, layer 3 - ACL,
12. Operating temperature: -10º to +50ºC
13. Storage/transport temperature: -40º to +70ºC
14. Relative humidity (non-condensing) and Seismic Loads: In accordance with Article "Project / Site Conditions" of this Specification.
15. Mounting: 19" Cabinet
16. Protection class: IP20

B. Switches shall ensure that networking will not cause collisions with the overall network.

2.9 NETWORK MANAGEMENT EQUIPMENT

A. General

1. System Architecture shall be based on a "Client-Server" configuration.

2. System software shall be controlled and configured by working parameters stored in tables and easy to change without programming.

B. Servers

1. The Contractor shall design Servers architecture to fulfil, as a minimum, the following requirements:
   a. Dual-redundant servers in clusters for high availability.
   b. Servers located in separate rooms for disaster recovery.
   c. The system shall support multiple:
      1) I/O servers to maintain high data acquisition performance
      2) alarm servers to maintain high alarming performance
      3) trend servers to maintain high historical logging performance

2. The Contractor shall design servers that are able to cope with the foreseen workload:
   a. The Contractor shall indicate the percentage increase of workload that the servers will be able to cope with.

3. The Contractor shall deliver and configure the required servers.

4. Minimum requirements of Servers shall be confirmed by the relevant manufacturer/supplier and shall comply with:
   a. Section "Computers & Related Peripherals".

C. End Users' Clients

1. The Contractor shall provide requirements for workstations for operation by the Employer.

2. Main characteristics shall be given in terms of Memory, CPU, Screen size, resolution, etc.

3. The Contractor shall configure the required workstations.

4. The following peripheral I/O devices shall be provided at the workstations and terminal/data servers:
   a. Keyboard and mouse
   b. Flat panel video display unit.

5. The intent is to have all Computers and related peripherals purchased independently of the systems they serve. Coordinate with Employer for recommended technical requirements and required quantities.

D. Network Time Protocol (NTP) Clock

1. Time synchronization shall be ensured by a time server broadcasting messages compliant with Network Time Protocol (NTP). All equipment delivering time-stamped data shall take into account these messages.

2. The times at all nodes on the SCADA, including the Servers, shall have their real time clocks updated by this NTP clock every 24 hours at minimum.

3. Provided with the appropriate architecture, the SCADA shall maintain time synchronization between IEDs, PLCs, and the system I/O servers.

4. The system shall be capable of integrating with a GPS receiver for global time synchronization.

5. The NTP server shall similar to that specified under Section “Master Clock System (MCS)”.

2.10 SCADA SYSTEM SOFTWARE

A. The Contractor shall expand and modify any existing software in the Control Centers / Master Stations to include all the additional substations and RTUs

2.11 OPERATOR WORKSTATIONS

A. The Contractor shall expand and modify the existing operator workstations in the Control Centers / Master Stations to include all the additional substations and RTUs

B. The Operator workstation shall comprise industrial Console-mounted PC’s and associated peripheral Operator I/O devices, located at the Control Room.

C. Provide an alarm to uniquely identify a PC communication failure.

D. All PC’s shall be the latest model at the time of purchase and shall be sourced from a recognized manufacturer. Purchase of the PC’s shall be delayed until the latest time possible without causing a delay in the construction schedule to ensure that they will be state-of-the-art, based on the latest proven technology.

E. All PC’s shall be suitable for rugged and continuous operation.

F. The workstation specifications shall be according to the SCADA System manufacturer requirements and shall comply with , Section “Computers & Related Peripherals” **.**

G. Refer to Article “Network Management Equipment” of this Specification Section.

2.12 PRINTERS

A. The Contractor shall expand and modify the existing printers in the Control Centers / Master Stations to include all the additional substations and RTUs

B. Alarm Printers

1. The alarm printer shall meet, at minimum, the following specifications:
    a. Minimum print speed of 300 characters/second. Slower speed printers shall not be acceptable when printing in normal quality.
    b. Selectable character sizes.
    c. Sprocket paper feed.
    d. Top-of-page, skip and tab control.
    e. The printers shall accept continuous fan-fold paper with a width equivalent to A3 size (297 mm by 420 mm).
    f. Constructed for heavy duty-cycle environment.
    g. 24 x 24 dot matrix printer.

C. Report Printers

1. The report printer shall meet, at minimum, the following specifications:
    a. Minimum print speed of twelve pages per minute black and three pages per minute color. Slower speed printers shall not be acceptable when printing in normal quality.
    b. Scalable fonts.
    c. Single or double bin paper trays, capable of printing A3 size (297mm x 420mm) and A4 size (210mm x 297mm).
    d. Page feed and page discharge controls.
    e. Color and black/white printing capability without changing ink or toner cartridges.
    f. 1200 dpi black and white and 600 x 300 dpi color.
    g. Laser jet technology.

2.13 OPERATOR DISPLAY UNIT

A. The Contractor shall expand and modify the existing operator display unit in the Control Centers / Master Stations to include all the additional substations and RTUs

B. LED, 20 inch, complying with, Section “Digital Media Displays”.

C. Refer to Article “Network Management Equipment” of this Specification Section.

2.14 MASTER DISPLAY UNIT

A. The Contractor shall expand and modify the existing master display unit in the Control Centers / Master Stations to include all the additional substations and RTUs

B. LED, 103 inch display with the following specifications as minimum:
1. Aspect ratio: 16:9.
2. HD resolution.
3. Brightness: 1,000 cd/m2.
4. Contrast Ratio: 5,000:1.
5. Gradation: 5,000:1.
6. PC Signal Compatibility: VGA, WVGA, SVGA, XGA, WXGA, WXGA+, SXGA, SXGA+, WSXGA+UXGA, WUXGA.
7. Supported Video Standards: NTSC, PAL, PAL 60, SECAM, Modified NTSC.
8. Input / Output: Mini D-sub 15pin x 1 (Female) Analog RGB/Components Plug & Play (VESA DDC 2B), M3 jack x 1, D-sub 9-pin x 1(Male) External control, RS-232C compatible RCA pin jack x 2(L/R), HDMI x 2, BNC x 3 Analog RGB / Component, RCA pin jack x 2.

C. Refer to Article “Network Management Equipment” of this Specification Section.

2.15 CUBICLES

A. As a part of local control system, cubicles shall be provided to house the Controllers, RTUs, PLCs, I/O modules, etc; other cubicles shall be provided to house wiring terminals between the previously mentioned cubicle and the field devices.

B. The cubicle shall consist of steel frames with vertically arranged terminals and terminals strips and covered channels for cables and interconnecting wires.

C. Potential-free contacts shall be provided on all equipment to permit the repetition of appropriate indications, alarms and controls by telemetry to a remote control center.

D. The dimensions of the cubicles shall not exceed (2200 x 800 x 800) (H x W x D) mm.

E. Cubicles shall be provided with hinged front and rear doors.

F. Cubicles shall be free standing, constructed from sheet steel.

G. Cubicles shall be designed to comply with degree of protection IP 54 and shall be vermin and termite proof. The bottom of the cubicles shall be sealed, provided with base-plates and cable-entry glands.

H. Cubicle doors shall be of the lift off type and shall be provided with sealing gasket on the rim to ensure tight closure. Doors shall be secured with integral handle provided with lock. All cubicle door locks/handles shall be of the same design and construction.

I. Cubicles shall be provided inside with a lamp operated by a door switch, suitably positioned to ensure an even illumination of the entire cubicle.

J. Cubicles shall be provided with a cooper earth bus bar.

K. In the event of the air conditioning system failure in the control and relay room the equipment must remain operational at full load, and at the ambient temperature of the 50 Deg. C and 100% relative humidity. In that case any condensation and overheating must be prevented by anti-condensation heaters controlled by one hygrostat and thermostat and ventilation fans. **Consideration shall be given to the use of Self-Cooled cubicles using integrated air-conditioners, to the approval of the Engineer.**

L. All equipment installed on the front of the cubicles shall be flush mounted. The arrangement of the inside equipment shall allow easy access to any part and shall be fixed on brackets.

M. Circuit labels shall be provided on the outside and the inside of each cubicle.

N. Where rack, cabinet, or console mounting is indicated, equipment shall be designed to mount in a 19-inch (483-mm) housing complying with ECA TIA/ECA-310-E and Section “Communications Equipment Room Fittings”.

2.16 SIGNAL TRANSMISSION COMPONENTS

A. Provide a dual redundant dedicated fiber optic network and Ethernet switches for the automation system communications as specified herein.

B. Comply with the following Specification Sections – as applicable to power, control, data and video signal transmission cables:

1. Section “Low-Voltage Electrical Power Conductors and Cables.”
2. Section “Communications Backbone Cabling.”

3. Section “Communications Horizontal Cabling.”

C. Low Smoke Zero Halogen (LS0H) cables: for plenum installation as per adopted Standards for the Project.

1. Low Smoke Zero Halogen (LSZH/LS0H) cables shall comply with the following standards:
   a. Flame retardant: IEC 60332-1.
   b. Halogen-free according to:
      1) IEC 60754-1 for amount of halogen acid gas.
      2) IEC 60754-2 for corrosiveness of combustion gases according to (degree of acidity).
   c. Low smoke density according to IEC 61034-2.

D. Fire Resistant Cables: For life safety installations interface. Refer to Section "Low-Voltage Electrical Power Conductors and Cables".

1. Use Fire-resistant cables Type FR4.

E. General Cable Requirements: Size and type as recommended in writing by system manufacturer unless otherwise indicated.

F. Cables for all field level installations shall be screened and sheathed with anti-termite / rodent PVC.

G. Grounding Components: Comply with requirements in Section "Grounding and Bonding for Electrical Systems".

2.17 OPTICAL FIBER CABLE

A. Optical Fiber Cable - For Indoor Use: Single Mode, optical fiber cable.

1. Optical fiber cables shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification and performance parameters of Fiber Optic Cable Category listed below so as to support and exceed the transmission performance Class E_A of EN50173-1.

   a. Category OS2.
2. Conductive cable shall be steel armored type.

B. Optical Fiber Cable - For Outdoor Use: Single Mode, optical fiber cable.

1. Optical fiber cables shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification and performance parameters of Fiber Optic Cable Category listed below so as to support and exceed the transmission performance Class E_A of EN50173-1.
   a. Category OS2.

2. Conductive cable shall be steel armored type.

C. Jacket:

1. Cable cordage jacket, fiber, unit, and group color shall be according to EN 50173-1.
2. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 1000 mm.

D. Number of Fiber Strands / Cores

1. The number of fiber strands shown on Drawings for various applications are indicative only. Contractor shall allow for strands in addition to those required for a specific system to ensure a minimum of 50% spare on all optical fiber cable links.

2.18 SINGLE-MODE OPTICAL FIBER CABLE – CATEGORY OS2

A. All backbone single-mode optical fiber cables shall be capable of Ethernet signal transmission at:

1. 100 Gb/s up to 40,000 meters in the 1550nm operating window.
2. 100 Gb/s up to 10,000 meters in the 1310nm operating window.

B. Maximum attenuation for a single-mode cable shall be no greater than 0.4dB/km and 0.4dB/km using 1310nm and 1550nm wavelengths respectively.

C. All optical fibers inside each individual cable shall be usable to the fullest capacity specified by the manufacturer and shall meet required specifications at all times.

D. All single-mode optical fiber cable jackets shall have: the industry standard
1. yellow colored jacket for ISP cables
2. black colored polyethylene jacket for OSP cables

E. All single-mode optical fiber cable jackets shall be spirally wrapped and encased within an interlocking armored metal made of aluminum or galvanized steel without interruption from end to end for protection and strength. The metallic armor shall also be wrapped in a black colored sheath to designate the type of optical fiber.

F. The optical fiber cables shall be rated per the installation environment as required by the local Authority Having Jurisdiction, National Fire Codes and MICE classification. Select an appropriate cable construction, including external jacket properties, when installing optical fiber cables in aerial, outdoor, underground and corrosive environments.

G. All single mode fiber optic cables shall meet or exceed EN 50173-1 compliant network cable-testing device certification by an independent laboratory, for verification of performance.

H. Accessory Products: Provide any accessory products related to the optical fiber backbone cabling required to provide a complete and functional infrastructure system.

2.19 OPTICAL FIBER CABLE HARDWARE

A. Optical Fiber Patch Bays (Panels)

1. Optical fiber patch bay housings shall be provided for cross-connecting or inter-connecting purposes between OSP, ISP, and/or distribution cables and the active network electronic switches.
2. All optical fiber termination panels shall be complete factory-provided assemblies that contain termination panels, factory-polished "pig tails", internal bend radius components and splice shelves that are provided in a housing which includes an accessible rear access hatch.
3. Optical fiber termination panels shall be suitable for installation in ECA TIA/ECA-310-E standard, 19-inch (482.6-mm) racks.
4. All connections between the horizontal and backbone optical fibers to the factory-provided "pig tails" within the termination shelves shall be made with a computer controlled, direct core, 3-axis electronic alignment, LED screen, push button controlled fusion splicing machine and protected by heat shrink fusion splice protection sleeves installed by an integrated heater within the same fusion splice machine.

5. All optical fiber patch panel trays and associated bulkhead inserts shall have factory numerical labeling included in the design and presentation to the user side of the panel.
6. The optical fiber patch panel bulkheads that house the terminating modules for the fiber backbone cabling and any station optical fiber cabling shall accept connectors on the end of each factory-terminated pigtail assembly.
7. The connectors shall conform to the requirements of the EN 50173 series for "Connecting Hardware Requirements" for performance parameters and shall have the same manufacturer, cable type, connector type and polish as noted above for the respective fiber optic cable (single-mode/multi-mode).

B. Patch Cords

1. Factory-made, dual-fiber cables in lengths that are appropriate for patching from network equipment ports to the optical fiber patch panels ports within the telecom spaces.

2. Patch cords shall conform to the requirements of the EN 50173 series for "Connecting Hardware Requirements" for standard performance parameters and shall have the same manufacturer, cable type, connector type and polish as noted above for the respective fiber optic cable (single-mode/multi-mode).

3. Jackets of patch cords shall have the industry standard yellow colored jacket for single-mode cables.

C. Cable Connecting Hardware:

1. Comply with EN 50173 series for "Connecting Hardware Requirements".
2. Quick-connect, simplex and duplex, Type LC connectors. Insertion loss not more than 0.75 dB at all wavelengths.

2.20 CONTROL AND SIGNAL CABLES

A. Multi-Core XLPE Insulated Control Cables: 0.6/1kV rating, multi-stranded circular copper conductors, with XLPE insulation of 7, 12, 19, 24, 30 or 37 cores. Cores shall be laid up together and filled with non-hygroscopic material, LS0H over-sheathed, to form compact and circular cable for use in switchgear, control gear and generally for control of power, motors, mechanical equipment and lighting systems. Armored cable shall have extruded XLPE bedding which may be an integral part of the filling, galvanized steel wire armoring, and over-sheath of LS0H type to IEC 60754 or BS EN 50267, IEC 61034 and IEC 60502-1, color black. Core identification shall be color-coded or shall have white printed numbers 1, 2, 3 etc. over black insulation at intervals not greater than 70 mm throughout the length of the core. Cross sectional area shall be certified by system vendor. The print shall be permanent and not easily removed. Cores shall be laid up in accordance with BS 5467. Cables shall be used for all installations inside the airport facilities and for installations in plenum areas outside airport facilities.

B. PE insulated control and signal cables, for use on data systems, shall be generally 300 V rating, polyethylene insulated, color-coded, tinned copper conductors (0.6-mm diameter), twisted together into pairs. Multi-pair core assembly shall be covered with binder tape, spirally wound 0.075-mm bare copper shielding tape and provided with drain wire and overall PVC sheath. Cables shall be used for installation outside the airport facilities except in air plenum.

C. Control and signal cables, enclosed in conduit and raceways with power cables, shall be insulated for same voltage grade.

D. All terminations shall be with tinned copper insulated lugs.

E. Conductors unless part of the individual equipment, shall be stranded and not less than 1.5 mm2 in cross section unless otherwise approved by the Engineer.

F. Conductors shall be of plain stranded annealed copper wires to IEC 60228 or BS 6360. Conductors less than 16 mm2 cross section shall be copper made up of 7 strands. Single strand conductor is not permitted.

G. Armor Bedding Multicore Cables: The armor bedding shall be of LS0H.

H. Armor: The armor shall consist of a single layer of galvanized steel wires complying with the requirements of BS EN 10257-1.

I. Jointing Accessories and Termination: Cables shall be terminated and jointed with accessories that have successfully been type tested. Straight through jointing of short cable lengths is not normally permitted but, in exceptional circumstances may be allowed subject to the Engineers' written approval. All cables entering or leaving terminal boxes shall be provided with separate terminations so that any cable out of a number of such cables can be removed or replaced without disturbing the remainder.

J. Modbus Cables: Use EIA-485 physical interface. Foamed High-density PE Insulated Data Cables: 0.3kV rating, 24 AWG stranded Copper Conductor, polyethylene insulation, twisted pairs, with aluminum Foil-Polyester Tape shielding plus a tinned copper braid shield with sunlight resistant PVC jacket. Modbus Cables shall be steel wire armoured with an outer jacket over armour. Operating temperature range to be between -10 to 50 deg C. Cables to be Flame tested according to UL and CSA standards. Only internal cable (interconnecting cable between panels in equipment rooms) shall be LS0H.

2.21 TWISTED PAIRS (BALANCED) ETHERNET CABLE

A. General Requirements

1. Balanced cables shall be rated per the installation environment as required by the local Authority Having Jurisdiction, National Fire Codes and MICE classification. Select an appropriate cable construction, including insulation, screen and external jacket properties, when installing Twisted Pair cables in harsh and corrosive environments.

2. Balanced cables that are exposed to moisture shall contain moisture-blocking materials to prevent moisture damage to cable performance.

3. Accessory Products: Provide any accessory products related to the Twisted Pair copper cabling required to provide a complete and functional infrastructure system.

B. Balanced cables shall be sufficiently free of surface imperfections and inclusions to meet the electrical, mechanical, and environmental requirements of this specification and performance parameters of Category 6A balanced cables so as to support and exceed the transmission performance Class E_A of EN 50173-1.

C. S/FTP (S-STP) Cable Description: 100-ohm, 23 AWG copper conductor, four-pair S-STP, Screened Shielded twisted pair Cable (braided screened overall, individually foil shielded twisted pairs cable), foam skin PE insulation and covered with a blue color, LSZH sheath and provided with a drain wire.

2.22 BALANCED CABLE HARDWARE

A. General Requirements for Cable Connecting Hardware: Comply with EN 50173 series for “Connecting Hardware Requirements”, IDC type, with modules designed for punch-down caps or tools. Cables shall be terminated with connecting hardware of same category or higher.

B. Connecting Blocks: 110-style IDC for Category 6A. Provide blocks for the number of cables terminated on the block, plus 25 percent spare. Integral with connector bodies, including plugs and jacks where indicated.

C. Cross-Connect: Modular array of connecting blocks arranged to terminate backbone cables and permit interconnection between cables.

1. Number of Terminals per Field: One for each conductor in assigned cables plus spares and blank positions adequate to suit specified expansion criteria.

D. Patch Panel: Modular panels housing multiple-numbered jack units with IDC-type connectors at each jack for permanent termination of pair groups of installed cables.

1. Number of Jacks per Field: One for each four-pair conductor group of indicated cables, plus spares and blank positions adequate to suit specified expansion criteria.

E. Jacks and Jack Assemblies: Modular, color-coded, eight-position RJ45 modular receptacle units with integral IDC-type terminals.

F. Patch Cords: Factory-made, 4-pair copper conductor cables in lengths to suit application and routing requirements; LSZH jacket, terminated with 8-position RJ45 modular plug at each end.

1. Patch cords shall have color-coded boots for circuit identification.
2. Patch cables shall be performance and impedance matched with respective horizontal cables and provided by the same manufacturer of the horizontal cable.
3. Exceed EN 50173-1 Class E_A transmission performance.
4. Patch cords shall have bend-relief-compliant boots.

G. Jacks: 100-ohm, balanced, twisted-pair connector; four-pair, eight-position RJ45 modular Category 6A components, wired to T568A pin assignments,. Comply with EN 50173-2.

H. Workstation Outlets: Four-port-connector assemblies mounted in multi-gang faceplate.

1. Plastic Faceplate: High-impact plastic. Coordinate color with Section "Wiring Devices."
2. Metal Faceplate: Stainless steel, complying with requirements in Section "Wiring Devices."
3. For use with snap-in jacks accommodating any combination of balanced and optical fiber, work area cords.

a. Flush mounting jacks, positioning the cord at a 45-degree angle.

4. Legend: Factory labeled by silk-screening or engraving for stainless steel faceplates.
5. Legend: Machine printed, in the field, using adhesive-tape label.
6. Legend: Snap-in, clear-label covers and machine-printed paper inserts.

2.23 UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. All components of the SCADA system shall operate on dual redundant UPS units. The UPS shall be provided by the SCADA System Contractor to cater to the load of all system components as described above and as recommended by the SCADA system Supplier considering a maximum of 80% loading and 20% spare capacity for future expansion to the approval of the Engineer.

B. Provide Power Strips, connected to the UPS Units. Locate the power strips in the equipment racks and on the equipment backboards for powering all electronic systems in the Equipment Rooms. For Power Strips, refer to Section “Communications Equipment Room Fittings”.

C. UPS configuration - whether centralized or decentralized – shall be as per manufacturer's recommendation and Engineer's approval. Ensure that the allocated space and environmental conditions are adequate for the adopted configuration.

D. Remote field-mounted components shall be fed from the nearest UPS source.

E. Coordinate UPS power requirements, voltage, circuit size, and connection requirements with the Project Electrical design.

F. Ensure that the allocated space and environmental conditions are adequate for the adopted configuration.

G. Connect the UPS Units to Project Emergency Branch. UPS units shall allow for normal continuous operation for 30 minutes or until the Project emergency generators become online; whichever occurs first.

H. Provide shutdown connections from the UPS to servers for graceful power down in the event of a power failure.

I. Equip the UPS Units with SNMP Management Card connected to the SCADA Management VLAN.

J. Comply with Section "Static Uninterruptible Power Supply".

2.24 CONDUITS, TRUNKING AND FITTINGS

A. Comply with the following Specification Sections:

1. "Raceways and Boxes for Electrical Systems".
2. "Cable Trays for Electrical Systems".
3. "Underground Ducts and Raceways for Electrical Systems".

2.25 ACCESSORIES

A. Interfaces With Distribution Equipment Specified In Other Sections

1. Provide accessories, adapters, electronic interface units, and connections required for functional performance indicated.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
1. All equipment shall be firmly secured in place unless requirements of portability dictate otherwise.
2. Equipment is to be laid out properly in communication rooms in a way to reserve relevant space for maintenance activities. This space shall also account for any future expansion of the system.
3. Installation shall be performed in accordance with the applicable standards, requirements, manufacturers' guidelines and any authorities having jurisdiction.
4. All boxes, equipment, etc. shall be plumb and square.

5. The Contractor shall take such precautions that are necessary to prevent and guard against electromagnetic interference. Refer to “Separation/Segregation of Services” paragraph in Section “Common Clauses for Structured Cabling” for separation from EMI sources.
6. After the proper layout of all equipment is accomplished, all components are to be labeled, and marked in accordance with Section “Identification for Communications Systems”.
7. During installation, consideration shall be given to operational efficiency as well as the overall aesthetic factors.
8. The Contractor shall supply and install all fittings and accessories, whether or not specified, required for proper, safe, and reliable operation of the system.
9. The Contractor shall ensure that safe ingress and egress from all work areas are maintained during movement and installation of equipment/materials.
10. Equipment Bases: Ensure that concrete bases and foundations provided for installation of equipment are constructed in accordance with approved shop and construction drawings and equipment manufacturers' drawings and that holes for fixing bolts and provisions for passage of cables etc. are provided as required.
11. Built-In Items: Ensure that equipment supports, fixings and the like, and sleeves for passage of feeders and cables which are to be built into concrete foundations, bases, cable trenches or building structure are provided as and when required and that they are properly installed.
12. Provide adequate grounding connections at all equipment to prevent the build-up of electromagnetic voltage potentials. Provide screening of panels, enclosures, devices, or components that emit interferences. All monitoring, control and communication cables shall be screened with one end earthed.

B. Examination
1. Examine the areas to receive the work and the conditions under which the work would be performed.
2. Examine all the communications rooms where equipment are to be deployed:
   a. Identify equipment location,
   b. Identify links on patch panels,
   c. Identify and check general power supply and grounding,
   d. Identify premises environmental characteristics (kW/m², air conditioning characteristics, etc.),
   e. Carry out heat dissipation calculations,
   f. Confirm feasibility for each communications room before starting to deploy.
3. Examine pathway elements intended for cable. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.
4. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Rack Mounted Equipment
1. The Contractor shall install rack mounted equipment according to locations, elevations, and plan views developed by the Contractor and approved by the Employer.
2. Rack mounted equipment shall be bolted with at least 4 mounting screws for support.
3. Cable guide shall be installed between each 2U rack unit set of equipment to insure proper patch cable run and adequate air circulation.
4. All distribution hardware shall be securely mounted in a manner that allows access to the connections for testing and provides sufficient room for the doors or access panels to open and close without disturbing the cables.
5. Distribution and backbone cables shall enter from rear of optical patch panels.
6. Cables shall be maintained with D-Rings.
7. Each cable shall enter patch panel through adequate bushings and inserts where required by Manufacturer’s installation manuals/sheets.
8. Bond all metallic raceway, racks, cable runway, enclosure, and other metallic hardware to the dedicated bus bar.
9. Ensure that bonding breaks through paint to bare metallic surface of all painted metallic hardware.
10. All spare or unused space shall be obstructed through blank panels.

11. Arrange all inputs, outputs, interconnections, and test points so they are accessible at rear of rack for maintenance and testing, with each item removable from rack without disturbing other items or connections.

D. Wiring Methods
1. Comply with Sections
   a. “Raceways and Boxes for Electrical Systems”.
   b. “Cable Trays for Electrical Systems”.
   c. “Underground Ducts and Raceways for Electrical Systems”.

2. Comply with Sections:
   a. “Common Clauses for Structured Cabling”.
   b. “Identification for Communications Systems”.
   c. “Communications Equipment Room Fittings”.
3. Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
4. Wiring within Enclosures: Bundle, lace, and train cables to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.
5. Install manufactured conduit sweeps and long-radius elbows whenever possible.
6. Terminate conductors; no cable shall contain un-terminated elements. Make terminations only at outlets and terminals.
7. Splices, Taps, and Terminations: Arrange on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Cables may not be spliced.
8. Secure and support cables at intervals not exceeding 760 mm (30 inches) and not more than 150 mm (6 inches) from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
9. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
10. Visually inspect wire and cable for faulty insulation prior to installation.
11. Protect cable ends at all times with acceptable end caps except during actual termination.
12. After installation, and before termination, all wiring and cabling shall be checked and tested to ensure there are no grounds, opens, or shorts on any conductors or shields.
13. A V.O.M. shall be utilized to accomplish these tests and a reading of greater than 20 Mega ohms shall be required to successfully complete the test.
14. Install LAN cables using techniques, practices, and methods that are consistent with Category rating of components and fiber-optic rating of components, and that ensure Class E_A performance of completed and linked signal paths, end to end. Comply with Section "Communications Horizontal Cabling."
15. The Contractor shall install all cabling required to make all connections between the PLC/RTU, substation interfaces, power supplies and communications media.
16. The extra low voltage alarm, indication and control signals shall be carried in separate multi core cables. All the cores of each cable shall be terminated at each end in terminal blocks within cabinets/enclosures and these terminals shall be segregated as per the separation stated for the cables. The number of cores and terminals shall include at least 20% spare capacity of each type.

E. Cleaning
1. Inspect interior and exterior of installed devices. Remove paint-splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish.

F. Connections
1. Tighten connector, and terminal bolts according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in applicable Standards.

G. Weatherproof Equipment
1. For units that are mounted outdoors, in damp locations, or where exposed to weather, install consistent with requirements of weatherproof rating.

H. Impedance and Signal Levels
   1. Match input and output impedance and signal levels at signal interfaces. Provide matching networks where required.
   2. Patch wiring must be traceable: Keep a database of patch cords installation up-to-date including details of physical and logical connections.

I. Labeling and Marking
   1. Provide a typed schedule of all data ports according to each related room jack designation for all Technical Rooms in accordance with Section “Identification for Communications Systems”.
   2. Patch wiring must be traceable: Keep a database of patch cords installation up-to-date including details of physical and logical connections.
   3. Provide warning signs as specified in Section "Basic Electrical Materials and Methods".

J. Firestopping

   1. Refer to Section “Common Clauses for Structured Cabling”.
   2. Comply with requirements in Section "Penetration Firestopping".

K. Grounding
   1. Comply with Section “Grounding and Bonding for Electrical Systems”.
   2. Ground cable shields and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

L. Coordinate layout and installation of system components and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

3.2 FUSION SPLICING DEVICE

A. Check actual site conditions prior to start of any work. Ensure all preceding trade works associated with the telecommunications system are accurate and complete before proceeding with installation or use of products specified in this section.

B. Follow manufacturer’s instructions at all times when operating the optical fiber fusion splicing device. Pay particular attention to cleanliness and axis alignment.

C. Utilize the integrated tensile testing function of the splicing device after each splice to analyze the strength of the fiber joint. Comply with manufacturer’s recommendations for tensile testing load to be applied. Any splice failing the tensile test shall be re-spliced immediately.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections.

   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Testing and Inspections

1. All components shall be tested to ensure compliance with the specifications before they leave the Manufacturer's premises and shall be tested again on-site by the Contractor before the commencement of acceptance testing. The Contractor shall not ship components to the project site until they have been found to be fully compliant with the specifications and the Contractor shall not request the commencement of acceptance testing until such time as the Contractor has made a complete and thorough checkout of all equipment on site.

2. Any component furnished under this Contract shall be made available for inspections or tests, as deemed necessary by the Engineer. Use of any component by the Employer and Engineer shall not imply acceptance of the system or acceptability of any component. Availability and demonstration of the systems shall not be withheld and the use of components shall not imply the start of the Defects Liability Period.

3. Costs associated with the required inspections and testing shall be included in this scope of work. Additional charges will not be accepted.

4. The Contractor shall make available all equipment, calibrated instruments and ladders, as necessary to satisfactorily demonstrate the acceptability of the components and systems. Instrumentation to be used for the verification of monitored parameters shall be calibrated or supplied by an approved laboratory or manufacturer. Provide copies of the calibration data with the component test sheets.

5. Installation, engineering, software and system personnel shall be available on-site during the commissioning tests. These personnel shall be familiar with the installation and shall undertake all tests as requested by the Engineer in order to verify that the SCADA components individually and in total meet the specifications.

6. The Contractor shall confirm that the person(s) who will be conducting the commissioning tests on his behalf has been actively involved (on site) throughout the commissioning of the control system. Software shall be developed, tested and demonstrated over a time Span short enough to guarantee continuity of personnel.

E. Factory Acceptance Test (FAT)

1. Factory Acceptance Test shall include on the system basis the following test:
   a. System Hardware Tests.
   b. System Functional Tests.
   c. System Performance Tests.
   d. 100-hour Test (continuous run of the whole configuration).
   e. 30-minutes Major Disturbance test (Avalanche test).

2. The FAT shall be witnessed by the Employer and Engineer.

3. Successful FAT is a precondition for equipment delivery to the Site.

4. System Hardware Tests
   a. Performance testing shall be conducted of Servers and Workstations, including demonstration of CPU, Memory and Storage functions. All hardware enclosures shall be inspected.
   b. As a minimum, the following shall be inspected and verified:
      1) Cabinet enclosures
      2) Frame structure
      3) Paint work and finish
      4) Dimensions
      5) Console Panels physical layout
      6) Power supply mounting
      7) Power cable routing
      8) Data cable routing

9) Wiring runs properly installed
10) Fans and blowers are unobstructed
11) Power conditioning.

5. System Functional Tests
   a. System Functional tests shall be conducted to demonstrate the successful operation of every specified system function and shall include, but not be limited to, the following:
      1) Operating all devices both individually and collectively.
      2) Verification of proper data acquisition of all status and data points.
      3) Verification of proper uploading or downloading to the PLCs/RTUs.
      4) Demonstration of input and output accuracy.
      5) Testing of user interface functions.
      6) Verification of the correct sequence of operation at all the PLCs/RTUs.
      7) Simulation of communication error conditions and demonstration of error detection and handling.
      8) All specified display types, reports, and operator procedures shall be demonstrated and verified for accuracy.
      9) Create and process device failure conditions including PLC failure, Operator Workstation failure, peripheral failures, etc. Particular attention shall be given to creating failures in the middle of operator sequences and control actions such as:
         a) Communication failure after a command is issued but before the result is recorded in the database.
         b) Computer failure after a command is issued but before the result is recorded in the database.
         c) Failure of a major communications component.
         d) Operator Workstation failure in the middle of a control action.
         e) Incorrect operator entry in the middle of a multi-step action.
      10) Demonstration of the following functions:
         f) Redundant functions and components.
         g) Alarm processing functionality, including audible annunciation.
         h) IT interface functions.
         i) Historical capture, storage, and retrieval functions.
         j) Device control functions.
         k) Software support utilities.
         l) Data logging functions.
         m) System diagnostics, both on-line and off-line.
         n) Database management functionality.
         o) Correct operation of calculated quantities.
   b. Functional Testing of system software shall also include the following, as a minimum:
      1) Demonstration of restoration of system using backup media.
      2) Demonstration of the editing of system parameters including timers, etc.
      3) Demonstration of system modification capabilities including the addition and deletion or modification of points in a PLC, displays, report formats, control strategies, and the modification of the database and all database parameters.
      4) Demonstration of utility software facilities, including assembling, compiling, appending, and executing new programs.
      5) On-line program debug facilities, including downloading of a program from the central system to a remote PLC/RTU.

6. System Performance Tests:
   a. The FAT shall also include a live simulation of the control logic in association with the relevant HMI graphics.
      1) The following components shall be interconnected using the LAN equipment: Workstations, Printers, communication equipment and PLC/RTUs, with final configuration loaded, SCADA System Servers.

7. 100-hour Tests
    a. After the successful completion of the functional testing, a 100-hour continuous test of the system shall be initiated.
    b. The test shall be deemed successful if no system function is lost, no hardware or software failure occurs, and no module automatic failover occurs.
    c. The system shall be exercised with simulated inputs, events, and conditions in a manner similar to an operational environment.

8. A 30-minutes Major Disturbance Test
    a. In test, the environment described above shall exist.
    b. The system shall be dimensioned to handle a large-scale disturbance in the power system, including a total collapse in the controlled and monitored network.
    c. Such a case shall be tested by simulation in accordance with the outline description below:
        1) Most circuit-breakers are tripped.
        2) Most measured values go to zero.
        3) The automatic control functions work during the minutes that follow.
        4) Fault signals are received from most stations.
        5) The test shall run for 30 minutes.
    d. The requirements for this test are:
        1) That no information is lost.
        2) That the control system is usable throughout the entire test, i.e. it shall always be possible, for example, to call up displays and to make entries.
        3) That all events are recorded in event logs.
        4) Five minutes after the initial burst of indication changes, i.e. six minutes after the start of the major malfunction, the system shall meet the performance requirements of the normal load case.

F. Commissioning

1. Generally accepted industry standards, as well as manufacturer's written installation instructions, will be used as a basis for quality control and final acceptance of the works.

2. Site Acceptance Tests (SAT) represent a repetition of FAT under real conditions and with actual field data..

3. In-System Commissioning
    a. Equipment commissioning shall be done through demonstration of product capability and compliance with requirements after being wired and configured in the system.
    b. Test system and power supply redundancies by unplugging redundant links.
    c. Check recovery times.

4. The Contractor shall be required to perform a range of Site Acceptance Tests on site for each individual sub-system to demonstrate that all items have been correctly installed and adjusted on a location by location basis and that the sub-system operates in every respect in accordance with the Specifications.
    a. During this commissioning phase, the equipment is powered and the automation and networking are gradually integrated layer by layer.
    b. Any defects, which may become apparent during the course of these tests, shall be immediately rectified by the Contractor at his expense.
    c. The Site Acceptance Test Specifications shall be prepared by the Contractor and submitted for Approval by the Engineer and Employer.
    d. All Site Acceptance Tests shall be carried out in the presence of the Employer who shall sign off the testing documentation on satisfactory completion of the tests.
    e. The Site Acceptance Test Specifications shall at every level, be subjected to configuration management and change control by the Contractor.

f. If modification or reprogramming is required as a result of the tests, all affected parts of the Site Acceptance Tests, as determined by the Employer, shall be re-tested.
g. The results of the Site Acceptance Tests (SAT), version of software and hardware tested, together with any re-testing as a result of failure, shall be recorded and signed by the authorized personnel of the Contractor and the Employer.

5. Those tests shall be carried out over two phases.
   a. Preliminary Testing:
      1) Mechanical:
      - Mechanical tests,
      - Calibration of the components.
      2) Automatism / Electrical:
      - Powering Tests with electricity,
      - Control of Input/Output,
      - Control of the safety measure either personal or material,
      - Test of local mode operation.
      3) Network / Software Tests:
      - Test of the Network,
      - Test of the Supervision Workstation user interface,
      - Test of the portable Terminal user interface.
   b. System Testing
      1) The tests performed during this phase are performed with and without loading conditions: Testing the crippled mode (Safe shut down consecutive to loss of energy, etc.).

G. General Inspection

1. Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.
2. Pretesting: Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements.
3. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
4. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.
5. Optical Fiber Cable Tests:
   a. Conduct the tests in accordance with EN 50346 and ISO/IEC 14763-3 for compliance with the relevant limits specified in EN 50173-1 or the applicable application-specific standard.
   b. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
   c. Test for:
      1) Link End-to-End Attenuation.
      2) Continuity and maintenance of polarity.
      3) Length.
      4) Propagation delay.
      5) Optical attenuation of link, 2 x wavelengths, 2 x direction.
      6) Where results exceed the power loss budget, the link shall be investigated with an OTDR to determine the location of the faulty component.

H. The system will be considered defective if it does not pass tests and inspections.

I. Prepare test and inspection reports.

J. Experimental Period: As described under “WARRANTY” Article. Demonstrate successful operation to confirm, to the satisfaction of the Engineer, that the system is free of remarks and is ready for taking-over.

3.4 OCCUPANCY ADJUSTMENTS

A. When requested within 12 months of date of Taking Over of, provide on-site assistance in adjusting and calibrating components and assisting Employer's personnel in making program changes and in adjusting sensors and controls to suit actual conditions. Provide up to three visits to Project site during other-than-normal occupancy hours for this purpose. Visits for this purpose shall be in addition to any required by warranty.

3.5 DEMONSTRATION AND TRAINING

A. Engage a factory-authorized service representative to train Employer's maintenance personnel to configure, program, adjust, operate, and maintain SCADA system equipment. Refer to Division 01 Section "Demonstration and Training Closeout Procedures."

B. In order to provide a reliable training, Employer’s maintenance personnel who are involved in the training program of this system, could be involved in the follow up of system installation as well. The Contractor shall provide an installation agenda to the Employer and confirm with him any coordination with assigned trainees.

C. Training Program
   1. Scope: Training shall be in sufficient scope to ensure that all trainees who complete the program will be certified as capable to operate and/or maintain the equipment, systems, and facilities provided and installed under this Contract, and to ensure a smooth transition between construction and operations activities.
   2. Language: Training shall be conducted in English.
   3. Training Aids shall include:
      a. Approved Operation and Maintenance (O & M) manual(s) prepared by the Contractor as part of this Contract,
      b. Training manuals, including course outline, basic text of instructions modules, and trainee workbook,
      c. Films, slides, video tape(s),
      d. Charts, models, hand-outs, catalogues,
      e. Samples and other visual,
      f. Written aids to complement instruction.
      g. In addition, spare parts and other special hardware shall be provided to support “hands-on” familiarization with the equipment or systems.
   4. Training Manuals
      a. Training manuals shall be provided for each training course covering both the classroom and on-the-job phases.
      b. The organization of the manuals shall follow the same sequence as the course’s scheduled presentation of material, providing such additional background and supplementary information, as a trainee may need to understand the O & M manuals.
      c. There shall be as many Training Manual types as Trainees categories.
   5. Training shall be performed in accordance with an approved training program. All training aids shall be available and approved prior to start of training.
   6. Course Contents
      a. Training course can be broken down into modules either classroom lecture or ‘On-the-job’ training.
      b. In case of lecture, it is the Employer responsibility to provide the classroom for the duration of the course.
      c. No lecture module should exceed 2-hours interval.
      d. “On-the-job” training can be scheduled for an entire 8 hour shift.

e. Handouts must support each module; the collation of the Handouts forms the Training Manual.
f. Laboratory equipment, spare parts, and mock-up models may be used for theoretical orientation.
g. However, practical "hands-on" familiarization shall be provided on equipment that is either installed and operable or ready to be installed and capable of being operated. **SCADA system** spares of special hardware items may be used to support "hands-on" familiarization as long as said spares are returned to inventory in satisfactory condition in accordance with approved procedures.
h. The Contractor shall provide a training environment of its **SCADA system**, which can be similar to the "test environment". All future operations shall be reproduced in this training environment with no consequences on the test or on the operational environment.
i. Training schedules: the Contractor shall indicate the duration of all sessions, the number of trainees and how they shall fit into the overall project planning.
j. Training facilities: the Contractor shall provide facilities for the training of the maintenance staff, trainers and end-users including equipment, software and documentation.

D. The Contractor shall provide training for **SCADA** operational, maintenance and administration staff:
1. Operators shall be provided with a thorough training in all aspects of system/sub-system operation under both normal and abnormal conditions. This training shall include, but not be limited to:
a. Orientation to provide overview of system/sub-system purpose, configuration, and operations,
b. Terminology,
c. Operations theory and interface,
d. Equipment appearance, functions, concepts and operations,
e. Operating mode, practices, and procedures under normal and emergency conditions,
f. Safety precautions,
g. On-the-job operating experience covering all system/sub-system operating functions, activities, and tasks including those associated with degraded operating modes, failure recognition, and recovery processes,
h. Familiarity with content and use of O & M manuals and related reference publications.
2. Maintenance Training
a. Maintenance training shall cover all on-site routine, preventive, and remedial maintenance of the system/sub-system.
b. This training shall include, but not be limited to:
1) Orientation to provide overview of system/sub-system purpose, configuration, and operations,
2) Terminology,
3) Operations theory and interfaces,
4) Equipment appearance, layout, functions, concepts and operations,
5) Operating modes, practice, and procedures under normal and emergency conditions,
6) Safety precautions,
7) Use of tools and test equipment,
8) Use of system utilities, diagnostic software and various software tools associated with the system maintenance,
9) Preventive maintenance,
10) Troubleshooting, diagnostics, and testing,
11) Backup and restoration of software/configuration,
12) Assembly and disassembly,
13) Repair and parts replacement,
14) Parts ordering practices and storage,
15) Failure and recovery procedures,
16) System/sub-system cabling,

17) Familiarization with and use of O & M manuals and other reference materials.

3. Administrator Training
   a. Administrator course shall be provided so the system administration staff will be able to:
      1) Identify and remedy software faults,
      2) Upgrade and implement data and software changes,
      3) Production of revised or new displays.
   b. This training shall include, but not be limited to:
      1) Orientation to provide overview of system/sub-system purpose, configuration, and operations,
      2) Terminology,
      3) Operations theory and interfaces,
      4) Software design and organization,
      5) Database structure, generation, and modification,
      6) Assembly, compilation, linking, editing, debugging, distributing, testing and integration of program modules,
      7) Interface software design,
      8) Configuration management and control of software,
      9) Backup and restoration of software,
      10) Use of system utilities, diagnostic software and various software tools associated with the design, development, and maintenance of the System,
      11) Familiarization with and use of O & M manuals and other reference materials.

END OF SECTION 260914

Z10 PURPOSE MADE JOINERY

To be read with Preliminaries/ General Conditions.

110 FABRICATION

- Standard: To BS 1186-2.
- Sections: Accurate in profile and length, and free from twist and bowing. Formed out of solid unless shown otherwise.
  - Machined surfaces: Smooth and free from tearing, wooliness, chip bruising and other machining defects.
- Joints: Tight and close fitting.
- Assembled components: Rigid. Free from distortion.
- Screws: Provide pilot holes.
  - Screws of 8 gauge (4 mm diameter) or more and screws into hardwood: Provide clearance holes.
  - Countersink screws: Heads sunk at least 2 mm below surfaces visible in completed work.
- Adhesives: Compatible with wood preservatives applied and end uses of timber.

120 CROSS SECTION DIMENSIONS OF TIMBER

- General: Dimensions on drawings are finished sizes.
- Maximum permitted deviations from finished sizes:
  - Softwood sections: To BS EN 1313-1:-
    Clause 6 for sawn sections.
  - Hardwood sections: To BS EN 1313-2:-
    Clause 6 for sawn sections.
    Clause NA.3 for further processed sections.

130 PRESERVATIVE TREATED WOOD

- Cutting and machining: Completed as far as possible before treatment.
- Extensively processed timber: Retreat timber sawn lengthways, thicknessed, planed, ploughed, etc.
- Surfaces exposed by minor cutting and/ or drilling: Treat as recommended by main treatment solution manufacturer.

140 MOISTURE CONTENT

- Wood and wood based products: Maintained within range specified for the component during manufacture and storage.

210 LAMINATED PLASTICS VENEERED BOARDS/ PANELS

- Fabrication: To British Laminated Plastics Fabricators Association Ltd (BLF) fabricating standards.
- Balancing veneer: From decorative veneer manufacturer and of similar composition. Applied to reverse side of core material.
- Finished components: Free from defects, including bow, twist, scratches, chipping, cracks, pimpling, indentations, glue marks, staining and variations in colour and pattern.
- Joints visible in completed work: Tight butted, true and flush.

250 FINISHING

- Surfaces: Smooth, even and suitable to receive finishes.
  - Arrises: Eased unless shown otherwise on drawings.
- End grain in external components: Sealed with primer or sealer as section M60 and allowed to dry before assembly.

Z11 PURPOSE MADE METALWORK

To be read with Preliminaries/ General Conditions.

310 MATERIALS GENERALLY

- Grades of metals, section dimensions and properties: To appropriate British Standards. When not specified, select grades and sections appropriate for the purpose.
- Prefinished metal: May be used if methods of fabrication do not damage or alter appearance of finish, and finish is adequately protected.
- Fasteners: To appropriate British Standards and, unless specified otherwise, of same metal as component being fastened, with matching coating or finish.

320 STEEL LONG AND FLAT PRODUCTS

- Hot rolled structural steels (excluding structural hollow sections and tubes): To BS EN 10025-1.
- Fine grain steels, including special steels: To BS EN 10025-3 and -4.
- Steels with improved atmospheric corrosion resistance: To BS EN 10025-5.

330 STEEL PLATE, SHEET AND STRIP

- Plates and wide flats, high yield strength steel: To BS EN 10025-6.

340 HOT ROLLED STEEL PLATE, SHEET AND STRIP

- Flat products, high yield strength for cold forming: To BS EN 10149-1, -2 and -3.
- Carbon steel sheet and strip for cold forming: To BS EN 10111.
- Narrow strip, formable steel and steel for general engineering purposes: To BS 1449-1.8 and BS 1449-1.14.

350 COLD ROLLED STEEL PLATE, SHEET AND STRIP

- Steel sections: To BS EN 10162.
- Flat products, high yield strength micro-alloyed steels for cold forming: To BS EN 10268.
- Carbon steel flat products for cold forming: To BS EN 10130 and BS EN 10131.
- Uncoated carbon steel narrow strip for cold forming: To BS EN 10139 and BS EN 10140.
- Narrow strip steel for general engineering purposes: To BS EN 10132-1, -2, and -3.
- Carbon steel flat products for vitreous enamelling: To BS EN 10209.

360 COATED STEEL FLAT PRODUCTS

- Hot dip zinc coated carbon steel sheet and strip for cold forming: To BS EN 10346 and BS EN 10143.
- Hot dip zinc coated structural steel sheet and strip: To BS EN 10143 and BS EN 10346.
- Organic coated flat products: To BS EN 10169.

370 STEEL STRUCTURAL HOLLOW SECTIONS (SHS)

- Non alloy and fine grain steels, hot finished: To BS EN 10210-1 and -2.
- Non-alloy and fine grain steels, cold formed welded: To BS EN 10219-2.
- Weather resistant steels, hot finished: To BS 7668.

380 OTHER STEEL SECTIONS

- Equal flange tees: To BS EN 10055.
- Equal and unequal angles: To BS EN 10056-1 and -2.
- Wire, carbon steel for general engineering purposes: To BS 1052.
- Wire and wire products, general: To BS EN 10218-2.
- Tubes:

© Copyright protected

- Seamless circular: To BS EN 10297-1.
- Seamless cold drawn: To BS EN 10305-1.
- Welded and cold sized square and rectangular: To BS EN 10305-5.
- Welded circular: To BS EN 10296-1.
- Welded cold drawn: To BS EN 10305-2.
- Welded cold sized: To BS EN 10305-3.

390 WARRANTY

General Warranty: The warranty specified in this Article shall not deprive the Employer of other rights the Employer may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties provided in accordance with the express requirements of the Contract Documents.

Full System Warranty: Provide full system warranty in which Manufacturer, contractor and Installer are jointly and severally responsible and agree to repair or replace, without limitations, any high-performance coating system that fails within the specified warranty period.

Failure includes, but shall not be limited to the following:

Peeling or blistering of paint.
Cracking of paint film.
Crazing of paint film.
Change in color of finish topcoat.
Staining.
Patchiness of sheen or color.

Warranty Period for Protective paint systems over abrasive blasted steel substrates: 20 years from the date of Substantial Completion.
Warranty Period for Hot Dip Galvanized items:15 years from the date of Substantial Completion.
Warranty Period for Duplex (HDG+ paint system) coated steel substrates: 20 years from the date of Substantial Completion.

411 METAL PRIMERS

- As recommended by coating system manufacturer based on substrate type, site corrosion category, and warranty duration. Minimum number of coats and dry film thicknesses to comply with ISO 12944-5 minimum requirements.

  - Zinc-Rich Inorganic Primer: Corrosion-resistant, inorganic-based, zinc-rich primer; formulated for use on prepared steel that will be exposed to severe industrial or severe marine environments.
  - Epoxy Zinc-Rich Primer: Solvent-based, multi-component, epoxy-type anti-corrosive primer; formulated for use on cleaned ferrous metal surfaces that will be exposed to moderate industrial or marine environments.
  - Water-Based, Rust-Inhibitive Primer: Corrosion-resistant, water-based-emulsion primer; formulated for resistance to flash rusting when applied to cleaned, ferrous metals that will be exposed to mildly corrosive environments.
  - Epoxy, Anti-Corrosive Primer: Two-component, epoxy, anti-corrosive primer; formulated for use on ferrous, galvanized metal surfaces, and the like.

© Copyright protected

415 HOT-DIPPED GALVANIZED STEEL FINISHES AND CARBON STEEL FINISHES

- Protective colored paint system: Paint system obtained from single manufacturer consisting of colored exterior coating over an anti-corrosive zinc rich pigmented primer and a barrier coat(s) where needed and as per manufacturer's recommended system. Color of coating system applied is to be selected by the Engineer from manufacturer's full range of colors and gloss. Polyurethane based top coats to be used for all exterior UV exposed elements.

  Substrate: Minimum G90 hot dip galvanized steel, or abrasive blasted carbon steel.
- The contractor shall provide corrosion protection to the steelwork, which has the following durability and maintenance characteristic:
- Fully compliant to the pertinent provisions of ISO 12944. Time to first maintenance shall be 25 years as a minimum for all categories of systems conforming to Very High (VH) durability to ISO 12944-5 for corrosivity category C5. All primers and paints shall be standard proprietary products manufactured by an approved manufacturer. The application of paint shall be in complete conformity to Manufacturer's recommendations and shall be guaranteed for 20 years (except for Duplex coating systems) as minimum for all categories of systems defined in accordance with ISO 12944-8. Minimum number of coats and dry film thicknesses to comply with ISO 12944-5 minimum requirements.

A. Hot Dip Galvanization Finish: Hot-dip galvanized items shall comply with ISO 1461 Table 3 and 4 or ASTM A123/123M, or ISO 14713-1 table 2 achieving the design life to first maintenance of 25 plus years conforming to Very High (VH) durability for corrosivity category C5 as outlined by ISO 14713-1. The application of hot dip galvanization shall be in complete conformity to applicable standards and shall be guaranteed for 15 years from date of substantial completion. All Hot dip galvanized items located outside the air and vapor control layer shall have a minimum coating designation of Z600 or a coating thickness not less than 85 microns.

B. Box members and hollow sections:

1. All structural box members and hollow components that are not hot dip galvanized, shall be impervious to air and moisture. For this purpose, all edges shall be sealed by means of continuous welds and any opening shall be provided with sealing covers. During the assembly of such components, care shall be taken to ensure that no water is trapped.
2. No penetrations shall be permitted during or after completion of works.

C. Steel protection systems shall undergo regular inspections by manufacturer/applicator at intervals as required by system manufacturer but not to exceed every 18 months.

FABRICATION

515 FABRICATION GENERALLY

- Contact between dissimilar metals in components: Avoid.
- Finished components: Rigid and free from distortion, cracks, burrs and sharp arrises.
  - Moving parts: Free moving without binding.
- Corner junctions of identical sections: Mitre.

520 COLD FORMED WORK

- Profiles: Accurate, with straight arrises.

525 ADHESIVE BONDING

- Preparation of surfaces of metals to receive adhesives:
  - Degrease.
  - Abrade mechanically or chemically etch.

© Copyright protected

  - Prime: To suit adhesive.
- Adhesive bond: Form under pressure.

527 WELDING GENERALLY

.

- Welding procedures:
  - Method and standard: Metal arc welding to BS EN 1011-1 and -2 for steel and TIG welding to BS EN 1011-3 for stainless steel TIG or MIG welding to BS EN 1011-4 for aluminium alloys.
  - Welding Procedure Specification (WPS): Not required.
- Preparation:
  - Joint preparation: Clean thoroughly.
  - Surfaces of materials that will be self-finished and visible in the completed work: protect from weld splatter.
- Jointing:
  - Joints: Fully bond parent and filler metal throughout with no inclusions, holes, porosity or cracks.
  - Dissimilar metals: Welding not permitted.
  - Strength requirements: Welds to achieve design loads.
  - Heat straightening: Not permitted.
  - Complex assemblies: Agree priority for welding members to minimize distortion caused by subsequent welds.
  - Tack welds: Use only for temporary attachment.
  - Jigs: Provide to support and restrain members during welding.
  - Filler plates: Obtain approval and submit proposals.
  - Lap joints: Minimum 5 x metal thickness or 25 mm, whichever is greater.
  - Weld terminations: Clean and sound.

FINISHING

710 FINISHING WELDED AND BRAZED JOINTS VISIBLE IN COMPLETE WORK

- Standard: To BS EN ISO 8501-3.
  - Preparation grade: P1.
- Butt joints: Smooth, and flush with adjacent surfaces.
- Fillet joints: Neat.
- Grinding: Grind smooth where indicated on drawings.

745 PREPARATION FOR APPLICATION OF COATINGS

- General: Complete fabrication, and drill fixing holes before applying coatings.
- Paint, grease, flux, rust, burrs and sharp arrises: Remove.

790 VITREOUS ENAMELLING

- Standard: To BS EN ISO 28722.
- Substrate metal: Steel to BS EN 10209.

COMPLETION

910 DOCUMENTATION

- Submit:
  - Manufacturer's maintenance instructions.
  - Guarantees, warranties, test certificates, record schedules and log books.

© Copyright protected

920 COMPLETION

- Protection: Remove.
- Cleaning and maintenance: Carry out in accordance with procedures detailed in fabricators' guarantees.

© Copyright protected

Z12 PRESERVATIVE/ FIRE RETARDANT TREATMENT

To be read with Preliminaries/ General Conditions.

110 TREATMENT APPLICATION

- Timing: After cutting and machining timber, and before assembling components.
- Processor: Licensed by manufacturer of specified treatment solution.
  - Operatives: Must have completed the PCA training scheme or WPA certified or equivalent.
- Certification: For each batch of timber provide a certificate of assurance that treatment has been carried out as specified.

120 COMMODITY SPECIFICATIONS

- Standard: Current edition of the Wood Protection Association (WPA) publication 'Industrial wood preservation specification and practice'.

130 PRESERVATIVE TREATMENT SOLUTION STRENGTHS/ TREATMENT CYCLES

- General: Select to achieve specified service life and to suit treatability of specified wood species.

165 WATER-BASED MICROEMULSION PRESERVATIVE TREATMENT

- Solution:
  - Manufacturer: Submit proposals.
    Product reference: Submit proposals.
  - Application: Double vacuum + low pressure impregnation.
- Moisture content of wood:
  - At time of treatment: As specified for the timber/ component at time of fixing.
  - After treatment: Timber to be surface dry before use.

210 FIRE RETARDANT TREATMENT

- Solution type: Humidity resistant.
  - Manufacturer: Submit proposals.
    Product reference: Submit proposals.
  - Application: Vacuum + pressure impregnation.
- Moisture content of wood:
  - At time of treatment: As specified for the timber/ component at time of fixing.
  - After treatment: Timber to be redried slowly at temperatures not exceeding 65°C to minimize distortion and degradation.

240 PRESERVATIVE TREATMENT APPLICATION

- The preservative treatment is to be applied by pressure impregnation or the double vacuum process. Dipping, deluging, spraying, brushing or other methods which only provide shallow protection are not permitted.
- The treatment to be carried out under factory conditions at the source of supply of the timber and the Subcontractor is to provide a Certificate of Impregnation when required by the Contractor.
- Treatment is to be carried out after all cutting and shaping has been completed.
  - If subsequent cutting of the timber is unavoidable all freshly exposed surfaces are to receive a liberal application of the preservative recommended in the relevant treatment specification.

250 STANDARD PRESSURE TREATED PRESERVATIVE

- Wood members and plywood exposed to weather or in contact with plaster, masonry or concrete, including wood framing of openings in exterior walls of concrete or masonry, roofed structures; wood

© Copyright protected

sills, sole plates, furring and wood members used in connection with roofing and flashing materials to be treated in accordance with BS 1282, BS 5268, BS 6566, and/or BS 5707.

260 TERMITE AND OTHER INSECT TREAT MENTFUNGAL TREATMENT

- All hardwood and softwood for permanent incorporation in the Works is to be treated with preservative to provide protection against damage from insect larvae, termites and fungal decay to BS 6566, Part 7. Organic solvent type preservatives are to contain a water repellent.
  - Certificates are to be provided confirming all necessary treatments required have been completed.
- For treatment to timber laminated beams and columns refer to Section M60- PAINTING.

610 MAKING GOOD TO PRESERVATIVE TREATMENT ON-SITE

- Preservative solution: Compatible with off-site treatment.
- Application: In accordance with preservative manufacturer's recommendations.

620 MAKING GOOD TO FIRE RETARDANT TREATMENT ON-SITE

- Fire retardant: Compatible with off-site treatment.
- Application: In accordance with fire retardant manufacturer's recommendations.

© Copyright protected

Z20 FIXINGS AND ADHESIVES

To be read with Preliminaries/ General Conditions.

PRODUCTS

310 FASTENERS GENERALLY

- Materials: To have:
  - Bimetallic corrosion resistance appropriate to items being fixed.
  - Atmospheric corrosion resistance appropriate to fixing location.
- Appearance: Submit samples on request.

320 PACKINGS

- Materials: Non-compressible, corrosion proof.
- Area of packings: Sufficient to transfer loads.

330 NAILED TIMBER FASTENERS

- Nails:
  - Steel: To BS 1202-1 or BS EN 10230-1.
  - Copper: To BS EN 1202-2.
  - Aluminium: To BS 1202-3.

340 MASONRY FIXINGS

- Light duty: Plugs and screws.
- Heavy duty: Expansion anchors or chemical anchors.

350 PLUGS

- Type: Proprietary types to suit substrate, loads to be supported and conditions expected in use.

360 ANCHORS

- Types:
  - Expansion: For use in substrate strong enough to resist forces generated by expansion of anchor.
  - Adhesive or chemical:
    For use in substrate where expansion of anchor would fracture substrate.
    For use in irregular substrate where expansion anchors cannot transfer load on anchor.
  - Cavity: For use where the anchor is retained by toggles of the plug locking onto the inside face of the cavity.

370 WOOD SCREWS

- Type:
  Wood screws (traditional pattern).
  Standard: To BS 1210.
  Wood screws.
  Pattern: Parallel, fully threaded shank or twin thread types.
- Washers and screw cups: Where required are to be of same material as screw.

380 MISCELLANEOUS SCREWS

- Type: To suit the fixing requirement of the components and substrate.
  - Pattern: Self-tapping, metallic drive screws, or power driven screws.
- Washers and screw cups: Where required to be of same material as screw.

© Copyright protected

390 ADHESIVES GENERALLY

- Standards:
  - Hot-setting phenolic and aminoplastic: To BS 1203.
  - Thermosetting wood adhesives: To BS EN 12765.
  - Thermoplastic adhesives: To BS EN 204.

410 POWDER ACTUATED FIXING SYSTEMS

- Types of fastener, accessories and consumables: As recommended by tool manufacturer.

EXECUTION

610 FIXING GENERALLY

- Integrity of supported components: Select types, sizes, quantities and spacings of fixings, fasteners and packings to retain supported components without distortion or loss of support.
- Components, substrates, fixings and fasteners of dissimilar metals: Isolate with washers/ sleeves to avoid bimetallic corrosion.
- Appearance: Fixings to be in straight lines at regular centres.

620 FIXING THROUGH FINISHES

- Penetration of fasteners and plugs into substrate: To achieve a secure fixing.

630 FIXING PACKINGS

- Function: To take up tolerances and prevent distortion of materials and components.
- Limits: Do not use packings beyond thicknesses recommended by fixings and fasteners manufacturer.
- Locations: Not within zones to be filled with sealant.

640 FIXING CRAMPS

- Cramp positions: Maximum 150 mm from each end of frame sections and at 600 mm maximum centres.
- Fasteners: Fix cramps to frames with screws of same material as cramps.
- Fixings in masonry work: Fully bed in mortar.

650 NAILED TIMBER FIXING

- Penetration: Drive fully in without splitting or crushing timber.
- Surfaces visible in completed work: Punch nail heads below wrot surfaces.
- Nailed timber joints: Two nails per joint (minimum), opposed skew driven.

660 SCREW FIXING

- Finished level of countersunk screw heads:
  - Exposed: Flush with timber surface.
  - Concealed (holes filled or stopped): Sink minimum 2 mm below surface.

670 PELLETED COUNTERSUNK SCREW FIXING

- Finished level of countersunk screw heads: Minimum 6 mm below timber surface.
- Pellets: Cut from matching timber, match grain and glue in to full depth of hole.
- Finished level of pellets: Flush with surface.

680 PLUGGED COUNTERSUNK SCREW FIXING

- Finished level of countersunk screw heads: Minimum 6 mm below timber surface.
- Plugs: Glue in to full depth of hole.
- Finished level of plugs: Projecting above surface.

© Copyright protected

690 USING POWDER ACTUATED FIXING SYSTEMS

- Powder actuated fixing tools: To BS 4078-2 and Kitemark certified.
- Operatives: Trained and certified as competent by tool manufacturer.

700 APPLYING ADHESIVES

- Surfaces: Clean. Adjust regularity and texture to suit bonding and gap filling characteristics of adhesive.
- Support and clamping during setting: Provide as necessary. Do not mark surfaces of or distort components being fixed.
- Finished adhesive joints: Fully bonded. Free of surplus adhesive.

© Copyright protected

Z21 MORTARS

To be read with Preliminaries/ General Conditions.

CEMENT GAUGED MORTARS

110 CEMENT GAUGED MORTAR MIXES

- Specification: Proportions and additional requirements for mortar materials are specified elsewhere.

120 SAND FOR SITE MADE CEMENT GAUGED MASONRY MORTARS

- Standard: To BS EN 13139.
- Grading: 0/2 (FP or MP).
  - Fines content where the proportion of sand in a mortar mix is specified as a range (e.g. 1:1: 5-6):
    Lower proportion of sand: Use category 3 fines.
    Higher proportion of sand: Use category 2 fines.
- Sand for facework mortar: Maintain consistent colour and texture. Obtain from one source.

161 CEMENTS FOR MORTARS

- Cement: To BS EN 197-1 and CE marked.
  - Types: Portland cement, CEM I.
    Portland limestone cement, CEM ll/A-L or CEM ll/A-LL.
    Portland slag cement, CEM II/B-S.
    Portland fly ash cement, CEM II/B-V.
  - Strength class: 32.5, 42.5 or 52.5.
- White cement: To BS EN 197-1 and CE marked.
  - Type: Portland cement, CEM I.
  - Strength class: 52.5.
- Sulfate resisting Portland cement:
  - Type: To BS EN 197-1 Sulfate resisting Portland cement, CEM I/SR and CE marked.
    To BS EN 197-1 fly ash cement, CEM ll/B-V and CE marked.
  - Strength class: 32.5, 42.5 or 52.5.
- Masonry cement: To BS EN 413-1 and CE marked.
  - Class: MC 12.5.
- Do not use lime unless otherwise approved by Engineer for particular work and application.

180 ADMIXTURES FOR SITE MADE CEMENT GAUGED MORTARS

- Air entraining (plasticizing) admixtures: To BS EN 934-3 and compatible with other mortar constituents.
- Other admixtures: Submit proposals.
- Prohibited admixtures: Calcium chloride, ethylene glycol and any admixture containing calcium chloride.

190 RETARDED READY TO USE CEMENT GAUGED MORTAR

- Standard: To BS EN 998-2.
- Lime for cement: lime: sand mortars: Nonhydraulic to BS EN 459-1.
  - Type: CL 90S.
- Pigments for coloured mortars: To BS EN 12878.
- Time and temperature limitations: Use within limits prescribed by mortar manufacturer.
  - Retempering: Restore workability with water only within prescribed time limits.

© Copyright protected

200 STORAGE OF CEMENT GAUGED MORTAR MATERIALS

- Sands and aggregates: Keep different types/ grades in separate stockpiles on hard, clean, free-draining bases.
- Factory made ready-mixed lime:sand/ ready to use retarded mortars: Keep in covered containers to prevent drying out or wetting.
- Bagged cement/ hydrated lime: Store off the ground in dry conditions.

210 MAKING CEMENT GAUGED MORTARS

- Batching: By volume. Use clean and accurate gauge boxes or buckets.
  - Mix proportions: Based on dry sand. Allow for bulking of damp sand.
- Mixing: Mix materials thoroughly to uniform consistency, free from lumps.
  - Mortars containing air entraining admixtures: Mix mechanically. Do not overmix.
- Working time (maximum): Two hours at normal temperatures.
- Contamination: Prevent intermixing with other materials.

LIME: SAND MORTARS DO NOT USE LIME.

© Copyright protected

Z22 SEALANTS

To be read with Preliminaries/General Conditions.

PRODUCTS

310 JOINTS GENERALLY

- Primer, backing strip, bond breaker: Types recommended by sealant manufacturer.

EXECUTION

610 SUITABILITY OF JOINTS

- Presealing checks:
  - Joint dimensions: Within limits specified for the sealant.
  - Substrate quality: Surfaces regular, undamaged and stable.
- Joints not fit to receive sealant: Submit proposals for rectification.

620 PREPARING JOINTS

- Surfaces to which sealant must adhere:
  - Remove temporary coatings, tapes, loosely adhering material, dust, oil, grease, surface water and contaminants that may affect bond.
  - Clean using materials and methods recommended by sealant manufacturer.
- Vulnerable surfaces adjacent to joints: Mask to prevent staining or smearing with primer or sealant.
- Backing strip and/ or bond breaker installation: Insert into joint to correct depth, without stretching or twisting, leaving no gaps.
- Protection: Keep joints clean and protect from damage until sealant is applied.

630 APPLYING SEALANTS

- Substrate: Dry (unless recommended otherwise) and unaffected by frost, ice or snow.
- Environmental conditions: Do not dry or raise temperature of joints by heating.
- Sealant application: Fill joints completely and neatly, ensuring firm adhesion to substrates.
- Sealant profiles:
  - Butt and lap joints: Slightly concave.
  - Fillet joints: Flat or slightly convex.
- Protection: Protect finished joints from contamination or damage until sealant has cured.

© Copyright protected

Z31 POWDER COATINGS

To be read with Preliminaries/ General Conditions.

120 POWDER COATING MATERIALS

- Manufacturer: Obtain from one only of the following: Submit proposals for Engineer's approval.
- Selected manufacturer: Submit details before commencement of powder coating including:
  - Name and contact details.
  - Details of accreditation schemes.
  - Technical data of product including current Agrément certificates.

210 WORKING PROCEDURES

- Comply with the follow following standards.
  - Aluminium components: To BS 6496 or BS EN 12206-1.
  - Steel components: To BS EN 13438.
  - Safety standards: To British Coatings Federation 'Code of safe practice - Application of thermosetting powder coatings by electrostatic spraying'.

220 POWDER COATING APPLICATORS

- Applicator requirements:
  - Approved by powder coating manufacturer.
  - Currently certified to BS EN ISO 9001.
  - Comply with quality procedures, guarantee conditions, standards and tests required by powder coating manufacturer.
  - Applicator to use only one plant.
  - Selected applicator: Submit details before commencement of powder coating including:
    Name and contact details.
    Details of accreditation schemes.

225 GUARANTEES

- Powder coating manufacturer and applicator guarantees:
  - Submit sample copies before commencement of powder coating.
  - Submit signed project specific copies on completion of work.

230 CONTROL SAMPLES

- Sequence: Prior to ordering materials for the works, obtain approval of appearance for:
  - Powder coated samples: Of various grades and forms of background metal to be used, showing any colour, texture and gloss variation.
  - Fabrication samples: Showing joint assembly, how powder coating is affected and how any cut metal edges are finished and protected.
- Samples to include the following information:
  - Product reference.
  - Colour.
  - Reference number.
  - Name.
  - Gloss level.

235 INDEPENDENT INSPECTION AT PLANT

- Requirement: Contractors/ suppliers of the following designated components must commission an approved Independent Inspection Authority to carry out acceptance inspections to confirm that powder coating application complies with this specification.

© Copyright protected

  - Designated components: all as indicated on drawings.
- Acceptance inspections: Carry out for each variation of colour and finish of each component work package at applicator's plant prior to any fabrication of units, in accordance with the following:
  - Where three of more production runs are required for application of coatings, not less than three acceptance inspections must be carried out in accordance with BS 6001-1, general inspection level 2, with an acceptance quality limit of 1%.
  - Where less than three production runs are required for application of coatings, one acceptance inspection must be carried out in accordance with BS 6001-2, with a limiting quality of 5% where the probability of acceptance is 10%.
- Components failing inspection: Reprocess or replace and reinspect.
- Inspection reports: Independent Inspection Authority must submit copies.

240 QUALITY ASSURANCE SYSTEM

- Requirement: Powder and coating application to the following designated components is to be tested and approved in accordance with the Qualicoat system.
  - Designated components: all.

250 COMPONENT DESIGN

- Condition of components to be powder coated:
  - To comply with relevant recommendations of BS 4479-1, -3, and -4.
  - Of suitable size to fit plant capacity.
  - Of suitable thickness to withstand oven curing.

310 PRETREATMENT OF ALUMINIUM COMPONENTS

- Condition of components to be pretreated:
  - Free from corrosion and damage.
  - All welding and jointing completed and finish off as specified.
  - Free from impurities including soil, grease, oil.
  - Suitable for and compatible with the pretreatment process.
- Conversion coating requirements:
  - Chromate system: To BS 6496 or BS EN 12206-1.
  - Chromate-free system: To BS EN 12206-1. Submit details before using.
- Rinsing requirements: Use demineralized water. Drain and dry.

320 PRETREATMENT OF STEEL COMPONENTS

- Condition of components to be pretreated:
  - Free from corrosion and damage.
  - All welding and jointing completed and finish off as specified.
  - Free from impurities including soil, grease, oil.
  - Suitable for and compatible with the pretreatment process.
- Conversion coating requirements: To BS EN 13438.
- Rinsing requirements: Use demineralized water. Drain and dry.

430 EXTENT OF POWDER COATINGS

- Application: To visible component surfaces, and concealed surfaces requiring protection. Coated surfaces will be deemed 'significant surfaces' for relevant BS 6496 or BS EN 13438 performance requirements.

© Copyright protected

430A EXTENT OF POWDER COATINGS

- Application: To visible component surfaces, and concealed surfaces requiring protection. Coated surfaces will be deemed 'significant surfaces' for relevant EN ISO12206 or BS EN 13438 performance requirements.

435 APPLICATION OF POWDER COATINGS

- Surfaces to receive powder coatings: Free from dust or powder deposits.
- Powder colours: Obtain from one batch of one manufacturer.
- Commencement of powder coating: To be continuous from pretreatment.
- Jig points: Not visible on coated components.
- Curing: Controlled to attain metal temperatures and hold periods recommended by powder coating manufacturer.
- Stripping and recoating of components: Only acceptable by prior agreement of powder coating manufacturer. Stripping, pretreatment and powder coating are to be in accordance with manufacturer's requirements.
- Overcoating of components: Not acceptable.

441 PERFORMANCE AND APPEARANCE OF POWDER COATINGS

- For aluminium components:
  - Standard: To BS EN 12206-1.
  - European Qualicoat: Certificate: Class 3 for high performance powder coating and Class 2 for super durable polyester powder coating.
  - AAMA: 2605 for high performance powder coating and 2604 for super durable polyester powder coating.
  - Total system Warranty: 30 years for high performance powder coating and 25 years for super durable polyester powder coating.
  - Minimum thickness: not less than 60 microns.
- For steel components:
  - Standard: To BS EN 13438.
  - GSB Certificate: Class A.
- Visual inspection after powder coating: Significant surface viewing distances to be as specified in the relevant Standard, unless specified otherwise.
- Colour and gloss levels: To conform with approved samples.

445 HIGH PERFORMANCE COATING (PVDF)

- Superior-Performance Organic Finish, Four-Coat PVDF: Fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat.

  - Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions for seacoast and severe environments.

- Color and Gloss: As selected by Engineer from manufacturer's full range.

- High-Performance Powder: Manufacturer's standard 1-coat, thermocured system consisting of specially formulated fluoropolymer powder. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions.

  - Color and Gloss: As selected by Engineer from manufacturer's full range.

© Copyright protected

450 ALUMINIUM ALLOY FABRICATIONS

- Units may be assembled:
  - Before powder coating.
  - From components powder coated after cutting to size.
  - Where approved, from components powder coated before cutting to size.
- Exposure of uncoated background metal: Not acceptable.
- Assembly sealants: Compatible with powder coatings. Obtain approval of colour if sealants are visible after fabrication.

460 STEEL FABRICATIONS

- Unit assembly: Wherever practical, before powder coating.
- Exposure of uncoated background metal: Not acceptable.
- Assembly sealants: Compatible with powder coatings. Obtain approval of colour if sealants are visible after fabrication.

470 FIXINGS

- Exposed metal fixings: Powder coat together with components, or coat with matching repair paint system applied in accordance with the powder coating manufacturer's recommendations.

480 DAMAGED COMPONENTS - REPAIR/ REPLACEMENT

- Before delivery to site: Check all components for damage to powder coatings. Replace damaged components.
- Site damage: Submit proposals for repair or replacement.

510 PROTECTION

- Powder coated surfaces of components: Protect from damage during handling and installation, or by subsequent site operations.
- Protective coverings: Must be:
  - Resistant to weather conditions.
  - Partially removable to suit building in and access to fixing points.
- Protective tapes in contact with powder coatings: Must be:
  - Low tack, self-adhesive and light in colour.
  - Applied and removed in accordance with tape and powder coating manufacturers' recommendations. Do not use solvents to remove residues as these are detrimental to the coating.
- Inspection of protection: Carry out monthly. Promptly repair any deterioration or deficiency.

535 DOCUMENTATION

- Submit the following information for each batch of powder coated components:
  - Supplier.
  - Trade name.
  - Colour.
  - Type of powder.
  - Method of application.
  - Batch and reference number.
  - Statutory requirements.
  - Test certificates.
  - Maintenance instructions.

540 COMPLETION

- Protection: Remove.

© Copyright protected

- Cleaning and maintenance of powder coatings: Carry out in accordance with procedures detailed in powder coating manufacturer and applicator guarantees.

© Copyright protected

Z210A - PIPELINES AND PIPEWORK - HVAC

210A.005 SUMMARY

- This section includes specs for piping applicable for:
    - Hydronic piping

210A.020 CARBON STEEL PIPES AND FITTINGS:

- Application: Refer to clause 210A.075 “PIPEWORK APPLICATION”
- Pipes and Tubes
    - Seamless carbon steel tubes
        - To BS EN 10255
            - Size - nominal diameter (DN) up to and including 150mm.
            - Black, heavy – Reference Y10.2010A
            - Black, medium – Reference Y10.2010B
        - To BS EN 10216-1
            - Reference Y10.2030
            - Wall thickness - to be suitable for the application duty / testing requirements.
- Fittings
    - Butt welding carbon steel fittings.
        - Size range - 25mm to 400mm.
        - To BS EN 10253-1 for general use in non-pressure piping applications without specific inspection requirements - reference Y10.2060A
        - To BS EN 10253-2 with specific inspection requirements for use on pressure piping applications covered by the Pressure Equipment Regulations - reference Y10.2060B
    - Malleable cast iron fittings, screwed
        - Size range - 10mm to 164mm.
        - Reference Y10.2070#
        - Finish
            - Black
            - Galvanised
    - Wrought Steel threaded pipe fittings
        - Type
            - Seamless fittings manufactured from seamless tube, forging or rolled bar.
            - Fabricated fittings manufactured from welded tube or where welding forms part of the fabrication of the fitting.

- Reference Y10.2090
- Size range - 6mm to 150mm.

- Fittings, grooved for mechanical joints

- Size range - 20mm to 600mm.
- Galvanised cast iron - reference Y10.2080E
- Painted steel - reference Y10.2080F

- Joints

- Up to and including 50mm

- Screwed for threaded end
- Mechanical joint for grooved end

- 65mm and above

- Welded
- Flanged
- Mechanical joint for grooved end

- Jointing materials

- Circular flanges

- Flanges to BS EN 1092-1 and BS ISO 7005-1
- Type

- Welding flanges - reference Y10.3010A

- Jointing rings for circular flanges

- Non-metallic flat for flanges to BS EN 1092-1 - reference Y10.3020A
- Metallic for flanges to BS EN 1092-1 - reference Y10.3020B

- Screwed joints to relevant parts of BS EN 10226

- Reference Y10.3030A
- Where chemical cleaning is required - reference Y10.3030C

- Union connections

- Low pressure applications - Railroad pattern - spherical seating bronze to iron.
- High pressure applications - Navy pattern - spherical seating bronze to bronze.

- Welding rods - Reference Y10.3050A

210A.030 COPPER PIPES AND FITTINGS:

- Application: Refer to clause 210A.075 “PIPEWORK APPLICATION”
- Pipes

- Copper pipe, soft (Class Y) - Reference Y10.2280#
- Copper pipe, half hard (Class X) - Reference Y10.2270#
- Copper pipe, hard (Class Z) - Reference Y10.2290#
- Pipe to be as recommended by supplier.

- Fittings

  - Capillary fittings for copper tubing - Reference Y10.2310#
  - Compression fittings for copper tubing - Reference Y10.2320#

- Jointing materials

  - Welding rods - Reference Y10.3050A
  - Brazed joints - to BS EN ISO 17672
  - Capillary joints - Reference Y10.3070#

210A.050 PLASTICS PIPES AND FITTINGS:

- Application: Refer to clause 210A.075 “PIPEWORK APPLICATION

  - UPVC (Solid-Wall) to BS EN 1329

    - Pipes - Reference Y10.2580A
    - Fittings - Reference Y10.2585A

210A.062 PRE-INSULATED UNDERGROUND PIPELINES:

- Application: Refer to clause 210A.075 “PIPEWORK APPLICATION”
- Type - Bonded single steel service pipes to BS EN 253 - reference Y10.2880
- Provide a complete installation capable of performing within the specified design conditions for the duration of the systems design life.
- The system shall be fully in accordance with the recommendations and instructions of the pipe component manufacturer.
- The distribution of force and pipe movement for the whole piping system shall be fully assessed and a complete system installed including all required expansion facilities.
- Maximum resultant stresses and movements shall be considered at all critical positions in the proposed piping system. Critical positions shall include anchors, bends, branches and building entries.
- All loading conditions shall be considered in order to ensure that maximum values of resultant stress and movement have been established. The effect of structural discontinuities and pipeline supports shall be taken account of in the design and installation.
- The contractor shall liaise with all other utilities in the design and selection of final routes. Details of equipment, pipework and the distribution system layout indicated on the layout drawing(s) are approximate.
- Materials - distribution mains

  - Carrier pipe - Steel
  - Thermal insulation

    - Polyurethane foam (PU)
    - Thermal conductivity to be in accordance with BS EN 253

- Outer casing - polyethylene (PE).

- Provide leak detection system and alarm monitoring

210A.070 PIPEWORK ACCESSORIES:

- Masking plates (Escutcheons)
  - Application: Wall masking plates
    - Chromium plated - reference Y10.3190A.
    - Plastic - reference Y10.3190B
    - Pipe rings and clips
  - Application: Floor and ceiling masking plates
    - Chromium plated - reference Y10.3190A.
    - Plastic - reference Y10.3190B
    - Pipe rings and clips
- Copper pipework clips:
  - Use brass pipe clips.

210A.077 PIPEWORK APPLICATION: HYDRONIC PIPING

- General
  - Working pressure : as designed.
  - Working temperature :as designed.
- Chilled water / Heating Water Piping Inside Buildings
  - Pipes and tubes:
    - Up to and including 50 mm
      - Seamless medium black steel tubes to BS EN 10255
    - 65 mm up to and including 150 mm
      - Seamless medium black steel tubes, grooved end to BS EN 10255
    - 200 mm and above up
      - Seamless black steel tubes to BS EN 10216-1
      - Material grade P235TR2
  - Fittings
    - Up to and including 50 mm
      - Malleable cast iron fittings, screwed

        - Finish
            - Black
        - 65 mm and above
            - Grooved end carbon steel fittings.
    - Joints
        - Up to and including 50 mm
            - Screwed for threaded end
        - 65 mm and above
            - Mechanical joints for grooved end
- External underground Chilled water / Heating Water Piping
    - Pipes and tubes - Pre-insulated, bonded single steel service pipes to BS EN 253
    - Provide leak detection system and alarm monitoring
- AC condensate drain piping:
    - Pipes and tubes:
        - UPVC (Solid-Wall) to BS EN 1329

210A.080 GENERAL WORKMANSHIP:

- Appearance - reference Y10.4010
- Spacing - reference Y10.4020
- Gradients - reference Y10.4030
- Air venting requirements
    - Air bottles - reference Y10.4040A
    - Automatic air vents - reference Y10.4040B
- Drain requirements - reference Y10.4050
- Expansion and contraction - reference Y10.4060
- Pipe fittings
    - Bends/swept tees
    - Elbows/square tees
    - Reference Y10.4070#
- Pipes through walls and floors - reference Y10.4110
- Protect pipework penetrating fire separating elements in accordance with, Building Regulations, BS 9999 and BESA Technical Bulletin TB/032.
- Pipe sleeves
    - Where Insulation not carried through pipe sleeve - Reference Y10.4120A
    - Where Insulation carried through pipe sleeve - reference Y10.4120B

- Connect to equipment.
- Use distribution headers.
- Temporary plugs, caps and flanges - Reference Y10.4150A.
- Flanged joints general - reference Y10.4160
- Dissimilar metals - reference Y10.4170
- Pipe rings and clips - reference Y10.4180
- Anchors - reference Y10.4190
- Slide guides - reference Y10.4200
- Pipe supports - reference Y10.4205

    - Comply with the manufacturers' installation recommendations for the following proprietary pipe systems:

        - Press-fit and push-fit pipework systems using thin wall carbon steel, stainless steel or copper.
        - Systems using grooved mechanical joints.
        - Plastic pipe systems.

- Support spacing

    - Tables for steel, copper, iron, PVC and ABS pipes - reference Y10.4220
    - Comply with tables in appropriate parts of BESA TR/20.
    - For the following proprietary pipe systems comply with the manufacturers' installation recommendations:

        - Press-fit and push-fit pipework systems using thin wall carbon steel, stainless steel or copper.
        - Systems using grooved mechanical joints.
        - Plastic pipe systems.

- Isolation and regulation - Reference Y10.4230A
- Maintenance and renewal - reference Y10.4240
- Clean by removing cement and clean off all pipework and brackets.
- Non-ferrous components - thoroughly clean and degrease.
- Pipe collars (closers) for plastic pipes

    - Type

        - Stainless steel collar with fixing brackets with intumescent liner.
        - Pre-assembled wrap for casing within concrete floor or masonry wall.

    - Fire resistance

        - 2 hrs

    - Installation to be in accordance with the manufacturer's instructions and grouted/sealed using the manufacturer's proprietary compound/sealant.
    - Standards - Test to BS EN 1366-3 and BS EN 1363-1.

210A.090 WORKMANSHIP, STEEL PIPEWORK:

- Welding, general

    - Class 1 - reference Y10.5010A (Weld pipeline joints to BS 2633)

    - Class 2 - reference Y10.5010B (Weld pipeline joints to BS 2971)

- Welded joints - reference Y10.5020
- Painting welded joints - reference Y10.5030
- Flanged joints - reference Y10.5040
- Screwed joints - reference Y10.5050
- Mechanical joints - reference Y10.5060
- Anchors

    - U-bolts - reference Y10.5070A
    - Flanges - reference Y10.5070B

- Pipework painting - reference Y10.5090
- Installation of stainless-steel pipework

    - Compression joints - reference Y10.5100
    - Mechanical joints - Y10.5060

210A.100 WORKMANSHIP, COPPER PIPEWORK:

- Compression joints - reference Y10.6030
- Capillary joints - reference Y10.6040
- Anchors

    - Flanges - reference Y10.6060A
    - Saddle clamps - reference Y10.6060B

210A.120 WORKMANSHIP, PLASTIC PIPES:

- Installation of thermoplastic piping for soil and waste discharge inside buildings and buried in ground within the building - reference Y10.8005
- Solvent welded joints, PVC - reference Y10.8010

210A.140 WORKMANSHIP UNDERGROUND/BURIED PIPEWORK:

- Protection of underground pipework - reference Y10.9030
- Protection of buried pipes – Reference Y10.9040#
- Protection of pipes in screed

    - Wrap with two protective tapes before laying.
    - Sheath with PVC.

- Thermally insulated underground pipelines - Reference Y10.9060#

210A.150 WORKMANSHIP MISCELLANEOUS:

- Flexible couplings and flange adapters, sleeve type - reference Y10.9010
- Corrosion protective tape - reference Y10.9100
- Mechanical protective tape - reference Y10.9110
- Steelwork painting - Reference Y10.9120#

Z210B - PIPELINES AND PIPEWORK - PLUMBING

210B.005 SUMMARY

- This section includes specs for piping applicable for:
    - Domestic water pipework
    - Sanitary drainage, vent and storm drainage piping
    - Instrument Air (Compressed Air)

210B.020 CARBON STEEL PIPES AND FITTINGS:

- Application: Refer to clause 210B.075 “PIPEWORK APPLICATION”
- Pipes and Tubes
    - Seamless carbon steel tubes
        - To BS EN 10255
            - Galvanised, heavy – Reference Y10.2010D
            - Galvanised, medium – Reference Y10.2010C
            - Galvanised, heavy, grooved ends – Reference Y10.2010G
            - Galvanised, medium, grooved ends – Reference Y10.2010H
        - To BS EN 10216-1
            - Reference Y10.2030
            - Wall thickness - to be suitable for the application duty / testing requirements.
- Fittings
    - Butt welding carbon steel fittings.
        - Size range - 25mm to 400mm.
        - To BS EN 10253-1 for general use in non-pressure piping applications without specific inspection requirements - reference Y10.2060A
        - To BS EN 10253-2 with specific inspection requirements for use on pressure piping applications covered by the Pressure Equipment Regulations - reference Y10.2060B
    - Malleable cast iron fittings, screwed
        - Size range - 10mm to 164mm.
        - Reference Y10.2070#
        - Finish
            - Black
            - Galvanised
    - Wrought Steel threaded pipe fittings
        - Type

- Seamless fittings manufactured from seamless tube, forging or rolled bar.
- Fabricated fittings manufactured from welded tube or where welding forms part of the fabrication of the fitting.

- Reference Y10.2090
- Size range - 6mm to 150mm.

- Fittings, grooved for mechanical joints

- Size range - 20mm to 600mm.
- Galvanised cast iron - reference Y10.2080E
- Painted steel - reference Y10.2080F

- Joints

- Up to and including 50mm

- Screwed for threaded end
- Mechanical joint for grooved end

- Jointing materials

- Circular flanges

- Flanges to BS EN 1092-1 and BS ISO 7005-1
- Type

- Welding flanges - reference Y10.3010A

- Jointing rings for circular flanges

- Non-metallic flat for flanges to BS EN 1092-1 - reference Y10.3020A
- Metallic for flanges to BS EN 1092-1 - reference Y10.3020B

- Screwed joints to relevant parts of BS EN 10226

- Reference Y10.3030A
- Where chemical cleaning is required - reference Y10.3030C

- Union connections

- Low pressure applications - Railroad pattern - spherical seating bronze to iron.
- High pressure applications - Navy pattern - spherical seating bronze to bronze.

- Welding rods - Reference Y10.3050A

210B.040 CAST/DUCTILE IRON PIPES AND FITTINGS:

- Application: Refer to clause 210B.075 “PIPEWORK APPLICATION”
- Pipes

- Ductile iron pipes for water applications to BS ISO 2531

- Flanged joints - reference Y10.2425A
- Spigot and socket joints - reference Y10.2425B
- Push-in self anchor joints

- Jointing materials
  - Flanges to BS EN 1092-2
  - Couplings
    - Material
      - Black ductile iron
    - Gasket - EPDM
  - Spigot/socket caulked joints for ductile iron pipes - Reference Y10.3110A

210B.050 PLASTICS PIPES AND FITTINGS:

- Application: Refer to clause 210B.075 "PIPEWORK APPLICATION"
- Pressure pipes for drainage to BS EN 15014 – Reference Y10.2442
  - UPVC to BS EN 1452
    - Size Range: 12 - 1000 mm
    - Pipes - Reference Y10.2455A
    - Fittings - Reference Y10.2475A
- Pressure pipes for cold and hot water and heating systems inside buildings to BS ISO 10508
  - PP to BS EN ISO 15874
    - Size Range: 12-250 mm
    - Reference Y10.2595
- Plastic rainwater piping systems comprising pipes, fittings and brackets for above ground external use to BS EN 12200-1
  - Pipe material
    - Solid wall PVC-U.
    - Multi-layer with acrylic outer layer and fittings
  - Pipe type / details
    - Circular
- Jointing equipment for polybutylene pipes
  - Compression fittings - provide the equipment recommended by the manufacturer to carry out compression jointing on polybutylene pipes and fittings.

- Socket fusion - provide the equipment recommended by the manufacturer to carry out socket fusion jointing on polybutylene pipes and fittings.
- Electrofusion - provide the equipment recommended by the manufacturer to carry out electrofusion jointing on polybutylene pipes and fittings.

210B.070 PIPEWORK ACCESSORIES:

- Masking plates (Escutcheons)
  - Application: Wall masking plates
    - Chromium plated - reference Y10.3190A.
    - Plastic - reference Y10.3190B
    - Pipe rings and clips
  - Application: Floor and ceiling masking plates
    - Chromium plated - reference Y10.3190A.
    - Plastic - reference Y10.3190B
    - Pipe rings and clips

210B.075 PIPEWORK APPLICATION: DOMESTIC WATER PIPING

- Above Ground water distribution pipe works:
  - PP to BS EN ISO 15874
    - Type
      - PP-R (type 3)
    - Piping running in plenums and concealed spaces shall be plenum-rated piping where pipes are to be wrapped with fire resistant plenumwrap blanket, and/or insulated with fiberglass or mineral-wool pipe insulation, and field installed.
    - System is to have a flame-spread index of less than 25 and smoke-developed index of less than 50 to ASTM E84 or UL 2846; or Class B-S2 d0 rating in accordance with EN 13823.
    - For insulation required for thermal and condensation reasons, see Section Z250b.
    -

210B.076 PIPEWORK APPLICATION: SANITARY WASTE, VENT AND STORM DRAINAGE PIPING

- Aboveground, Soil, Waste, and Vent pipe works:
  - UPVC (Solid-Wall) to BS EN 1329
  - PE to BS EN 1519 for Kitchens and laundry
- Underground, Soil, Waste, and Vent pipe works:
  - Gasket – EPDM
  - PE to BS EN 1519.

- Aboveground, Rainwater drainage pipe works:
    - Plastic piping to BS EN 12200
        - Pipe material
            - Solid wall PVC-U.
        - Pipe type / details
            - Circular
- Aboveground, External, Rainwater drainage pipe works:
    - UPVC (Solid-Wall) to BS EN 1329
- Aboveground, Sewage Force Mains pipe works:
    - Ductile Iron
        - Ductile Iron to BS ISO 2531
        - Joints - Push-in self anchor joints
- Underground, Sewage Force Mains pipe works:
        - Gasket – EPDM
    - PE to BS EN 1519.

210B.077 PIPEWORK APPLICATION: INSTRUMENT AIR (COMPRESSED-AIR) PIPING

- Compressed-Air piping:
    - Galvanised Steel
        - Pipes and tubes:
            - Seamless medium galvanised steel tubes to BS EN 10216-1
            - Seamless medium galvanised steel tubes, grooved ends to BS EN 10216-1
            - Material grade P235TR2
        - Fittings
            - Up to and including 50 mm
                - Malleable cast iron fittings, screwed
                    - Finish Galvanised
                - Wrought Steel threaded pipe fittings
                    - Type - Fabricated fittings manufactured from welded tube or where welding forms part of the fabrication of the fitting.

- 65 mm up and above
    - Butt welding carbon steel fittings.
    - Fittings, grooved for mechanical joints
- Joints
    - Up to and including 50 mm - Screwed
    - 65 mm and above
        - Mechanical joint for grooved end

- Drain Piping:
    - UPVC (Solid-Wall) to BS EN 1329

210B.080 GENERAL WORKMANSHIP:

- Appearance - reference Y10.4010
- Spacing - reference Y10.4020
- Gradients - reference Y10.4030
- Air venting requirements
    - Air bottles - reference Y10.4040A
    - Automatic air vents - reference Y10.4040B
- Drain requirements - reference Y10.4050
- Expansion and contraction - reference Y10.4060
- Pipe fittings
    - Bends/swept tees
    - Elbows/square tees
    - Reference Y10.4070#
- Pipes through walls and floors - reference Y10.4110
- Protect pipework penetrating fire separating elements in accordance with, Building Regulations, BS 9999 and BESA Technical Bulletin TB/032.
- Pipe sleeves
    - Where Insulation not carried through pipe sleeve - Reference Y10.4120A
    - Where Insulation carried through pipe sleeve - reference Y10.4120B
- Connect to equipment.
- Use distribution headers.
- Temporary plugs, caps and flanges - Reference Y10.4150A.
- Flanged joints general - reference Y10.4160
- Dissimilar metals - reference Y10.4170
- Pipe rings and clips - reference Y10.4180
- Anchors - reference Y10.4190
- Slide guides - reference Y10.4200
- Pipe supports - reference Y10.4205
    - Comply with the manufacturers' installation recommendations for the following proprietary pipe systems:

        - Press-fit and push-fit pipework systems using thin wall carbon steel, stainless steel or copper.
        - Systems using grooved mechanical joints.
        - Plastic pipe systems.

- Support spacing

    - Tables for steel, copper, iron, PVC and ABS pipes - reference Y10.4220
    - Comply with tables in appropriate parts of BESA TR/20.
    - For the following proprietary pipe systems comply with the manufacturers' installation recommendations:

        - Press-fit and push-fit pipework systems using thin wall carbon steel, stainless steel or copper.
        - Systems using grooved mechanical joints.
        - Plastic pipe systems.

- Isolation and regulation - Reference Y10.4230A
- Maintenance and renewal - reference Y10.4240
- Clean by removing cement and clean off all pipework and brackets.

    - PP-R Piping System: Materials and chemical concentrations used shall comply with the pipe and accessory manufacturers' recommendations and shall be in accordance with applicable third-party standards and regulatory authority requirements. PP-RCT pipes system disinfection accordance with pipe manufacturer limits

- Non-ferrous components - thoroughly clean and degrease.
- Pipe collars (closers) for plastic pipes

    - Type

        - Stainless steel collar with fixing brackets with intumescent liner.

    - Fire resistance

        - [2 hrs]

    - Installation to be in accordance with the manufacturer's instructions and grouted/sealed using the manufacturer's proprietary compound/sealant.
    - Standards - Test to BS EN 1366-3 and BS EN 1363-1.

210B.090 WORKMANSHIP, STEEL PIPEWORK:

- Welding, general

    - Class 1 - reference Y10.5010A (Weld pipeline joints to BS 2633)
    - Class 2 - reference Y10.5010B (Weld pipeline joints to BS 2971)

- Welded joints - reference Y10.5020
- Painting welded joints - reference Y10.5030
- Flanged joints - reference Y10.5040
- Screwed joints - reference Y10.5050
- Mechanical joints - reference Y10.5060
- Anchors

    - U-bolts - reference Y10.5070A
    - Flanges - reference Y10.5070B

- Pipework painting - reference Y10.5090
- Installation of stainless-steel pipework

    - Compression joints - reference Y10.5100
    - Mechanical joints - Y10.5060

210B.110 WORKMANSHIP, CAST/DUCTILE IRON:

- Flanged joints - reference Y10.7010
- Caulked joints - reference Y10.7020
- Flexible joints - reference Y10.7030

210B.120 WORKMANSHIP, PLASTIC PIPES:

- Installation of thermoplastic piping for soil and waste discharge inside buildings and buried in ground within the building - reference Y10.8005
- Installation of thermoplastic polybutylene and cross-linked polyethylene piping for heating systems - reference Y10.8006
- Solvent welded joints, PVC - reference Y10.8010
- Fusion joints, PE - Reference Y10.8020
- Mechanical fittings, PE - reference Y10.8030
- Anchors, PVC - reference Y10.8040
- Jointing polybutylene pipes and fittings - reference Y10.8050
- Plastic pipes and fittings with secondary containment and fittings for underground fuel oil systems - reference Y10.8070.

210B.140 WORKMANSHIP UNDERGROUND/BURIED PIPEWORK:

- Protection of underground pipework - reference Y10.9030
- Protection of buried pipes – Reference Y10.9040#
- Protection of pipes in screed

    - Wrap with two protective tapes before laying.
    - Sheath with PVC.

- Thermally insulated underground pipelines - Reference Y10.9060#

210B.150 WORKMANSHIP MISCELLANEOUS:

- Flexible couplings and flange adapters, sleeve type - reference Y10.9010
- Corrosion protective tape - reference Y10.9100
- Mechanical protective tape - reference Y10.9110
- Steelwork painting - Reference Y10.9120#

Z211A - PIPELINE ANCILLARIES - HVAC

211A.010 GENERAL:

- Comply with work section general clauses below
    - Safety and relief valves, self-operated, application - reference Y11.1010
- For applicable valves comply with BS EN 16668 for all essential safety requirements of the Pressure Equipment (Safety) Regulations. Valves excluded from conformance to this standard in the Regulations shall meet "sound engineering practice" by conformity to the relevant product standard.
- Face to face and centre to face dimension of PN and Class designated flanged metal valves to be in accordance with BS EN 558
- Testing of valves
    - Pressure test metallic valves at manufacturer's works, in accordance with BS EN 12266-1 or BS ISO 5208 in conjunction with given specific requirements of the valve product or performance standard.
    - Undertake supplementary tests below in accordance with BS EN 12266-2 in conjunction with given specific requirements of the valve product or performance standard
        - Obturator strength
        - Back seat tightness
        - Operability
        - Anti-static design at 12V
        - Anti-static design at 100V
        - Fire tested design
        - Flow resistance
    - Pressure test thermoplastic valves at manufacturer's works, in accordance with BS ISO 9393-1 in conjunction with given specific requirements of the valve product or performance standard.
- Supply valves as specified in work section
- Supply valves as schedule reference
- Supply local controls as schedule reference

211A.030 STOP VALVES:

- Type : provide selection.
- Service fluid
    - Water
- Operating temperature : as designed.
-
- PN to suit system maximum working pressure.
- Comply with WRAS requirements for water services applications.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.

- Copper alloy gate valves for general use to BS EN 12288
    - Screwed to BS EN ISO 228-1, or ISO 7-1 - reference Y11.2020A
    - Compression to BS EN 1254-2 - reference Y11.2020B
    - Flanged to BS EN 1092-3 - reference Y11.2020C
    - Loose nut/union end - reference Y11.2020D
- Cast iron gate valves for general use to BS EN 1171
    - Grey cast iron flanged to BS EN 1092-2 - reference Y11.2030A
- Copper alloy globe valves for general use to BS 5154 and BS EN 12288
    - Screwed to relevant parts of BS EN 10226 - reference Y11.2040A
    - Flanged to BS EN 1092-3 - reference Y11.2040B
    - Compression to BS EN 1254-2 - reference Y11.2040C
    - Compression to BS EN 1254-3 - reference Y11.2040D
- Cast iron globe valves for general use to BS EN 13789
    - Grey cast iron flanged to BS EN 1092-2 - reference Y11.2050A
- Steel parallel slide for steam and other high temperature / pressure applications to BS EN 1984
    - Reference Y11.2060A
- Steel wedge type gate valve for general use to BS EN 1984
    - Flanged to BS EN 1092-1 - reference Y11.2070A
    - Threaded - reference Y11.2070D
    - Auxiliary connections
- Ball valves
    - Application, standard and material
        - General purpose heating, cooling and other applications - copper alloy to BS EN 13547.
        - Gas - to BS EN 331.
    - Screw driver/key operated
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080A
        - Compression to BS EN 1254-2 - reference Y11.2080B
    - Lever operated
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080C
        - Compression to BS EN 1254-2 - reference Y11.2080D
    - Lockshield
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080E
        - Compression to BS EN 1254-2 - reference Y11.2080F
- Butterfly valves for general use to BS EN 593
    - Semi-lugged between flanges to BS EN 1092-2
        - Lever operated - reference Y11.2090A
        - Gear operated - reference Y11.2090B

- Between mechanical joints
    - Lever operated - reference Y11.2090C
    - Gear operated - reference Y11.2090D
- Fully-lugged to BS EN 593 - reference Y11.2090E
    - Lever operated.
    - Gear operated.
- Key operated type A - reference Y11.2110A
- Closed bottom taper plug valves for gas installations for buildings to BS EN 331.

211A.040 REGULATING VALVES:

- Type: provide selection
- Service fluid
    - Wate
- Operating temperature: as designed.
- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.

211A.050 DOUBLE REGULATING VALVES:

- Type: provide selection
- Service fluid
    - [Water]
- Operating temperature: as designed
- PN to suit system maximum working pressure.
-
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
- Butterfly type to BS EN 593
    - Between flanges to BS EN 1092-2
        - Lever operated - reference Y11.2210A
        - Gear operated - reference Y11.2210B
    - Between mechanical joints

        - Lever operated - reference Y11.2210C
        - Gear operated - reference Y11.2210D
    - Globe valves to BS 7350, section 3.1.
        - Copper alloy
            - Screwed to relevant parts of BS EN 10226 - reference Y11.2220A
            - Flanged to BS EN 1092-2 - reference Y11.2220B
        - Cast iron
            - Flanged to BS EN 1092-2 - reference Y11.2220C

211A.060 FLOW MEASUREMENT VALVES:

- Type :provide selection
- Service fluid
    - Water
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Provide expansion devices / bellows as schedule reference Expansion Bellows and Flexible Hose Compensators
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
    - Flow measurement devices to BS 7350
        - Section 3.2 Type 3
            - Copper alloy
                - Screwed to relevant parts of BS EN 10226 - reference Y11.2230A
                - Flanged to BS EN 1092-3 - reference Y11.2230B
            - Cast iron
                - Flanged to BS EN 1092-2 - reference Y11.2230]
        - Section 3.2 Type 4
            - Copper alloy
                - Screwed to relevant parts of BS EN 10226 - reference Y11.2230E
                - Flanged to BS EN 1092-3 - reference Y11.2230F
            - Cast iron - reference Y11.2230G
    - Variable orifice valve

- Fixed orifice valve

211A.065 PRESSURE INDEPENDENT CONTROL VALVES (PICV'S):

- Select, install and commission valves to provide the functions of flow limitation or modulating and differential pressure control within a single valve body.
- Commission valves in accordance with the manufacturer's recommendations and Commissioning Specialists Association TM18.
- The valve manufacturer shall provide test results for each type and size of PICV to be used on the project in accordance with BSRIA Test Method for Pressure Independent Control Valves BTS 1/2012.
- Incorporate a flushing drain in the pipework between the terminal unit and the PICV.
- Type
    - Full stroke constant k_V where the control and flow setting functions are separated within the valve and the full stroke of the valve is available for control.
    - Full stroke variable k_V where the control valve section has a constant unchangeable stroke distance but its k_V can be varied by means of an inlet port with an adjustable opening size.
    - Stroke limited variable k_V where the control valve and flow setting devices are combined in a single component.
    - Globe.
    - Rotary, characterised ball.
- Valve characteristic/control function
    - Linear (modulating).
    - Equal percentage (modulating).
- Application
    - Cooling terminal units
    - Heating and cooling terminal units
- Duties
    - To suit terminal unit design flow rates as detailed in equipment schedules
    - Duties and details as schedule reference Motorised Control Valves
- Standard
    - Relevant parts of BS EN 60534
    - Valve leakage class to BS EN 60534-4 when shut off.
- Maximum pressure differential (kPa) as per design
- Minimum operating pressure differential for PICV operation (kPa) as per design
- Materials
    - Body - DZR brass.
    - Globe or ball - brass.
    - Stem - brass.
    - O-Ring/diagram - EPDM rubber.
    - Springs - stainless steel.
- Features
- Facility to measure pressure drop across valves at commissioning.
- Actuator
    - 0-10V proportional electric for modulating control.

- 3 point floating control.
- Prefabricated packaged valve assembly requirements
    - Type of heating/cooling terminal:
        - Air handling units
    - Fan coil units Components required:
        - PICV.
        - Ball type isolation valves on flow and return.
        - Flushing blow down drain valve.
        - Flow measurement venturi for commissioning verification.
    - Component to be pre-assembled and tested at the manufacturer's works, test pressure (kPa)
    -
- Labeling requirements

211A.070 FLOW REGULATORS AND COMBINATION VALVES:

- Type : provide selection
- Service fluid
    - Water
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.

211A.075 HEAT METERS:

- Type: provide selection
- Standards
    - Meters - BS EN 1434-1, BS EN 1434-2, BS EN 1434-3, BS EN 1434-4, BS EN 1434-5
    - Heat meter installation commissioning, operational monitoring and maintenance - BS EN 1434-6
    - Provide heat meters with integrator, flow sensor, matched pair of temperature sensors and interconnecting cables calibrated as a single unit at manufacturer's works. Installations to be in accordance with manufacturer's recommendations.
    - RHI compliant heat meters and their installation shall meet the requirements of the following:
        - The Renewable Heat Incentive Regulations 2011 as amended.
        - The most recent version of Volume 1 of Ofgem Renewable Heat Incentive Guidance: Eligibility and How to Apply.
        - Annex MI-004 of the EU Measuring Instruments Directive (MID) 2004/22/EC refer to Directive 2014/32/EU from 20th April 2016.

- Commissioning to be carried out by the manufacturer.
- Metering installation arrangement for RHI eligibility
    - Standard metering
- Meter accuracy class for RHI eligibility as defined in Annex MI-004 of the MID/BS EN 1434-1
    - Class 2.
- For RHI installation with a capacity of 45Wth and below the installation shall be undertaken by a Microgeneration Certification Scheme (MCS) certified installer.
- For RHI installation of a capacity of 1MWth and above or when the installation is classed as a multiple metering arrangement, provide an independent report on metering as defined by Ofgem.
- Arrangement
    - In-line.
- Service fluid
    - Water.
- Duty as schedule reference Heat Meters
    - Accuracy class
    - Temperature sampling rate
    - Temperature sensors
        - Installed in pockets.
    - Power
        - External 12V supply.
    - Data option
        - Number of channels
        - Outputs per channel
        - Type
        - Display
    - BMS interface requirements
- Information to be provided for RHI accreditation
    - Manufacturer and models.
    - Design duties.
    - Serial numbers.
    - Evidence of the meter's 'M' and 'CE' marking and approval numbers.
    - Manufacturer's declaration of conformity.

- Confirmation that the maximum and minimum design flow rates/temperatures are within the max/min calibration range of the meter.
- Heat loss assessment questionnaire for external piping in accordance with Ofgem automatic heat loss calculator.

211A.076 ENERGY METERS (FOR PIPELINES):

- Type: provide selection
- Provide energy meters as schedule reference Energy Meters
- Provide heat meters with integrator, sensors and interconnecting cables calibrated as a single unit at the manufacturer's works. Installation to be in accordance with manufacturer's recommendations.
- Commissioning to be carried out by the manufacturer..
- Standard
  - BS EN 1434-6.
- Arrangement
  - In-line.
- Heat transfer fluid
  - Water.
- Temperature sensors
  - Installed in pockets.
- Power
  - External 12V supply.
- Data options
  - Number of channels
  - Outputs per channel
  - Type
  - Display
- BMS interface requirements

211A.080 TEST PLUGS:

- Self sealing test points - reference Y11.2670A
- Valve controlled test points - reference Y11.2670B

211A.100 PIPELINE STRAINERS:

- Bronze (Y type)
  - Screwed to relevant parts of BS EN 10226 - reference Y11.2680A
  - Flanged to BS EN 1092-3 - reference Y11.2680B
  - Compression to BS EN 1254-2
  - Reference Y11.2680C
- Cast iron/ductile iron
  - Y type - flanged to BS EN 1092-2 - reference Y11.2680D

- Flanged suction diffuser type reference Y11.2680G
- Cast iron body with ductile iron cover and cast iron guide vanes (PN16)

    - Ductile iron body and cover, and ductile guide vanes (PN25)

- Ductile iron grooved ends

    - Y type - reference Y11.2680E
    - Suction diffuser strainer - reference Y11.2680F

211A.140 GAUGES:

- General - reference Y11.2700A

    - 150mm black stoved enamel finish

        - Flush panel mounting - reference Y11.2700B
        - Direct mounting - reference Y11.2700C

    - 100mm - finish

- Temperature gauges general - reference Y11.2710A

    - Mercury in steel - reference Y11.2710B
    - Vapour pressure to BS EN 13190

        - Direct mounting - reference Y11.2710C

- Pressure and altitude gauges - reference Y11.2720
- Vacuum gauges - reference Y11.2730
- Differential pressure gauges
- Gauge mounting boards

    - Hardwood - reference Y11.2750A

211A.150 CONTROL VALVES:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Ball control valves

    - Open/close - reference Y11.2315A
    - Two way - reference Y11.2315B
    - Three way - reference Y11.2315C

211A.160 LOOSE ITEMS:

- Keys for spindle shank valves - reference Y11.3010A
- For drain cocks - reference Y11.3010B

211A.170 CHECK VALVES:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.

- Service fluid
    - Water.
    -
- Operating temperature (°C)
- PN rating to suite testing pressure.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
- Copper alloy check type to BS 5154
    - Swing type screwed to relevant parts of BS EN 10226 - reference Y11.2320A
    - Swing type flanged to BS EN 1092-3 - reference Y11.2320B
- Steel and cast iron check valves to BS EN 16767
    - Swing check
        - Flanged - reference Y11.2330A
        - Grooved for mechanical joints.
        - Wafer body - reference Y11.2330B
    - Lift check
        - Flanged - reference Y11.2330C
        - Wafer body - reference Y11.2330D
    - Body material
        - Grey cast iron
        - Malleable cast iron
        - SG cast iron
        - Steel]
- Wafer flange fitting type
    - Reference Y11.2340A
- Steel globe stop and check type to BS EN 13709 - reference Y11.2370#
- Device to prevent contamination of water by backflow to BS EN 14451
    - Combined check and anti-vacuum - reference Y11.2385A
- Anti-back syphonage valve, combined check and anti-vacuum type
    - Reference Y11.2390A
- Anti-back syphonage valve, hose union anti-vacuum type
    - Reference Y11.2391A

211A.175 VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ VALVE):

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.

- General requirements - reference Y11.2395A.
- Service fluid
    - Water.
- Operating temperature (°C)
- PN rating to suite testing pressure
- Assembly complete with
    - Isolating valves
    - Strainers
    - Pressure reducing valves
    - Non-return valves
    - Test points
- Tamper free housing or secure cabinet
- Mounting
    - Vertical.
    - Horizontal.
- Installation - reference Y11.2395B.
- On-site inspection and testing - reference Y11.2395C.
- Record of installation and test data - reference Y11.2395D.

211A.180 WORKMANSHIP:

- Installation - reference Y11.4010
- Location - reference Y11.4020
- Location of thermostatic radiator valves - reference Y11.4025
- Positioning of components
    - Flow/pressure measurement valves - reference Y11.4030
    - Double regulating variable orifice valves - reference Y11.4040
    - Install control ball valves in accordance with manufacturer's recommendations.
    - Control components
        - Reference Y11.4050A
- Provide outlets of vent cocks with discharge pipes.
- Valve stuffing boxes - reference Y11.4070
- Discharge connections
    - Safety and Relief valves - reference Y11.4080A
    - Vent cocks - reference Y11.4080B
    - Air bottles - reference Y11.4080C
    - Automatic air vents - reference Y11.4080D
- Expansion devices - reference Y11.4090
- Expansion compensators - reference Y11.4100
- Flexible connections installation - reference Y11.4110
- Terminal unit connections - install hose connections strictly in accordance with manufacturer's instructions.

211A.190 PRESSURE REDUCING AND CONTROL VALVES:

- CE certified and Kitemark compliant.
- Pressure reducing valve
- Pressure control valve - direct acting
- Pressure control valve - with flow regulation

211A.200 DIRECT ACTING SAFETY VALVES:

- Standard
  - BS EN ISO 4126-1 (Safety Valves)
  - BS EN ISO 4126-7 (Common data)
- PN rating to suite testing pressure
- Copper alloy
  - Single spring - reference Y11.2430A
  - Double spring - reference Y11.2430B
- Cast iron

211A.210 DRAIN COCKS:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Throughway gland cock type
  - Reference Y11.2440A
- Screwdown to BS 2879, type 1 - reference Y11.2450
- Ball type - reference Y11.2460

211A.220 VENT COCKS:

- CE certified and Kitemark compliant.
- PN rating to suite testing pressure
- Two way gland cock type - reference Y11.2470
- Ball type - reference Y11.2480
- Three way gland cock type - reference Y11.2490
- Plug valve type
  - Wrench operated - reference Y11.2500A
  - Gear operated - reference Y11.2500B

211A.230 AUTOMATIC AIR VENTS:

- Float type
  - Reference Y11.2510A

211A.240 DEAERATORS AND SEPARATORS:

- Deaerators
  - Microbubble temperature differential
    - Reference Y11.2515A
  - Pressure differential
    - LTHW - reference Y11.2520A
    - Chilled water - reference Y11.2520B
- Separators
  - Centrifugal air separators
    - Reference Y11.2521A]
  - Gravitation dirt separators
    - Reference Y11.2522A
  - Microbubble air and dirt separators
    - Reference Y11.2524A

211A.260 EXPANSION ARRANGEMENTS/DEVICES AND FLEXIBLE CONNECTIONS:

- PN rating to suite testing pressure
- Provide expansion devices / bellows as schedule reference Expansion Bellows and Flexible Hose Compensators
- Expansion loops
  - Steel
    - Reference Y11.2610A
    - Galvanized after manufacture.
  - Copper - reference Y11.2620
- Expansion compensators
  - Axial bellows
    - Screwed to relevant parts of BS EN 10226 - reference Y11.2630A
    - Flanged to BS EN 1092-1 - reference Y11.2630B
  - Articulated bellows
    - Screwed to relevant parts of BS EN 10226 - reference Y11.2630D
    - Flanged to BS EN 1092-1 - reference Y11.2630E

- Slip-type axial, grooved and expansion compensators
    - Reference Y11.2630J
- Multiple grooved couplings type compensators
    - Reference Y11.2630K

- Flexible connections for noise and vibration attenuation
    - EPDM rubber, up to 100°C
        - Flanged to BS EN 1092-1 - reference Y11.2650A
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2650B
    - Grooved flexible mechanical joints for noise and vibration attenuation
        - Install 3 grooved flexible mechanical joints after the source of vibration and before the first change in pipe direction. Installation to be strictly in accordance with the manufacturer's instructions.
    - Convoluted stainless steel, above 100°C
        - Flanged to BS EN 1092-1 - reference Y11.2650C
    - EPDM rubber, up to 70°C
        - Flanged to BS EN 1092-1 - reference Y11.2650D
        - Screwed to relevant parts BS EN 10226 - reference Y11.2650E
    - Chlorobutyl rubber, up to 100°C
        - Flanged to BS EN 1092-1 - reference Y11.2650F
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2650G
    - Chlorobutyl rubber, up to 60°C
        - Flanged to BS EN 1092-1 - reference Y11.2650H
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2650I
- Terminal unit connections
    - Heating services
        - Stainless steel - reference Y11.2660A
        - Stainless steel with quick release couplings - reference Y11.2660B
        - Rubber - reference Y11.2660C
    - Chilled water services
        - Stainless steel - reference Y11.2660D
        - Stainless steel with quick release couplings - reference Y11.2660E
        - Rubber - reference Y11.2660F

- Flexible hose assemblies for drinking water installations to connect sanitary tap ware, heaters and similar appliances with maximum operating temperature 70°C to be in accordance with BS EN 13618. Flexible hose assemblies intended for use as integral parts of appliances, to be in accordance with BS EN 61770
- Hose and hose assemblies for saturated steam and hot water condensate.

    - Standard - BS EN ISO 6134
    - Type 1 - low pressure, maximum working pressure 6 bar
    - Type 2 - high pressure, maximum working pressure 18 bar
    - Incorporate an oil-resistant cover

Z211B - PIPELINE ANCILLARIES - PLUMBING

211B.010 GENERAL:

- Comply with work section general clauses below
    - Safety and relief valves, self-operated, application - reference Y11.1010
- For applicable valves comply with BS EN 16668 for all essential safety requirements of the Pressure Equipment (Safety) Regulations. Valves excluded from conformance to this standard in the Regulations shall meet "sound engineering practice" by conformity to the relevant product standard.
- Face to face and centre to face dimension of PN and Class designated flanged metal valves to be in accordance with BS EN 558
- Testing of valves
    - Pressure test metallic valves at manufacturer's works, in accordance with BS EN 12266-1 or BS ISO 5208 in conjunction with given specific requirements of the valve product or performance standard.
    - Undertake supplementary tests below in accordance with BS EN 12266-2 in conjunction with given specific requirements of the valve product or performance standard
        - Obturator strength
        - Back seat tightness
        - Operability
        - Anti-static design at 12V
        - Anti-static design at 100V
        - Fire tested design
        - Flow resistance
    - Pressure test thermoplastic valves at manufacturer's works, in accordance with BS ISO 9393-1 in conjunction with given specific requirements of the valve product or performance standard.
- Supply valves as specified in work section

211B.030 STOP VALVES:

- Service fluid
    - Water
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Comply with WRAS requirements for water services applications.
- Comply with BS EN 1074-1 and BS EN 1074-2 in addition to the particular valve type standard, for valves for water supply applications carrying water for human consumption.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.

    - To suit plastic tube.
    - To suit steel tube.

- Copper alloy globe type stop valves (stop cocks) to BS EN 1213 for potable water supplies

    - Compression ends for copper - reference Y11.2015A
    - Compression ends for plastics - reference Y11.2015B
    - Capillary - reference Y11.2015C
    - Threaded - reference Y11.2015D

- Copper alloy gate valves for general use to BS EN 12288

    - Screwed to BS EN ISO 228-1, or ISO 7-1 - reference Y11.2020A
    - Compression to BS EN 1254-2 - reference Y11.2020B
    - Flanged to BS EN 1092-3 - reference Y11.2020C
    - Loose nut/union end - reference Y11.2020D

- Cast iron gate valves for general use to BS EN 1171

    - Grey cast iron flanged to BS EN 1092-2 - reference Y11.2030A

- Copper alloy globe valves for general use to BS 5154 and BS EN 12288

    - Screwed to relevant parts of BS EN 10226 - reference Y11.2040A
    - Flanged to BS EN 1092-3 - reference Y11.2040B
    - Compression to BS EN 1254-2 - reference Y11.2040C
    - Compression to BS EN 1254-3 - reference Y11.2040D

- Cast iron globe valves for general use to BS EN 13789

    - Grey cast iron flanged to BS EN 1092-2 - reference Y11.2050A

- Steel wedge type gate valve for general use to BS EN 1984

    - Flanged to BS EN 1092-1 - reference Y11.2070A
    - Threaded - reference Y11.2070D
    - Auxiliary connections

- Ball valves

    - Application, standard and material

        - Potable water - copper alloy to BS EN 13828, PN 10 and distribution temperature of 65 °C with occasional excursions up to 90 °C permitted for a period of 1 hour maximum.

    - Screw driver/key operated

        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080A
        - Compression to BS EN 1254-2 - reference Y11.2080B

    - Lever operated

        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080C
        - Compression to BS EN 1254-2 - reference Y11.2080D

    - Lockshield

        - Screwed to relevant parts of BS EN 10226 - reference Y11.2080E
        - Compression to BS EN 1254-2 - reference Y11.2080F

- Servicing valves, for water services for maintenance of fittings / appliances, copper alloy to BS 6675

    - Handwheel operated

        - Screwed ends - reference Y11.2085A
        - Compression ends - reference Y11.2085B
        - Capillary ends - reference Y11.2085C

    - Lever operated

        - Screwed ends - reference Y11.2085D
        - Compression ends - reference Y11.2085E
        - Capillary ends - reference Y11.2085F

    - Screw driver operated

        - Screwed ends - reference Y11.2085G
        - Compression ends - reference Y11.2085H

    - Capillary ends - reference Y11.2085I

- Butterfly valves for general use to BS EN 593

    - Semi-lugged between flanges to BS EN 1092-2

        - Lever operated - reference Y11.2090A
        - Gear operated - reference Y11.2090B

    - Between mechanical joints

        - Lever operated - reference Y11.2090C
        - Gear operated - reference Y11.2090D

    - Fully-lugged to BS EN 593 - reference Y11.2090E

        - Lever operated.
        - Gear operated.

- Cast iron gate type for waterworks purposes to relevant parts of BS 5163
- Key operated type A - reference Y11.2110A

211B.040 REGULATING VALVES:

- Service fluid
    - Water
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.

211B.050 DOUBLE REGULATING VALVES:

- Service fluid
    - Water
- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
- Butterfly type to BS EN 593
    - Between flanges to BS EN 1092-2
        - Lever operated - reference Y11.2210A
        - Gear operated - reference Y11.2210B
    - Between mechanical joints
        - Lever operated - reference Y11.2210C
        - Gear operated - reference Y11.2210D
- Globe valves to BS 7350, section 3.1.
    - Copper alloy
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2220A
        - Flanged to BS EN 1092-2 - reference Y11.2220B

- Cast iron
    - Flanged to BS EN 1092-2 - reference Y11.2220C

211B.060 FLOW MEASUREMENT VALVES:

- Service fluid
    - Water
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Provide expansion devices / bellows as schedule reference Expansion Bellows and Flexible Hose Compensators
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
- Flow measurement devices to BS 7350
    - Section 3.2 Type 3
        - Copper alloy
            - Screwed to relevant parts of BS EN 10226 - reference Y11.2230A
            - Flanged to BS EN 1092-3 - reference Y11.2230B
        - Cast iron
            - Flanged to BS EN 1092-2 - reference Y11.2230C
    - Section 3.2 Type 4
        - Copper alloy
            - Screwed to relevant parts of BS EN 10226 - reference Y11.2230E
            - Flanged to BS EN 1092-3 - reference Y11.2230F
        - Cast iron - reference Y11.2230G
- Variable orifice valve
- Fixed orifice valve

211B.070 FLOW REGULATORS AND COMBINATION VALVES:

- Service fluid
    - Water

- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Pipe material

    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.

211B.080 TEST PLUGS:

- Self sealing test points - reference Y11.2670A
- Valve controlled test points - reference Y11.2670B

211B.100 PIPELINE STRAINERS:

- Bronze (Y type)

    - Screwed to relevant parts of BS EN 10226 - reference Y11.2680A
    - Flanged to BS EN 1092-3 - reference Y11.2680B
    - Compression to BS EN 1254-2
    - Reference Y11.2680C

- Cast iron/ductile iron

    - Y type - flanged to BS EN 1092-2 - reference Y11.2680D
    - Flanged suction diffuser type reference Y11.2680G
    - Cast iron body with ductile iron cover and cast iron guide vanes (PN16)

        - Ductile iron body and cover, and ductile guide vanes (PN25)

- Ductile iron grooved ends

    - Y type - reference Y11.2680E
    - Suction diffuser strainer - reference Y11.2680F

211B.120 TUNDISHES:

- Copper - reference Y11.2690A
- Mild steel, galvanized - reference Y11.2690B

211B.130 FLOAT OPERATED VALVES:

- Service fluid

    - Water

- Operating temperature: as designed

- PN to suit system maximum working pressure.
- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- WRc approved.
- To BS 1212
    - Piston type 1
        - Copper float - reference Y11.2280A
        - Plastic float - reference Y11.2280B
    - Float BS reference
        - Spherical
        - Grade C Float.
        - Grade H Float.
- Balanced equilibrium type
    - Screwed inlet to relevant parts of BS EN 10226 - reference Y11.2290A

211B.140 GAUGES:

- General - reference Y11.2700A
    - 150mm black stoved enamel finish
        - Flush panel mounting - reference Y11.2700B
        - Direct mounting - reference Y11.2700C
    - 100mm - finish
- Temperature gauges general - reference Y11.2710A
    - Mercury in steel - reference Y11.2710B
    - Vapour pressure to BS EN 13190
        - Direct mounting - reference Y11.2710C
- Pressure and altitude gauges - reference Y11.2720
- Vacuum gauges - reference Y11.2730
- Differential pressure gauges
- Gauge mounting boards
    - Hardwood - reference Y11.2750A

211B.150 CONTROL VALVES:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.

- Ball control valves
    - Open/close - reference Y11.2315A
    - Two way - reference Y11.2315B
    - Three way - reference Y11.2315C

211B.155 WATER-HAMMER ARRESTERS (WATER SHOCK ABSORBER)

- Type
    - Metal bellows]
    - Copper tube with piston
- Comply with WRAS requirements.
- CE certified.
- Factory precharged
- Connection
    - Threaded
- Shell
    - Stainless steel
- Body
    - Stainless steel

211B.160 LOOSE ITEMS:

- Keys for spindle shank valves - reference Y11.3010A
- For drain cocks - reference Y11.3010B

211B.170 CHECK VALVES:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Service fluid
    - Water.
- Operating temperature: as designed
- PN to suit system maximum working pressure.
- Pipe material
    - To suit copper tube.
    - To suit plastic tube.
    - To suit steel tube.
- Copper alloy check type to BS 5154

- Swing type screwed to relevant parts of BS EN 10226 - reference Y11.2320A
- Swing type flanged to BS EN 1092-3 - reference Y11.2320B

- Steel and cast iron check valves to BS EN 16767
  - Swing check
    - Flanged - reference Y11.2330A
    - Grooved for mechanical joints.
    - Wafer body - reference Y11.2330B
  - Lift check
    - Flanged - reference Y11.2330C
    - Wafer body - reference Y11.2330
  - Body material
    - Grey cast iron]
    - Malleable cast iro
    - SG cast iron
    - Steel
- Wafer flange fitting type
  - Reference Y11.2340A
- Steel globe stop and check type to BS EN 13709 - reference Y11.2370#
- Device to prevent contamination of water by backflow to BS EN 14451
  - Combined check and anti-vacuum - reference Y11.2385A
- Anti-back syphonage valve, combined check and anti-vacuum type
  - Reference Y11.2390A
- Anti-back syphonage valve, hose union anti-vacuum type
  - Reference Y11.2391A

211B.175 VERIFIABLE BACKFLOW PREVENTER WITH REDUCED PRESSURE ZONE (RPZ VALVE):

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- General requirements - reference Y11.2395A.
- Service fluid
  - Water.
- Operating temperature: as designed.
- PN to suit system maximum working pressure.
- Assembly complete with

        - Isolating valves
        - Strainer
        - Pressure reducing valves
        - Non-return valves
        - Test points

    - Tamper free housing or secure cabinet
    - Mounting

        - Vertical.
        - Horizontal.

    - Installation - reference Y11.2395B.
    - On-site inspection and testing - reference Y11.2395C.
    - Record of installation and test data - reference Y11.2395D.

211B.180 WORKMANSHIP:

    - Installation - reference Y11.4010
    - Location - reference Y11.4020
    - Location of thermostatic radiator valves - reference Y11.4025
    - Positioning of components

        - Flow/pressure measurement valves - reference Y11.4030
        - Double regulating variable orifice valves - reference Y11.4040
        - Install control ball valves in accordance with manufacturer's recommendations.
        - Control components

            - Reference Y11.4050A

    - Provide outlets of vent cocks with discharge pipes.
    - Valve stuffing boxes - reference Y11.4070
    - Discharge connections

        - Safety and Relief valves - reference Y11.4080
        - Vent cocks - reference Y11.4080B
        - Air bottles - reference Y11.4080C
        - Automatic air vents - reference Y11.4080D

    - Expansion devices - reference Y11.4090
    - Expansion compensators - reference Y11.4100
    - Flexible connections installation - reference Y11.4110
    - Terminal unit connections - install hose connections strictly in accordance with manufacturer's instructions.

211B.190 PRESSURE REDUCING AND CONTROL VALVES:

    - CE certified and Kitemark compliant.
    - Pressure reducing valve
    - Pressure control valve - direct acting
    - Pressure control valve - with flow regulation

211B.200 DIRECT ACTING SAFETY VALVES:

- Standard
    - BS EN ISO 4126-1 (Safety Valves)
    - BS EN ISO 4126-7 (Common data)
- PN to suit system maximum working pressure.
- Copper alloy
    - Single spring - reference Y11.2430A
    - Double spring - reference Y11.2430B
- Cast iron

211B.210 DRAIN COCKS:

- Comply with WRAS requirements.
- CE certified and Kitemark compliant.
- Throughway gland cock type
    - Reference Y11.2440A
- Screwdown to BS 2879, type 1 - reference Y11.2450
- Ball type - reference Y11.2460

211B.220 VENT COCKS:

- CE certified and Kitemark compliant.
- PN to suit system maximum working pressure.
- Two way gland cock type - reference Y11.2470
- Ball type - reference Y11.2480
- Three way gland cock type - reference Y11.2490
- Plug valve type
    - Wrench operated - reference Y11.2500A
    - Gear operated - reference Y11.2500B

211B.230 AUTOMATIC AIR VENTS:

- Float type
    - Reference Y11.2510A

211B.260 EXPANSION ARRANGEMENTS/DEVICES AND FLEXIBLE CONNECTIONS:

- PN to suit system maximum working pressure.
- Provide expansion devices / bellows as schedule reference Expansion Bellows and Flexible Hose Compensators
- Expansion loops
    - Steel
        - Reference Y11.2610A
        - Galvanized after manufacture.
    - Copper - reference Y11.2620
- Expansion compensators
    - Axial bellows
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2630A
        - Flanged to BS EN 1092-1 - reference Y11.2630B
    - Articulated bellows
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2630D
        - Flanged to BS EN 1092-1 - reference Y11.2630E
    - Slip-type axial, grooved and expansion compensators
        - Reference Y11.2630J
    - Multiple grooved couplings type compensators
        - Reference Y11.2630K
- Flexible connections for noise and vibration attenuation
    - EPDM rubber, up to 100°C
        - Flanged to BS EN 1092-1 - reference Y11.2650A
        - Screwed to relevant parts of BS EN 10226 - reference Y11.2650B
    - Grooved flexible mechanical joints for noise and vibration attenuation
        - Install 3 grooved flexible mechanical joints after the source of vibration and before the first change in pipe direction. Installation to be strictly in accordance with the manufacturer's instructions.
    - Convoluted stainless steel, above 100°C
        - Flanged to BS EN 1092-1 - reference Y11.2650C

- EPDM rubber, up to 70°C

    - Flanged to BS EN 1092-1 - reference Y11.2650D
    - Screwed to relevant parts BS EN 10226 - reference Y11.2650E

- Chlorobutyl rubber, up to 100°C

    - Flanged to BS EN 1092-1 - reference Y11.2650F
    - Screwed to relevant parts of BS EN 10226 - reference Y11.2650G

- Chlorobutyl rubber, up to 60°C

    - Flanged to BS EN 1092-1 - reference Y11.2650H
    - Screwed to relevant parts of BS EN 10226 - reference Y11.2650I

SECTION Z220a - PUMPS - HYDRONICS

220A.010 GENERAL:

- Comply with general clauses below
    - Pumps generally - reference Y20.1010
    - Pump selection for efficiency/EC ecodesign requirements - reference Y20.1020
    - Safety guards - reference Y20.1030
    - Pump testing - reference Y20.1040
- Ensure all electrical equipment supplied and installed is suitable for power supply indicated.
- Provide details of electrical input, starting and performance characteristics of all motors above 750W to an agreed format.
- Where appropriate ensure motors and drives are supplied complete with keys and keyways.
- Spare parts
    - Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
        - Mechanical Seals: One set of mechanical seals for each pump.
- Design duties
    - Ensure scheduled volume is provided when operating against resistance of system corrected for changes between specified and selected component resistances.
- Comply with section Y92A for specifications of starters and VSD

220A.030 PUMP AND MOTOR:

- Type:
    - Centrifugal, Close coupled direct drive end suction. Reference Y20.2010C
    - Centrifugal, Split Case. Reference Y20.2010F
    - Centrifugal pumps. Comply with BS EN ISO 9908.
    - Connections
        - Flanged to BS EN 1092-1 PN for Steel flanges
    - Motor
        - Motor operating conditions
            - Standard operating conditions - reference Y92.2010A
        - Surge suppressors
            - Manufacturer fitted - reference Y92.1040#
        - Motor type
            - Asynchronous induction with VSD.
        - Standards - reference Y92.1010

- General - reference Y92.2020

  - Provide protected enclosures against external mechanical impacts in accordance with BS EN 62262

    - IK08.

- Motor efficiency

    - For VSD motors: Efficiency class IE2, reference Y92.2025A;

- Degree of protection in accordance with BS EN 60034-5

  - IP55.

- Method of motor cooling in accordance with BS EN 60034-6, reference Y92.2020
- Motors - over temperature protection

  - Thermistors - reference Y92.2060A

- Guards -Reference Y92.2090A
- Accessories

  - Casing thermal insulation.
  - Matching flanges PN

220A.060 WORKMANSHIP:

- General - reference Y20.4010
- Pipeline connections - reference Y20.4020
- Alignment - reference Y20.4040
- Access - reference Y20.4050

SECTION **Z220B - PUMPS - PLUMBING**

220B.010 GENERAL:

- Comply with general clauses below
    - Pumps generally - reference Y20.1010
    - Pump selection for efficiency/EC ecodesign requirements - reference Y20.1020
    - Safety guards - reference Y20.1030
    - Pump testing - reference Y20.1040
- Ensure all electrical equipment supplied and installed is suitable for power supply indicated.
- Provide details of electrical input, starting and performance characteristics of all motors above 750W to an agreed format.
- Where appropriate ensure motors and drives are supplied complete with keys and keyways.
- Design duties
    - Ensure scheduled volume is provided when operating against resistance of system corrected for changes between specified and selected component resistances.
- Comply with section Y92A for specifications of starters and VSD

220B.030 PUMP AND MOTOR:

- Type:
    - Centrifugal, Close coupled direct drive end suction. Reference Y20.2010C
    - Centrifugal, Direct drive in-line, Vertical pump. Reference Y20.2010D
    - Centrifugal, Direct drive, glandless circulator. Reference Y20.2010E
    - Centrifugal, Split Case. Reference Y20.2010F
- Maximum temperature of fluid: as designed
- Centrifugal pumps. Comply with BS EN ISO 9908.
- Connections
    - Flanged to BS EN 1092-1 PN for Steel flanges
    - Flanged to BS EN 1092-2 PN for Cast iron flanges
    - Screwed to relevant parts of BS EN 10226
- Motor
    - Motor operating conditions
        - Standard operating conditions - reference Y92.2010A
    - Surge suppressors
        - Manufacturer fitted - reference Y92.1040#
    - Motor type
        - Induction (asynchronous).

        - Asynchronous induction with VSD.
        - Permanent-Magnet Synchronous with VSD.
        - Magnet free synchronous reluctance with VSD.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter (rectifier) and electronic controls with 0-10V control input.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter (rectifier) and electronic controls with 0-10V control input and integral PID controller to enable sensors to be connected directly to the motor.

    - Standards - reference Y92.1010
    - General - reference Y92.2020

        - Provide protected enclosures against external mechanical impacts in accordance with BS EN 62262

            - IK08.

    - Motor efficiency

        - For VSD motors: Efficiency class IE2, reference Y92.2025A;
        - For constant speed motors: Efficiency class IE3, reference Y92.20205B

    - Degree of protection in accordance with BS EN 60034-5

        - IP55.

    - Method of motor cooling in accordance with BS EN 60034-6, reference Y92.2020
    - Motors - over temperature protection

        - Thermistors - reference Y92.2060A

- Guards -Reference Y92.2090A
- Accessories

    - Casing thermal insulation.

220B.040 PACKAGED WATER BOOSTER SETS:

- Pressure booster set(s) to be complete with pump(s), control vessel (hydraulic accumulator), suction and discharge manifolds, control transducer, pre-wired control panel and interconnecting pipework assembled on a fabricated skid, and tested in pumps manufacturer own facility.
- Booster set to be compliant with WRAS requirements.
- Type

    - [Multiple pumps with break tank.]

- Pumping arrangement

    - Variable speed pumps.

- Base frame skid

- Stainless steel.

- Pumps/motors
    - Number of duty pumps to achieve design total flow rate and pressure
    - Number of standby pumps: as designed
    - Pump type
        - Stainless steel multistage centrifugal.
        - Stainless steel end suction, single impeller self-priming.
    - Motor type
        - Permanent magnet super premium efficiency.
        - TEFV AC asynchronous induction high efficiency.
    - Motor efficiency to BS EN 60034-30-1 (IE)
    - Pump starting method
        - Frequency converter/inverter built into motor.

- Hydraulic accumulator
    - Diaphragm material to be WRAS approved in accordance with relevant parts of BS 6920 and BS EN 15768

- Pipework manifolds
    - Connections
        - Screwed
        - Flanged
    - Material
        - 304 stainless steel

- Valves and fittings
    - Provide isolation valves on suction and discharge side of pumps.
    - Provide non-return valves on discharge side of each pump.
    - Provide pressure gauge in discharge manifold.
    - Isolation valve type
        - Ball Valve.
        - Butterfly.

- Controls
    - Pump operation
        - Constant pressure control by pump switching.
        - Constant pressure control by pump seed control.

        - Multiple pump cascade operation by pressure transducer in discharge flow manifold.

    - Alarms and indication
    - Audiable alarm is not required when there is a BMS interface for the Pumps.

        - For interface points to the BMS, refer to BMS control diagrams and specs.
        - Pump run and trip for each pump.
        - Low water cut off.

    - Control panel

        - Factory installed and connected as an integral part of unit.
        - Panel IP rating IP54

    - BMS interface requirements

- Accessories

    - Additional control module to provide surge protection on start-up or when power is restored by allowing only one pump to be enabled and pulsed for a pre-set time until a pre-set pressure is reached.
    - Combined anti-vacuum, automatic air vent and surge protection valve supplied loose for fitting at top of risers
    - Flexible connections
    - Anti-vibration mountings

220B.060 WORKMANSHIP:

- General - reference Y20.4010
- Pipeline connections - reference Y20.4020
- Alignment - reference Y20.4040
- Access - reference Y20.4050
- Maintenance requirements for sewage pumps

    - Reference Y20.4060

- Install pressurisation equipment and pressure booster sets in accordance with manufacturer's recommendations.
- Install test and commission systems to comply with equipment manufacturer's recommendations, BS EN 806-4

SECTION Z220c - PUMPS - FIREFIGHTING

Z220C.010 SYSTEM PERFORMANCE REQUIREMENTS

- Fire-Pump Systems: Fire-pump and pressure-maintenance-pump units that comply with performance requirements specified and are compatible with building fire-suppression systems.

- Pump, Equipment, Accessory, and Piping Pressure Rating: 1200-kPa (175-psig) minimum working-pressure rating, unless higher rating is indicated.

Z220C.020 QUALITY ASSURANCE

- Manufacturer Qualifications: Firms whose fire pumps, pressure-maintenance pumps, drivers, controllers, and accessories are listed by product name and manufacturer in UL's "Fire Protection Equipment Directory" and FM's "Fire Protection Approval Guide" and that comply with requirements indicated.

- Source Limitations: Obtain fire-pump and pressure-maintenance-pump units through one source with responsibility and accountability to respond to and resolve problems regarding compatibility, installation, performance, and acceptance of units.

- Product Options: Drawings indicate size, profiles, connections, and dimensional requirements of fire-pump and pressure-maintenance-pump units and are based on specific models selected. Other manufacturers' pump units with equal performance characteristics may be considered. Refer to Division 1 Section "Product Requirements."

- Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

- Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to Engineer.

- Comply with standards of authorities having jurisdiction pertaining to materials, hose threads, and installation.

- Comply with NFPA 20, "Installation of Stationary Pumps for Fire Protection," for fire pumps, drivers, controllers, accessories, and installation.

Z220C.030 SPLIT-CASE FIRE PUMPS

- Multistage, Horizontally Mounted, Split-Case Fire Pumps: UL 448, factory-assembled and –tested as a one package in country of origin (UL listed & FM approved), electric-drive, two-stage, single-suction, horizontal type. Include pump, driver, controller, etc… mounted on same base and connected with coupling.

    - Characteristics: Capable of furnishing not less than 150 percent of rated capacity at not less than 65 percent of total rated head. Shutoff head is limited to 140 percent of total rated head.
    - Casing: Axially split cast iron with suction and discharge flanges machined to ASME B16.1, Class 125 dimensions, unless Class 250 flanges are indicated.
    - Impeller: Cast bronze of construction to match fire pump, statically and dynamically balanced, and keyed to shaft.

- Wear Rings: Replaceable, bronze.
- Shaft and Sleeve: Stainless Steel shaft with bronze sleeve.
- Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing.
- Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland.
- Coupling: Flexible and capable of absorbing torsional vibration and shaft misalignment. Include metal coupling guard.
- Driver: Electric motor.
- Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
- Nameplate: Complete with capacities, characteristics, and other pertinent data.
- Base: Fabricated and attached to fire-pump and driver unit with reinforcement to resist movement of pump during seismic events when base is anchored to building substrate.

Z220C.040 PUMP DRIVERS

- Description: UL 1004A, NEMA MG 1, totally enclosed, fan cooled, squirrel-cage, induction motor. Motor shall comply with Division 21 Section “Common Motor Requirements for Fire Suppression Equipment”. Include construction complying with NFPA 20 and NFPA 70, and include wiring compatible with controller used.

  - Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
  - Nameplate: Complete with motor horsepower, characteristics, and other pertinent data.

Z220C.050 PUMP CONTROLLERS, GENERAL

- Description: Combined automatic and nonautomatic operation; factory assembled and wired; factory tested for capacities and electrical characteristics; and with the following features:

  - Enclosure: UL 50, Type 12, water proof, indoor, unless special-purpose enclosure is indicated.
  - Controls, devices, alarms, functions, and operations listed in NFPA 20 as required for drivers and controller types used, and specific items listed for each controller type.
  - Nameplate: Complete with capacity, characteristics, approvals and listings, and other pertinent data.
  - Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous-metal sensing piping, DN15 (NPS 1/2), with globe valves for testing controller mechanism from system to pump controller as indicated. Include bronze check valve with 2.4-mm orifice in clapper or ground-face union with noncorrosive diaphragm having 2.4-mm orifice.

Z220C.055 DIESEL ENGINE PUMP DRIVERS

- Fire-Pump Drivers: UL 1247, horizontal-shaft, open-type diesel engine. Include the following:

  - Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
  - Nameplate: Complete with engine horsepower, characteristics, and other pertinent data.
  - Emergency Manual Operator: Factory wired for standby engine starting and operation in case of main controller or wiring malfunction.

- Engine Cooling System: Factory-installed water piping, valves, strainer, pressure regulator, heat exchanger, coolant pump, bypass piping, and fittings. Include ASTM B 88M, Type B (ASTM B 88, Type L), copper water tube; ASME B16.22, wrought-copper, solder-joint pressure fittings; AWS A5.8/A5.8M, BCuP Series brazing filler metal; and brazed joints.
- Exhaust Connector: Flexible type.
- Exhaust Silencer: Residential type.
- Engine-Jacket Water Heater: Factory-installed electric elements.
- Dual Batteries: Lead-acid-storage type, with 100 percent standby reserve capacity.
- Fuel System: According to NFPA 20.
- Fuel Storage Tank: Size indicated, but not less than required by NFPA 20. Include floor legs, direct-reading level gage, and secondary containment tank with capacity at least equal to fuel storage tank.
- Exhaust System: ASTM A 53/A 53M, Type E or S, Schedule 40, black steel pipe; ASME B16.9, weld-type pipe fittings; ASME B16.5, steel flanges; and ASME B16.21, nonmetallic gaskets. Fabricate double-wall, ventilated thimble from steel pipe.

Z220C.058 MULTISTAGE, PRESSURE-MAINTENANCE PUMPS

- Description: Factory-assembled and -tested, multistage, barrel-type vertical pump as defined in HI 2.1-2.2 and HI 2.3; designed for surface installation with pump and motor direct coupled and mounted vertically.

- Pump Construction:

  - Barrel: Stainless steel.
  - Suction and Discharge Chamber: Cast iron with flanged inlet and outlet.
  - Pump Head/Motor Mount: Cast iron.
  - Impellers: Stainless steel, balanced, and keyed to shaft.
  - Pump Shaft: Stainless steel.
  - Seal: Mechanical type with carbon rotating face and silicon-carbide stationary seat.
  - Intermediate Chamber Bearings: Aluminum-oxide ceramic or bronze.
  - Chamber-Base Bearing: Tungsten carbide.
  - O-Rings: EPDM or NBR.

- Motor: Single speed with permanently lubricated ball bearings and rigidly mounted to pump head.

  - Power Cord: Factory-connected to motor for field connection to controller and at least 10 feet (3 m) long.

- Nameplate: Permanently attached to pump and indicating capacity and characteristics.

- Capacities and Characteristics, as per design requirements:
  - Working Pressure: 175-psig (1200 kPa) minimum.

Z220C.060 FIRE-PUMP CONTROLLERS

- Description: UL 218 and NFPA 20; listed for electric-drive, fire-pump service.

- Motor Starting: Reduced-voltage soft starter or auto transformer type as per manufacturer's recommendation and Engineer's approval, unless otherwise specified or shown on the Drawings.

- Fire pump controller shall be provided with surge arresters in compliance with IEEE C62.1 or IEEE C62.11 and shall be installed in common mode to eliminate overvoltage between each phase and earth. As an alternative, the controller shall withstand without any damage 10 kV impulse in accordance with IEEE C62.41 or ANSI/UL 1449.

- Method of Control:

    - Pressure-switch actuated.

        - Water-pressure-actuated switch and pressure transducer with independent high- and low-calibrated adjustments responsive to water pressure in fire-suppression piping.
        - System pressure recorder, electric ac driven, with spring backup.
    - Emergency Start: Mechanically operated start handle that closes and retains the motor RUN contactor independent of all electric or pressure actuators.

- Method of Stopping: Nonautomatic.

- Rate controllers for scheduled horsepower. Include short-circuit withstand rating at least equal to short-circuit current available at controller location. Take into account cable size and distance from substation or supply transformers.

- Method of Isolation and Overcurrent Protection: Interlocked isolating switch and MCCB (Molded-case circuit breaker); with a common, externally mounted operating handle, and providing locked-rotor protection. Fire pump controller circuit breaker settings shall comply with NFPA 20 requirements. The circuit breaker shall not trip when starting a motor from rest in the across-the-line mode, whether or not the controller is of the reduced inrush starting type.

- Door-Mounted Operator Interface and Controls:

    - Monitor, display, and control the devices, alarms, functions, and operations listed in NFPA 20 as required for drivers and controller types used.
    - Method of Control and Indication:

        - Microprocessor-based logic controller, with multiline digital readout.
        - Membrane keypad.
        - LED alarm and status indicating lights.

    - Local and Remote Alarm and Status Indications for Electric Driven Pump:

        - Controller power on.
        - Motor running condition.
        - Loss-of-line power.
        - Line-power phase reversal.
        - Line-power single-phase condition.

    - Local and Remote Alarm and Status Indications for Diesel Engine Pump:

        - Controller power on.
        - Engine-lubrication-system critically low oil pressure.
        - Engine-jacket coolant high temperature.
        - Engine fail-to-start.
        - Engine overspeed shutdown.
        - Low fuel level.
        - Missing or failed battery.
        - Battery charger failure.
        - System overpressure.

        - ECM selector switch in alternate ECM position.
        - Fuel injector malfunction.

    - Audible alarm, with silence push button.
    - Nonautomatic START and STOP push buttons or switches.

- Optional Features:

    - Extra Output Contacts:

        - One N.O. contact(s) for motor running condition.
        - One set(s) of contacts for loss-of-line power.
        - One each, Form C contacts for high and low reservoir level.

    - Local alarm bell.
    - Door-mounted thermal or impact printer for alarm and status logs.
    - Operator Interface Communications Ports: USB, Ethernet, and RS485.

- Automatic Transfer Switches:

    - Complies with NFPA 20, UL 218, UL 1008 and FM approved.
    - Integral with controller as a listed combination fire-pump controller and power transfer switch and shall be housed in a barriered compartment of the fire pump controller or in a separate enclosure attached to the controller and marked “Fire Pump Power Transfer Switch”.
    - Automatically transfers fire-pump controller from normal power supply to alternate power supply in event of power failure and retransfers to normal power supply upon return of power supply with a time delay till the normal source is stabilized, unless the alternate source fails.
    - Electrically operated and mechanically held.
    - Allows manual transfer from one source to the other.
    - Local and Remote Alarm and Status Indications:

        - Normal source available.
        - Alternate source available.
        - In normal position.
        - In alternate position.
        - Isolating means open.

    - Audible alarm, with silence push button.
    - Nonautomatic (manual, nonelectric) means of transfer.
    - Engine test push button.
    - Start generator output contacts.
    - Timer for weekly generator tests.

Z220C.065 CONTROLLERS FOR PRESSURE-MAINTENANCE PUMPS

- General Requirements for Pressure-Maintenance-Pump Controllers:

    - Type: UL 508 factory assembled, -wired, and tested, across-the-line; for combined automatic and manual operation.
    - Enclosure: UL 508 and NEMA 250, Type 12 for wall-mounting.
    - Factory assembled, wired, and tested.
    - Finish: Manufacturer's standard color paint.

- Rate controller for scheduled horsepower and include the following:

    - Fusible disconnect switch.
    - Pressure switch.
    - Hand-off-auto selector switch.
    - Pilot light.
    - Running period timer.

Z220C.070 FIRE-PUMP SPECIALTIES AND ACCESSORIES

- Match fire-pump suction and discharge ratings as required for fire-pump capacity rating, and complying with NFPA-20 requirements. Include the following:

    - Automatic air-release valve, complying with NFPA 20 for installation in fire-pump casing.
    - Circulation relief valve, UL 1478, brass, spring loaded; for installation in pump discharge piping.
    - Relief valves, UL 1478, bronze or cast iron, spring loaded; for installation in fire-suppression water-supply piping.
    - Suction and discharge pressure gages.
    - Eccentric-tapered reducer at suction inlet.
    - Concentric-tapered reducer at discharge outlet.
    - Discharge Cone: Closed or open type.

    - Hose Valve Manifold Assembly:

        a. Standard: Comply with requirements in NFPA 20.
        b. Header Pipe: ASTM A 53/A 53M, Schedule 40, galvanized steel with ends threaded according to ASME B1.20.1.
        c. Header Pipe Fittings: ASME B16.4, galvanized cast-iron threaded fittings.
        d. Automatic Drain Valve: UL 1726.
        e. Manifold:
            - Test Connections: Comply with UL 405 except provide outlets without clappers instead of inlets.
            - Body: Flush type, brass or ductile iron, with number of outlets required by NFPA 20.
            - Nipples: ASTM A 53/A 53M, Schedule 40, galvanized-steel pipe with ends threaded according to ASME B1.20.1.
            - Adapters and Caps with Chain: Brass or bronze, with outlet threaded according to NFPA 1963 and matching local fire-department threads.
            - Escutcheon Plate: Brass or bronze; rectangular.
            - Hose Valves: UL 668, bronze, with outlet threaded according to NFPA 1963 and matching local fire-department threads.
            - Exposed Parts Finish: Polished or brass.
            - Escutcheon Plate Marking: Equivalent to "FIRE PUMP TEST."

Z220C.075 PRESSURE-MAINTENANCE-PUMP SPECIALTIES AND ACCESSORIES

- Match pressure-maintenance-pump suction and discharge ratings as required for pump capacity rating. Include the following:

    - Circulation relief valve.
    - Suction and discharge pressure gages.

Z220C.080 ALARM PANELS

- Description: Factory-assembled and -wired remote panel complying with UL 508 and requirements in NFPA 20. Include audible and visible alarms matching controller type.
    - Enclosure: NEMA 250, Type 2, remote wall-mounting type.
    - Enclosure Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
- Features for electric driven pump: Include manufacturer's standard features and the following:
    - Motor-operating condition.
    - Loss-of-line power.
    - Phase reversal.
    - Low-water alarm.
- Features for diesel engine driven pump: Include manufacturer's standard features and the following:
    - Engine running.
    - Main switch off or in manual position.
    - Engine trouble.
    - Low-water alarm.
    - Low fuel.

Z220C.090 FLOW-MEASURING SYSTEMS

- Description: UL-listed or FM-approved, fire-pump, flow-measuring systems that indicate flow to not less than 175 percent of fire-pump rated capacity. Include sensor of size to match pipe, tubing, flow meter, and fittings.
    - Pressure Rating: 1200 kPa (175 psig)) minimum.
    - Sensor: Venturi, annular probe, or orifice plate, unless otherwise indicated. Sensor size shall match pipe, tubing, flow meter, and fittings.
    - Flow Meter: Compatible with flow sensor with dial not less than 115 mm in diameter or manufacturer's equivalent size.
    - Permanently Mounted: Flow meter suitable for wall mounting with copper tubing to connect to flow sensor.
    - Include complete operating instructions.

Z220C.100 SOURCE QUALITY CONTROL

- Factory Tests: Hydrostatically test and test run fire pumps before shipping according to UL 448 requirements for "Operation Test" and "Manufacturing and Production Tests." Test at 150 percent of shutoff head plus suction head, but not less than 1725 kPa (250 psig). Produce certified test curves and inspection reports showing head capacity and brake horsepower of each pump.
- Fire pumps will be considered defective if they do not pass tests and inspections.

Z220C.110 GROUT

- Description: ASTM C 1107/C 1107M, Grade B, factory-mixed and -packaged nonshrink and nonmetallic grout; suitable for interior and exterior applications.
- Characteristics: Post-hardening, volume-adjusting, dry, hydraulic-cement grout.
- Properties: Nonstaining, noncorrosive, and nongaseous.
- Design Mix: 34.5-MPa, 28-day compressive strength.

Z220C.120 EXAMINATION

- Examine areas, equipment foundations, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting fire-pump performance.
    - Proceed with installation only after unsatisfactory conditions have been corrected.
- Examine roughing-in of fire-suppression piping systems. Verify actual locations of piping connections before pump installation.

Z220C.130 CONCRETE BASES

- Install concrete bases of dimensions indicated, or otherwise required, for fire pumps, and controllers. Refer to Section "Cast-in-Place Concrete."

Z220C.140 INSTALLATION

- Comply with fire-pump, relief valves, accessories and controller manufacturers' written installation and alignment instructions, and with NFPA 20.
- Install pumps and controllers to provide access for periodic maintenance, including removal of motors, impellers, couplings, and accessories.
- Set base-mounting-type pumps on concrete bases. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.
    - Support pump baseplate on rectangular metal blocks and shims or on metal wedges having small taper, at points near foundation bolts to provide 19- to 38-mm gap between pump base and foundation for grouting.
    - Adjust metal supports or wedges until pump and driver shafts are level. Check coupling faces and pump suction and discharge flanges to verify that they are level and plumb.
- Install suction and discharge piping equal to or greater than diameter of fire-pump nozzles, and as required by NFPA 20.

- Install valves that are the same size as piping connecting fire pumps, bypasses, test headers, and other piping systems.

- Install pressure gages on fire-pump suction and discharge at pressure-gage tappings.

- Support pumps and piping separately so weight of piping does not rest on pumps.

- Install piping accessories, hangers and supports, anchors, valves, meters and gages, and equipment supports according to NFPA 20.

- Install fuel system according to NFPA 20.

- Install water supply and drain piping for diesel-engine heat exchangers. Extend drain piping from heat exchangers to point of disposition.

- Install exhaust system piping for diesel engines. Extend to point of termination outside structure. Install pipe and fittings with welded joints, and components having flanged connections with gasketed joints.

- Install condensate drain piping for diesel-engine exhaust system. Extend drain piping from low points of exhaust system to condensate traps and to point of disposition.

- Install flow meters and sensors where indicated. Install flow-measuring-system components and make connections according to NFPA 20 and manufacturer's written instructions.

- Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted. Furnish copies of manufacturers' wiring diagram Submittals to electrical Installer.

    - Verify that electrical wiring is installed according to manufacturers' submittal and installation requirements in Division 26 Sections. Proceed with equipment startup only after wiring installation is satisfactory.

Z220C.145 PRESSURE MAINTENANCE PUMPS INSTALLATION

- NFPA Standard: Comply with NFPA 20 for installation of pressure-maintenance pumps.

- Base-Mounted Pump Mounting: Install pumps on concrete bases.

    - Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
    - For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
    - Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
    - Install anchor bolts to elevations required for proper attachment to supported equipment.
    - Attach pumps to equipment base using anchor bolts.

- Install multistage, pressure-maintenance pumps according to HI 1.4.

Z220C.150 ALIGNMENT

- Align fire-pump and driver shafts after complete unit has been leveled on foundation, grout has set, and foundation bolts have been tightened.

- After alignment is correct, tighten foundation bolts evenly but not too firmly. Fill baseplate completely with grout, with metal blocks and shims or wedges in place. Tighten foundation bolts after grout has hardened. Check alignment and make required corrections.

- Make piping connections, check alignment, and make required corrections.

    - Align pump and driver shafts for angular and parallel alignment according to HI 1.4.
    - Alignment Tolerances: Comply with manufacturer's written instructions.

Z220C.160 CONNECTIONS

- Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping and specialties. The following are specific connection requirements:

    - Install piping adjacent to fire pumps and equipment to allow service and maintenance.
    - Connect fire-pump discharge piping to building fire-suppression piping.
    - Connect relief-valve discharge to point of disposal.
    - Connect cooling-system water supply and drain piping to diesel-engine heat exchangers.
    - Connect exhaust system piping to diesel engines.

- Connect flow-measuring-system meters and sensors according to manufacturer's written instructions.

- Connect fire-pump controllers to building fire alarm system.

- Connect controllers to pumps.

- Ground equipment.

    - Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

- Support exhaust system from building structure using rigid structural shapes for attachment of fixed point supports (Plate Support Assembly). Anchor supports to structure by welding, bolting, steel expansion anchors, or concrete inserts. Size of structural shapes shall be in accordance with manufacturer’s recommendations.

- Protect incomplete chimney installations by attaching temporary closures over open ends of sections.

- Clean all exhaust system sections of dust and debris prior to final connection to appliances.

Z220C.170 IDENTIFICATION

- Identify system components. Comply with requirements for fire-pump marking according to NFPA 20 and Section Z254.

Z220C.180 FIELD QUALITY CONTROL

- Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including fire-pump and pressure-maintenance-pump units, piping, and electrical connections. Report results in writing.
    - Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
    - Check suction line connections for tightness so no air gets into pumps.
    - Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.
    - Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    - Furnish fire hoses in number, size, and length required to reach storm drain or other acceptable location to dispose of fire-pump test water. Fire hoses are for field-acceptance tests only and are not property of Employer.
    - Final Checks before Startup: Perform the following preventive-maintenance operations and checks:
        - Lubricate oil-lubrication-type bearings.
        - Remove grease-lubrication-type bearing covers, flush bearings with kerosene, and clean thoroughly. Fill with new lubricant according to manufacturer's written instructions.
        - Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
        - Verify that pump is free to rotate by hand. If pump is bound or if it drags even slightly, do not operate until cause of trouble is determined and corrected.
    - Starting procedure for electric driven pumps is as follows:
        - Prime pump by opening suction valve and closing drains, and prepare pump for operation.
        - Open sealing liquid supply valves if pump is so fitted.
        - Start motor.
        - Open discharge valve slowly.
        - Observe leakage from stuffing boxes and adjust sealing liquid valve for proper flow to ensure lubrication of packing. Do not tighten gland immediately but let packing run in before reducing leakage through stuffing boxes.
        - Check general mechanical operation of pump and motor.
    - Starting procedure for diesel engine driven pumps is as follows:
        - Install coolant in cooling system. Fill closed-loop cooling system with potable water and add rust inhibitor.

- Install coolant in cooling system. Fill closed-loop cooling system with solution of 50 percent potable water and 50 percent ethylene glycol permanent antifreeze. Add rust inhibitor if not in antifreeze.
- Prime pump by opening suction valve and closing drains, and prepare pump for operation.
- Open sealing liquid supply valves if pump is so fitted.
- Start engine.
- Open discharge valve slowly.
- Observe leakage from stuffing boxes and adjust sealing liquid valve for proper flow to ensure lubrication of packing. Do not tighten gland immediately but let packing run in before reducing leakage through stuffing boxes.
- Check general mechanical operation of pump and driver.

- Perform field tests for each fire-pump unit and system piping when installation is complete. Comply with operating instructions and procedures in NFPA 20 to demonstrate compliance with requirements. Where possible, field correct malfunctioning equipment, then retest to demonstrate compliance. Replace equipment that cannot be satisfactorily corrected or that does not perform as indicated, then retest to demonstrate compliance. Verify that each fire-pump unit performs as indicated. Report test results in writing.

Z220C.190 DEMONSTRATION

- Engage a factory-authorized service representative to train Employer's maintenance personnel to adjust, operate, and maintain fire pumps.

  - Schedule at least 8 (eight) hours of training.

Z221 - WATER TANKS AND CISTERNS

221.010 GENERAL

- Comply with work section general below
    - Tank design - reference Y21.1010
    - Domestic storage water cisterns - reference Y21.1020
        - BS EN 12845
        - Loss Prevention Certification Board (LPCB) standard LPS 1276.

221.040 GLASS REINFORCED PLASTICS SECTIONAL TANK TO BS EN 13280:

- Type
- Application
    - Cold water storage for domestic water use.
- Sectional A1 - reference Y21.2020A (for potable water incorporating screened air inlet, vent pipe entry device for the cover, screened)
- Sectional A2 - reference Y21.2020B (For potable water)
- Access ladders
- Manholes or access hatches
    - 600mm diameter.
    - 600mm square
- Raised level control valve chamber.
- Limiting conditions
    - In a building.
- Special requirements
    - Venting Level switches

221.100 WORKMANSHIP:

- General - reference Y21.4010
- Protection and cleaning - reference Y21.4020
- Inspection and access - reference Y21.4030

Z223 - STORAGE CYLINDERS AND CALORIFIERS

223.010 GENERAL:

- Hot water storage tanks / vessels to comply with EU Regulation 814/2013 with regard to ecodesign requirements (limiting standing loss and product information).
- Comply with work section general clauses below
    - Standards - reference Y23.1010
    - Definitions - reference Y23.1020

223.090 CALORIFIER AND STORAGE VESSELS TO BS 853-1:

- Galvanised steel with sacrificial anode
    - Reference Y23.2060A
- Duty
    - Primary Medium
        - Hot water
- Type of heater
    - Helical coil.
        - Fixed.
- Independent inspection requirements
    - Welding as BS 853-1
    - Factory inspection as BS 853-1
- Factory applied insulation
- Insulation jacket to BS 5615

223.110 WORKMANSHIP:

- General - reference Y23.3010
- Flange drillings - ensure flange drillings are uniform to facilitate interchange of tube assemblies.
- Protection and cleaning - reference Y23.3030
- Inspection and cleaning - reference Y23.3040

Z225 - CLEANING AND CHEMICAL TREATMENT

225.010 GENERAL:

- The specifications of this section applies to HVAC, plumbing, and firefighting works.
- Comply with work section general clauses below

    - Conditions for cleaning and chemical treatment - reference Y25.1010
    - Method statement - reference Y25.1015

- Supply cleaning and chemical treatment as specified
- Comply with Approved Codes of Practice and associated technical guidance published by HSE on the requirements of the Health and Safety at Work etc. Act 1974 and the Control of Substances Hazardous to Health Regulations 2002 as amended, that apply to the risk from exposure to legionella bacteria.

225.020 CLEANING AND CHEMICAL TREATMENT SPECIALIST:

- Reference Y25.2010
- On closed systems the specialist shall, in addition to specific requirements detailed elsewhere in this specification or drawings, undertake the following:

    - Obtain relevant information on the closed system to be treated.
    - Evaluate which treatment options will achieve the corrosion control and water quality objectives, taking account of regulatory issues and product selection constraints.
    - Follow up the treatment programme with proper monitoring of chemical, microbiological and physical parameters, ideally including monitoring of corrosion rates.

225.030 MAINS WATER ANALYSIS:

- Reference Y25.2020A
- The following is an analysis of mains water taken from site supply point:-

    - Conductivity (uS/cm)
    - Total Dissolved Solids (mg/l)
    - pH
    - Chloride Cl (mg/l)
    - Calcium Ca (mg/l)
    - Magnesium Mg (mg/l)
    - Sodium Na (mg/l)
    - Potassium K (mg/l)
    - Total Hardness $CaC0_3$
    - Alkalinity $CaC0_3$
    - Total Iron Fe (ug/l)
    - Copper Cu (ug/l)
    - Total Viable Count (cfu/ml)
    - Pseudomonas (cfu/100ml)

225.040 PRELIMINARY CHECKS:

- Reference Y25.2030A

225.050 PROCEDURAL PRECAUTIONS:

- Reference Y25.2040A
- Including taking samples - reference Y25.2040B

225.060 CHEMICAL INJECTION AND DOSING METHODS:

- Water treatment methods
    - Water treatment methods for hot water heating closed circuit recirculating systems - reference Y25.2050A
    - Water treatment methods for chilled and condenser water closed circuit recirculating systems - reference Y25.2050B

- **Method of introducing chemicals into closed systems - reference Y25.2060A**
- **Method of introducing chemicals into open recirculating systems - reference Y25.2060B**
- Packaged plant - reference Y25.2060C
- Dosing for closed systems - reference Y25.2060D
- Dosing for open systems - reference Y25.2060E
- Dosing chemicals - reference Y25.2065

225.065 CORROSION TEST COUPON RACKS:

- Type
    - Serpentine, incorporating isolation valves on both sides of the rack and built-in flow control to hold the water flow through the rig at the ASTM recommended velocity of 0.6m/s to 1.8m/s.

- Standard
    - ASTM D2688

- Rack material
    - Mild steel

- Install rack in accordance with the manufacturer's recommendations.
- Provide corrosion coupons for monitoring the system for a period after handover.
-

225.070 MONITORING AND SAMPLING:

- Monitoring closed systems - reference Y25.2070A
- Sampling closed systems - reference Y25.2070B

- Sampling hot and cold water services - reference Y25.2070E

- Sampling kits - reference Y25.2070C
- Monitoring of open systems - reference Y25.2070D

225.080 CHEMICAL PROVISION:

- Standard arrangement - reference Y25.2080A

225.090 FLUSHING:

- Application
  - Heating, cooling and other closed pipework systems
    - BSRIA Guide BG 29/2012 - Pre-commission Cleaning of Pipework Systems - reference Y25.3010A
    - System filling
      - Temporary connection from mains in compliance with
      - England and Wales - The Water Supply (Water Fittings) Regulations 1999 as amended, the Water Act 2014 and The Construction Products Regulations 2013.
      - Scotland - The Water Supply (Water Fittings) Byelaws 2014.
      - Northern Ireland - The Water Supply (Water Fittings) Regulations 2009.]
      - Temporary connection from fire hydrant pipework.]
      -
    - Flushing - reference Y25.3010B
  - Flush system until discharge water is visually clear.
- Services supplying water for domestic use - reference Y25.3010D
- –

225.110 CHEMICAL CLEANING AND SOLIDS REMOVAL:

- Water quality required after final flushing
  - As BSRIA BG 29.
- BSRIA Application Guide 29/2012: Pre-commission Cleaning of Pipework Systems.
  - Inhibited acid - reference Y25.3030A
  - Formulated products - reference Y25.3030B
- Cleaning and chemical treatment regime - reference Y25.3035

225.120 DISINFECTION:

- General - reference Y25.3040
- Hot and cold water systems - reference Y25.3050
- Water storage systems - reference Y25.3060

225.140 SERVICE VISITS:

- Reference Y25.3080
- Special requirements

    - Include for 6 visits during the first 2 months commissioning.
    - Provide 1 annual review of system.
    - 4 times per annum send samples to an independent laboratory for differential micro-biological analysis.
    - Include for carrying out all necessary maintenance and inspections during the first 12 months following, the agreed date of practical completion.
    - Use only fully qualified operatives for any maintenance carried out.

225.150 DOCUMENTATION:

- Reference Y25.3090

Z230 – AIRDUCTS AND ANCILLARIES

230.010 GENERAL:

- Comply with work section general clauses below
    - Ductwork installation standards - reference Y30.1010
    - Ductwork dimensions - reference Y30.1020
    - Electrical bonding terminal - reference Y30.1030
- Fire stopping
    - All components forming the seal system to be from the same manufacturer. All products used, to have third party product certification by a scheme accredited by UKAS.
    - Only use UKAS accredited or Local Authority approved, third party installer certified contractors. The contractor should be ASFP members and their certification must cover the passive fire protection element they are installing.
    - Install all fire stopping systems in accordance with the manufacturer's written instructions and the test / assessment / certification evidence provided by the installer / manufacturer of the penetration seal.
    - Support centres for services passing through penetration seals serving fire barriers to be the same as those covered by the test / assessment / certification evidence provided by the installer / manufacturer of the penetration seal.
    - Install and inspect fire stopping systems in accordance with Building Regulations Approved Document B, ASFP Code of Practice TGD 17 and general best practice guidance given in the ASFP On-site guide to installing fire-stopping.

230.020 INSTALLER SELECTION:

- Where post installation cleaning is specified, appoint a cleaning contractor to undertake the work in accordance with BESA TR/19, and supply and install any additional cleaning openings to suit their selected specific methods of cleaning and to suit the practical site conditions relative to the fabric of the building and position of other services.

230.030 DUCTWORK AND FITTINGS:

- Electrical bonding terminal - reference Y30.1030
- Design Information
    - Pressure classification – reference Y30.2010#
    - Cleanliness quality class to BS EN 15780 and BESA TR/19
        - Prior to final commissioning, in addition to a visual assessment of the internal surfaces, undertake Preferred Vacuum Test (PVT) to establish dust accumulation level is within the acceptable level for the cleanliness quality class listed in Table 2 (A.4) in BESA TR/19.
    - Protection Delivery and Installation (PDI) level to BS EN 15780 and BESA TR/19
        - Advanced (including post installation cleaning) - reference Y30.4090C

- Post installation cleaning for advance level of PDI
    - To be undertaken by a ductwork cleaning contractor.
    - Dry method - reference Y30.4090D
    - Wet method - reference Y30.4090E
- Flexible ductwork
    - Aluminium - reference Y30.3100B
    - Flexible ductwork installation - reference Y30.4015
- Spark testing on plastics ductwork - reference Y30.2025
- Ductwork air leakage testing
    - High pressure ductwork - reference Y30.2030A
    - Medium pressure ductwork - reference Y30.2030B
    - Low pressure ductwork - reference Y30.2030C
- Ductwork strength and air leakage testing, circular sheet metal ductwork - reference Y30.2035.
- Ductwork strength and air leakage testing, rectangular sheet metal ductwork - reference Y30.2036.
- Floor plenum airtightness testing - reference Y51.2015.

230.040 SHEET METAL DUCTWORK TO DW/144:

- Type
    - Application: General
    - Material
        - Zinc coated. Hot-dip galvanized steel to BS EN 10346.
    - Protective finishes
        - Galvanizing.
    - Construction
        - Rectangular.
    - Man access and safety bars - reference Y30.2070
- Type
    - Application: Locker shower rooms exhaust
        - Material
            - Aluminium.
    - Construction
        - Rectangular.

- Man access and safety bars - reference Y30.2070

230.045 SHEET METAL DUCTWORK OFR KITCHENS TO DW/172:

- Type
  - Application: Concealed grease hood exhaust
    - Grease hood extract - reference Y30.2065
  - Material
    - Mild steel.
  - Protective finishes
    - Galvanizing.
  - Construction
    - Rectangular.
  - Man access and safety bars - reference Y30.2070

- Type
  - Application: Exposed grease hood exhaust and Dishwasher hood exhaust
    - Grease hood extract - reference Y30.2065
  - Material
    - Stainless steel.
  - Construction
    - Rectangular.
  - Man access and safety bars - reference Y30.2070
- Kitchen extract to be fire resisting as per clause Y30.2110D or Y30.2110E

230.071 FIRE RESISTING SMOKE EXTRACT DUCTWORK AND METHOD OF MAINTAINING FIRE INTEGRITY:

- Install and inspect fire resisting duct systems in accordance with Building Regulations and ASFP Code of Practice TGD 18.
- The installation shall be fully in accordance with the test certification.
- Supply fire resisting ductwork as below

- Duct type
    - Fire inside smoke control duct Type C
    - Application
        - Smoke and heat removal
    - Fire resistance when tested to the requirements of BS EN 1366-8 or BS EN 1366-9 and classified in accordance with BS EN 13501-4 for smoke control ducts using BS EN "EI" nomenclature by UKAS accredited certification body.
        - Integrity: 120 mins
        - Insulation: 120 mins
    - Fire rating when tested to the requirements of BS 476-24 by a UKAS accredited certification body.
    - Pressure class of ductwork to BESA DW/144
- Standards
    - Smoke and heat control duct systems to BS EN 12101-7
    - BS 9999 for general fire safety
    - BS EN 1363-1 Fire resistance tests. General requirements
    - BS EN 1366-8 Fire resistance tests for service installations. Smoke extraction ducts
    - BS EN 1366-9 Fire resistance tests for service installations. Single compartment smoke extraction ducts
    - BS EN 13501-4 Classification using data from fire resistance tests on components of smoke control systems
    - BS 476-24
- Methods of fire rated smoke extract ductwork
    - Fire resisting ductwork
        - Contractor shall submit clear method statement for the constructing of fire/ smoke rated ducts compliant with the below relevant standards and references for approval, such as applying fire resistant coating, or by treating the duct on-site (i.e. externally encasing with insulation or fire rated boards.
        - Fire resisting and smoke extract ductwork, tested to BS 476-24 - reference Y30.2110C
        - Fire resisting and smoke / heat control ductwork tested to BS EN 1366 - reference Y30.2110F
- The manufacturer/installer shall be assessed and registered in accordance with BS EN ISO 9001
- Systems/materials shall be listed within the Loss Prevention Certification Board (LPCB) Red Book.
- Systems/materials used shall have third party accreditation by a UKAS accredited certification body, or a certification body approved by the local Authorities Having Jurisdiction.

230.090 SUPPORTS:

- Hangers and supports
    - Reference Y30.2140A
- Support of air terminal units
    - Reference Y30.2150A

230.100 ACCESSORIES:

- Construction and finishes - reference Y30.3010
- Inspection/servicing access openings
    - Metal ductwork - reference Y30.3020A
    - BESA TR/19 - reference Y30.3020D
- Test holes
    - Metal ductwork - reference Y30.3030A
- Holes for controls/instruments - metal ductwork - reference Y30.3040
- Controls/sensing equipment - plastics ductwork - reference Y30.3041
- Installation of instruments and controls - reference Y30.3042
- Cleaning access
    - Advanced level of PDI with post installation cleaning - reference Y30.3050C
- Flexible ducts
    - Aluminium - reference Y30.3100B
- Flexible joint connections
    - Reference Y30.3110A

230.110 REGULATING DAMPERS - METAL DUCTWORK:

- Acoustic testing requirements to BS EN ISO 5135
- Balancing dampers
    - Steel single-blade dampers - reference Y30.3060A
    - Steel multi-blade dampers - reference Y30.3060B
- Control dampers
    - Steel single-blade dampers - reference Y30.3060C
    - Steel multi-blade dampers - reference Y30.3060D
- Steel backdraft regulating dampers - reference Y30.3060F

230.130 FIRE DAMPERS:

- General - reference Y30.3075
- Folding curtain
    - Steel
        - Blades partially in air stream - reference Y30.3070A
        - Out of air stream - reference Y30.3070C
    - Stainless steel
        - Blades partially in air stream - reference Y30.3070B
        - Out of air stream - reference Y30.3070D
- Steel single-blade - reference Y30.3070E]
- Stainless steel single blade - reference Y30.3070F
- Steel multi-blade - reference Y30.3070G
- Stainless steel multi-blade - reference Y30.3070H
- Intumescent - reference Y30.3070I
- Fire damper accessories - reference Y30.3070J
- Fire stops - plastics ductwork - reference Y30.3071

230.140 SMOKE DAMPERS:

- General - reference Y30.3079
- Steel single-blade
- Steel multi-blade
- Reference Y30.3080#
- Smoke control dampers to be in accordance with BS EN 12101-8 tested to BS EN 1366-10 and classified in accordance with BS EN 13501-4.

230.150 COMBINATION SMOKE AND FIRE DAMPERS:

- General - reference Y30.3089
- Steel single-blade
- Steel multi-blade
- Reference Y30.3090#
- Combination smoke control / fire dampers to be in accordance with BS EN 12101-8 tested to BS EN 1366-10 and BS EN 1366-2 and classified in accordance with BS EN 13501-4.

230.160 GUARDS:

- Bird wire guards
    - Finish
        - Plastic coated wire - reference Y30.3120A

- Insect guards
    - Manufacturers standard
        - Woven wire cloth - reference Y30.3130A
- Kit form
    - Black high density polyethylene - reference Y30.3130B

230.180 AIR DUCTLINES & ANCILLARIES WORKMANSHIP:

- General - reference Y30.4010
- Ductwork supports - reference Y30.4020
- Component support on pre-insulated aluminium ductwork
    - Reference Y30.4025
- Duct support for vapour seal continuity
    - Reference Y30.4030A
- External ductwork
    - Construction
        - Galvanised steel to BESA DW/144 Section 26, protected from the elements by a watertight membrane installed immediately after the ductwork has been installed.
        - All welded construction using black mild steel sheet galvanised after manufacture refer to Appendix C in BESA DW/144, minimum thickness 1.6mm, flanged and all nuts, bolts and fixings shall be bright zinc plated.
        -
    - Protective finish
        - Aluminium cladding.
    - External ductwork supports - reference Y30.4040
- Ductwork floor support - reference Y30.4050
- Flexible ductwork installation - reference Y30.4015
- Drainage of ductwork - reference Y30.4060
- Connections to building openings
    - Metal ductwork, comply with DW/144, Appendix K.
- Weather proofing
    - Flashing plate and cowl - reference Y30.4100A
- Ductwork sleeves

    - Plain - reference Y30.4110A
    - Flanged - reference Y30.4110B

- Fire rated ductwork sleeves

    - Provide as indicated on drawing.

- Installation of control equipment

    - Reference Y30.4130
    - Positions

        - Position components as indicated and in accordance with manufacturer's instructions as shown on the following drawings

            - Contract drawings.
            - Manufacturer's drawings.
            - Supplier's drawings.
            - Contractor's drawings.

- Instrument connections

    - Reference Y30.4140

- Damper access - reference Y30.4160

230.190 PRESSURE EQUIPMENT DIRECTIVE/PRESSURE EQUIPMENT REGULATIONS:

- All equipment and assemblies which fall within the scope of the Pressure Equipment Directive (PED) 2014/68/EU must be tested by the manufacturers, and be certified as compliant with the Directive. Such compliance shall be evidenced by displaying the appropriate CE Mark on the equipment and assemblies.
- Only relevant equipment and assemblies certified as compliant will be permitted under this specification, and any substitution put forward must also be compliant with the Directive.

230.200 VAV /CAV TERMINAL UNITS:

- Provide variable / constant air volume units with facility to limit air flow between pre-set minimum and maximum limits. Ensure pressure drop across unit is less than 250 P at design flow rate. Pre-set air flow regulators at manufacturer's works.
- Pressure-independent devices venturi Valves, can be mounted next to an elbow, transitions or branches without affecting accuracy, valve mechanically correct static pressure fluctuations without involving a controller.
- Duty

    - Terminal heater battery
    - Sound attenuator

- Casing

        - Fabricate from mild steel sheets and stiffeners without sharp edges and incorporate fixing lugs. Do not use self-tapping screws.

    - Finish
        - Protect against corrosion internally and externally and finish with stoved primer
    - Duct Connections
        - Upstream
            - Suitable for attachment of circular connection.
        - Downstream - Flanged
    - Components
        - Self-acting constant volume control to maintain air quantity to plus or minus 5 per cent of design quantity up to 2 kPa air static pressure.
        - Acoustic insulation lining.
        - Device actuated by thruster responsive to thermostat to vary air flow.
    - Access
        - Provide access to moving parts by cover plate incorporating an air-tight seal. Ensure moving parts can be removed as one piece for single duct units.
    - Testing
        - Ensure manufacturer's ratings comply with BS EN 12589 and where appropriate BS 4857.

230.210 INSTALLATION:

- Install VAV / CAV terminal units in accordance with manufacturer's recommendations.

Z240 - AIR HANDLING UNITS

240.010 GENERAL:

- Comply with general clauses below
    - AHU's general mechanical performance and testing/rating - reference Y40.1000
    - AHU's generally for healthcare buildings and mechanical performance and testing / rating - reference Y40.1001
- Ensure all electrical equipment supplied and installed is suitable for the power supply indicated.
- Provide details of electrical input, starting and performance characteristics of all motors.
- Where appropriate ensure motors and drives are supplied complete with keys and keyways.
- Comply with section Y92A for specifications of starters and VSD
- Spare parts
    - Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
        - Filters: Furnish 1 set for each central-station air-handling unit.
        - Fan Belts: Furnish 1 set for each central-station air-handling unit fan.
        - Gaskets: Furnish 1 for each sectional joint of each central-station air-handling unit.

240.020 AIR HANDLING UNITS DUTY AND CONSTRUCTION:

- Air leakage
    - Casing air leakage class to BS EN 1886 - reference Y40.1010B
    - Filter bypass leakage - reference Y40.1010C
- Unit Skin Type
    - Manufacturer’s standard
    - Reference Y40.2010#
    - Double skin unit
        - Manufacturer's standard
        - Reference Y40.2020#
- Air handling unit construction
    - Detail mechanical performance requirements to BS EN 1886
        - Casing strength class
            - D1.
        - Thermal transmittance class
            - T1.

- Thermal bridging class
    - TB1.
    - Reference Y40.2030#

- Air handling unit access
    - Reference Y40.2040A
    - Permanent access platforms for double deck AHU's reference Y40.2040B.

- External air handling units - Reference Y40.2060A

240.030 AIR HANDLING UNIT FANS:

- Standards - Reference Y41.1000
- Fan selection, efficiency and EC eco-design requirements for fans - reference Y40.1020
- Fan duty
    - Centrifugal fan
        - Double inlet double width
            - Backward curved
            - Airfoil blades
            - Reference Y41.2080C
    - Overall total efficiency of fan and motor/drive combination (%) as defined in BS EN ISO 12759
    - Limiting Fan Motor Efficiency Grade to BS EN ISO 12759 (FMEG)

- Motor
    - Type
        - Asynchronous induction.
        - Asynchronous induction with VSD.
        - Permanent-Magnet Synchronous with VSD.
        - Magnet free synchronous reluctance fitted with VSD.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter and electronic controls with 0-10V control input.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter and electronic controls with 0-10V control input and integral PID controller to enable sensors to be connected directly to the motor.]
    - Standards - reference Y92.1010
    - General - reference Y92.2020
    - For belt driven fan, fit motors on slide rails - reference Y92.2030
    - Motor efficiency
        - For VSD motors: Efficiency class IE2, reference Y92.2025A
        - For constant speed motors: Efficiency class IE3, reference Y92.20205B

- Vibration isolation
    - Fan and motor
        - Mount fan/motor on galvanized steel frame with vibration isolators
        - Mount fan on spring isolators with 50mm as minimum static deflection
    - Casing - No vibration is to be transmitted to casing
- Fan section - Reference Y40.3010#

240.040 AIR HANDLING UNIT FILTER:

- Refer to clauses under Z242 / Y 42 Reference clauses for details / materials and workmanship requirements.

240.050 AIR HANDLING UNIT HEATING COIL:

- Refer to Z243 series of clause / Y 43 Reference clauses for details / materials and workmanship requirements.
- Reference Y40.3030
- Type
    - Heater Battery – Electric - Reference 243.050

240.060 AIR HANDLING UNIT COOLING COIL:

- Refer to Z243 series of clauses / Y 43 Reference clauses for details / materials and workmanship requirements.
- Reference Y40.3040
- Type
    - Chilled Water-Cooling Coil - Reference 243.030

240.070 AIR HANDLING UNIT HEAT RECOVERY EQUIPMENT:

- Refer to Z243 series of clauses / Y 43 Reference clauses for details / materials and workmanship requirements.
- Type
    - Thermal wheel - Reference 243.060
- Reference Y40.3042

240.080 ULTRAVIOLET UV-C LAMP:

- Description:
    - UV-C lamp system consisting of power supply, power supply housing, wiring, UV lamp(s), lamp plug, lamp plug protector, encapsulated lamp, and lamp holder used for UV germicidal irradiation of cooling coil and condensate drain pan.
    - Factory installed and preengineered.

- Standard: UL Category Code ABQK, HVAC accessories, air-duct mounted or equivalent European standard.
- Lamps: High output, hot cathode.
- Lamp-Holder Construction:

    - UV- and moisture-resistant materials and designed to connect the lamp to the plug.
    - Adjustable positioning.

- Lamp-Clamp Construction:

    - UV- and moisture-resistant materials, water-tight connection.
    - Adjustable positioning.

- Lamp Protection: Hermetically sealed to provide protection against lamp breakage and to ensure lamp contents from a broken lamp are contained.
- Lamp Output: UV-C energy, primarily at the 254-nm wavelength with a 360-degree energy distribution.
- Access Door Interlocks: Automatic disconnect on all access doors into UV-installed casing sections to shield servicing personnel from contact with light.
- Power Supply: UL-listed, single-point electrical connection with service disconnect.
- Power Consumption: Maximum of 161 W/sq. m

240.090 AIR HANDLING UNIT ATTENUATOR:

- Refer to Z245 series of clauses / Y 45 Reference clauses for details / materials and workmanship requirements.

240.110 AIR HANDLING UNIT VIBRATION ISOLATION EQUIPMENT

- Refer to Z252 series of clauses / Y 52 Reference clauses for details / materials and workmanship requirements.

240.130 ACCESSORIES:

- Drainage from air handling unit components

    - Refer to Z243 series of clauses / Y 43 Reference clauses for details / materials and workmanship requirements.
    - Reference Y40.3050

- Control dampers

    - Reference Y40.3060#

- Lighting

    - Provide a suitably IP rated bulkhead fitting in each of the AHU access sections and fan sections.
    - Provide switch mounted on the side of the unit.
    - Provide all wiring as part of AHU package. Terminate in a terminal box mounted on the unit.

240.140 WORKMANSHIP:

- Component assembly
- Assemble air handling units using gaskets to prevent air leakage from casing.
- Ensure air handling units are positioned to allow adequate space for maintenance and access.
- UV-C lamp system installation:

    - UV-C lamp systems shall constitute of UV-C lamps installed before, and after air handling unit cooling coil to be sized and arranged by the manufacturer to achieve the design requirements.
    - Irradiation: Quantity of UV lamps are to be installed to provide an equal distribution of available UV-C energy. When installed, UV-C energy produced shall be of the lowest possible reflected and shadowed losses, distributed in a 360-degree pattern within the cavity or plenum space.
    - Intensity: UV-C lamp system modeling shall be included in the submittal and must contain necessary calculations to demonstrate the following:

        - For coils disinfection: A minimum of (64.6 W/sq. m) of coil surface area to achieve a minimum of 100 microwatts/sq. cm equally distributed on the target surface as recommended by ASHRAE.
        - For air disinfection: Array of UV-C lamps to be provided to deliver a minimum dose of 1500 microjoules/sq. cm total to air flowing through.

- Duct connections - reference Y40.4040
- Services connections - reference Y40.4050
- Isolation of units - reference Y40.4060
- Drainage of free water - reference Y40.4070
- Supports – on builders work base.

240.150 TESTING:

- Factory tests - reference Y40.4090#
- Testing prior to incorporation into works - reference Y40.4100#
- Fit clean filters in all air handling systems (AHU's and any duct mounted units) before the systems are commissioned under validation load conditions in accordance with Annex D in BS EN 13779.

Z241 - FANS

241.010 GENERAL:

- Comply with general clauses below
  - Standards - Reference Y41.1000
    - Fans for smoke and heat control to be in accordance with BS EN 12101-3
  - Design duties, fan selection, efficiency and EC eco-design requirements for fans and ventilation units - Reference Y41.1010
  - Protection - Reference Y41.1020
- Ensure all electrical equipment supplied and installed is suitable for power supply indicated.
- Provide details of electrical input, starting and performance characteristics of all motors above 750W to an agreed format.
- Where appropriate ensure motors and drives are supplied complete with keys and keyways.
- Comply with section Y92A for specifications of starters and VSD
- Spare parts
  - Furnish one set of belts for each belt-driven fan that match products installed, are packaged with protective covering for storage, and are identified with labels clearly describing contents.
- Duty
  - Overall total efficiency of fan and motor/drive combination as defined in BS EN ISO 12759
  - Limiting Fan Motor Efficiency Grade to BS EN ISO 12759 (FMEG)
- Operating conditions
  - Supply fan to suit environment subject to
    - Contaminants
    - Weather conditions
    - Risk of impact
    - Risk of explosion: for hazardous exhaust.
    - Non-overloading requirement
  - Potentially explosive atmospheres - reference Y41.2010B
- Normal operating conditions – Reference Y41.2010A
- Construction and handling - Reference Y41.2020A
- Testing - Reference Y41.2030

241.020 FAN AND MOTOR:

- Type
  - Axial flow fan
    - Operation
      - Single.
      - [Two in series.]
    - Impellers
      - Fixed pitch.
      - Adjustable pitch.

- Casing
    - Enclosed motor and impeller
    - Reference Y41.2070#
- Inspection doors - reference Y41.3010
- Guide vanes - supply fan with guide vanes as indicated.

- Centrifugal fan
    - Single inlet single width
    - Double inlet double width
    - Reference Y41.2080#
    - Inspection doors - reference Y41.3020
- Propeller fan
    - Reference Y41.2090A
    - Inspection doors for diaphragm mounted fans - reference Y41.3030
- Mixed flow fan
    - Reference Y41.2100A
    - Inspection doors - reference Y41.3040
    - Fit automatically controlled guide vanes.
- Roof mounted fan
    - Single fan
    - Twin fan with automatic changeover
    - Reference Y41.2110#
- In line fans
    - Reference Y41.2120#
    - Installation arrangement in accordance with BS EN ISO 5801 and BS EN ISO 13349
        - A: free inlet - free outlet.
        - B: free inlet - ducted outlet.
        - C: ducted inlet - free outlet.
        - D: ducted inlet - ducted outlet.

- Materials
    - Construct casing from galvanized sheet steel in accordance with BS EN 10346 or BS EN 10143
    - Construct casing from mild steel coated with epoxy polyester finish.
- Motor
    - Type
        - Asynchronous induction with Variable Speed Drive (VSD).
        - Asynchronous induction single speed.
        - Permanent-Magnet Synchronous, with Variable Speed Drive (VSD).
        - Magnet free synchronous reluctance with VSD.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter and electronic controls with 0-10V control input.
        - EC Permanent-Magnet Synchronous with integral AC to DC converter and electronic controls with 0-10V control input and integral PID controller to enable sensors to be connected directly to the motor.

- Standards - reference Y92.1010
- General - reference Y92.2020
    - Provide protected enclosures against external mechanical impacts in accordance with BS EN 62262
        - IK 08
- For belt driven fan, fit motors on slide rails - reference Y92.2030
- Motor efficiency
    - For VSD motors: Efficiency class IE2, reference Y92.2025A
    - For constant speed motors: Efficiency class IE3, reference Y92.20205B
- Degree of protection in accordance with BS EN 60034-5
    - IP55.
- Method of motor cooling in accordance with BS EN 60034-6
- Surge suppressors
    - Manufacturer fitted - reference Y92.1040#
- Motor operating conditions
    - Standard operating conditions
    - Non-standard operating conditions (above 1000m with air conditions exceeding 40°C)
- Motors - over temperature protection
    - Thermistors - reference Y92.2060A
- Drives
    - Indirect drives
        - Toothed belt - reference Y92.2070A
        - Flat belt - reference Y92.2070B
    - Direct coupled drives - Reference Y92.2080A
    - Guards - Reference Y92.2090A
- Motor mounting classification - reference Y92.2100#

- Accessories
    - Guards - Reference Y41.3050A
    - Connections to duct - Provide matching flanges and flexible connections where indicated.
    - Shutters - Shutters to be fitted to prevent reverse flow through fan where indicated.
    - Mounting - Provide base frames/mounting brackets when there is an integral part of fan set.
    - Airflow sensor: Provide flow measurement facility - reference Y41.3110
    - Access – Provide access via hinged casing or removable panel

241.050 WORKMANSHIP

- Location - reference Y41.4010
- Attitude - reference Y41.4020
- Alignment - reference Y41.4030
- Testing - reference Y41.4040
- Drain connections - reference Y41.4050

Z242 - AIR FILTRATION

242.010 GENERAL

- Comply with work section general clauses below
    - Pressure loss data - reference Y42.1010
    - Air flow through media - reference Y42.1020
    - Seals - reference Y42.1030

242.020 FILTER:

- Type
    - Panel filter
        - Application: AHU Pre-Filter
        - Class to BS EN ISO 16890-1
        - Reference Y42.2040#
        - Filter Frame
            - Water resistant cardboard frame
            - Aluminum frame
            - Light gauge mild steel frame with corrosion resistant coating
    - Bag filter
        - Application: AHU Secondary Filter
        - Class to BS EN ISO 16890-1
        - Reference Y42.2050A
        - Terminal filter housing
            - Gasket seals - reference Y42.3030A
            - Steel frame with epoxy resin seal - reference Y42.3030B
        - Safe change filter changing unit
            - Mild steel
            - Stainless steel 316L
            - Reference Y42.3040#
    - Activated carbon filter
        - Media type in accordance with BS EN ISO 10121-1
        - Test complete devices and provide report in accordance with BS EN ISO 10121-2
        - Reference Y42.2080A
        - Media
            - Reactivated media.
        - Reference Y42.2090A
- Casings
    - With bolts, nuts and washers fixing - reference Y42.2010A
    - With captive nuts or tapped holes fixing - reference Y42.2010B
    - With clips - reference Y42.2010C
- Filter testing

- Test particulate air filters for general ventilation to BS EN 779
- Test air filters for general ventilation to relevant parts of BS EN ISO 16890
    - BS EN ISO 16890-2. Measurement of fractional efficiency and air flow resistance.
    - BS EN ISO 16890-3. Determination of gravimetric efficiency and air flow resistance versus mass of test dust captured.
    - BS EN ISO 16890-4. Conditioning method to determine the minimum fractional test efficiency
- Test complete gas phase air cleaning device and provide report in accordance with BS EN ISO 10121-2
- Accessories
    - Differential pressure indication
        - Dial gauge - reference Y42.3010A
        - Inclined manometer - reference Y42.3010B
        - Differential pressure switch - reference Y42.3010C
    - Filter housing
        - Provide filter housing to hold banks of filters rigidly in place.
    - Cleaning
        - Supply cleaning materials for metal plate filter, supply coating solution for one complete cleansing operation.

242.030 WORKMANSHIP:

- Access for maintenance
    - Reference Y42.4020A
    - Provide access
        - On upstream side of media.
        - On side of filter casing.
        - On bottom of filter casing.
        - From chamber on upstream side of media for front withdrawal.

Z243 - COILS, HEAT RECOVERY EQUIPMENT AND GAS / ELECTRIC BATTERIES

243.010 GENERAL:

- Where a heating or cooling coil, heater battery or heat recovery section forms part of an air handling unit.
    - Comply with the 240.050, 240.060 and 240.070 clauses and Y 40 References Clauses
    - Comply with relevant sections of BS EN 1886 and BS EN 13053
    - Coils shall be rated in accordance with BS EN 1216
    - Test the supply and extract sections of the AHU together as a single unit in accordance with BS EN 1886 and BS EN 13053 where a heat recovery device is included in the AHU.
- Heat exchangers and heat recovery equipment to comply with BS EN 305, BS EN 306, BS EN 307, and BS EN 308 as appropriate to the application.
- Comply with section Y92A for specifications of starters and VSD
- Spare parts
    - Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
        - Filters: Furnish one set of each type of filter specified.
        - Fan Belts: Furnish one set of belts for each belt-driven fan in energy recovery units.
        - Wheel Belts: Furnish one set of belts for each heat wheel.

243.030 CHILLED WATER COOLING COIL:

- Duty
    - Maximum working pressure (1380 kPa)
    - Coil test pressure (2070 kPa)
- Maximum air velocity
    - 2.5 m/s.
- Material
    - Tubes – Seamless round copper to BS EN 12451
    - Fins
        - Copper
    - Headers
        - Galvanized Steel
        - Copper with copper connections
    - Casing
        - Galvanized sheet steel in accordance with BS EN 10346 or BS EN 10143
        - Stainless steel
    - Reference Y43.2010#
- Accessories

- Drip tray - reference Y43.3010
    - Provide removable drip trays.
    - Material
        - 316 stainless steel.
- Drain traps
    - Material
        - Plastic.
    - Arrangement
        - Under suction
        - Reference Y3020#
- Eliminator plates - reference Y43.3030.
- Duct connections
    - In AHU - reference Y43.3050A
    - Duct Mounted
        - External flange - reference Y43.3050B
- Matching flanges ductwork - provide to suit coil.
- Matching flanges pipework - provide to suit coil.
- Anti-freeze thermostat - position where indicated.
- Auto air purging valve
- Access doors - provide to allow adequate access for maintenance. Provide access for cleaning to both sides of the coil on healthcare projects.
- Access walkway - provide for maintenance access.

243.050 HEATER BATTERIES - ELECTRIC:

- Duty
    - Maximum air velocity (m/s) 2.5
- Heater
    - Duct mounted - reference Y43.2040#
        - Flanged for rectangular ductwork.
        - Spigot connection for circular ductwork.
    - Heating element
        - Supply heating elements mounted on removable terminal plate
        - Metal sheathed tubular elements
        - Finned tubular elements
        - Open coil bare wire elements
- Casing
    - Material
        - Galvanized sheet steel
        - Stainless steel

- Finish – Manufacturer's Standard

- Control
  - Modulating thyristor control.
- Accessories
  - Matching flanges ductwork - provide to suit coil.
  - Access doors - provide to allow adequate access for maintenance.
  - Access walkway - provide for maintenance access.

243.060 THERMAL WHEELS:

- Type
  - Non-hygroscopic (heat transfer only)
  - Hygroscopic (heat and moisture transfer)
- Where the thermal wheel forms part of an air handling unit AHU, test the supply and extract sections together as a single unit in accordance with BS EN 1886 and BS EN 13053
- Materials
  - Rotor
    - Material
      - Epoxy coated aluminum for unit in corrosive environments
    - For enthalpy wheels, rotors are to be coated with silica gel.
  - Seals - Manufacturers' standard to suit environment.
  - Casing
    - Aluzinc steel for non-corrosive environment
    - Stainless steel for corrosive environment.
- Accessories
  - Bypass damper.
  - Adjustable purging sector.
  - Speed controller.
- Drive system
  - Motor
    - Motor with variable speed drive.
- Reference Y43.2060

243.100 WORKMANSHIP

- Position/location of coils and heat recovery equipment in distribution system - reference Y43.4010
- Connections
  - Cooling coil - reference Y43.4020A
  - Heating coil - reference Y43.4020B

- Coils to be fully supported independently of adjacent ductwork.
- Protection - reference Y43.4040
- Equipment installation - reference Y43.4050

Z245 - SILENCERS AND ACOUSTIC TREATMENT

245.010 GENERAL:

- Comply with work section general clauses below
    - Performance - reference Y45.1010
    - Testing - reference Y45.1020
    - Protection - reference Y45.1030
    - Direction of flow - reference Y45.1040
- Comply with IGEM/UP/10 and BS 6644 for silencers in fan diluted flue systems. Material of construction to be 304 stainless steel.
- Provide a 'Melinex' lining in front of the infill to prevent product migration or contamination of the infill in the following applications. Full account of the reduction in performance of the silencer brought about by the addition of the membrane shall be made when selecting silencers to meet the required performance
    - Healthcare premises

245.030 SILENCERS:

Insertion loss (dBA): according to the final acoustical study that intent to achieve the required noise level in the space

- Duty : Generator radiator fan, 2.4m length silencer
- Noise reduction spectrum
    - 63 Hz (dB) [11]
    - 125 Hz (dB) [19]
    - 250 Hz (dB) [30]
    - 500 Hz (dB) [50]
    - 1 kHz (dB) [50]
    - 2 kHz (dB) [43]
    - 4 kHz (dB) [34]
    - 8 kHz (dB) [28]
- Pressure rating of ductwork system: As designed.
- Resistance to air flow (Pa): As designed.
- Infill protection
    - Fibre glass scrim bonded to the rear of the linings and the galvanised sheet steel mesh of the splitter facings.
    - "Melinex" polyester film to be provided in front of the infill in the following applications:
        - Systems serving clinical areas in healthcare applications
        - Minimum thickness of Melinex film 23µm

- Full account of the reduction in performance of the silencer brought about by the addition of the infill protection shall be made when selecting silencers to meet the required performances.

- Fire properties
  - BS 476-7, Class 1
  - Building Regulations Class O
  - Reference Y45.2010#

- Circular silencers - metal
  - Casing to DW/144.
    - External flanges - reference Y45.2020A
    - Internal flanges - reference Y45.2020B
    - Spigot ends - reference Y45.2020C

- Circular silencers - non-metal
  - External flanges - reference Y45.2030A
  - Internal flanges - reference Y45.2030B
  - Plain spigot ends - reference Y45.2030C

- Rectangular silencers - metal
  - Casing to DW/144
    - Manufacturer's standard ends to splitters
      - Connections to match AHU - reference Y45.2040A
      - External flanges - reference Y45.2040B
      - Internal flanges - reference Y45.2040C
    - Low loss fairings
      - Connections to match AHU - reference Y45.2040D
      - External flanges - reference Y45.2040E
      - Internal flanges - reference Y45.2040F

- Rectangular silencers - non-metal
  - Manufacturer's standard ends to splitters
    - External flanges - reference Y45.2050A
    - Internal flanges - reference Y45.2050B
    - Spigot ends - reference Y45.2050C
  - Low loss fairings
    - External flanges - reference Y45.2050D
    - Internal flanges - reference Y45.2050E
    - Spigot ends - reference Y45.2050F

- Acoustic splitters
    - To manufacturer's standard - reference Y45.2060A
    - With low loss fairings - reference Y45.2060B
- Air transfer/cross talk attenuators
    - External flanges - reference Y45.2070A
    - Internal flanges - reference Y45.2070B
    - Spigot ends - reference Y45.2070C

245.060 ACOUSTIC FLEXIBLE CONNECTORS:

- Duty
    - Insertion loss (dBA) : according to the final acoustical study that intent to achieve the required noise level in the space
    - Pressure rating of ductwork system: As designed.
    - Resistance to air flow (Pa): as designed.
- Fire properties
    - BS 476-7, Class 1 - reference Y45.2010A
    - Building Regulations Class O - reference Y45.2010B
- Reference Y45.2110

245.070 ACOUSTIC LOUVRES:

- Manufacturer and reference
    - Use manufacturers of assessed capability to BS EN ISO 9001 and produce louvre to relevant Quality Assessment schedule.
- Duty: louvers in ancillary building.
    - Minimum noise reduction spectrum
        - 63 Hz (dB) [6]
        - 125 Hz (dB) [6]

- Fire properties
    - BS 476-7, Class 1 - reference Y45.2010A

- Building Regulations Class O - reference Y45.2010B

- Acoustic louvres

  - Reference Y45.2120A
  - With infill - reference Y45.2120B
  - Infill protection
  - Fibre glass scrim bonded to the rear of the linings and the galvanised sheet steel mesh of the splitter facings.
  - " Full account of the reduction in the performance of the acoustic louvre brought about by the addition of the infill protection shall be made when selecting silencers to meet the required performances.

- Arrangement

  - In breakdown form for site assembly.
  - In modular panel form.

    - For assembly on-site to form an enclosure complete with roof and door.

245.090 WORKMANSHIP

- Access to acoustic enclosures - reference Y45.3030
- Supports - reference Y45.3040
- Sound power level readings - reference Y45.3060

Z246 - GRILLES DIFFUSERS AND LOUVRES

246.010 GENERAL:

- Comply with work section general clauses below
    - Performance - reference Y46.1010
    - Size - reference Y46.1020
    - Noise levels - reference Y46.1030
    - Protective wrapping - reference Y46.1033
    - Electrical bonding terminal - reference Y46.1040

246.020 GRILLES:

- Subjected to engineer approval
    - Electrical bonding terminal - reference Y46.1040
    - Fixed blade type
        - Blade Rows
            - One set of straight blades.
            - One set of angled blades.
            - Horizontal.
            - Vertical.
        - Air pattern control
            - Rear set of individually adjustable blades perpendicular to front set.
            - Set fixed blades at angle to the horizontal as indicated.
        - Reference Y46.2010#
        - Material
            - Aluminum
            - Reference Y46.2210#
    - Adjustable blade type
        - Blade Angles
            - Allow each blade in a row of blades to be individually adjustable.
            - Allow all blades in a row to be linked and adjusted by an operating key or lever.
        - Reference Y46.2020#
        - Material
            - Aluminum
    - Mesh type
        - Core material

Z250b - THERMAL INSULATION - PLUMBING

250.010 GENERAL:

- Comply with work section general clauses reference below
    - Temperature range - reference Y50.1010
    - Standards - reference Y50.1020
    - Materials - reference Y50.1030
    - Pre-insulated equipment - reference Y50.1032
    - Protection applied in situ - reference Y50.1034
    - European classification for reaction to fire performance - reference Y50.1035A
    - Spread of flame - reference Y50.1050A
    - Smoke emission characteristics - reference Y50.1055
    - Electrical bonding terminal - reference Y50.1080
    - Inspection and testing - reference Y50.1090
- Allow for inspection of insulation on all systems for correct thickness and compliance with specification .
- Insulation thicknesses
    - Reference Y50.2289

250.018 F GAS REGULATION:

- Use insulating materials that comply with EC Regulation 842/2006 The F Gas Regulation, on certain fluorinated greenhouse gases.

250.019 OZONE REGULATION:

- Use insulating materials that comply with EC Regulation 1005/2009 The Ozone Regulation, on substances that deplete the ozone layer.

250.040 CLOSED CELL MATERIALS THERMAL INSULATION - PIPEWORK:

- Application :hot water supply / return.
- Thermal conductivity - reference Y50.2010
- Thermal performance life expectancy
    - For plant design life - reference Y50.2015A

- Vapour barrier permeance
  - Reference Y50.2170

- Vapour barrier coatings
  - Bitumen - reference Y50.2180A
  - Vinyl - reference Y50.2180B
  - Solvent polymers- reference Y50.2180C
  - Bitumen emulsion- reference Y50.2180D

- Adhesives - reference Y50.2190
- Protection
  - Self-adhesive multi-layer laminate covering - reference Y50.2200A
  - Roofing felt - reference Y50.2200B
  - Flat aluminium-zinc coated steel - reference Y50.2200C
  - Ribbed aluminium-zinc coated steel - reference Y50.2200D
  - Aluminium sheeting - reference Y50.2200E
  - Canvas - reference Y50.2200G
  - Canvas with aluminium bands - reference Y50.2200H

- Reinforcement - Reference Y50.2210#
- Valve and flange insulation
- Thickness table
  - Insulation thickness calculation methods, ECA Enhanced - reference Y50.2287
  - Insulation thickness tables - reference Y50.2289
  - Non-domestic hot water supply services, ECA Enhanced maximum permitted heat losses - reference Y50.2307
  - Domestic central hot water systems, ECA Enhanced maximum permitted heat losses - reference Y50.2331

250.080 THERMAL INSULATION - PLANT:

- Materials
- Thermal conductivity - reference Y50.2010
- Thermal performance life expectancy
  - For plant design life - reference Y50.2015A
  - Details - reference Y50.2015B

- Restrictions on use of materials - reference Y50.2020
- Mineral fibre insulation for hot water storage vessels
  - Resin bonded slabs

- Closed cell rigid phenolic foam (PF) slab
  - Obtain written confirmation from the manufacturer that the material is CFC and HCFC free.
  - Foil faced - reference Y50.2120A
  - Reference Y50.2120B

- High density phenolic pipe support foam
    - Reference Y50.2130A
    - Obtain written confirmation from the manufacturer that the material is CFC and HCFC free.
- Closed cell nitrile and EPDM rubber elastomeric sheet and preformed sections.
    - Reference Y50.2140A
- Vapour barrier coatings
    - Bitumen - reference Y50.2180A
    - Vinyl - reference Y50.2180B
    - Solvent polymers- reference Y50.2180C
    - Bitumen emulsion- reference Y50.2180D
- Adhesives - reference Y50.2190
- Protection
    - Self-adhesive multi-layer laminate covering - reference Y50.2200A
    - Roofing felt - reference Y50.2200B
    - Flat aluminium-zinc coated steel - reference Y50.2200C
    - Ribbed aluminium-zinc coated steel - reference Y50.2200D
    - Aluminium sheeting - reference Y50.2200E
    - Canvas - reference Y50.2200G
    - Canvas with aluminium bands - reference Y50.2200H
- Reinforcement - Reference Y50.2210#
- Protection for heat exchangers and other vessels
    - Aluminium
        - Reference Y50.2230A
        - With chest covers - reference Y50.2230B
        - Aluminium-zinc coated steel
    - Multi-layer laminate - reference Y50.2230E
- Supply cylinder jackets
- Pumps and other irregular shapes - reference Y50.2280
- Thickness of insulation
    - Unless specified otherwise elsewhere, the thicknesses for flat surfaces or irregular shaped plant items shall not be less than that for the largest pipe size given in the thickness tables below
    - Insulation thickness tables - reference Y50.2289
    - Non-domestic hot water supply services (Building Regulations)
        - Rock mineral wool - reference Y50.2290
        - Glass mineral wool - reference Y50.2295
    - Domestic hot water systems, Building Regulations (rock mineral wool) - reference Y50.2330
    - Nitrile rubber - reference Y50.2440

- Thickness of insulation to BS 5422 for process pipework and equipment- reference Y50.2490#.

250.090 WORKMANSHIP PIPEWORK INSULATION:

- General - reference Y50.3010
- Installation of foil faced phenolic foam insulation - reference Y50.3030
- Installation of closed cell nitrile rubber insulation - reference Y50.3050
- Installation of protection
    - Polyisobutylene (PIB) - reference Y50.3120
    - Self-adhesive multi-layer laminate covering - reference Y50.3125
    - Sheet metal finish
        - Reference Y50.3130A
    - Canvas - reference Y50.3150
    - Roofing felt - reference Y50.3160
    - Aluminium sheeting - reference Y50.3170
    - Aluminium-zinc coated steel - reference Y50.3180
    - Rigid PVC - reference Y50.3190
- Flanges and valves - reference Y50.3210
- Installation where insulation is carried through pipeline support
    - Reference Y50.3230A
    - Closed cell insulation - reference Y50.3230B
- Liquid vapour barriers - reference Y50.3260
- Integrity of vapour barriers - reference Y50.3270

250.110 WORKMANSHIP EQUIPMENT INSULATION:

- General - reference Y50.3010
- Installation of insulation on tanks - reference Y50.3090
- Installation of mineral wool insulation on vessels - reference Y50.3100
- Installation of phenolic foam insulation on vessels - reference Y50.3110
- Installation of protection
    - Polyisobutylene (PIB) - reference Y50.3120
    - Self-adhesive multi-layer laminate covering - reference Y50.3125
    - Sheet metal finish
        - Reference Y50.3140A
    - Canvas - reference Y50.3150
    - Roofing felt - reference Y50.3160
    - Aluminium sheeting - reference Y50.3170
    - Aluminium-zinc coated steel - reference Y50.3180
    - Rigid PVC - reference Y50.3190
- Liquid vapour barriers - reference Y50.3260
- Integrity of vapour barriers - reference Y50.3270

Z251 - TESTING AND COMMISSIONING OF MECHANICAL SERVICES

251.010 GENERAL:

- The specifications of this section applies to HVAC, plumbing, and firefighting works.

251.020 SPECIALIST:

- Use a commissioning specialist who is a member of The Commissioning Specialists Association (CSA).
- Or approved equivalent

251.030 STATIC TESTING:

- Carry out air pressure and leakage testing on air ductwork in accordance with specification section covering air ductlines and ancillaries.
- Carry out pressure / leakage testing of builders work air shafts, voids and floor plenums where they are used for supply ventilation - reference Y51.2015
- Pressure testing
    - General - reference Y51.2010
    - Hot and cold water supply systems, water circulating systems (LTHW, MTHW, HTHW, chilled and condenser water) and steam and condense lines - reference Y51.2020
    - Underground pipework
        - Reference Y51.2030#
        - Test pre-insulated bonded steel pipe systems for district heating in accordance with BS EN 13941.
        - Test pre-insulated non bonded pipe systems in accordance with the system manufacturer's recommendations.
        - Test pre-insulated bonded flexible pipe systems in accordance with the system manufacturer's recommendations.
    - Underground cold water supply mains - reference Y51.2040
    - Fire risers - reference Y51.2050
    - Refrigerant pipework
        - Strength pressure test
        - Leak test
        - Deep vacuum test
        - Reference Y51.2055#
    - Oil pipework - reference Y51.2065
    - Condense and overflow systems - reference Y51.2075
    - Soil, waste, ventilation, anti-syphon and rainwater pipework - reference Y51.2080
    - Underslab drainage - reference Y51.2090
- Vacuum testing - reference Y51.2100
- Provide an air compressor and subject the pipework to sectional testing by air at low pressure (not exceeding 0.5 bars) before commencing any flushing or testing with water.
- On completion of all cleaning, flushing and air testing operations, recharge each system with clean water and subject them to sectional hydraulic tests of one and a half times the working pressure.

- There is to be no loss of pressure for a period of not less than 30 minutes for each test.

251.040 COMMISSIONING:

- Commissioning codes - reference Y51.3020
- Commissioning
    - Water distribution
        - Including BSRIA pre-commissioning check list
        - Reference Y51.3030
    - Air distribution
        - Including BSRIA pre-commissioning check list
        - Reference Y51.3040
    - Boiler plant - reference Y51.3050
    - Gas plant and systems - reference Y51.3055
    - Refrigerating systems - reference Y51.3060
    - Automatic control systems - reference Y51.3070
- Instruments and gauges
    - Reference Y51.3090A
- Commissioning records
    - For air systems
        - To BSRIA Guide BG 49/2015 - reference Y51.3100A
    - For water systems
        - To BSRIA Guide BG 2/2010 - reference Y51.3100B
- BMS commissioning
    - Control system specification details required for commissioning - reference Y51.3110
    - Pre-commissioning - reference Y51.3120
    - Plant ready for control system commissioning
        - Reference Y51.3130A
    - Control system requirements for plant commissioning - reference Y51.3140
    - Commissioning of building services as required by ADL2 (Section 5.16-5.28).
    - Commissioning of building services as required by Scottish Technical Handbook Section 6.7.
    - Commissioning - reference Y51.3150

251.042 SEASONAL COMMISSIONING:

- Seasonal commissioning - reference Y51.3025
- The seasonal commissioning shall prove that the operating performance of the following building services systems and associated equipment is as specified
- Commissioning codes - reference Y51.3020
- Work to be completed over a minimum 12 month period after building occupation
    - Testing of services under full load conditions
    - Re-commissioning of systems after any work needed to serve revised loads

- Updating of record documentation

251.050 PERFORMANCE TESTING:

- System performance testing - reference Y51.4010
- Testing of residential ventilation systems - reference Y51.4015
- Specific Fan Power Validation tests (SFPv)
    - After fitting clean filters, air handling systems to be commissioned under validation load conditions in accordance with Annex D in BS EN 13779. Measure the specific fan power SFPv of each system for calculation of the building "as constructed" CO_2 emission rate.
- Environmental tests for HVAC systems
    - Artificial loads - reference Y51.4020A
    - Ambient Air Quality - reference Y51.4020B
- Recorders - reference Y51.4030
- Testing to specified conditions - other systems
    - Rainwater Systems
        - Demonstrate by flow tests that the systems give satisfactory performance.
    - Sanitary Systems
        - Comply with performance tests given in BS EN 12056.
    - Hot and Cold Water Systems
        - Demonstrate that outlets supply adequate rates of flow.
        - Demonstrate that the hot water temperature at each outlet reaches designed temperature within one minute of turning on the tap.
        - In installations where the HWS return is local to the outlet, demonstrate that the hot water temperature at each outlet reaches designed temperature in less than 30 seconds.
    - Fire Fighting and Smoke / Heat Control Systems
        - Comply with requirements of the local Fire Authority, with the appropriate sections of BS 9999 and BS 9990 and the appropriate systems standards detailed elsewhere in this specification.
    - Acoustic Treatment
        - Demonstrate by measured tests that noise criteria indicated have been achieved.

Z252 - VIBRATION ISOLATION MOUNTINGS

252.010 GENERAL:

- The specifications of this section applies to HVAC, plumbing, and firefighting works.
- Comply with work section general clauses below
    - Design intent - reference Y52.1010
    - Spring anti vibration mountings - reference Y52.1020
    - Locking facility - reference Y52.1040

252.020 MAT AND PAD MOUNTINGS:

- Configured mat mountings
    - Neoprene/composite fibre/synthetic rubber
        - Reference Y52.2010A
    - Natural rubber - reference Y52.2010B
    - High temperature synthetic rubber
        - Reference Y52.2010C
- Resilient mat mountings
    - Cast in base - reference Y52.2010D
- Pad mountings
    - Composite synthetic rubber - reference Y52.2010E

252.030 MOUNTINGS:

- Turret compression mountings
    - Synthetic rubber - reference Y52.2020A
        - Lockable facility - reference Y52.1040
    - Neoprene - reference Y52.2020B
        - Lockable facility - reference Y52.1040
- Spring compression mountings - reference Y52.2030
    - Lockable facility - reference Y52.1040
- Captive spring mountings - reference Y52.2040

252.040 EQUIPMENT HANGINGS:

- Turret compression hangers
- Spring compression hangers - reference Y52.2060
    - Lockable facility - reference Y52.1040
- Combined turret/spring compression hangers
    - Synthetic rubber - reference Y52.2070A
        - Lockable facility - reference Y52.1040
- Neoprene - reference Y52.2070B
    - Lockable facility - reference Y52.1040

252.050 PIPEWORK HANGERS:

- Turret compression hangersProvide turret compression hangers fabricated from
    - Synthetic rubber incorporated with hanger box.
    - Neoprene incorporated within hanger box.
    - Reference Y52.2050#
- Spring compression hangers - reference Y52.2060
    - Lockable facility - reference Y52.1040
- Combined turret/spring compression hangers
    - Synthetic rubber - reference Y52.2070A
        - Lockable facility - reference Y52.1040
- Neoprene - reference Y52.2070B
    - Lockable facility - reference Y52.1040

252.060 HORIZONTALLY RESTRAINED SPRING MOUNTINGS:

- Horizontally restrained spring mountings
    - Reference Y52.2080
    - Lockable facility - reference Y52.1040

252.070 INERTIA BASES:

- Reinforced concrete - reference Y52.2090A
    - Lockable facility - reference Y52.1040
- Welded steel frame - reference Y52.2090B
    - Lockable facility - reference Y52.1040

252.080 VIBRATION ISOLATION HOSES:

- Vibration isolation hoses - reference Y52.2100

252.090 PIPEWORK NOISE VIBRATION ISOLATION:

- Natural corkwood - reference Y52.2110A
- Reconstituted corkwood granules - reference Y52.2110B
- Rubber matting - reference Y52.2110C

252.100 WORKMANSHIP:

- Horizontally restrained spring mountings - reference Y52.3040

252.110 PIPE, WALL AND RISER SEALS:

- Sponge foam packing - reference Y52.2120A
- Mineral fibre packing - reference Y52.2120B

Z254 - IDENTIFICATION MECHANICAL

254.010 GENERAL:

- The specifications of this section applies to HVAC, plumbing, and firefighting works.
- Comply with work section general clauses below
    - Requirements - reference Y54.1010
    - New systems - reference Y54.1020
    - Existing systems - reference Y54.1030
    - Colours - reference Y54.1040
    - Performance and durability - reference Y54.1045

254.020 PIPEWORK IDENTIFICATION:

- Reference Y54.2010

254.030 DUCTWORK IDENTIFICATION:

- Reference Y54.2020

254.040 PLANT AND EQUIPMENT IDENTIFICATION:

- Lettering
    - Engraved plates filled with paint
    - Laminated plates, multi-coloured with outer layer removed for lettering
    - Clear perspex back filled to reveal lettering
- Reference Y54.2030#

254.045 GRAPHICAL SYMBOLS FOR USE ON EQUIPMENT IN ACCORDANCE WITH BS EN 80416:

- Reference Y54.2035

254.050 VALVE AND COCK IDENTIFICATION:

- Reference Y54.2040

254.080 AIR VOLUME REGULATING AND CONTROL DAMPER IDENTIFICATION:

- Reference Y54.2070

254.090 INSTRUMENT IDENTIFICATION:

- Reference Y54.2080

254.100 DANGER AND WARNING NOTICES:

- Reference Y54.2090

254.110 SYSTEM IDENTIFICATION INSTALLATION CHARTS:

- Perspex sheet glazing with frame
- Hardboard in hardwood frame and glazed
- Plastic encapsulated chart
- Reference Y54.2100#

Z290 - FIXING TO BUILDING FABRIC

290.010 GENERAL:

- The specifications of this section applies to HVAC, plumbing, and firefighting works.
- Comply with work section general clauses below
    - Preparation - reference Y90.1010
    - Manufacturer's drawings - reference Y90.1020
    - Fixings - reference Y90.1030
    - Loading details - reference Y90.1040
    - Building-in by others - reference Y90.1050
    - Size of fixing - reference Y90.1060
    - Greasing of fixings - reference Y90.1070

290.020 FIXINGS:

- Standards - reference Y90.2010
- Plugs - reference Y90.2020
- Screws - reference Y90.2030
- Non-penetrative support systems - reference Y90.2080

290.030 WORKMANSHIP:

- Drilling - reference Y90.3010
- Fixing to timber rails - reference Y90.3050
- Fixing to hollow stud/tile/block wall
    - Reference Y90.3060A
- Fixing to concrete, brickwork or blockwork
    - Reference Y90.3070A
- Fixing to metalwork
    - Reference Y90.3080A
- Fixing to structural steelwork and concrete structures
    - Reference Y90.3090A

Z291 - OFF-SITE PAINTING AND ANTI-CORROSION TREATMENT

291.010 GENERAL

- The specifications of this section applies to HVAC, plumbing, and firefighting works.
- Comply with work section general clauses below
    - General requirements - reference Y91.1010
    - Damaged finishes - reference Y91.1020

291.020 PAINT MATERIALS:

- Paint materials
    - Reference Y91.2010A
- Paint quality - reference Y91.2020

291.030 WORKMANSHIP

- Weather and other conditions - reference Y91.3020
- Cleaning and preparing for painting
    - Steel surfaces - reference Y91.3030A
    - Surfaces - reference Y91.3030B
    - Reference Y91.3030#
- Application off-site - reference Y91.3040
- Application - reference Y91.3050
- Cold galvanizing - reference Y91.3060
- Protection of bright machine parts - reference Y91.3070

Z305 - BAGGAGE HANDLING SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions of Contract and Division 1 Specification Sections, apply to this Section.

1.2 CODES AND STANDARDS

A. ICAO:

- Annex 17th – 9th edition March 2011 – security – Safeguarding International Civil Aviation against Acts of Unlawful Interference.

B. IATA:

- Airport Handling Manual (16th edition);
- Airport Development Reference Manual (9th edition);

C. Electrical and Communication

- IEC: International Electro technical commission
- NETA: the international electrical testing association
- IEE: Institute of electrical engineers

D. Fire protection:

- NFPA 1 Fire protection code
- NFPA 13 Standard installation if sprinkler systems
- NFPA 70 National electrical code
- NFPA 80 Standard for fire doors and fire windows
- NFPA 80A Recommended practice for protection for buildings from exterior fire exposure
- NFPA 101 Life safety code
- NFPA 220 Standard on types of building construction
- NFPA 221 Standard for fire walls and fire barrier walls

E. Quality Assurance / quality control

PART 2 - SCOPE OF WORKS

1. The scope of works includes all aspects of the checking the design, as necessary, manufacture, installation, all controls including hardware and software for the proposed system, testing and commissioning of the Departures, of BHS after obtaining the approval of the Engineer in case any modifications of the design.
2. The works are to include for the supply and installation of the following but not limited to:
    a. Weighing, Labeling
    b. Collector and Transport conveyors
    c. Steel Work and structure.
    d. Circulation support equipment such as dolly circulation ground marking (painting), signpost (equipment identification) and metallic protection (of

concrete column, concrete wall and equipment dimensioned to take impact loads from tugs and dollies.

e. Baggage Screening Site Cabling and trucking.
f. Laptop to be used for maintenance.
g. BHS system shall include integration to the general airport information systems (Common Use Passenger Processing and Airport Operations Database, Baggage Screening machine, Fire Alarm System (FAS), and all the required interface for the proper functioning of the system.
h. PLC control cabinets.
i. Field devices and Emergency Stop Switches.
j. Spare Parts for one-year operation are to be included under the scope of supply of this scope of work.
k. All accessories and components which are not listed above but necessary for the safe and satisfactory operation of the system.
l. Site tests and commissioning.
m. Functional specifications, O&M manuals, record drawings of all works.
n. The Baggage Handling System (BHS) package is made up of all the conveyors, automation and data processing equipment and the procedures allowing the automatic transport of bags from their input into the system to their output.

3. All equipment used for the baggage handling system must be proven design, and must be of the latest technology used successfully for a minimum period of one year in a comparable environment.
4. All equipment shall be suitable for operation 24 hours a day, 365 days a year, in the arduous duty of a regional Airport.
5. Safety, Availability, Reliability and Maintainability shall be to the highest standard and the Contractor may be requested to demonstrate these features of the equipment offered.
6. Coordinate with the company that will supply and install the EDS Hold Baggage Screening machines to ensure that the entire system will work as one unit. Coordinate the capacity of the PLC, MIS and the Operator Center Control.
7. Originating Process includes an explosives detection process, and shall therefore include additional equipment for security conveying, data processing and procedures allowing the implementation of this process. This process makes it possible to control 100% of hold baggage conveyed by the system.

PART 3 - SYSTEM DESCRIPTION

3.1 GENERAL DESCRIPTION

A. The following is a performance specification of the operation of the Baggage Handling System and is intended to serve as a guideline to highlight features which are required in the upgrade of such a system. Actual extent of works is to be decided by the Contractor's design after obtaining the approval of the Engineer.

B. Bag profile:

1. Hold Bags. The hold bags are divided into two subcategories:

a. In-gauge (IG) baggage: Baggage that is able to be fully handled by the baggage handling system, included security aspects.

b. Out of Gauge (OOG) baggage: Baggage for which at least one manual operation is performed.

C. Bag dimensions: The dimension of the hold baggage in upright-position shall be as per the table below:

Baggage Type	Length (mm)	Width (mm)	Height (mm)	Weight (kg)
Maximum "In Gauge" baggage size (mm)	900	300	750	60
Maximum "Out of Gauge" baggage size (mm)*	2500	600	1500	70

** Sum of all dimensions of OOG shall be less than 3000 mm (to be verified by the Contractor based on his equipment)*

*** Maximum conveyable baggage size is determined by the screening machine tunnel aperture, i.e. in the upright position, the maximum conveyable bag sizes are defined to be: Length: 900 mm Width: 700 mm Height: 900mm.*

D. System Description:
For the BHS system description, refer to document [Concept Design Report, KE26040-0101D-RPT-PM-01]

3.2 DESIGN PARAMETERS

A. Finishes will be selected to prevent damage from all possible combinations of atmospheric deterioration, corrosion, mould and pollution, and shall in no way be a potential health hazard to manufacturers, installers or operators. Material certificates will be requested as part of the Contractor's internal QA system.

B. Paint finishes will be powder coated, but exposed steel materials in public areas will be stainless steel of appropriate quality and surface finish. Other methods than powder coated are acceptable, but subject to approval of Contractors alternative painting specification by the Engineer.

C. Where materials are proposed by the Contractor, they shall not in any way be a potential hazard to health and the environment. The Contractor shall be deemed to have a full up-to-date knowledge of all current published research and legislation in this respect.

D. The Contractor shall warrant that none of the following will be used in the construction and manufacturing process:

1. Asbestos or asbestos-containing products.
2. Lead where the metal or its corrosive products may be directly ingested, inhaled or absorbed
3. Lead based paints and primers
4. Urea formaldehyde in quantities which may be hazardous or an irritant.
5. Materials which are generally comprised of mineral fibers, either man-made or naturally occurring, which have a diameter of 3 microns or less or which contain any fibers which are not sealed, encapsulated, or otherwise stabilized to ensure that fiber migration prevented.
6. Other substances generally known to be deleterious at the time of use.
7. Species of tropical hardwood, unless obtained from sustainable sources.

8. Chlorofluorocarbons (CFC) or any goods and materials containing the same.

E. All equipment placed by the Contractor as well as apparatus, materials and accessories used in the BHS installations shall be capable of a normal operation under the climatic conditions found in CBHS:

1. Temperature:

a.	Maximum outdoor temperature:	38ºC
b.	Minimum outdoor temperature:	15ºC

F. Contractor shall pay particular attention to air humidity, not only in open-air area but also in non-air-conditioned rooms. Materials for any part of the system shall be chosen in accordance. Implanted close to outdoor, the BHS electromechanical equipment at the new BHS building (ground floor) could be affected by above mentioned climatic conditions.

G. Running schedule: The baggage processing facility can be operated 24 hours every day of the year. Depending on the operation rate, maintenance may be performed while the system is running.

H. Noise Level: The proposed system shall be designed and installed so as to avoid the generation of acoustic noise levels that are unlawful or harmful to personnel. Noise levels at 1 m from any part of the equipment shall not exceed 75dB (A) in the Baggage hall and 65dB (A) in the Public Areas under the following circumstances. Noise measurements shall be done based on the principles described in ISO 373 6- 19799 part 6. The integration of the measurements results shall cover a time period of 15 minutes.

1. Absence of warning sounders.
2. Only that part of the system is in operation.
3. System is loaded with baggage.
4. That part of the equipment is operating at its design capacity (speed).

I. Design Loads of conveyors:

1. Continuous Load Capacity not less than 100 Kg/m.
2. Max Load 150 Kg/m
3. Conveyors shall be capable of starting under full design static load conditions.
4. Capacity: 1,200 bags/hour.

J. Bag Jam Rate Requirements:

1. The maximum acceptable bag jam event rate is 1/1000. This is calculated by taking the total number of bag jam events divided by the total number of bags in a 24-hour period.
2. No more than three bags shall be involved in any given bag jam event.

K. Tracking accuracy:

1. Tracking accuracy shall be maintained at a minimum of 99.5 percent where baggage tracking is required. This percentage will be calculated using the total number of bags inputted into the baggage system on a monthly basis.

L. Lifetime Constraints

1. Additional BHS components' lifetime: 15 years
2. Service lifetime: The service life required of the equipment is:
    a. 10 years for electromechanical equipment.
    b. 5 years for data processing equipment.
3. This service life does not apply to wearing parts (belt, drum, roller, etc.).
4. The equipment must retain their characteristics and performance throughout the agreed service life.

M. Wearing parts and spare parts

1. Wearing and rotating parts shall be designed for 24 hours/day, seven days/week, 52 weeks per annum at full load service without requiring excessive maintenance, repairs, work stoppages or direct operator supervision.
2. Wearing and rotating parts shall be designed for a minimum lifetime of 60,000 hours.
3. The equipment manufacturer shall submit warranty to ensure this required minimum lifetime of 60,000 hours. The warranty shall cover replacing any component or part that is faulty or defective at no cost to the client. Client shall not pay for shipping or handling, replaced parts shall be delivered to client store.
4. Standardization of the equipment components/parts (drum, bearing or other equipment) shall be considered.

3.3 SUBMITTALS

A. Compliance sheet to be filled in by the manufacturer of the BHS indicating the following data:

Description	Comply	Not Comply	Remarks
Item no.----			

B. Manufacturer's catalog data shall be submitted for the following items:

1. Equipment and Accessories
2. Spare Parts including parts numbers

C. Certificates of all equipment including country of origin shall be submitted for following items showing conformance with the referenced standards contained in this section:

D. Contractor shall identify critical long lead parts and shall provide cost, part number and delivery period.

E. Spare Parts list for parts needed for one-year operation are to be included under the scope of supply of this scope of work, the Contractor shall provide detail spare parts number including itemize cost. Without being limited to the following list, parts shall include:

1. Mechanical:
    a. motor reducers / electric motors
    b. bearings and bearing blocks
    c. belts- all types provided in system

d. return rollers

e. snub rollers

f. sprockets

g. drive drums and tensioning drums

h. head and tail pulleys

2. Electrical and PLC:

a. relays

b. contactors

c. thermic overloads

d. push buttons

e. emergency stops

f. Converters

g. Photo switches

h. Weighing scale elements

i. Input and output card

j. Main processor

k. Communication cables

F. Operating and Maintenance Manual: Operating and maintenance manuals shall be supplied with the installation (draft shall be submitted at least two months prior to testing and commissioning of the system, for review and approval by the engineer).

G. Manuals shall describe both operating and maintenance procedures and comprise detail information to operate, fault find and allow maintenance activities.

H. Manual shall include all maintenance detail activities and cycles for each component in the system.

I. Manual shall illustrate complete lists of the mechanical and electrical components applied in the installation with all relevant information with ordering references for replacement shall be included as well as a complete set of drawings and wiring diagrams.

J. Product information of sub-suppliers shall also be enclosed. Three hard and soft copies of each manual, written in English language, must be submitted before the completion of the total installation. Any modification to their contents required by the Engineer shall be incorporated.

K. Product Data: Equipment and Performance Data shall be submitted for all items as specified indicating use life, system functional flows, safety features, and other features such as electrical system protective device ratings.

L. Sample Warranty: Copy of manufacturer's proposed warranty, stating obligations, remedies, limitations, and exclusions.

M. Shop Drawings: Signed and sealed by a qualified professional engineer. Connection

diagrams shall be submitted indicating the relations and connections of all items. The drawings shall indicate the general physical layout of all controls items such as control cabinets, wiring details and control room layout.

1. Control cabinets: details such as size, location, Panel IP rating, Panel material, Panel color, internal components description and rating, etc.…

2. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring.

N. Coordination Drawings: Floor plans drawn to scale and coordinating the following:

1. Structural supports.

2. Wiring roughing-in requirements.

3. Determine spaces reserved for electrical equipment.

4. Access requirements around other work.

5. Required clearances for operation and maintenance.

O. The Contractor shall supply as built drawings hard and soft copy on completion of the installation. They shall include general layouts, "as finished" general arrangements and steelworks, platforms, etc.

P. Test Plan: The Contractor is to submit a detailed written Test Plan for review and approval by the Engineer prior to the start of any testing activities to include but not be limited to all static, functional, and integrated testing procedures required to assure a fully operational system.

Q. Tools: Submit a list of all special tools required to perform any kind of maintenance or repair. The list shall include part no, type and itemized price.

3.4 QUALITY ASSURANCE

A. Contractor must employ a Quality Management System complying with the program described in ISO 9001-2000, or similar system. This system shall comprise all the participants of the project within the Contractor's teams and subcontractors. The Quality Assurance Plan shall be based on the quality manuals of the Contractor and sub-Contractors.

B. The Contractor shall nominate from the beginning of the project the Quality Assurance Manager in charge of quality assurance of the whole project, who is directly linked to the Project Director.

C. The Contractor shall establish from the beginning of the project the Quality Assurance Plan based on Contractor's quality system that shall define:

1. The quality assurance plan of Contractor and Sub-Contractors considered during project life.

2. Management Master Plan:
   a. It is the leading document of the Quality Plan.
   b. It defines the organization and the list of procedures the Contractor intends to set in order to conduct the project.

D. Moreover, the Client may at his own will:

1. Inspect any of the Contractor or subcontractor facility,
2. Request any production document, as purchase order, material flow order, operation shop sheet, etc...
3. Attend any in-house test
4. Inspection of Contractor or subcontractor facility or test attendance shall be done by the Client representatives at Contractor expenses (air fares and daily allowances).

3.5 WARRANTY

A. Provide a written warranty signed by the system manufacturer and countersigned by Contractor, agreeing to furnish parts for motor failures within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion and issuance of taking over certificate.
2. During warranty period, the Contractor shall replace defective parts, with the exception of parts that are subject to normal wear.
3. All defective parts shall be supplied with no cost.

PART 4 - PRODUCTS

4.1 STANDARD COMMERCIAL PRODUCTS

A. Materials and equipment shall be standard products of a manufacturer regularly engaged in the manufacturing of such products, which are of a similar material, design and workmanship.

B. The standard products shall have been in satisfactory commercial or industrial use for 5 years prior to bid opening.

The 5-year use shall include applications of equipment and materials under similar circumstances and of similar size. The 5-year experience shall be satisfactorily completed by a product that has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 5-year field service record shall not be acceptable. System components shall be environmentally suitable for the indicated locations.

SECURITY CONSIDERATIONS

GENERAL: In line with the ICAO directives, 100% of hold baggage on outgoing flights shall be inspected to prevent explosive devices to be taken onboard. All originating and transfer baggage must be screened. This inspection process should achieve the best compromise between operating constraints (minimizing handling time, matching the throughput needed by large number of bags) and security constraints (quality of the detection process for explosives) and in the most economical way possible.

The originating BHS incorporates Hold Baggage Screening devices, making it possible to screen 100% of baggage carried by the system for departure baggage.

The security procedure for IG baggage defined is based on the principle of successive baggage inspections by Conventional CT (Computer tomography) and then by ETD equipment for un-cleared bags.

OOG baggage is sent first to screening machine and then to ETD machine and then they are opened and physically inspected in the presence of the passenger.

Contractor shall coordinate with security and screening system supplier regarding all screening units, conveyor belt integration and system interfaces.

PRODUCTS

STANDARD COMMERCIAL PRODUCTS

Materials and equipment shall be standard products of a manufacturer regularly engaged in the manufacturing of such products, which are of a similar material, design and workmanship. The standard products shall have been in satisfactory commercial or industrial use for 5 years prior to bid opening. The 5-year use shall include applications of equipment and materials under similar circumstances and of similar size. The 5-year experience shall be satisfactorily completed by a product that has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 5-year field service record shall not be acceptable. System components shall be environmentally suitable for the indicated locations.

GENERAL

The following is a complete specification for the major equipment and material. Final products and all equipment and accessories necessary to achieve the layout are to be as per manufacturer’s recommendations.

All below equipment are specified for Baggage Handling System

The following is a main specification for the major equipment and material:

Finish: Where a stainless-steel finish is requested it is to be, as a minimum, a 320 Grit polish with a 2B finish. Where a painted mild steel finish is requested it is to be an epoxy resin powder coating, galvanized sheet.

1. Drive Motor: One manufacturer is to be used for all conveyors and sorter drive motors installations.

2. Drive Drum: One manufacturer is to be used for all conveyors and machine drive drums.

3. Bearings: One manufacturer is to be used for installations.

4. Belting: All belts are to have vulcanized endless joints. All belting is to be Fire Retardant to ISO 340 or equivalent. Belting is to be supplied by one supplier.

5. Pulleys: Pulley diameters quoted are minimum dimensions. Collect/Transport Conveyor pulleys with more than 45-50 mm of belt wrap are to be fitted with external bearings.

MOTORIZED CONVEYORS REQUIREMENTS

Motorization system:

A friction drive unit to engage and drive the carrier chain unit. A SEW motor reducer of a worm gear type with a hollow shaft shall be directly fitted onto the drive shaft. An electrical soft start unit shall be included. Motor power to be selected in accordance with the length.

CONVEYING BELTS

Generalities: Items involved in present specification are the following

- Check-in belts,
- Conveying belts, which may be flat or slightly sloping,
- Flat curved belts,
- Description of components: Main technical characteristics are the following

Resistance to fire: According to EN 20340 (ISO 340),

Structure:

2 plies polyester fabric, with a woof being transversally rigid for check-in belts, for conveying belts - inclined or not - and for belts that stand transversal stress (e.g. take-away conveyors),

2 plies polyester fabric, transversally flexible, for curved conveyors, being helical or not,

Top Smooth surface: 0.5 to 1.2 mm of black hard PVC;

Top Gripping surface: 1.5 to 3.2 mm of black PVC;

Bottom side:

Soundproof; friction coefficient on steel slider bed0.2 to 0.3; equipped - if necessary - with two guidance lateral trapezoidal sections,

Total thickness: 2.4 to 9 mm (without possible guidance sections),

Electrostatic characteristics: anti-static.

Design and measurement rules of conveying belts

Generalities

The joining of belts must absolutely not be executed using hooking system, except in case of rapid replacement of a strip under working.

Both external developed lengths of each edge shall be identical.

Belts for curved conveyors, being helical or not

The bearing face is equipped with a flange, placed on the side of external diameter, in order to prevent the risks of jamming which may be caused by the space existing between belt and sidewall bottom

4.2 CONVEYORS SUPPORTS

A. Conveyors resting upon the ground

1. Conveyors are supported with trestles equipped with bracing or metallic stands (depending on height), the lower portion of them including height-position adjustment-jacks, equipped with anti-skidding pads.

2. The upper portion of trestles or metallic stands is fixed on the conveyor structure with silent blocks. These silent blocks may be insulation-mounted between the ground and the trestles or metallic stands.

3. The fixed portion of ground-conveyors supporting systems can be possibly fixed with auto-drilling or chemical pins (to be determined with the Client).

4. In case of conveyors resting upon a metal floor, each supporting system is underpinned with a whole metallic set equipped with adjustment-jacks, so that loads and points of supports can be distributed over floor beams and joists, if necessary. The fixing method applied to the fixed portion of supporting systems shall be adapted to the nature of the ground.

B. Design and measurement rules

1. Check-in conveyors frames and roller-paths shall be calculated so that they can support the loads of all the conveyors and loads resulting from working operations.

2. Elements of supporting systems are to be calculated by the Contractor, according to rules of measurements (loads to be supported) as defined below:

   a. Weight of the structure of each conveyor or each conveying mechanism,

   b. Dynamic moving stress carried out by the belt or conveying mechanism, once loaded (baggage and possible supports),

   c. Weight of a man: 80 kg

   d. Weight of maintenance tooling (e.g. sticking of belt),

   e. Load of baggage increased with the weight of handling supports, for every lineal meter, depending on conveying technologies applied. In case of crude conveying, the load to be considered is 100 kg for one lineal meter.

3. The supporting method (hanger tie rods, stands, cross-bars, intermediate supports etc.) applied to conveyors must allow the dismounting of principal components without being forced to remove the conveyors themselves.

4. Supporting methods implemented have to:

   a. Allow conveyors to be isolated from building structures or steel frameworks,

   b. Prevent vibrations coming from conveyors from being transmitted to building structures or steel frameworks.

5. Bolt-and-nut works have to be carefully locked after adjustment operations.

6. CIRCULATION SUPPORT EQUIPMENT

a. Dolly circulation ground marking (painting), signpost (equipment identification) shall be durable and resistant to dirt and dust.

b. Metallic protection of concrete column, concrete wall and equipment shall be shock resistant. For instance, column protection shall be able to support the shock of a typical full dolly traveling at its maximum speed.

4.3 Tilt Tray Sorter

The TTS track shall be completely level without any incline or declines.
The TTS layout shall conform to the manufacturers' recommended design parameters.

All TTS inductions shall consist of a 30 Degree Induction unit with strip belts and 2 or more belt conveyors for spacing baggage

4.3.1 Specific Tilt Tray Sorter Performance Requirements

TTS shall have a minimum capacity of 90 bags/min along any point in the TTS. Each TTS is logically divided into 2 sorters each with 90 bags/min capacity. The logical sorters are defined as starting with a set of initial inductions (check-in or transfer inductions), screening discharges and re-inductions and ending with discharges to the conveyors leading to ICS loading.During testing, demonstrate the throughput along both logical sorters at the same time at 95% of the required rates for a 5-minute period out of a 30-minute period while the average for the 30-minute period shall be a minimum of 85% of the required rate. To demonstrate this during testing, the screening functions may be bypassed.

Limit bags loaded in tubs from all the input points and then become separated after a TTS discharge to 0.5% of the bags that are in tubs.

Where applicable, the HLC shall determine the sort destination based on the combined information obtained from the 90-degree under-belt barcode reader plus 270-degree over-sorter barcode reader. The final sort destination shall be decided after the result of the information obtained from the 270-degree over-sorter barcode reader consolidated with all previous barcode reads.

Provide TTS induction and discharge capacity in accordance with the following table.

Table 1: TTS Minimum Performance Requirements

ID	Sorter Induction Type	Required Induction Rate
1	Originating/Transfer	45 bpm or every second tray (whichever is greater)
2	Manual Encoding	30 bpm or every third tray (whichever is greater)
3	HBS Re-Induction	45 bpm or every second tray (whichever is greater)
4	Sorter Discharge Type	Required Discharge Rate
5	Untracked Discharge	Every second tray
6	Tracked Discharge	Every third tray

4.4 Automatic Tag Reader Read Rates

Achieve a minimum Successful Read Rates as indicated in the table below (with the exception of bags on which no machine-readable tag has been applied), including bags in which the machine-readable tag is present, but is unable to be read due to tag orientation. Mis-reads of baggage tag information shall not occur. Notify the Owner of any degradation of read rates due to poor quality of tags and provide clear evidence of such poor quality and that it is affecting read rates. Tag quality shall be considered acceptable unless and until evidence of poor-quality tags is provided to the Owner.

Table 2: Minimum Required Bag Tag Read Rates (Optical/Barcode)

Type of Tag	During Testing (%)	During Live Operations (%)
Optical Tag on Originating Baggage	98	95
Optical Tag on Transfer Baggage	98	95

During FAT, carry out testing with 3 different RF tag reader suppliers in an attempt to achieve a minimum 99% successful read rate. If the read rate on all three RF tag

readers is below 99%, the RF tag reader with the highest successful read rate during the testing shall be chosen for this Contract and the read rate proven during testing shall be maintained during SATs and live operations. Provide video recording and test results from 3 different RF suppliers.

Baggage Tracking and Encoding Rates

Track all outbound conveyors from the input locations (defined as check-in take-away and transfer input belts) to the discharge onto the make-up device.

The required tracking accuracy varies depending on the purpose of the tracking.

The purpose of tracking upstream of the security process is for data gathering purposes (processing times, throughput, etc.).

The purpose of tracking during the security process and up to and including the TTS and related manual encoding lines is for security and sortation purposes.

The purpose of tracking from the TTS discharge to the make-up device is for data gathering purposes.

Tracking accuracy shall be measured along the entire process of a bag, not on a Subsystem-by-Subsystem basis.

Table 3: Raw Bag Minimum Tracking Performance Requirements

Tracking Requirement	Mis-track Definition	Minimum Performance
Data Gathering	A bag has moved out of the tracking window	95%
Security Screening Decision Zones	A bag has moved from the tracking datum by an amount greater than 300mm, or less if required by local regulations.	99%
From ATR to Final Sortation Point	A bag has moved from the tracking datum by an amount greater than 300mm	99%

For calculation of processing times, assign bags that do not successfully track the average processing time of the bags that did track successfully and had to go to Level 3 screening and manual encode.

Bags proven (as reported by BHS O&M or BHS operations staff) to have lost tracking due to being incorrectly introduced into the BHS, for instance bags with wheels down or bags that are moved out a tracking window as a result of the clearance of a bag jam, shall not be counted against the tracking accuracy. Report these situations to the Owner and request approval to deduct them from the mis-tracked bags quantity.

BDD Sizing Performance Rates

The Baggage Dimensioning Device shall accurately size 99% of all items that pass through the array. Any item detected by the present photocell but not sized by the BDD shall be treated and acted upon as an out-of-gauge item by the BHS.

Sortation Accuracy

Sortation accuracy from an encoded position (ATR or MES) of 99.9998% shall be achieved for the total number of bags input into the BHS. Demonstrate sortation accuracy during SATs; maintain sortation accuracy during any operational trials.

Start-up and Recovery Times

The expected boot time from fully powered off condition shall be as identified below:

Table 4: BHS Boot Times

BHS Condition	Maximum Boot Time
No power to the complete BHS	5 minutes
Redundant server pair (master and standby server) from a power off condition.	5 minutes
Switchover in case of a server failure	3 minutes
Operator workstation	1 minute
Any PLC or LLC controller	30 seconds

The HLC servers shall respond to all real-time requests from other BHS equipment such as ATR, PLC and any other interfacing equipment within 900 ms of receiving the request.

Data in any BHS that contains bag information data (e.g., TTS controllers or) shall be reconciled to the HLC data at all times. If the connection to the HLC is broken, download the most recent bag information first from the external interface, then followed by older bag information once the connection is re-established. The data tables shall be reconciled within 2 minutes of the connection being re-established.

Damaged Bag Limit

During each calendar month of BHS O&M, the number of damaged bags shall not exceed 1 bag per 100,000 bags handled by the BHS. Only damage caused by the BHS shall be considered for the purposes of this clause. Prove to the Owner without any reasonable doubt if there are any damaged bags, which are deemed to not be due to BHS related problems.

Minimum Redundancy Requirements

General

Demonstrate through appropriate design submittals and during SAT that the BHS meets the minimum redundancy fallback requirements as described within the TS.

Processing Path Redundancy

Power redundant Subsystems from different building power sources such that a power failure of a single source does not reduce the BHS capacity by more than 50%.

Design BHS power distribution such that any single failure in the BHS power distribution does not reduce the BHS capacity by more than 50%.

Demonstrate the redundancy concept prior to finalization of the BHS design with drawings that identify the power distribution redundancy together with LLC redundancy and the layout (physical path) redundancy.

Low-Level Control System Redundancy

Provide PLCs in the following configurations:

Table 5: LLC Redundancy

Redundancy Configuration	Sub-Systems
Hot Back-up	• Each Safety PLC
Warm Back-up	• Any subsystem whose failure affects more than 25% of the capacity of the specific BHS function. • Each TTS - (1 PLC per TTS) • Complete Bag Store
Cold Back-up	• Each Arrivals sub-system - (1 PLC per subsystem) • Each OOG sub-system - (1 PLC per Subsystem)

Connect each PLC to two network switches such that a failure of any one network line or switch shall not affect the normal function of the BHS.

Do not control parallel Subsystems of the same function from the same PLC unless they are fed from or feed a single Subsystem.

Each PLC shall only control Subsystems connected to the same power source as defined in the TS such that a failure of a PLC would not cause more Subsystems within its control to be inoperable than a failure of a power source.

High Level Control System Redundancy

The entire HLC System shall be provided in warm back-up configuration.

The failure of primary redundant equipment shall not degrade the response time of the Control System. In the worst-case scenario where every piece of primary control equipment has failed, there shall be no impact on BHS performance whatever the combination of the failure and the BHS shall continue operating on the secondary control equipment.

The BHS shall reconfigure itself automatically after redundant hardware takes control (the secondary system shall become the primary; the failed system shall become the secondary when it comes back on-line). The switch over shall be fully automatic without need for any operator intervention for the reconfiguration. The BHS shall report any hardware failure, power failure,

communication loss, etc., raise a critical alarm and inform the maintenance personnel through both graphical and textual displays on SCADA.

Backup equipment where provided shall be used as redundant equipment. All hardware, software, networking, and architecture shall comply with the requirements of the redundant system. The back-up equipment shall not be used for normal production (e.g., load sharing/balancing).

4.5 CONTROLSYSTEM REQUIREMENT

A. General:

1. New control panels shall be added to control and monitor the new system. One control panel will be dedicated to the arrival system and one dedicated panel will be dedicated to the departure system.

2. The electrical control system shall be designed for maximum security, reliability and easy access for maintenance.

3. Energy Saving: considerable energy saving, extended mechanical lifetime as well as noise reduction shall be achieved by automatic controlled starting and stopping of groups of motors, individual motors and good system management. This shall be coordinated with the existing energy saving scheme used in the existing system. Energy saving shall be achieved by software that stops those conveyors that are not required to run because there is no baggage in that area.

4. Safety: Emergency stop facilities, emergency stop push buttons without key shall be provided next to the newly added equipment. The number of e-stops stations shall be dictated by the conveyor design (for example, there should be sufficient e-stops stations for a group of conveyors). Operation of an emergency stop shall be immediate in effect being hardwired into the equipment drive contactor circuits and must stop the complete system. Emergency stops shall be of the latch release type wired direct to the main panel. Emergency stop shall have priority over all other functions. The number of emergency stops shall be mentioned in the submittal for approval.

5. The control system shall be based on the use of PLC systems.

6. The chosen PLC system shall provide support for a communication network in order to permit inter-PLC communication if required and communication between the control PLC systems and the SCADA Management Information System (MIS).

7. The Contractor shall ensure that all added control items related to PLC/SCADA system shall be supplied from Uninterruptible Power Supply (UPS)

8. The Contractor shall consider minimize the number of components used within the control system in order to reduce the required spares holding and maximize component inter-changeability.

B. Control System Architecture

1. The architecture of the control system in terms of the number of PLC systems that are proposed and the parts of the system that each control, shall be such that no single failure within a control system shall cause a system failure whose effect in throughput is greater than 50% can be caused by a single failure in the mechanical

sub system. each of the PLC cabinets, related to departure and arrival system shall consist of Hot Type Dual redundant PLC.

2. The controls architecture may be based upon centralized control and I/O or centralized control and distributed I/O at the discretion of the Contractor.

C. Deliverables

1. The architecture for the control system shall be detailed in the tenderers' response. This shall identify as a minimum the following: -

   a. Selected PLC Type
   b. Centralized/Distributed I/O configuration
   c. Communication network types and standards
   d. The number of PLC System proposed
   e. The mechanical equipment controlled by each PLC
   f. The redundancy philosophy employed to restrict failure effect.

2. A set of electrical drawings shall be included and shall consist of:
   a. Electrical layout showing all sensors, motors and terminal boxes
   b. Schematic diagrams
   c. List of all outgoing terminals
   d. Layout drawing of cabinets
   e. Layout drawing of control room
   f. Drawings of all terminal boxes

3. Functional Design Specification

   a. The Contractor shall produce a functional specification at the outset of the project using performance parameters and functions indicated in this specification. This description must include all proposed system functions including human machine interface screens, operational procedures, emergency procedures and all other aspects of the control systems, etc.… It shall also include the interface with the existing SCADA/PLC system including all required upgraded in the existing SCADA/PLC system.

   b. The Functional Design Specification (FDS) shall be approved by the customer considering that it remains the Contractor's responsibility that system meets the requirements.

4. Interface Control Documents

   a. The Contractor shall prepare interface control documents for all interfaces and obtain approvals/Sign-off from the interface system providers through the employer.

D. SCADA Management Information System (MIS)

1. The SCADA system shall be provided to perform the following functions:

   a. Display of the conveyor layout in an onscreen mimic using color change to represent the status of each item of equipment.
   b. Graphical displays shall be provided for an overview on which the whole system is visible on a single screen and detailed displays each showing parts of the system in sufficient detail to show all conveyors and associated device status. Equipment's interfaces status with SCADA should be shown i.e. (interface available, interface offline, etc…)

c. Display fault information in the form of color change of appropriate elements of graphical displays and as text messages indicating the equipment reference that the fault relates to and the nature of the fault and its occurrence time.

d. The 4 most recent faults should be shown on a banner at the bottom of each screen and a fault summary screen shall be provided which displays all active faults.

e. A historic faults screen shall be provided allowing the user to view all faults that have occurred over the past 24 hours.

f. Log statistical and fault data for use in reports such data should be held on disk for a minimum of the last complete calendar month. Statistics data shall be logged every hour; faults shall be logged on occurrence. Statistics shall log the parameter value against the time every hour; fault data logs shall include equipment reference, fault message occurrence clearance and duration times. The log file format should use Comma Separated Variable (CSV) or other format that can be easily loaded to an external package for analysis such as spreadsheet or database applications.

g. Performance report including as a minimum:

1) Throughput through each check-in desk
2) Throughput from each group of check-ins
3) System performance
4) Missed bag read at each stage
5) Record of each failure
6) Number of bags processed at each level of screening process
7) scanner performance (read/no read)

h. Performance report should use key performance indicators for performance analysis and optimization of baggage process. Measurement of KPIs such as Baggage entering the system and exiting for outbound baggage based on various criteria i.e. by flight, by Airline, By Sector, etc…. at any given duration of time as specified. KPI's shall include but not be limited to:

1) First bag / Last bag (integrated with FIDS for arrival PAX)
2) The journey time of every bag through the system including average processing time, average number of bags rejected at hold baggage screening levels.
3) Throughput of the line / hr
4) Bag tags read failure rate
5) % of OOG bags

i. Fault Report including as a minimum

1) Total Quantity of Faults
2) Total Duration of Faults
3) Top Ten Faults by total Fault Duration
4) Top Ten Faults by Number of occurrences of each fault

j. Reports shall be produced on demand for a time period selectable from a minimum of 1 hour to the maximum duration of the logged data.

k. A control screen to provide system start/stop and rote selection functions

l. The system should send alerts (faults and others as specified) to systems specified by the employer. Other alerts will be aiming at continuously improving your baggage operation

m. There should be clear separating of the reporting and analysis tasks from real time functions like sort control and baggage reconciliation

n. Centralized reporting facility, combining data from several sources to enrich the reports, allowing for analysis to stretch your systems operational ability.

o. Easy to use web-based interface with full flexibility to select intersections of information for better insight into and control of your baggage processes,

p. Enabling pro-active actions on facts instead of feelings

q. System should allow for baggage Process Trend Reports and for real- time trend analysis onscreen.

r. integrated security control, passenger profiling

s. optimization of resource usage reports

t. real-time information on system service levels

u. Performance statistics of the BHS processes including performance of screening

v. Proactive alerts for potential capacity, blockages and throughput thresholds

w. Analysis of system usage and performance by handlers and airlines

x. Proactive preventive maintenance alerts on devices and schedule tracking

y. Alerts and alarms distribution to Employer specified method such as mobile devices.

2. One laser printer shall be provided to enable statistical and fault reports to be printed.

3. The Systems disk shall be sized to ensure that the data volumes produced by the above requirements can be accommodated along with all operating software and a minimum 30% spare capacity. Moreover, storage capacity shall allow for a backup storage period of 2 years.

4. The system shall also provide a DVD+RW writer to allow large files to be extracted from the system in a means that can easily be loaded onto other computers.

5. The SCADA system shall support the chosen communication network for interface with the PLC systems.

6. It should be in contractor scope to review the BHS analysis report with the employer and verify the operational requirements. Contractor must then provide customized management report as per the requirements.

E. Control Panels

1. Control panels shall be provided to house all electrical equipment which requires control panel mounting including but not limited to:

a. PLC and I/O Hardware

b. Motor Control Equipment
c. Power Distribution
d. Emergency Stop Circuits
e. Combined thermal overload and short circuit protection switches
f. Main switches
g. Control relays
h. Power supply
i. Circuit breakers
j. Surge arrestors
k. Power, current and voltage monitoring devices
l. Protection devices
m. Lighting bulb
n. Thermostats/hygrostat
o. Fans/heater (as needed)

2. Control panels shall be built with sufficient spare room of at least 25% for future expansion. Control cabinet shall be constructed form sheet steel and finished in paint of color as per the Engineer's approval. IO spare shall ensure at least 25% spares for each type of IO.

3. All field wiring connections shall be made via terminals in the control panel.

4. Contractor to ensure that the PLC is furnished with a minimum of forty (40) percent spare control and data base processor memory.

5. Control panels shall provide door mounted controls for the following as a minimum:

   a. A panel mounted HMI (15" at least) shall be provided to indicate the operation status of the system
   b. Main door Interlocked Isolator
   c. System Enable
   d. Emergency Stop
   e. Fault Lamp with horn
   f. Control voltage on/off button + indication
   g. System on/off buttons + indication
   h. Emergency stop reset button
   i. Panels shall meet a minimum ingress protection rating of IP55 for indoor locations and IP65 (NEMA 4X) for outdoor locations. Panel construction shall be sturdy and suited to the environment.

6. Panels shall be fitted with fans/heaters connected to redundant thermostat/hygrostat to ensure equipment remains functional in the environmental conditions used for this project, same to be confirmed by cooling/heating calculation provided by the panel manufacturer
7. Motor Control

   a. Motor control circuits shall generally take the form of Direct On Line starters. Motors in excess of 4.0 kW in size shall be provided with soft start device.
   b. The Contractor shall determine and incorporate variable speed inverters drives as required by the equipment proposed and its application.
   c. All motor control circuits shall incorporate thermal and magnetic curve D circuit breakers that incorporate phase failure protection.
   d. The Contractor shall incorporate any electrically powered brake and or clutch

circuits as are required for proper operation of the equipment proposed and its application.

e. Motor control wiring shall be at least 2.5 mm2 rated 500 Volt.

f. Contractor shall consider reverse operation for reverse operated motors as mentioned in the drawings.

F. Field Devices

1. Field Devices such as photo electric cells proximity switches etc shall be selected to be suited the duty imposed on them by their application and should be included but not limited to:

   a. Local Motor Isolators
   b. Photo Electric Cells
   c. Emergency Stop Push-buttons
   d. Emergency Stop Tripwire Assemblies
   e. Photo electric cells
   f. Proximity switches
   g. Audible and visual alarm, etc….

2. Consideration shall be given to selecting devices so as to minimize the number of different parts and maximize the component inter-changeability.
3. Devices shall employ a plug-in type electrical connection to facilitate quick disconnection and re-connection.
4. Devices shall be securely mounted in a manner that will prevent accidental displacement or misalignment causing improper operation.
5. Devices shall be mounted so as not to cause an obstruction to baggage flow.
6. It is the Contractors responsibility to specify and provide all devices necessary for the correct operation of the system.

G. Manual Encoding Subsystem

1. General requirements:
   a. Manual encoding subsystems are secondary tag identification system providing a method to manually identify bags not properly identified by scanner arrays.
   b. The manual encoding subsystem shall consist of a small, MS Windows® based computer with a built-in monitor, a detached keyboard and a hand-held scan gun.
   c. The encode position shall include an optical tag printer for printing replacement tags as necessary.
   d. The hand-held scan gun is used with readable bar codes that were not successfully read by the scanner array.
   e. The manual encoding system shall be easily programmed and configured with clearly defined procedures.
   f. The encoding system shall be connected directly to the PLC.

2. Hardware requirements.
   a. Power fluctuations EMF and RF normally experienced in industrial and airport environments shall not adversely affect the manual encoding operation
   b. The manual encoding device shall be designed to operate in an airline baggage room environment. Separate conditioning of the power line, i.e., constant voltage transformers, shall not be required.

3. Manual Encoding System
   a. The manual encoding system shall be capable of a full range of graphic and text displays
   b. The mode of operation, numeric keystrokes of the operator or characters read by the

hand-held scan gun shall be displayed.

c. Information received in response to other user entries and entry combinations shall be displayed. This includes sort information and errors.

4. Hand held Scan Gun
   a. The handheld scan gun enables the operator identify a bag by scanning the machine-readable bag tag
   b. The tag information shall be displayed on the monitor stating that it was received from the scan gun.
   c. If the tag is readable, an audible alert should sound, and the green LED indicator on the hand-held scan gun should illuminate.
   d. The contractor shall also supply a holster type device to hold the handheld scan gun while not in use.
5. Connection
   a. Manual encoding device shall be connected by Ethernet directly to the BHS LAN
   b. Provision shall be included for transmission of tag data directly to the controlling PLC and the inclusion of a carrier ID to destination pier table.
6. Outdoor requirements
   a. The manual encoding station, handheld scan gun and the printer shall be suitable to be installed outdoor environment with specification suitable to handle Kenya. environmental conditions.
   b. Manual encoding station, handheld scan gun and the printer shall be installed under a well-ventilated outdoor cabinet (NEMA 4x) suitable to handle Kenya environmental conditions.

H. Electrical requirements

1. Cable Installation and requirements

   a. Cables shall be laid in galvanized cable trays, trunking and conduit. Cables used in the system shall comply with BS 6004. It shall be acceptable for final device terminations not to be contained however such final terminations shall not exceed 1.5m in length and in any event shall be suitably clipped to prevent undue interference with thecables.

   b. Cable trays used should be hot dip galvanized suitable to environmental condition in the project area as per related electrical specifications

   c. All Cable containment shall be sized to include for a 25% spare capacity to allow for future modifications.

   d. Cabling shall be adequately specified for its duty.

   e. The installation shall generally be of a good standard and tidy in appearance. The customer reserves the right to point out installation snags and the Contractor shall put such snags right at their cost.

   f. All field control wiring will be a minimum of 1.5mm2 single core or multi-core cables.

   g. All internal control wiring shall have low smoke halogen free outside jacket.

   h. All electric wire and cable shall be color coded and shall have wire numbers.

   i. Controls shall operate on 24 VDC. Control components shall not be subject to operation under loads exceeding manufacturer recommendation.

2. Emergency Stops

   a. The Contractor shall provide emergency stop devices for the additional equipment of the button, trip wire or press line type such that personnel will

not be more than 5 meters from an emergency stop device when working adjacent to the system.

b. The emergency stop circuits shall be zoned such that a line of sight rule is followed but with due consideration to allowing redundancy routes to remain operational in the event of an emergency stop where possible. Suitable overlap shall be provided between emergency stop zones. The Contractor shall advise in the tender response the EMS Zoning arrangement proposed.

c. In assessing the emergency stop requirements the Contractor is advised to pay particular attention to the EC machinery safety directives.

d. It shall not be acceptable to use any form of logic solving device such as a PLC in the primary Emergency stop circuits. Emergency stop circuits shall use an approved emergency stop safety relay, which provides contact monitoring. The emergency stop circuit shall be wired in a fail-safe manner using normally closed contacts on all devices.

e. All E-stop devices shall provide an additional Normally Open contact connected to its own PLC Input such that the operation of any E-stop device can be detected and displayed on the SCADA system and PLC HMI.

I. Telecom requirements

1. BHS Local area network:

a. The PLC cabinet switches shall be compatible with the existing switches and shall be connected to the existing network.

b. Cabling–Cabling shall be Ethernet 10/100/1000BaseT with unshielded twisted pair (UTP) cables, fiber optic or a combination thereof.

c. The UTP cables shall be plenum rated Cat 6 Cable defined by EIA/TIA- 568B and ISO/IEC11801 standard capable of 350 MHz All connections shall be made with RJ-45 connectors.

d. All connectors shall carry the same rating as the above cable.

e. The network cabling plant shall be arranged in a star configuration with a 10/100/1000BaseT Hub in the center.

f. All LAN cables shall be identified at both ends of the cable noting the controller or connection port. This shall also be reflected on all associated system drawings.

g. Redundancy–The LAN shall be designed in such a manner as to ensure full network capability in case of any single component failure.

2. Computer system requirements

a. Contractor shall provide all media and appropriate license keys, including but not limited to the following:

1) The original operating system

2) Databases

3) Anti-virus software

4) Any and all software that is part of the applications environment and was purchased and used in the development and / or execution of this project.

b. Contractor shall ensure that software and equipment versions shall be the latest revisions at the time of commissioning and shall be published and approved in design review meetings.

c. Contractor shall ensure that computer hardware provided to be appropriately sized for the application and identified by the Contractor in the proposal. Contractor shall ensure that the total average CPU load shall not exceed 40%.

d. Workstation components shall operate 24 hours per day, 7 days per week, and 365 days per year and maintain 99 percent availability during each operational day, excluding a four-hour window each day for maintenance and repairs.

e. Contractor shall ensure to provide System Status Monitor. Applications software running on the BHS Workstation that provides a graphical depiction of the BHS activities, alarms and other events.

f. Contractor shall ensure to provide all the passive and active components for the proper functioning of the system. Fully managed Ethernet switches shall be used.

J. Control Requirements

1. The control system interface with the check-in conveyors and shall provide a means for check-in discharge control which assures equal opportunity to all desks feeding a common collector conveyor.
2. Start-up of a subsystem shall be executed if all emergency switches controlling any zone are reset, local isolators in the subsystem are switch on and all fault conditions are reset.
3. Energy saving: The control system shall provide an automatically selected energy saving mode. This shall stop conveyors after a time period (adjustable via SCADA system and PLC HMI) since the last bag passed through each conveyor. The first conveyor in each route shall continue to run to facilitate loading of new bags. The passage of new bags through the system shall automatically restart conveyors, which have stopped in energy saving mode.
4. Dieback: The control system shall provide 'Dieback' control. If any conveyor is unavailable to accept bags arriving on the next upstream conveyor shall cause this conveyor to stop. Recovery from Dieback shall be automatic when the problem, which caused the Dieback, is cleared (i.e. when the downstream conveyor restarts, the conveyor previously stopped in die back will restart automatically). In this way the system shall handle any operational or fault conditions, which interrupt baggage, flow in an orderly and controlled fashion. Recovery from Dieback by upstream conveyor shall take place without loss of baggage tracking.
5. Each transport conveyor shall incorporate blockage detection to detect any bag jams or blockages, which may occur. Blockages or jams shall be represented on the SCADA and PLC HMI as a fault condition.
6. Operation of the emergency stops shall have an immediate action. Emergency stops shall be part of a fail-safe automation system integrated in the standard automation components. Status of the emergency stop shall be reported to the SCADA system and PLC HMI.
7. Each sub-circuit within the control panel shall be protected against short circuit, overload tripping devices shall be provided with manual reset to prevent automatic restarting.
8. Control system shall provide time-out errors on certain items where a blockage would occur
9. Control system shall be able to provide tracking and updating of the bags starting from the check-in delivery lines. Necessary sensors such pulse position indicators and photo eyes shall be used.
10. Remote support: a VPN connection shall be available for remote assistance to the PLC system. The PLC system shall be connected to a VPN server of the airport.

K. Operating modes

Control system shall be able to be operated in 3 modes

1. Nominal Mode
2. Crippled Mode
3. Maintenance Mode
4. Nominal Mode
   a. This is the system running in the normal operation. The sub-system can be started via SCADA or via the control panel. The in-line screening machines must be operational. When starting the system, first a sound a luminous indication will be present for a predefined time prior to the movement of the equipment. This mode requires the authorization of the SCADA supervisor.
   b. In case of SCADA failure, it shall be possible to start each subsystem from local control cabinets (by the mean of push button, operator terminal …): local mode.
5. Crippled Mode
   a. During this mode, defined backup scenarios can be selected. In this way, it is always possible to empty the system. Operational scenarios shall function during the sub system or system malfunction. The crippled mode shall be selected and operated by the Operation Supervisor (in agreement with Security, Customs and maintenance supervisors):
6. Maintenance Mode
   a. Maintenance supervisor (in coordination with operation supervisor) can select the maintenance mode, from SCADA or from local control

      cabinets. This mode is used in case of a breakdown or for maintenance procedures.
   b. This mode allows the maintenance operators to perform maintenance and adjustment operations.
   c. The maintenance mode does not allow automatic processes, but authorizes local individual commands.
   d. This mode allows work on a part of the system, which is then isolated of the rest of the system. The operator can then actuate each piece of equipment separately using a control box integrated in each equipment unit or which can be connected close by. When the maintenance mode is selected, automatically the subsystem shall stop.
   e. The following equipment is available for the maintenance team to perform their tasks:

      1) Control Panels

a) A switch to select the maintenance mode is available on the front panel of the control panel controlling a functional part of the system.

b) Selecting this mode shall stop the equipment within the chosen functional area.

c) Additional switches allow to locally and individually control each equipment. These commands shall only be applied to the selected equipment, without affecting the other equipment of the BHS.

2) Maintenance Laptop

a) one maintenance laptop shall be available for the maintenance team, to allow the operators to communicate with the PLC.

b) The industrial type laptop shall have the following functions:

- Analysis support (messages, alarm display…)
- Parameter setting
- Acknowledgement of some failures or problems on the system (jammed baggage, loss of follow-up, emergency stop acknowledgement, electrical failure acknowledgement…)
- Test (for example, status light).

3) Each individual device is equipped with a local maintenance box, allowing the selection of several operating modes:

a) Nominal mode

b) Maintenance mode with the possibility to control:

- Forward movement of the device
- Backward movement of the device

L. External Interfaces

1. Interface with Airport control system

a. Contractor shall coordinate the integration of the BHS control system with airport control network and as a minimum the following interface:
   1) BSM are to be received from DCS and BPM from the BHS sent to BRS or/and to DCS
   2) Flight schedule shall be received from FIDS.

b. BHS system is connected to airport network through BHS servers

c. BHS network Clock should be synchronized with the Airport network clock.

d. Programming within the BHS control system to be able to interface with the airport control systems (FIDS, DCS, etc.…) are within BHS contractor. BHS contractor and Main Works shall have to coordinate and agree on interface details, signoff and thereafter implement measures and configurations

required to enable the interfaces.

2. Interfaces with screening machines

   a. Contractor shall coordinate the integration of the screening devices in the baggage handling system.

   b. Safety interface shall be provided through safety signals as dry contacts

   c. I/O interface shall be used to physically control the transport of baggage.

   d. Data interface: this is the report on individual bags. A unique identifier and the security status is data to be exchanged. Preferable over Profibus.

3. Interface with Fire Alarm System

   a. Contractor is required to coordinate with end users and stakeholders Fire safety, Building control and Local Fire Authority for door control and program the fire and security doors.

   b. The Contractor shall coordinate to connect an input on each BHS PLC to a relay in a fire relay panel. Each PLC shall have a hardwired input for the fire signal.

   c. Fire door shall be integrated in the fire alarm system and in the SCADA system.

   d. The fire alarm system shall provide a signal to the BHS of the fire status relevant to each location of the fire doors. The fire alarm system shall not directly control any part of the system.

4. Interfaces

   a. All incidents and system failure alerts should be sent to employer's central Help Desk System.

5. General requirements

   a. It is in BHS contractor scope that system shall continue to be operational independently of the availability of interfaces and must have all functionalities available within the system to input the required information, i.e. flight schedules, Sort Allocation, etc. this doesn't apply to BSM.

M. Control room

Contractor shall provide furniture in terms of desks, equipment cabinets and chairs required by the equipment and the operators. Contractor shall ensure that coordination is taking place with electrical and telecom discipline to ensure that power and data outlets are properly located. Contractor shall ensure to allocate the required space for the SCADA workstation and the report printer. Control room setup shall be defined by Contractor and will be subject to Engineer / employer approval. Server rack related to the BHS will be included in the server's room.

PART 5 - EXECUTION

5.1 INSTALLATION

A. General

1. All installations to be made according to manufacturer recommendations and instructions. Special attention is to be given for protection against chocks by providing properly located knockers in the inbound area.

2. The Contractor is responsible for the all phases of installation during this project.

3. All workmanship and quality control shall adhere to and comply with industry construction standards.

B. Compliance with Drawing Package

1. All construction of the BHS upgrade shall follow the prescribed and agreed upon installation drawings.
2. Any divergence from these drawings will be considered out-of-specification and will be rejected unless changes are agreed upon prior to installation.
3. As-Built drawings shall accurately reflect these changes.

C. Work Duration

1. The Contractor is responsible for the timely completion of the project during the installation phase.
2. Any divergence from the schedule must be agreed upon by all parties and when necessary actions shall be undertaken by the Contractor to accelerate the installation process.

D. Employee Work Conditions

1. All tools and other construction equipment will be provided for by the Contractor.
2. All work spaces shall be kept clean and safe for employees and others who must access these areas.
3. The Contractor is responsible for the safety of all its employees while on the job site.
4. All applicable rules and regulations regarding employee behavior shall be followed.
    a. Employees shall not engage in drug or alcohol use within the facility
    b. Employees shall not, at any time, be under the influence of drugs or alcohol while at the job site.
    c. Employees shall not engage in any illegal activities while at the job site.
    d. Smoking is prohibited except in designated areas.

5.2 ACCESSIBILITY

The Contractor shall respect each of the following principles regarding the installation:

A. Platforms shall be installed in all locations where maintenance interventions are scheduled. They have to be designed to avoid any object falling down on to the lower levels (platforms and conveyors).

B. Protection and access mean of the equipment devices shall be designed to allow maintenance interventions without shutting down the surrounding devices working.

C. All maintainable organs shall be positioned on the side of the conveyors (motors, cells, belt tensioning organs…) and be accessible via the platforms.

D. The free width of maintenance way shall be at least 800 mm.

E. Portable means of intervention shall be avoided except when the technical impossibility to use stationary platforms has been systematically demonstrated.

F. The conveyors shall be spaced from walls or columns at least 300 mm provided that the other side be completely accessible, i.e.:

1. At least 800 mm free if the bottom of the conveyor is located at a height superior to 500 mmabove ground (or maintenance platform);
2. At least equivalent to the conveyor width in the other cases.

G. A 300 mm free space width shall be left in front of at least 1 front side (rectangular column) or ¼ circle (circular one) of each column, on the whole height, to allow installation of facilities (such as fire protection system…).

H. Specific means shall be put in place to receive the baggage that was accidentally ejected, in order to protect the personnel working at a lower level. Further, other means shall also be implemented to facilitate recovery of the fallen baggage.

I. Special handling means (tackles, hoists, winch and so on) shall be implemented in all locations where the maintainable unit's weight is superior to International Standards considering the intervention conditions (e.g. human intervention with one's arm straight out).

J. Shock-absorber protective materials shall fit all salient angles.

K. Access to platforms shall only be by steps (no ladder).

L. Footbridges used to cross the conveyors shall be installed so that all areas can be accessed without deviation or by-pass of more than 50 m. The footbridges must be equipped with steps, guardrails, and leave free height to enable progress of the maintenance staff in satisfactory conditions.

M. Accessibility to the devices (regarding stacked conveyors in particular) shall be possible, but under no circumstances the cable paths or outer conveyors can be used as a step.

N. Direct clearing of ground conveyors is allowed on condition that these points be marked out (no clearing possible out of mark out point) and secured by the automatic breakdown of conveyors (i.e. sensitive steps, safety line curtain, and so on). Emergency stops shall be positioned in every point of clearing.

O. Access for the operators has to be planned (and demonstrated) in order not to interfere, from the security point of view, the maintenance interventions.

P. In case of maintenance operation, any subsystem is easily disconnected of the others, which continue operating to work in goodconditions.

Q. In any case, making it impossible to observe one of these principles for particular layout restrictions, the Contractor shall make a request for deviation comprising the envisaged replacement means and/or the ergonomic studies that shall be submitted to the Employer for approval.

5.3 BELT CONNECTIONS

A. Two belts (crude, circled, or linear conveying) shall be interconnected in an overlapping manner and include chute of the upward belt on the downward belt.

B. Values of chute and overlap are function of the drum diameters used and of the nature of the adjacent conveyors (curve, flat, upward and downward conveyors, as well as injectors towards curved, flat, upward and downward conveyors).

C. Overlap shall also depend on the connection location (e.g. passage of a fire protecting

device).

D. Particular measures shall be taken concerning upward and downward belts adjacent to the X-Rays, according to the devices used.

E. This connection mode has not been considered for the special conveying modules (e.g. injection belt on to the sorting machine, if any).

5.4 Layout Requirements

1. General
   a. The Contract Drawings are intended to be a general guideline to the design of the overall BHS and do not necessarily show all the detailed segmentation of the conveyor lines. Any segmentation shown on the drawings shall, however, be followed as a minimum, except that additional queue conveyors and/or platforms may be required based on the guidelines below.
   b. Design the BHS to accommodate the following physical constraints imposed upon the BHS by either operational or facility considerations.
   c. If any design criteria cannot be maintained after the Contractor's investigation of all feasible solutions, submit an RFD for resolution.
   d. Adhere to the following guidelines for the detail design of the BHS:
2. Bag Clearance Requirements
   a. Provide a minimum bag clearance between the surface on which the bag is transported to the underside of any obstruction of 900 mm, unless otherwise noted on the Contract Drawings.
3. Minimum Staff Clearances
   a. Provide a minimum 2,100 mm of height clearance at all staff areas, all manned work areas, maintenance areas and BHS escape routes.
4. Minimum Vehicle & Staff Clearances
   a. At all make-up positions and cart/containers staging locations, maintain a minimum of 3,000 mm vertical clearance above the vehicle driving surface for the purpose of opening ULD containers with vertically hinged solid doors.
   b. The make-up cart/container staging zone shall be a minimum of 2,200 mm in width, adjacent to the make-up the operator plinths.
   c. At all other vehicle drive aisle locations, maintain a minimum of 3,000 mm vertical clearance above the driving surface.
5. Operator Plinth Sizing
   a. Unless otherwise coordinated operator plinths shall be 950 mm wide and 150 mm high.
6. Minimum Maintenance Access Requirements
   a. Provide catwalks and platforms to ensure compliance with all applicable codes, standards and the requirements of the TS. Ensure sufficient maintenance access points are provided to meet the performance criteria of the TS and to provide a safe, efficient, and easily maintainable BHS.
   b. Locate maintenance catwalks on a minimum of 1 side of all equipment unless accessible from building floor/walk surface. "Accessible" is defined as 1,800 mm or less from floor/walk surface to TOB except adjacent to high potential jam locations such as turns, merges, hinge conveyors, diverts and other similar high frequency jam locations where "accessible" is defined as 800 mm or less from floor/walk surface to TOB.
   c. All equipment shall have a primary maintenance access side from which all regular maintenance activities can be performed with the exception of a change of pulley or bearing. Locate any catwalk on this primary access side. Where maintenance activities are required on the side opposite of the primary access side, the equipment shall have a minimum clearance, when viewed from above, of 150 mm to any obstruction of 150 mm or less in width or 400 mm to any obstruction with a

width greater than 150 mm for the full conveyor and bag height clearance. Provide greater clearances where possible to facilitate maintenance activities.

d. Select motors/gearboxes that minimize protrusion into the catwalk and do not obstruct passage by maintenance personnel.

e. Catwalk shall have a nominal width of 1,000 mm and all catwalk locations shall be provided with a suitable means of access by stairs or ladders. Locate catwalk access stairs/ladders less than 40 meters apart based on catwalk travel lengths or within 20 meters walking distance to an access stair or ladder (when on the catwalk), whichever is less, unless building constraints make such a requirement impossible to achieve.

f. Provide a minimum of 1 access method for each catwalk segment; wherever possible, provide 2 access routes for catwalk more than 10 meters long. Provide a suitable number of catwalk conveyor crossovers to allow maintenance staff to cross over conveyor ROWs to access catwalk sections on opposite sides of conveyors without the need to travel down an access stairs/ladders and back up another access stairs/ladders.

g. Wherever possible, provide access stairs as the primary method to access catwalks. Where access stairs are not possible, provide ships ladders to access catwalks. Where ships ladders or access stairs are not possible, provide vertical ladders to access catwalks. Where vertical ladders are not possible, provide swing-down ladders to access catwalks. Do not locate swing down ladders in unsafe locations, such as vehicular drive aisles.

h. Design all BHS areas with a 2,100 mm minimum headroom clearance and 1,000 mm wide access clearance on platforms and walkways. In any BHS area where these requirements are not achievable revise the BHS design to comply with the TS requirements or as a final measure identify such locations within project submittals and seek resolution with the Owner. Coordinate with Others to ensure no services impede access to the BHS.

i. At any agreed locations where the clear height is less than 2,100 mm, install safety padding on the obstruction across the full length of the catwalk to protect maintenance personnel from injury. Padding shall be an appropriate and durable rubber or foam with a minimum thickness of 15 mm permanently attached without the use of adhesive tape. The padding shall be yellow with black stripes. Provide safety signage at each obstruction.

7. Minimum Routes for operational staff

   a. All access routes through the BHS to workplaces for operational staff (ground handlers, security, customs, and manual encoding staff) shall have a minimum width of 1,200 mm and a minimum clear height of 2,100 mm.

   b. Changes in elevation shall be based upon the provision of stairs; ladders cannot be accepted for operational staff.

8. Minimum HBS/CS Machine Installation/Maintenance routes

   a. Provide sufficient clearances for routes through the BHS to allow installation, removal, and maintenance of the HBS/CS Machines. If the HBS/CS Machine makes and models is not known during initial design, then provide sufficient space for routing for all HBS/CS Machines on the market and known machines under development with published dimensions. Where the HBS/CS Contractor has published requirements for such routes, then use these requirements. If there are no published route dimensions, then use reasonable sizes for movement of the largest shipping part of the HBS/CS Machine. Coordinate the list of HBS/CS Machines considered in the design with the Owner.

   b. If the HBS/CS Machine installation, removal, and maintenance route crosses other BHS equipment, such equipment shall be movable on lockable caster wheels and equipped with quick disconnect type electrical and controls connections (include clear individual makings to mitigate incorrect reassembly). Displacement and reinstatement into service of movable equipment necessary to remove or install the HBS/CS Machine shall not require more than 2 hours total.

9. ROW for Future BHS Expansions

a. Maintain clear ROWs for any future equipment as indicated in the Contract Drawings to allow the Owner to expand the BHS without the need to demolish any equipment installed under this Contract. Base clear ROWs for future equipment on the design developed for such future equipment.

10. Belt Conveyors

a. General

- Inclined and declined conveyors shall have a maximum slope of 18 degrees for non-tracking conveyors and 15 degrees maximum for tracking conveyors, unless otherwise indicated in the Contract Drawings. In all cases, where space permits a lower angle, minimize the slope utilizing the least possible incline/decline angle to achieve the proper elevation change.
- The maximum length of any conventional conveyor segment shall be no longer than 18 meters.
- Limit all power turns to no more than 90 degrees increments per conveyor.
- Avoid the use of spiral power turns wherever possible. Demonstrate that the use of spiral power turns cannot be avoided after investigating all feasible solutions.

b. Queue Conveyors

- Queue conveyors for standard gauge conveyors shall be 1,200 mm in length. A power turn of 45 degrees or more may be used as a queue conveyor, if designed with a suitable radius and equipped with a suitable drive and controls and the queuing capability with a maximum length bag is demonstrated.
- If the above requirements related the number of queue conveyors cannot be achieved due to building space limitations, then coordinate rearrangement at these locations and obtain design approval from the Owner.
- For Out of Gauge conveyors, the minimum queue conveyor length shall be 2,000 mm. Where this is not feasible an absolute minimum requirement of 1,500 mm shall apply.

c. Diverters

- Provide horizontal and vertical diverters with minimum capacities as defined in Table 26. The capacity is defined based on the diverter having to switch destinations for each bag. When the diverter does not have to switch position for each bag, the throughput shall be equal to the throughput of the conveyor line on which the diverter is located.

Table 6: Diverter Minimum Performance Requirements

ID	Diverter Type	Minimum Performance Requirement
1	VSU & VMU	25 bpm, when switching for each bag (one-for-one)
2	Pivoting Conveyor	5 activations per minute (not switching for each bag)
3	HSD	45 bpm, when switching for each bag (one-for-one)
4	LTD	5 activations per minute (not switching for each bag)

No more than 0.5% of bags in operational baggage tubs may be separated from their tubs after a discharge or divert except at the final sort output locations (discharge from conveyor onto make-up

device) where no more than 5% may be separated. Demonstrate this with typical bags transported in tubs during normal operations.

- VSUs and VMUs are to be constructed with the following capabilities:

Table 7: Design Load Capacities of VSUs & VMUs

#	Description	Requirement
1	Static Load Capacity	150 kg/m
2	Dynamic Load Capacity	50 kg/m
3	Belt Speed	As required for specified processing rates

11. Tilt Tray Sorter
    a. The TTS track shall be completely level without any incline or declines.
    b. The TTS layout shall conform to the manufacturers' recommended design parameters.
12. Tub Return
    a. All inclines and declines shall not exceed 18 degrees.
    b. The maximum length of a tub return conveyor shall be no longer than 18 meters.
    c. The height of the load conveyor shall be 400 mm from top of the curb.
    d. The maximum number of tubs in a tub stack shall be 4.
    e. Provide the quantity of queue positions as shown in the Contract Documents, at minimum. Provide additional queue positions if needed to achieve the performance requirements.
13. System Resilience
    a. The BHS shall provide sufficient resilience so that in the event of a failure on any single processing capacity, the remaining capacities are sufficient to process 75% of the peak design demand, as demonstrated through the simulation fault scenario testing.
    b. The HBSS shall be designed around an N+1 principle, where the BHS/HBSS shall have sufficient capacity to meet the peak design demand in the event of the loss of a single HBS machine.
    c. The power and controls design shall consider resilience requirements. Similar processing capacities shall be sub-divided between power supplies and control zones to ensure that the loss of a single power supply shall not disable an unacceptable % of the BHS for that processing capacity.
    d. Single points of failure shall be avoided where possible. Each shall be highlighted in submittals.
    e. Identify any instances where the BHS does not meet the resilience requirements. Demonstrate why the resilience requirements cannot be met and propose a concept of operations for the processing of bags in the event of a BHS outage. In the event the Owner does not approve the deficiency, modify the BHS design to provide additional capacity in order to meet the resilience requirements.

5.5 BHS Functional Design Specifications

a. Submit FDS's describing all Power, HLC & LLC functionalities, HMI screen interfaces and fallback procedures for failure modes of operation.
b. Prepare the FDS following the structure below:
    - FDS – System Description
        - System Description
        - Concept of Operations Description
    - FDS – Power Distribution
        - Interface to the building power supply
        - Power requirements calculation method
        - Calculated power requirements

- Redundancy of power distribution
- Grounding/Earthing method
- Power factor correct and power conditioning provisions
- Calculation of UPS requirements and details of UPS provisions

- FDS – LLC
  - Control System development and implementation master schedule
  - Schedule of System hardware employed
  - Interface with inline and check-in weighing equipment
  - Interface with HBSS/CSS equipment
  - Full and detailed description of the proposed BHS tracking algorithm
  - Full and detailed description of HBSS associated routing
  - Start-up/shutdown procedures
  - Description of BHS control logic outlined by subsystem
  - Automatic operational/maintenance/defect/status routines
  - Audio/Visual indications
  - Control station layouts/functions/operations
  - Fall-back/Anti-grid lock procedures
  - Redundancy schematics/provisions
  - Submit an overall System architecture diagram clearly identifying LLCs. At minimum, show all PLCs, power distribution up to one level above motors, network switches connected to PLCs, ATR's, CBS machines, existing PLCs that interface with the Works and any other major element of the LLCs.
- FDS – HLC
  - Interfaces to external systems
  - Interfaces to existing systems
  - SAC system
  - Empty carrier management
  - SCADA system
  - HMI/GUI
  - MIS Reporting Functionality with sample report formats
  - User Right Management
  - BVMS
  - Network and IT hardware
  - Resource planning and bag destination lookup (i.e., SAC functionality)
  - Overall System architecture diagram clearly identifying HLC with respective networks

2. BHS Layout Drawings
   a. Submit a comprehensive set of plan views, elevation/section views layout drawings defining the entirety of the BHS project scope.
   b. Demonstrate dimensions of all new, modified, and relocated equipment including conveyors, ULD stillage, racking, Steelwork and control panels.
   c. Demonstrate vertical and horizontal operational and maintenance access and vehicle clearance dimensions.

d. Demonstrate the escape routes from the BHS spaces identifying the distance of escape routes to the nearest exit. Highlight the worst-case conditions in each area of the BHS.
e. Demonstrate all Subsystem, equipment references and equipment lengths.
f. Demonstrate HBS/CSS machine replacement route clearance dimensions.

3. Conveyor List
   a. Submit a conveyor list that shall as a minimum include the following information:
      - Conveyor
        - ID
        - Type
        - Function
        - Conveyor Length
        - Conveyor Width
        - Conveyor Angle of inclination
        - Throughput Capacity
        - Belt Speed
        - Belt Type
        - Total Belt Length (endless length or length including vulcanising allowance)
        - Single or Bidirectional
        - Drive handing
        - Notes
      - Gearbox Type
      - Motor Characteristics:
        - Motor kilowatt,
        - Voltage,
        - Phase,
        - Source,
        - VFD (if applicable),
        - Circuit breaker size,
        - Efficiency (e.g., IE4),
        - Function variant description (e.g., straight, curve, etc.)
        - Overload protection.
      - Notes

4. System Power & Heat Output
   a. Submit the System power (heat output) requirements which shall include calculations for the areas of the facility listed below. The information shall include friction losses from BHS equipment and heat output from the drive motors, MCPs, and computer equipment.
   b. At minimum, provide System power information for the following areas:
      - BHS Control room
      - BHS MCP room
      - Conveyor equipment enclosures
      - Equipment grouped by different building areas based on HVAC zones
   c. Submit all the control panel sizes and related power requirements for all Subsystems of this project. Submit all the revised power requirements for the existing modified systems. The power requirements shall indicate conveyor control group and conveyor segment kilowatt removed, kilowatt added, and the total connected load of the new and existing modified Subsystems (kW, KVA, and full load amps). The electrical loading requirement of the System shall not exceed that shown in the TS.
   d. Illustrate (in colour) in plans how the BHS shall be powered to satisfy redundancy requirements.
   e. Submit the basis for calculating demand load relative to connected load including diversity factors, chosen drive size versus calculated demand, and maximum load on a conveyor versus maximum load across all conveyors simultaneously.

5. System Equipment Calculations

a. Provide a package of calculations to demonstrate how each of the BHS products and components meet all applicable performance requirements of the TS. The package shall include minimum, typical and worst-case conditions for each product type, considering:
    - Components – Pulleys, Rollers, Bearings, Belt Pull
    - Drives
    - Control Panels

6. Steelwork Typical Design
    a. Provide drawings and specification sheets to demonstrate in detail the design principles to be employed for each type of BHS Steelwork deployed on the Project.
7. System Availability Calculations
    a. Provide a detailed system availability report showing Availability, MTBF, and MTTR (as applicable for) for:
        - Individual BHS equipment (mechanical, electrical, network & IT)
        - Individual BHS Subsystems
        - Overall BHS
8. Detailed Design Specification
    a. The DDS shall comply with international software practices and shall be written such that it can be passed on to a software engineer to begin writing code and therefore it shall detail function blocks, links between function blocks and other requirements to allow coding of the software directly from the DDS.
    b. If certain parts are required to be operational prior to others, submit FDSs and DDSs for these sections of the BHS earlier than other sections.
9. BHS Control Room Equipment
    a. Submit BHS Control Room equipment requirements containing all information pertaining to the proposed computer/control hardware including:
        - A proposed room layout of equipment showing spatial requirements
        - Environmental requirements (temperature and humidity)
        - Raised floor for cable access
        - Cable routing in the Control Room
        - UPS sizes and locations
        - Fire protection and suppression
        - Electrical power requirements and distribution
        - Location of utility power outlets for workstations, printers, BVMS control station, walkie-talkie chargers, video wall and other ancillary equipment
        - Suggest lighting concept based on layout of Control Room
10. BHS Operator Interface Drawings
    a. Submit drawings demonstrating BHS-Operator/PAX interfaces. As a minimum, drawings shall include:
        - PAX to:
            - Check-In Conveyor (Standard & OOG)
            - Arrivals Carousel (Standard & OOG)
        - Operator to:
            - Control stations in public areas
            - Control Stations in non-public areas
            - MES Equipment
            - ILS
            - BCR
            - TMS
            - HBS Level 2
            - HBS Level, 3, 4 and Level 5 TCU
            - Arrivals/Transfer Input conveyor (standard & OOG)

- OOG BHS lift
- Make-up devices
- TTS maintenance station

- Provide the detailed design of:
  - Operator Interface Covers
  - Recessed Supports with Kickstrips

5.6 Spare Parts

1. General
   a. Submit the recommended spare parts and consumables inventory levels, as identified in the TS. If approved by the Owner, ensure the spare parts and consumables inventory is onsite before Preliminary Acceptance.
   b. All parts shall be designed with a lifetime of 15-years. However, this shall not relieve the Contractor of the responsibility of supplying the minimum required quantity of spare parts.
   c. The price per unit for the spare parts shall have the same monetary value as the unit price listed in the BHS Contract. The spare parts unit price shall be valid and remain unchanged through to Final Acceptance.
   d. The Owner shall be permitted to inspect the onsite spare part store at any time.
2. Spare Parts List
   a. Submit a comprehensive spare parts inventory list identifying all spare parts and quantities to be held on site by the Contractor.
   b. Organize the list by discipline and include the part description, quantity installed, recommended spare parts inventory level, lead time, supplier name and OEM part number, and price including delivery.
   c. Provide a minimum quantity of 2.5% spare parts of the totally installed quantity of each particular part, or a minimum of 1 unit for short lead time items and minimum 2 units for long lead time items, whichever is the greatest.
   d. Where parts can be replaced with alternative parts from different suppliers that have equal characteristics, such as bearings or photocells, with the same form factor, performance and connections and do not require any modification to the BHS or product, provide an alternative part supplier with a part number.
   e. The list shall include parts critical to the operation of the System but not normally used in preventative and typical corrective maintenance and may require replacement as a secondary consequence of a failure.
   f. Indicate the general storage environmental requirements for spare parts. If certain parts have special storage requirements, then identify such parts and their recommended storage conditions.
   g. Identify the estimate of spare parts consumption, including consumables, for a 10-year period.
   h. Identify any item that's of a hazardous material.
   i. Spare parts shall be identified in a spare parts list that shall include all spares required for all products supplied on the Project and shall include a consolidated set of spare parts required from the Contractor's sub-suppliers within the single consistently formatted spare parts list. The list shall, as minimum include the following:
      - Mechanical Spare Parts
        - Weighing scales
        - Conveyor frames
        - Power turn components
        - Spiral turn components
        - Horizontal Merge components
        - Horizontal Divert components
        - VSU components
        - VMU components
        - Bag Dimensioning Devices

- Lift components
- Belting
- Drive assemblies
- Motors
- Pulleys
- Rollers
- Chains
- Shafts
- Bearings
- Lubrication
- TTS trays
- TTS carriers
- TTS side guards
- TTS linear motors
- Section of TTS straight track
- Section of TTS curve track (turn)
- Vertical carousel shelf
- Vertical carousel shelf bearings
- Vertical carousel drive mechanism
- Slide bushings for Non-Powered Gravity Roller Conveyors

- Electrical Spare Parts
  - Cables
  - Connectors
  - Boxes
  - Control stations
  - Pushbuttons
  - Lanyards
  - Fuses
  - Breakers
  - Contactors
  - Capacitors
  - Varistors
  - Actuators
  - Thermostats
  - Displays
  - Beacons
  - Horns
  - Fans
  - Panel lighting
  - Press lines
  - Safety edges
- Control Spare Parts
  - Sensors
  - Switches
  - Relays
  - Light curtains
  - Laser scanner heads
  - Laser scanner blowers
  - Laser scanner controllers, network cards, connectors
  - RFID equipment (tags, readers, writers, antennas)
  - PLC CPU, RAM
  - LLC bus equipment
  - Motor starters
  - Touchscreen control panel for vertical carousel
- IT Spare Parts

- CPU
- Graphics cards
- Network cards
- Motherboards
- RAM
- Hard drives
- Power supplies

- BVMS Spare Parts
  - Camera
  - Lenses
  -
  - Video cards
  - Matrix box
  - Switches
  - Operator control station
- Paging/Intercom Spare Parts
  - Handsets
  - Speakers
  - Switch board parts
- BHS LAN and WLAN Spare Parts
  - Routers
  - Switches
  - Repeaters
  - Cables
  - Fans
  - Power Supply
  - Antennas
  - Wireless Handheld Scanner
- MES Spare Parts
  - MEC including touchscreen monitor
  - Wired handheld scanners
  - Label printers
- Consumables
  - Barcode labels
  - Lubricants
  - Fasteners, nuts, bolts, washers
  - Welding electrodes
- Made to Order Spare Parts
  - List equipment and parts that are not practical to stock as part of the spare parts inventory and provide the Owner with their appropriate lead-time and unit price delivered.

5.7 FACTORY ACCEPTANCE TEST (FAT)

A. The purpose of the factory acceptance test is to demonstrate and document the readiness to install the system at the project site. This test will validate that the system is complete, functional and that the operator interface and system reports are consistent and compliant with this specification.

B. The system shall not be installed at the project site prior to successful completion of this test.

C. The FAT shall include, but not limited to the following:

1. All graphic and text status and alarm notifications

2. All sort functionality as described in this specification

3. All operator interface functions

4. All maintenance and operations reporting functions, including the successful population of all required data fields from data collected in the execution of these tests

5. Connectivity to third party system (airport system, scanners, fire alarm panel, etc)

D. This test environment shall connect to the functional PLC's as used in the project for the purpose of providing data representative of the site environment

E. The use of simulator to provide data from scanning arrays, and other third-party system.

PART 6 - TRAINING

A. Engage a factory-authorized service representative to train Employer's operations and maintenance personnel to adjust, operate, and maintain BHS equipment. Refer to Division 1 Section "Demonstration and Training"

1. Schedule at least one (1) week of site training.

2. Provide in-class and in-field training.

3. Contractor to submit training program for review and approval by the Client and the Engineer.

4. Contractor to carry out video recording of training

5. Certificates will be issued to each case delegate. Course feedback forms will be supplied to each delegate for their completion.

PART 7 - TESTING AND COMMISSIONING AT SITE

The BHS equipment needed for the upgrade shall be installed and fully tested (mechanical and controls equipment, and software) on site by the Contractor with recommended instructions and on-site guidance in the presence of the Employer and the Engineer. Contractor is to provide the test bags needed for testing the system. The quantity of those bags shall be equivalent to at least 40% of the system's capacity.

Any deficiencies or exemptions to the Specification shall be handed on to the Contractor who shall, within an acceptable time frame, perform the corrective measures.

Equipment will be subject to site performance testing for a period of at least seven (7) days.

Site performance testing shall establish that the equipment supplied meets the requirements set out in this specification and also that the Contractor has demonstrated the equipment is capable of the performance specified in this specification.

Z300 - PASSENGER LOADING BRIDGES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions, Project Requirements and other Division 01 Specification Sections, apply to this Section.

B. Contractor shall refer the specification volume (MTB specifications sections) where items are described to match the similar FLB and MTB products. Contractor shall consider the applicable sections as part of the tender documents, and shall meet all the technical requirements, accordingly.

1.2 SUMMARY

A This Section covers Passenger Loading Bridges (PLB) as shown and as specified.

B Engineer, design, fabricate, supply, and install working Passenger loading bridges of the apron drive type with completely enclosed walkway assemblies, capable of extending from the fixed loading bridge structures to the designated aircraft parked at the concourses.

1.3 WORK INCLUDED

A Unless otherwise specified or shown, provide all plant, labour, materials, tools, equipment, apparatus, facilities, design services and perform all operations and incidentals necessary to fabricate, deliver, install, test, and certify for operation the PLB as shown. The work for each PLB includes, but is not limited to, the following:

1. Rotunda assembly complete with weathertight interfacing connections between the bridge tunnel and the fixed loading bridges.
2. Telescoping tunnel sections with glazing walls.
3. Cab with PLB control console, weathertight door and aircraft closure piece.
4. Service stairs, landings, and access door where feasible.
5. Drive assemblies including lifting and braking mechanisms.
6. Rotunda supports, including supply of foundation anchor bolts and grouting at base plates.
7. Electrical equipment and devices for power, grounding, lighting, PLB controls and monitoring including all necessary conduits, wires, cables, junction boxes and hardware.
8. Console telephone, wiring and data port for voice and data transport to Terminal.
9. Incoming main supply power interfacing cabinet.
10. Underside-mounted collapsible PLB, PCA and GPU power feeder cable systems.
11. Automatic bridge levelling system.
12. PLB movement proximity sensors.
13. PLC bridge controls with provisions for fully automatic docking system operations and interfacing with the Aircraft Visual Docking Guidance System (VDGS) provided by others.
14. Passenger Loading Bridge Control Monitoring System (PLB CMS) and

integration with aprons systems (PLB, PCA, GPU, GOS and GSE water pumping station).

15. Air conditioning units type roof tops, one at the external tunnel and one in the inner tunnel.
16. Exterior and interior finishes, lighting, insulation, and sealing as required.
17. Special tools and recommended spare parts.
18. Operations and maintenance manuals.
19. Operators training.
20. Furnish & Install a new fire extinguisher, UL Listed, ABC Rated 3A:40B:C
21. Fire Alarm installation and connections.

B PLB Schedule:

1. Refer to fleet mix.
2. Refer to the PLB Schedule, the manufacturer of Passenger Loading Bridge should provide the drawings and schedule of the final PLB because it depends on their product for unit quantity and the operational requirements for the bridges to be furnished.

C Related Gate Equipment:

1. Gate equipment to be bridge-mounted include the following:
   a. Aircraft Pre-Conditioned Air units (PCA)
   b. 400 Hz Aircraft Ground Power Units (GPU)
2. The PLB, PCA and GPU shall be supplied by the PLB Specialist Contractor (e.g., the PLB manufacturer).
3. Contractor has the overall responsibility to coordinate and interface with the PCA supplier, and the GPU supplier to ensure that these elements are properly mounted to the PLB and that they are provided with the necessary utilities to render them fully functional as intended by each of the individual manufacturers/ suppliers.
4. Similarly, when furnished by separate suppliers, Contractor has overall responsibility to coordinate and interface with the PCA and GPU suppliers and require these suppliers to coordinate together and to provide detailed requirements to the PLB manufacturer such that the interfaces among the various suppliers are clearly defined and the various components function as a complete and single integrated system, as intended.

D PLB CMS - SCOPE OF WORK

1. Revise the following paragraph(s) to suit Project. Refer to Division 27 Section “Common Clauses for IT, Security & Special Airport Systems”.
2. Other Clarifications Related to the Scope of Work:
   a. The PLB CMS shall utilize the Project Structured Cabling Network and Data Communications Network Installations. This connectivity shall form part of the Structured Cabling Network and Data Communications Network as applicable. It shall not form part of the PLB CMS system.
   b. Network switches and other similar devices which are strictly dedicated and configured for the PLB CMS system, but installed remotely from the PLB

CMS headend, shall form part of the work for the PLB CMS system.

c. Inter-wiring, conduits and related accessories, network connectivity and any other material which is specific to the PLB CMS central equipment, and which is required to provide a complete operational system, shall form part of the PLB CMS system.

d. All interfaces to the airport systems shall occur through the Master System Integration (MSI). See Annex A of Division 25 Section "Master System Integration (MSI)" of the Specifications.

3. PRODUCTS AND WORK BY OTHERS

a. The Employer may separately purchase and/or provide certain equipment and miscellaneous items that will be installed during the course of the installation process. Such items may not be indicated in the Specifications. Contractor shall coordinate with the Employer and his Suppliers when considering:

i. Structured communications system cabling, termination, identification and testing.

ii. Provision and installation of phone systems, computer hardware, racks/cabinets and related networking software and equipment.

iii. Active communication and data processing equipment.

iv. Fiber optic cabling infrastructure.

v. Provision and installation of a Virtualized Servers Environment.

vi. Provision and installation of UPS in communications rooms.

vii. Communications grounding busbars and grounding wires connecting to the main building earth electrode system.

viii. Dedicated power panels, ground busbars, circuits, floor boxes and utility outlets.

ix. Installation and finishing of plywood backboards.

x. Building mechanical ductwork, cooling/heating system and environmental control sensors.

xi. Communications pathway devices such as cable trays, conduits, conduit sleeves, and penetrations in walls and floors.

b. Accordingly, Contractor shall:

i. Meet jointly with representatives of above systems, Contractors, Operators, Engineer and Employer to exchange information and agree on details of project implementation, equipment arrangements and interface, etc.

ii. Record agreements reached in meetings and distribute record to participants.

iii. Adjust arrangements and locations of equipment in technical rooms to accommodate and optimize arrangement and ensure necessary interface with other systems.

iv. Coordinate with the other Contractors whose deliveries are necessary for the correct operation of the PLB CMS including but not limited to the Data Network, Master Clock, MIS, MSI, etc.

v. Coordinate chases, slots, inserts, sleeves, and openings with general

construction work and arrange in building structure during progress of construction to facilitate the electrical installations that follow.

vi. Set inserts and sleeves in poured-in-place concrete, masonry work, and other structural components as they are constructed.

vii. Sequence, coordinate, and integrate installing electrical materials and equipment for efficient flow of the Work. Coordinate installing large equipment requiring positioning before closing in the building.

viii. Coordinate electrical service connections to components furnished by utility companies.

ix. Coordinate installation and connection of exterior underground and overhead utilities and services, including provision for electricity-metering components.

x. Comply with requirements of Authorities Having Jurisdiction and of Utility Company providing electrical power and other services.

xi. Coordinate with the IT Contractors.

xii. Coordinate with the main Contractor for the final locations of the display units based on the adopted mounting type (pole mounted, bracket mounted or mounted on building façade).

xiii. Clearances required by International Regulations shall be respected. In case of a conflict, the issue shall be raised to the Engineer accompanied with the proposed solution for approval before proceeding with any works. It is the Contractor's responsibility to ensure that the required Regulations and Clearances are met.

1.4 WORK NOT INCLUDED

A The following work is not included in PLB package:

1. Fixed loading bridges (FLB).
2. Foundation work below the finished elevation of the apron.
3. Electrical system upstream of the main power supply interfacing cabinet.
4. Visual Docking Guidance System (VDGS) and VDGS operator panel.

1.5 DEFINITIONS

A Left and Right: When referring to “left” or “right”, the observer is positioned with his/her back to the terminal end and facing the aircraft end of the PLB.

1.6 SYSTEM DESCRIPTION

A This specification describes a system developed during detailed engineering that is considered to be suitable and appropriate. It is not intended to be prescriptive. Contractor may propose alternative arrangements provided that the system design criteria and system functional requirements are met.

B General: The PLB assemblies and the Fixed loading bridges (FLB) are designed to enable passengers to enplane and deplane completely protected from the elements during normal or

emergency operations while the aircraft is parked at the designated gate position. All the designated and alternate aircraft listed on the Schedules are accommodated.

C Scope: All necessary apparatus, equipment, and field labour and supervision to install and checkout factory assemblies and system components is included in the scope, including foundation baseplates and the bridges' flexible interfacing connections with the fixed loading bridges.

D Rotunda Assembly: The rotunda assembly is located at the terminal end of the PLB. It consists of a corridor, rotunda, and a support column. The rotunda assembly is designed so that no loads or vibrations are transmitted to the fixed loading bridges. The rotunda assembly is designed as the terminal end pivot for both PLB vertical and horizontal motions.

1. Corridor: A fixed interfacing walkway structure is provided between the rotunda and the fixed loading bridge. The corridor is designed to allow the installation of flexible weather seals and a floor threshold to the face of the fixed loading bridge.
2. Rotunda: A smooth transition between the fixed loading bridge interface and telescoping tunnels is provided. Flap type seals are provided for weather protection between the rotunda and the adjacent hinged tunnel section.
3. Support Column: A structural column, including anchor bolts, is provided to support the PLB assembly. The column is designed to rest on an apron foundation supplied by Employer. The apron foundation will be designed to meet Contractor's requirements.
4. Electrical Panel: The PLB's electrical disconnect panel is mounted on the PLB column support.

E Telescoping Tunnels: Telescoping tunnel sections are provided to connect the rotunda assembly with the cab section, with the largest cross section tunnel section physically closest to the aircraft. A hinged transition ramp is provided to accommodate the difference in elevation where telescoping tunnel sections overlap. The tunnels are moveable horizontally and the cab (aircraft) end is able to be raised and lowered as necessary to match the doorsill height of the designated aircraft. Tunnels are equipped with an underside-mounted electrical cable conveyance system through a movable drag chain in the direction of the tunnels' horizontal movements. The cable system is accessible for inspection at all PLB positions.

F Cab: A cab assembly is located on the aircraft end of the PLB. The cab is designed to rotate from the PLB / tunnel centreline so that the PLB can be fitted to the parked aircraft. The aircraft end of the cab is equipped with a folding bellows-aircraft closure. The closure is designed such that, when fitted against the fuselage, it surrounds both the open aircraft door and the doorway to protect passengers from the elements. The cab floor is adjustable to provide a smooth platform at the same height as the aircraft doorsill. No raised surfaces that may introduce a tripping hazard to the passengers are allowed, regardless of the position of the cab floor or the PLB. The cab is equipped with a forward-facing control console. An all-weather roll-up door is provided adjacent to the console to seal and secure the interior when the PLB is not in use.

G Control Station: A PLB control station is located at the aircraft cab end, where it provides the operator with a control console, service utilities, and control interlocks required to accomplish PLB operation. The control station compartment is positioned on the left side of the cab. The position of the operator is oriented to face forward in full view of the aircraft during the manoeuvring and docking operations. The PLB is designed such that operation of the PLB can be accomplished from the control console without opening the weather door.

1. Automatic control of PLB lights, roof top units and all other dependent services shall be done by the PLB PLC based on the Flight Schedule from the GOS/MIS. Unit shall switch ON/OFF at a pre-programmable time interval before and after the flight schedule.
2. PLB movement shall be interlocked with PCA unit system and GPU unit system.
3. PLB movement shall be interlocked with PCA unit cabin temp sensor in its "holder" position.
4. PLB movement shall be interlocked with GPU cable management systems.
5. Alarm from the smoke detector of the PLB shall be interfaced to the Building Fire Alarm System
6. Provide interlocks between VDGS and PLB in coordination with the VDGS contractor requirements:
    a. Bridge in – Signal from PLB to BDGS when the PLBs are not in parking position or in the safety area.
    b. PLB Lock – Signal from VDGS to PLBs when the VDGS is in docking mode, this signal locks all the PLBs movements.
7. Supply and install a pushbutton "VDGS emergency stop" on the PLB control desk.

H Control Console: A control console is provided in the operator compartment. All necessary indications and controls for all movements, interior and exterior lighting status and controls, controls and status indications for the auto-height feature for the bridge are included. The control console is protected from the outside environment.

I Service Access: The Service Access is comprised of a service door, landing and stairs leading to the apron area. One service access is provided at the cab end of each PLB, where layout constraints allow it.

J Each PLB is provided with suitable connections and outlets, prefabricated and pre-wired to accommodate the installation of telephone, data transmission, security devices, and/or intercom equipment and convenience electrical outlets at the control console. Internal lighting and under-bridge external lighting are provided. On/off lighting controls are provided.

K Power Supply: The power supply furnished by two (2) line feeds with 400 V, 3-phase + Neutral and PE, 50 Hz. Power requirements of the PLB line feeds are as follows:

PLB main supply: max. 100 A

PLB Air Conditioning supply (Roof Tops): 200 A

L UPS: connect to 230V AC UPS power supply from Rotunda UPS (electrical outlet provided by facility contractor) to supply PLB critical components such as control system, including PLC, touch screen, safety shoe, auto leveller etc.

M ECBS: connect to 230V AC ECBS power supply from Rotunda ECBS UPS (electrical outlet provided by facility contractor) to supply emergency lighting and exit signs.

N PLB CMS: it is designed to monitor on real time the status of Stands and all interfaced items (PLB, PCA, GPU, GOS and GSE water pumping station). The "PLB CMS" centralizes data available from the interfaced items and from the Airport Operation Systems in order to inform Maintenance and Operation of the availability and the status of the equipment monitored by the "PLB CMS". The main

functions, but not limited to, of the "PLB CMS" shall include:

1. Display overall view HMI.

2. Display specific Docking aircraft live in correct position and in scale,

3. Monitor and Display PLBs alarms and event messages, not limited to power supplies status, Air conditioning status, Limit sensors, Anti-collisions, Auto-levelling alarms, Emergency stops, VDGS interlocks, PLC failure, PLC configuration and diagnostic and Communication failures,

4. Display status, operating mode and positions of the PLBs, not limited to Off/On /Auto- levelling/automatic pre-positioning, Preposition, Parking, docked, Bridge-In, PLB Locked (VDGS), Faults, Operator logged-in, Duplicate information displayed on the Touchscreen…,

5. Monitor communication between "PLB CMS" and PLCs,

6. Send messages to PLB operator on the PLB touch screen from the O&M workstation.

7. Send flight schedule for the stand and expected aircraft type to each PLB. The "PLB CMS" provides the PLBs with the aircrafts type expected on the stand, as well as the estimated arrival and departure time, the flight number, stand number

8. Manage Users login and password.

9. Inform about maintenance schedule (corrective and preventive maintenance), not limited to Display PLB maintenance schedule, including expected time of unavailability and Lock a PLB for maintenance purposes (mostly in case of failure of one component of the PLB) from the O&M workstation.

10. Create and Edit O&M reports based on selected criteria,

11. Store all PLBs data, events, consumptions, maintenance downtime, metering and data information available in the PLB, stand occupation,

12. Analyse and filter PLBs data based on selected criteria,

13. Back-up PLBs data,

14. Synchronize PLB (PLC and Touchscreen) time with the Airport Master Clock using NTP,

15. The PLB CMS centralizes the data available for PLBs

1.7 DESIGN AND PERFORMANCE REQUIREMENTS

A Structural Criteria:

1. Wind Load, W: Calculate wind load on each PLB structure in accordance with BS EN 1991- 1-4, for the following parameters:
   a. Basic wind speed (10 min): 30 m/s
   b. Importance factor: 1.15
   c. Terrain Category: 1

2. Temperature Load: Unless otherwise specified, design the PLB structures for a uniform temperature increase or decrease of 17 deg C.

3. Seismic (Earthquake) Load, EQ: Design all PLB structures and components in accordance with RS 112 AND BS EN 1998 (TYPE 1) for the following parameters:
   a. Design Ground Acceleration: ag=0.25g

b. Importance Factor, IE: 1.2

A. Soil Class: Refer to Geotechnical report

4. Dead Loads, D: Include in the Dead Load the weight of the structure and all permanently attached equipment and accessories, including weights of bridge-mounted gate equipment, as selected.

5. Live Loads, L: Include in the Live Loads due to intended use and occupancy of an area, moveable equipment and partitions (e.g., loads associated with movement of the PLB), and vehicle loads (e.g., motorized wheel chairs, small baggage tugs), but in no case design for less than 320 kg/m2.

6. Roof Load: Design for a roof load of 75 kg/m2 and 100Kg of punctual load.

7. Design all mechanisms for actuating, guiding, and restraining the PLB and its associated components so that no noise or sway is apparent to the passengers using the PLB. Do not allow operating vibrations or loads to be transmitted to the fixed loading bridges from the PLB.

8. Provide sufficient torsional rigidity in the structural design to avoid excessive sway when the PLB is brought to a gradual stop.

B Mechanical Criteria:

1. Design temperatures: Base the design on the following ambient outdoor design environment (design temperatures):

a.	Summer:	Dry Bulb Temp:	32.8°C (26°C for 100% fresh air unit)
b.		Wet Bulb Temp:	21.17°C (23.08°C for 100% fresh air unit)
c.		Maximum Temp:	40°C (for air-cooled equipment)
d.	Winter:	Dry Bulb Temp:	13.2°C
e.	Mean Exposed Sunlight:	Maximum Temp:	75°C

2. Weather Data: Design the PLB and all associated components to withstand the following extreme climatic conditions and operation without damage or failure:

a.	Relative Humidity:	100% is common throughout the year, and may occur at temperatures in excess of 30°C
b.	Solar Radiation	Peak 1,000/W/sq.m
c.	Precipitation:	180 mm/hr.

3. Additional Environmental Design Considerations: Design the PLB and all associated components and appurtenances to comply with the following general requirements:
   a. Design the PLB to operate satisfactorily under the ambient temperature and humidity conditions identified above and loads.
   b. Design and select all components and materials for long operating life service under such conditions, especially the airport's coastal humid and saline environments.
   c. Make all electrical junction boxes used on the PLB from high strength non-corrosive materials NEMA 4 rated or greater. Painted steel boxes are not acceptable.

1.8 CONFIDENTIALITY

A. Refer to Division 27 Section "Common Clauses for IT, Security & Special Airport Systems".

1.9 QUALITY ASSURANCE

A General:

1. Manufacturer will employ and require its suppliers to employ, a Quality Management System that controls the design development, manufacturing, installation, testing and inspection of the equipment. Unless accepted otherwise by the Project Manager, use manufacturers and installers that employ a Quality Management System complying with the program described in ISO 9001-2000, or similar system.
2. PLB CONTRACTOR shall install all works to the satisfaction of the Project Manager, Employer, and inspecting authorities having jurisdiction.
3. PLB CONTRACTOR shall notify the Project Manager in writing of any instances in the Specifications or on the Drawings that are in conflict with any of the a forementioned authorities. All costs arising from performance of any work contrary to such laws, rules, or regulations without notice, are to Contractor's account.
4. Bring all deviations from the Drawings and/or Specifications required for conformance with the applicable codes and/or laws to the attention of the Project Manager. Correct all such deviations in accordance with the Project Manager's direction.
5. Applicable codes and/or laws govern minimum requirements only. Where the Drawings and/or Specifications identify materials, design details, etc., that are in excess of the code requirements, the Drawings and Specifications govern.
6. Notify the Project Manager of any scheduled testing at least 10 days prior to the test date. Provide the Project Manager with the option to witness any factory and field tests. The Project Manager reserves the right to conduct factory inspection at any time prior to shipping of equipment from the manufacturer.

B Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.

1. Build mockups of typical PLB that will be used in the project, according with the Drawings.
2. Build mockups for demountable partitions including accessories of each type of exposed construction, corner, door and frame, glass and frame and accessory panel.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Owner specifically approves such deviations by Change Order.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

C Codes, Regulations, and Reference Requirements: The following codes, standards, and regulations cover the design, general hardware, construction, and quality control requirements for the PLB and associated components and systems. Other equivalent international standards are acceptable, subject to Project Manager's acceptance. Unless otherwise indicated, the latest edition of the following codes and standards apply to the extent indicated herein:

No.	Reference	Description
a.	EN 12312-4 latest edition	Aircraft ground support equipment – Specific requirements - Passenger Loading bridges.
b.	ICAO	In particular Annexes 14 and 17 l– latest Edition– Aerodromes.
c.	IATA	AHM (particularly AHM922) and ADRM latest Editions
d.	ICAA	International Civil Airports Association
e.	CARs IX	General Civil Aviation Authority. Civil Aviation Regulations
f.	EN 1915-1	*Aircraft ground support equipment - General requirements - Part 1: Basic safety requirements*
g.	EN 1915-2:2001+A1-latest edition	Aircraft ground support equipment. General requirements, Stability and strength Requirements, calculation and test methods
h.	EN 1915-3	Aircraft ground support equipment – General requirements, Vibration measurement methods and reduction
i.	EN 1915-4	Aircraft ground support equipment – General requirements, Noise measurement methods and reduction
j.	NFPA– latest edition	National Fire Prevention Association - NFPA 415 (latest edition), when Glass PBBs are used add the following sentence: “except clause 6.4.2”

No.	Reference	Description
		Referenced Standards such as NFPA 101, shall be governing codes for PBB
k.	ISO 9011	Quality Assurance
l.	EU 89/106	European Directive 89/106 – Construction Products
m.	DI 98/37/EEC	EN Directive Safety of Machinery
n.	DI 2004/108/EEC	EN Directive Safety of Machinery
o.	IEC	International Electro technical commission
p.	NETA	The international electrical testing association
q.	IEE	Institute of electrical engineers
r.	FEM	European Federation of Materials Handling
s.	IBC	International Building Code
t.	ADA	Americans with Disabilities Act

1.10 SUBMITTALS

A Product Data:

1. General: Submit manufacturer's data, specifications, and catalogue cuts. Include photographs or renderings of items exposed to view.
2. Submit the following product data, as applicable:
    a. Manufacturer’s nameplate data including product name, model, and manufacturer's name.
    b. Physical description, dimensions and weights.
    c. Foundation loads (forces and moments) imposed by the PLB for the anticipated range of rotation limits.
    d. Product properties, characteristics, capabilities and limitations.
    e. Data for coordination with other project work.
    f. Clear spaces required for handling, installing, operating and maintaining products.
    g. Required installation clearances and tolerances, and the location and size of openings or sleeves necessary for installation.
    h. Product specifications, including protective coatings.
    i. Information on any protective devices (e.g., stop blocks) or protective coatings that are applied to the equipment for protection during shipment that must be removed upon receipt at the Project site and prior to installation.
    j. Methods and details for anchorage to support rotunda foundation design and construction.
    k. PLB CMS system architecture, components datasheets and model number, operation and control philosophy, list of interfaces and data, interface control documents detailing interfaces with all third-party systems.

A. Shop Drawings:

1. General: Submit shop drawings including plan and elevation view layout for all work. Submit the following shop and erection drawings:
    a. Apron drive general arrangement including limits of bridge operations
    b. Foundation anchor bolt general arrangement, bolt design and layout.
    c. Foundation loads
    d. Anchor bolt installation
    e. Rotunda-FLB connection
    f. Support columns installation
    g. Rotunda assembly
    h. Tunnel assembly
    i. Cab assembly
    j. Lifting unit assembly
    k. Drive unit assembly

l. Service access and stairs assembly

m. Control console layout and details

n. Electrical panel and layout

o. Electrical cable conveyance system

p. Electrical schemes & wiring diagrams

q. Color schemes & selections

r. Lighting fixture catalogue data & controls

s. Proposed painting systems

t. Nameplate drawings

u. Communications and interfacing block diagrams

v. PLC controls including automatic vertical propositioning gate docking logic diagrams with interfacing signals provided from the aircraft docking system (ADS) provided by others.

w. Fire Alarm System connections and hardware.

x. PLB CMS control room layout, system architecture showing all control and monitoring components, cable routing drawings, panels layout and wiring diagrams.

2. Bill of Materials: Include bill of materials for major components.

3. Slope Calculations: Submit calculations tabulating the operating bridge slopes for each designated aircraft of the fleet mix by gate. Measure extended bridge slope length from the articulation point rotunda/ tunnel to the centreline of the levelled cab floor. Subtract a drop allowance for the tunnel ramp transition(s) in determining the total vertical drop. Include apron slope variations in the calculations.

4. Power Requirements: Submit itemized electrical power loads and demands for each PLB with the Proposal.

5. Drawing Certificates: Ensure shop drawings are certified by originator of work.

6. Structural Drawings and Calculations: Engage the service of a Professional Structural Engineer to carry out the design of the PLB structures. The Professional Structural Engineer shall endorse on the design drawings, calculations as well as the construction records.

B. Inspection and Test Reports:

1. General: Submit inspection and pre-operational test reports to demonstrate operability of the installed equipment. Provide documented statements of methods, procedures, results and evaluations prepared by Contractor, and/or installer, manufacturer or supplier, or independent consultants employed by any of these parties to indicate properties, characteristics and capabilities of a product or portion of the work.

2. Submit the following data with the inspection test reports:

a. Identification of product or work area represented by inspection or test.

b. Methods, procedures and results of inspections and tests, including observations of unusual conditions.

c. Evaluation of results, and acceptability and use limitations.

3. Certification: Ensure inspection and test reports are certified by organization that performed inspections, tests and evaluations.

C. Compliance Certificates:

1. General: Submit compliance certificates for the work in accordance with the following requirements.

2. Certification: Ensure compliance certificates are certified by the issuing organization.

3. Certificates Required: Submit compliance certificates for the following:

a. Design and fabrication of the PLB are in compliance with NFPA 415.

b. Equipment bearing the UL Listing Mark or equivalent nationally recognized independent testing laboratory, subject to acceptance by the Project Manager.

c. Any products not of the manufacturer's standard design, modified to suit these requirements.

D. Operation and Maintenance Data: Prepare and submit operation and maintenance manuals.

E. Maintenance Products:

1. General: Furnish maintenance products for all work required.

2. Delivery: Deliver maintenance products to the Project site 30 days prior to completion of the work. Unload, and place in storage as directed by the Project Manager.

F. Record Documents: Submit record documents in accordance with Section 01 00 00.

G. Refer to Division 27 Section "Common Clauses for IT, Security & Special Airport Systems" for applicable requirements related to PLB CMS

1.11 JOB CONDITIONS

A. Pre-Installation Meetings:

1. Primary: Conduct a pre-installation meeting at Project site prior to start of the construction/installation work. Include review of construction conditions, environmental requirements and coordination required for installation of the work, and responsibilities for temporary operation of permanent systems required for the work. Include in meeting invitees the Project Manager, installers of the work, and product manufacturer representatives, as necessary. Require PLB manufacturer to assist in working out conflicts, interferences, adjustment and responsibilities.

2. Other Work: When required, participate in other pre-installation meetings at the Project site to review conditions of other related project work. Assist in working out conflicts, interfaces, adjustments, and responsibilities.

B. Manufacturer's Representative: Furnish installation assistance of product manufacturer's factory trained representative to give installation instructions, assist in start-up operations, direct acceptance inspections and tests, and perform like services at Project site as required.

C. Structural Components: Do not cut, drill or weld existing structures, asphalt surfaces, or Apron concrete for attachment of PLB works without prior review and acceptance by Project Manager of each condition, except where specifically indicated on the Contractor Drawings. Submit requests for authorization in writing, designating specific extent and limits of work, and components proposed to be cut, drilled or welded.

D. Coordination: Coordinate PLB construction, installation, startup and testing work with Terminal and apron work in the vicinity. Coordinate details related to connection of PLB

to expansion joints, steel work, and foundations with the Employer and Terminal and other apron contractors. Any changes required in PLB work due to lack of coordination are to the Contractor's account.

1.12 SPARE PARTS

A. PLB CONTRACTOR shall provide spare parts that are required for the commissioning and start- up of the equipment.

B. PLB CONTRACTOR shall provide a quotation covering recommended on-hand spare parts for two years of continuous operation and a complete parts list with an illustrated parts breakdown or a cross-sectional drawings.

1. Information required with the recommended spare parts includes the following:

a. Part description, serial or part number, and price

b. Reference to assembly drawing

c. Total number of identical parts in the equipment

d. Number of on-hand parts recommended

e. Location and seller of stocked spare parts

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Provide all equipment and material new, undamaged, and of the best grade.

B. Where items exceed one in number, provide products with identical construction, model numbers, and appearance, from the same manufacturer.

C. Insofar as possible, provide products that are the standard and proven design of the manufacturer. Select manufacturer that has been engaged in the manufacture of the product for a minimum of 5 years. When standard products are modified to suit these Specifications, certify operating conditions, ratings and capacity of the product based on qualification tests and submit compliance certificates.

D. Acceptable Products: Certain makes and/or manufacturers of material and equipment are specified herein and/or indicated on the Drawings as acceptable products. Prior to submittal, use manufacturer's published data to verify that the product meets the requirements of the Contract Documents. Subject to acceptance by the Project Manager. Notify the Project Manager of conflicts.

E. Substitutions: Submit the specified materials and equipment. Where "or equal" products are specified, equivalent materials and equipment of other manufacturers may be submitted for consideration for acceptance by the Project Manager but must be clearly distinguished in the submittal as substitutions. Refer to Section 01 60 00 Product Requirements for protocol regarding substitutions.

F. Maintenance Products Required: Furnish the following maintenance products.

1. Special Tools: Two sets of special tools required for servicing the PLB mechanical / electrical works.

2. Touch-up finish paints and coatings: When major products are required to be factory finished, furnish four litres of each type and color finish coat paint applied

to product for field touch-up.

3. Jack stands and tow bar: Two sets.

2.2 PRODUCT SPECIFICATIONS

A. General Service / Product Requirements:

1. Design the PLB assemblies, together with the fixed loading bridges by others, to enable passengers to enplane and deplane, completely protected from the elements during normal or emergency operations while the aircraft is parked at the designated gate position. Accommodate all of the designated and alternate aircraft listed on the Schedules
2. Provide PLB assemblies including rotundas with supports, telescoping tunnel sections, cabs, drive assemblies, and controls. Furnish assemblies with complete wiring for power, lighting, communications, and other systems necessary for operation and interfaces with the building utilities provided by the Terminal Contract.
3. Provide complete PLB assemblies capable of telescoping, rotating about the vertical axis of the rotundas, and elevating and lowering the cab with independent cab rotation as specified and as necessary to serve the range of design aircraft specified for each Gate position. Ensure the total length of each PLB assembly in the fully extended position and in the fully retracted position meets the minimum requirements specified and shown.
4. Design the complete PLB assembly to be weathertight, both when sealed against an aircraft and when parked in any position with the weather door closed.
5. Design the complete PLB assembly to withstand / accommodate the environmental and design loading conditions as specified in Part 1.
6. For PLB components, including aircraft closure, flexible materials, seals, and other consumable parts that that are exposed to sunlight, select and use only UV-rated materials to minimize UV degradation.
7. Provide a new fire extinguisher, UL Listed, ABC Rated 3A:40B:C.
   c

B. Rotunda Assembly:

1. Make the rotunda assembly the Terminal end pivot for the PLB's vertical and horizontal motions. Design the rotunda assembly to rotate on a support column and to allow PLB rotation where specified and shown. Make the PLB rotunda assembly floor height fixed to match the fixed loading bridge floor elevation. Design the rotunda floor to remain stationary and level at all times and to provide a smooth transition between the fixed loading bridge and the telescoping tunnel section.
2. Design the corridor between the rotunda and the fixed loading bridge with a minimum inside clear width of 1.30 m and a minimum inside clear height of 2.10 m.
3. Make the rotunda assembly completely weathertight by means of suitable weather protection seals at connections to fixed and hinged tunnel sections.
4. Design the assembly such that the support column is not anchored or secured to the fixed loading bridge structure and does not transmit any loads (forces or moments) or vibrations to the fixed connecting components.
5. Design the rotunda assembly to allow the PLB to swing a minimum of 160 degrees;

80 degrees clockwise and 80 degrees counter-clockwise. Design the PLB to be capable of rotating sufficiently to allow the PLB to be positioned to the designated aircraft doors for any of the specified aircraft for gate positions as listed.

6. Limit the vertical tunnel slope from the rotunda to the aircraft door level(s) of any of the designated and alternate aircraft to 10% or less as per EN12312-4:2014

7. Fabricate the rotunda rolling wall slats using hot-dipped galvanized steel and finishes.

8. Provide adjustable slope, over-travel, and operational swing limit switches at the rotunda assembly. Make slope limits adjustable for both up and down slopes.

9. When the adjustable over-travel swing limit switch is actuated, cut off all control power so that the bridge can be moved only by using an emergency bypass switch provided on the control console. Equip rotunda frame with suitable mechanical stops (e.g., rubber bumper type stops) to prevent collapse of the telescoping tunnel sections.

10. In addition to the bridge swing limit switch, provide suitable controls to sound an adjustable warning buzzer at the control console prior to actuation of the over-travel swing limit.

11. Provide an electrical distribution panel to be mounted on the rotunda column. Provide in this panel the electrical disconnects, circuit breakers, and transformers needed to adapt the Terminal power to meet the PLB and attaching gate equipment electrical requirements. Provide a NEMA 4X enclosure made of steel material properly anti-corrosion treated and electrostatic coated for the control panel.

12. Design the rotunda support sole plates and foundation anchor bolts to match the rotunda foundation pedestals as provided and as shown.

C. Telescoping Tunnels:

1. Provide the tunnel portion of the PLB with 3 telescoping tunnels, rectangular in cross section, with largest cross section located adjacent to the aircraft.

2. Design development of the tunnel section(s) to attach to and be supported by the rotunda at one end and supported by a drive column at or near the cab end. Provide the drive column with a means to raise and lower the cab and thus vary the slope of the telescoping tunnel section as necessary to service the aircraft.

3. Make tunnel section wall and roof construction of steel framing with exterior flush glazing side wall panels, to suit PLB CONTRACTOR standard.

4. Furnish tunnels complete with factory installed lighting, insulation, and all inside /outside floor, walls, and ceiling/roof finishes as specified herein, suitable for the stated tropical humid and saline environmental conditions.

5. Provide transition ramps to accommodate the difference in elevation where tunnel sections overlap. Design development of the ramp to slope over a sufficiently large tunnel length to minimize the slope severity.

6. Provide the following minimum interior clear dimensions:

a.	Minimum Width: glass sidewall)	1.5 m (glass sidewall to
b.	Minimum Interior Height:	2.1 m (Floor to Ceiling)
c.	Minimum Inter-tunnel Ramp Width:	1.4 m
d.	Minimum Corridor Width:	1.3 m

7. Maintain clearance between tunnel sections where movement is necessary for the operation of the PLB. Protect openings between tunnel sections with suitable seals

such that the tunnel sections are weathertight. Ensure that the seals prevent ingress of fumes and hydrocarbons as far as reasonably practicable

8. Equip the telescoping tunnels with an under-mounted electrical cable conveyance system of PLB manufacturer's standard design. Ensure the system is accessible to maintenance personnel.

9. Provide tunnel rollers with sealed bearings.

D. Glass Wall Panels and Exterior Envelope:

1. Provide bridge tunnel walls constructed of flush-mounted glazing with internal steel framing. Match color, type of glazing including window trims, if provided, used in the design of fixed loading bridge as follows:

2. Glass: Meet NFPA 415 fire ratings.

3. Glass to match FLB curtain wall glass (visual appearance). Refer to drawings for the following systems and glass types that shall be matched:

   a) FLB Vision glass: EWS 115 (GL01c)

   b) FLB Spandrel Glass (shadow box): EWS 115 (GL02c)

   c) Rotundas Spandrel Glass (shadow box): EWS 124 (GL02e)

   d) The Glass color is neutral/light greenish as mentioned in the spec section 088000 "Glazing", for the above-mentioned glass types.

4. Metal panelling to match FLB metal panelling colour and finish.

   a) Rotundas cladding: EWS119 (FLB's Solid Cladding)

5. Depending on the Passengers Loading Bridges Locations, Contractor shall consider metal/finishes color that are similar to the following buildings' exterior finishes colors:

   a) The color adopted for all curtain walls structure/elements, whether they are steel or Aluminum, is RAL 9016 (white)
   b) The Standing Seam roof color (including bullnoses) adopted is RAL 9001 (SRI 88)
   c) The ACP cladding (EWS 116) color is RAL 1013
   d) The ACP soffit cladding (ESS 301) color is RAL 9016 (white)
   e) The cladding color of the BHS & Staff Entrance buildings is RAL 1013

6. Contractor shall submit:

   a) Method Statements
   b) Shop Drawings and Materials' Samples
   c) Colors, finishes samples, and mock-ups for approval and agreement of the Project Manager before commencing with Works. If any discrepancy of any sort is found, the Contractor shall inform the Project Manager and propose and coordinate the solution.

7. The Contractor shall coordinate all elevations with skin details and specifications and present all necessary shop drawings in conjugation with approved materials, for the Project Manager's review and approval.

8. for glazing types, refer to spec section 088000 "Glazing". Color of glazing is as specified. Provide sample for Project Manager's approval.

E. Service Access

1. Provide a service stair, landing, and service door at the cab, where possible.

2. Ensure that the stair is functional at all heights and positions of the PLB. Support

the bottom of the service stairs on wheels and make moveable with the PLB.

3. Locate the service access on the right side of the cab end of the bridge, where possible. Design the service access to provide access between the PLB and the Apron for authorized personnel. Locating the service access stairs on the left side of the cab to meet layout requirements.

4. Provide a service door of commercial grade steel with laminated half window, which meets or exceeds the 3/4 hour fire rating per ASTM E152. Ensure that the door size can accommodate a 1.9 meter tall person. Design the door to open to the service stairs and equip the door with a commercial-type hardware, automatic door closer. Equip each door with an electrically-operated door lock, door contacts and provisions for local door alarms and remote annunciations. Provide pathway for wire or cable to operate the door lock. Door access control, including card readers with PIN on both sides of each service door, will be installed by the Access Control System contractor. Provide a stainless steel kick plate covering the lower portion of the inside surface of the access door.

5. Design the service door to open outward onto the service stair landing. Make threshold flush with PLB floor without any tripping hazard.

6. Make the entire service stair assembly of hot-dipped galvanized steel construction with non- skid treads. Make all steps of equal depth and rise.

7. Protect the service stair with handrails on each side, designed to comply with OSHA standards.

F. Cab:

1. Design development of the cab to rotate a minimum of 120 degrees; a minimum of 90 degrees counterclockwise and 30 degrees clockwise relative to the tunnel section centerline(and 90 degrees clockwise and 30 counterclockwise, whenever the PLB is a left sided one). Provide limit switches and physical stops to control the rotation limits.

2. Provide the cab with a forward facing control console. Locate the console behind laminated glass windows to allow the operator a full view of the aircraft. Provide windows to the left, in front of and to the right of the operator.

3. Make cab wall slats of hot-dipped galvanized steel and finishes.

4. Provide a roll-up (coiling) aluminum door (which can be latched open or closed) with a key lock. Provide a cab restraint safety chain to be used when the weather door is open and the PLB is not docked.

5. Provide a full width spacer bar at the aircraft end of the cab floor. Ensure the spacer materials are flexible and non-abrasive to prevent scratching or other damage to the aircraft and meet NFPA 415. Provide built-in pressure sensitive switches in the space bar to prevent excessive pressure against the aircraft and to disable the forward movement of the PLB.

6. Equip the aircraft end of the cab with a cab floor that adjusts the level to horizontally align the cab floor with the aircraft doorsill. Make the floor individually actuated and independently adjustable to adapt to all aircraft doorsills and to provide a level surface adjacent to the aircraft doorsill for all PLB slopes. Ensure the transition floor presents no tripping hazards for the passengers.

G. Electrical Work:

1. General: Include wiring, raceways, starters, relays, switches, transformers, control devices, lighting fixtures, and telephone set.

2. Electrical Interface: Provide an interface at each gate position consisting of a Terminal contractor-installed switchboard for power supply to the PLB contractor-

installed interface junction box for communications, data, and fire detection systems. Install the interface junction box at the rotunda support column.

3. Power: Connect the main feeder for each gate to a dedicated circuit breaker at the Terminal contractor-installed interface switchboard. Provide distribution panel board with branch circuit protections and transformers for all other required voltages.

4. Grounding: Interconnect cab, tunnel sections, service stairs and landings, rotunda, and all electrical items including the attached gate equipment by a continuous grounding conductor. Provide the main grounding conductor with the power supply feeder.

5. Interior Lighting: Provide LED interior lighting, emergency lighting and exit signs with necessary drives. Provide lighting sufficient to produce an average light intensity of not less than 200 lux measured at 0.2 meter from the floor level.

    a. Provide interior lighting fixtures comprising a lateral lighting system installed in the upper right corner of the tunnels along their entire length to ensure the specified lux level. The number of the luminaires required will depend on the length of the tunnel sections.

    b. Provide cab lighting by means of two LED, downlights, with two LED in each.

    c. Provide rotunda lighting by means of the luminaires installed at the tunnel near the rotunda.

    d. Provide the luminaires installed at the transition points of the bridge (at rotunda end of the tunnel, at the ramp between tunnels, and at the cabin) with a 60-minute battery pack in case of main power interruption.

    e. Provide emergency lighting to illuminate at least 10.8 Lux measured at the floor level. Emergency lighting are arranged so that the failure of any single lighting unit does not result in an illumination level of less than 2.2 lux in any designated area, in accordance with NFPA 101. Emergency lighting shall be connected to ECBS outlet supplied from Rotunda ECBS.

    f. Provided Approved signs in compliance with local civil defense requirements to mark exits and exit access. Directional signs are placed at locations where the direction of travel is not obvious. Emergency lighting shall be connected to ECBS outlet supplied from Rotunda ECBS.

    e. Other bridge manufacturer's standard designed lighting fixture system will be acceptable, subject to acceptance by the Project Manager.

6. Exterior Under-Bridge Lighting: Provide three floodlights for each PLB. Direct two lights forward to illuminate the apron and aircraft. Direct one light to illuminate the drive column. Locate and protect the lights from damage due to operation of bridges or passing vehicles.

7. Communications System: Provide a telephone set and two data ports for voice and data transport at or near the PLB control console. For each PLB, provide and install:

    a. Cat 5e cables for phones and data transport.

    b. One telephone set and two data ports as indicated above.

    c. All necessary raceway for the Cat 5e cables, extending from the interface cabinet (on the rotunda column) to each data port.

    d. Data ports compatible with airport Ethernet TCP/IP communications.

    e. Communications interface suitable for connection to the airport BMS by others.

f. Communications interface compatible with the Control & Monitoring System (CMS), Visual Docking Guidance System (VDGS) and Building Management System (BMS) by others.

g. Pathway for cable and wiring to operate and annunciate door status.

8. Warning System: Provide the following safety devices / indicators:

a. Flashing warning beacon mounted under the cab. Design this beacon to flash when the PLB console power is turned on indicating that the PLB may be moving or may be moved at any moment.

b. Audible warning bell mounted under the PLB. Design this bell to ring to notify ramp personnel when the PLB is moving.

9. Convenience Receptacles: Provide a minimum of two convenience electrical outlets (240 VAC, 50 Hz, 1 Phase) as follows:

a. One at or near the control console or on the left wall adjacent to the control console

b. One at the rotunda end of the PLB.

10. Power Cables: Make power supply cables from the power interface switchboard underside- mounted.

11. Landing Light: Provide a LED lighting fixture with above the landing of the service access. Light may be photocell controlled or on-off controlled from the control console.

12. Closed Circuit TV (CCTV): Provide CCTV camera and LCD monitor to show apron area near the PLB drive wheels. Mount monitor on the control console.

13. Smoke Detectors: Provide smoke detection sensors as required. Provide alarm signals to the Fire and Smoke Detection System of the terminal (by Terminal Contractor) through dry contacts in the junction box on the rotunda support column.

Provide access control system and interface it with the main system in the terminal building.

H. Control Station:

1. PLB CONTRACTOR shall locate the control station on the left side of the cab and orient to position the operator facing forward in full view of the aircraft during the maneuvering and docking operations.

2. PLB CONTRACTOR shall provide a TFT display at the control console for control interfaces, indicators, and messages as required to support the functions. Accomplish all bridge motion (vertical, horizontal, and cab rotation) with switches / controls not located on the TFT display.

3. PLB CONTRACTOR shall make all bridge motion controls momentary contact type (deadman) pushbuttons. PLB CONTRACTOR shall employ appropriate ergonomic controls
/ layout for clarity /simplicity of operations (e.g., for raise and lower functions; physically locate the “raise” pushbutton above the “lower” pushbutton, etc.)

4. PLB CONTRACTOR shall include, as a minimum, the following controls:

a. A keyed switch which may be set to “AUTO”, “OFF” or “ON”. Design development of the controls to the require switch to be unlocked with a key prior to selecting “ON”, and for the key to be removable only with the switch in the “OFF” or “AUTO” position. Arrange circuitry to activate the automatic leveling system when the control station is turned to the “AUTO” position.

b. Single lever arm, “joystick”, to control horizontal PLB motions.

c. Controls for raising / lowering the cab end of the PLB.

d. Controls for left / right cab rotation.

e. Controls for operating the cab closure.

f. Controls for operating the adjustable portion of the cab floor.

g. Emergency Stop pushbutton for disconnecting all PLB operations.

h. Controls for operating the service landing light.

i. Controls for switch on / off the PLB self-contained HVAC systems (Roof top).

5. PLB CONTRACTOR shall provide the following mechanical and/or logic interlocks to prevent damaging control circuits or PLB components, or injuring personnel:

a. Design development of the controls so that selection of the "OFF" position by the operator disables all basic bridge controls.

b. Bridge motion detection sensors interlocked with bridge motion controls incorporating two levels of limits. First level limit to provide warning to the operator

and interrupt the specific problem motion only. Second level limit to prevent physical travel that may damage the PLB or potentially endanger personnel.

c. In addition to the electrical/instrument interlocks, PLB contractor shall provide positive mechanical stops to prevent overtravel of the PLB and individual tunnel sections, over-rotation of the cab or rotunda, and to limit cab up and down motions within pre-set limits.

d. Lock bridge drive out of operation when aircraft closure is fully extended.

e. Bridge-mounted proximity type anti-collision devices to sound alarm and lock out bridge drives upon activation.

6. Illuminate the control console and its surrounding area with adequate lighting for operational and maintenance functions to be carried out.

I. Aircraft Closure:

1. Equip the aircraft end of the cab with a folding bellows aircraft closure. Design the closure such that, when fitted against the fuselage, it surrounds both the open aircraft door (for swing- out type doors) and the doorway to protect passengers from the elements. Design the closure covering to remain flexible and accommodate the environmental conditions as specified, to be waterproof, and to be highly resistant to punctures and tearing.

2. Equip each side of the aircraft closure with a canopy drive to make each side independently adaptable to the aircraft fuselage.

3. Incorporate into the closure mechanisms pressure safety devices to prevent excessive pressure on the aircraft.

4. Provide contacting seal or seals in the aircraft closure with a soft material to prevent scratching or other damage to the aircraft. Make the seals that contact the aircraft easily replaceable.

5. Enclosure shall meet NFPA 415.

J. Automatic Leveling:

1. Equip the PLB with an automatic leveling system that permits the PLB to follow small changes in aircraft doorsill height automatically. Design development of the

system to function with the same reliability for all specified aircraft regardless of door location or fuselage contour.

2. Provide the following control functions:

   a. Design development of the auto-leveling system to engage when the "AUTO" mode / control is selected at the control console. Design the automatic leveling arm actuator motor to extend the arm to the aircraft when "AUTO" position keyed switch is selected and retract automatically when "ON" position is selected.

   b. Display the auto-leveler position at all times by means of a message on the control panel display.

   c. Design development of the system so that, if the auto-leveler arm fails to make effective contact with the aircraft when the "AUTO" mode / control is selected, an alarm is actuated and a message is displayed to notify the operator.

3. Provide a contact controlled "safety shoe" type device as a back-up feature to the auto-level system. Plug the safety shoe into an electrical receptacle provided in the cab near the control console. Design the system so that in the "Automatic" operation mode, the safety shoe is placed under the open aircraft door, and in case of contact with the aircraft door, the PLB is automatically lowered and an alarm is actuated.

K. Drive Column:

1. Design development of the drive column to provide for both vertical and horizontal motion of the PLB, with the range of motion adequate to serve the specified types of aircraft. Design the drive column and control systems for smooth, quiet operation. Design vertical and horizontal drive systems to operate independently of each other, however, restrict all PLB motion, with the exception of the vertical drive system, when the PLB is in the auto level mode of operation.

2. Design development of the PLB to be moved vertically by two hydraulically-actuated assemblies.

3. Hydraulically Actuated System: Provide a hydraulic power pack and two cylinders. Equip the hydraulic drive assemblies with non-return valves to hold securely without creep at each elevation within the range. Make the vertical brakes fail-safe, to apply automatically in the absence of power.

4. Make each assembly capable of supporting the PLB under full design load for 100% redundancy.

5. Move the PLB horizontally via a variable speed drive system.

6. Support the PLB on solid rubber tires.

7. Make the PLB vertical and horizontal movement speeds sufficient to allow the PLB to be safely and smoothly re-positioned from any starting point to dock at any of the specified aircraft door sills within two minutes. Make the vertical and horizontal speeds controllable within the following ranges:

   a. Vertical travel speed - lifting: 1.1 m/min minimum.

   b. Vertical travel speed - lowering: 1.1 m/min minimum.

   c. Horizontal travel speed - normal: 1.0 to 25.0 m/min.

   d. Horizontal travel speed - slow: 1.0 to 10.0 m/min.

8. Make the drive wheels independently driven, and provide each drive motor with integral brakes. Employ a dynamic braking system to allow the PLB to come to a smooth controlled stop. Design the brakes to lock the PLB in place when it is not being driven horizontally.

9. Equip the horizontal drive motors with a means to manually release the brakes to allow the PLB to be towed in the event of power failure. Provide tow lugs on the wheel frame.

10. Furnish motors used in the column drives as permanently lubricated type.

L. Interior Finishes:

1. General: Make the interior finishes of the PLB durable and easy to clean, proven to withstand the humid and hot environment and airport traffic. Subject to acceptance by the Project Manager /Client, provide the following features:

2. Ceiling:

a. Customized perforated metal ceiling system with powder coating finish.

b. Color: White, to RAL 9016.

c. Moldings for corners and top edge of wall panels, where provided.

d. Ceiling to match FLB ceiling system and finish.

3. Walls:

a. See wall glazing requirements in paragraph 2.2.D for exterior glass, with vision glass in the middle, and spandrel glass at bottom and top.

b. At Separation between two passages: Decorative glass type 08:GL20, heat-strengthened laminated ultra clear glass, as specified in Section 088113 “Decorative Glass Glazing”.

c. Interior Metal Cladding System, to match FLB metal cladding system and finish, fabricated from Stainless Steel (type 316), brushed satin finish.

4. Insulation:

a. Insulation meeting the requirements of NFPA 415.

b. Mineral wool pads: 60 mm thick at ceiling and floor

5. Subflooring:

a. Galvanized steel sheets.

6. Floor Finishes:

a. Carpet Tiles, Mist Greige color.

b. Carpet tiles to match FLB carpet tiles.

M. Exterior Finishes:

1. Provide exterior steel finish as indicated in the above Part 2.2-D, and meeting the client specifications.

2. Contractor’s shop-applied exterior coating systems as alternative substitutes will be considered, in case Contractor submits valid reasons in writing, subject to review and acceptance by the Project Manager.

N. PLB Ventilation and Air Conditioning:

1. Provide a means to pre-cool the PLB (either use of a separate bridge-mounted air-conditioning (A/C) unit or the use of the PCA Unit). Include ducting, controls and instrumentation, airflow diversion dampers, fittings, registers, etc., as necessary for

a "bleed system" from either the A/C or PCA unit to the tunnel sections of the PLB.

2. Design the system so that, in the event of an activation of a smoke alarm in the PLB, the PCA and exhaust fan are shut off automatically. The roof top units are shut off automatically.

3. Equip each PLB with an air-conditioning system. The system shall consist of bridge-mounted air conditioners, HVAC ductworks, registers, diffusers and independently operated controls and thermostats to allow for an even and uniform distribution of the conditioned air throughout the tunnels (assuming the constraints attached to the telescopic movement). Integration of the bridge mounted air conditioners to the bridge assemblies shall be aesthetically pleasing and compatible with the bridge designs. The final design and layout of the PLB air conditioning system shall be subject to review and acceptance by Employer and Project Manager.

   a. The air conditioning system shall be capable of pre-cooling and maintaining a summer temperature of 25º C with 50% Relative Humidity maximum in the PLB.

   b. The air conditioning system shall be capable of reducing the PLB interior space temperature of a heat-soaked PLB from 40º C to 25º C or lower on a summer design day in 15 minutes, with no occupants. The system shall be capable of automatically adjusting supply air temperature and flows under the specified design ambient conditions.

O. Equip each of the 400 Hz ground power units with an integral powered coil and storage. Refer to Spec No. 16211 for the cable coil storage requirements.

P. The condensate piping of the PLB air conditioning system shall be installed and connected to the MTB drainage system.

Q. Diagonal Truss

1. Provide double diagonal (x-shape) truss.

R. Diagonal Truss

1. In lieu of a single diagonal steel truss in glassed walls, provide double diagonal (x-shape) truss.

2.3 PASSENGER LOADING BRIDGE – CONTROL MONITORING SYSTEM (CMS)

A. SYSTEM ARCHITECTURE

1. The main functions of the PLB CMS shall be:
   a. Monitoring of the status of the aircraft stands and their equipment.
   b. Reporting stands availability.
   c. Informing the Resources Management System of aircraft effective arrivals and departures.
   d. Reporting of stand equipment use for billing purposes.
   e. Lock a PLB for maintenance purposes (usually in case of failure of one component of the PLB).
   f. Management of PLBs Users login and long term storage of the PLBs data storage.

2. The PLB CMS centralizes the data available for equipment such as the passenger loading bridges (PLB), associated air handling units (AHU), the pre-conditioned air (PCA), the 400Hz, and the water supply system.
3. All the data shall be diagnosed to determine stand availability. Unavailability of a stand shall be reported to the Resources Management System (RMS). In case of restriction of use of an aircraft stand, the diagnostic shall also indicate the duration

of the restriction (beginning and end time), as well as a free text to indicate the cause of the unavailability. A pre-set time is reported to the RMS in case of stand unavailability.

4. The PLB CMS shall provide the PLBs with the aircraft type expected on each aircraft stand, as well as the estimated arrival and departure time, the flight number and the stand allocated for the flight. The information shall be supplied by the Management Information System (MIS) and shall be used to prepare the stand for the next incoming aircraft.
5. Information concerning equipment usage and consumption shall be available at the PLB CMS, for billing calculation and invoices issued to airlines by the Billing System. The aircraft presence at the stand (block ON, block OFF) needed by the billing system shall be collected from the MIS.
6. Stand equipment unavailability shall be reported to Airport Management Information System MIS shortly before an aircraft arrival (user configurable time).
7. The Airport Master Clock sets all the equipment of the PLB CMS to the same date and time.
8. The system shall interface with the following equipment:
    a. Passenger loading bridges (PLB)
    b. Pre-conditioned air (PCA) system and associated pits
    c. The water supply system
    d. 400 Hz and associated pits
    e. Water supply System
9. In addition to the above integrated systems, the PLB CMS shall interface with the following systems:
    a. The Resources Management System (RMS)
    b. The Management Information System (MIS)
    c. The Billing System
    d. The Master Clock System
10. Communication with the RMS, MIS, the Billing System and the Master Clock shall occur through the Master System Integration (MSI).
11. Dedicated PLB CMS Spaces:
    a. Operations Room to include the Operations workstation.
    b. Maintenance Room to include the Maintenance workstation and printer.

B. SYSTEM REQUIREMENTS

1. The System shall be a Commercial off the Shelf (COTS) product utilizing the latest hardware and software technology and shall be based on an open architecture.
2. Data provided by 3rd party systems must be stored in a fault tolerant manner within the application.
3. Systems which maintain historical data must maintain appropriate static tables to enable accurate historical lookups.
4. The system shall provide management capabilities to support problem, alert and performance monitoring, configuration management and access control.
5. The system shall have maintenance reporting tools to notify the operator of any System failure.
6. The system shall provide comprehensive maintenance and configuration management tools including support for remote system management using VPN provided by others.
7. The system shall be installed with the recommended RAM capacity indicated by the software manufacturer.

8. System shall be integrated into a Virtual Environment, all requirements in terms of CPU, RAM, network bandwidth, backups and storage capacity shall be well taken care of and properly implemented in the system.

C. System performance requirements

1. For calculations purposes the virtual environment shall be considered with 100% availability.
2. Unless otherwise stated system availability shall be better than 99.99%.
3. Maximum time to display information on the operator workstation screen is 10 seconds.

D. System Design

1. The Contractor shall coordinate the design with the Project Manager and Authorities and shall accommodate the changes in specifications, design, etc…, if any before final approval, with no additional cost to the Client within context and intent of this section.
2. The contractor shall provide the latest proven technology (hardware and software) from reputable A-Brand manufacturers,
3. General System Design Requirements
   a. The Contractor shall provide a complete single line diagrams for the system
   b. The system shall be capable to be installed on a virtual server
   c. All components of the system shall have the exact same time. The System time shall be synchronized through the network by the NTP time server of the Master Clock System.
4. As the Airport is planned to have a steady growth rate the following shall be considered in the design of the system:
   a. Support of increasing number of user groups and stakeholders
   b. Support increasing number of airport resources, buildings and assets
5. Any failures shall be logged and viewable at a central point on the Network Management Administration Console.
6. The System shall fully support remote management
7. The System shall report, but not limited to Applications hardware status (e.g. Hardware, Storage, etc.), Workstation status, Field Device status and Network status
8. The System shall support configuration management and software updates from a central point.
9. The system storage calculation shall consider data, logging, archiving, growth (increase in number of devices) and 25% spare,
10. All PLB CMS components shall be connected to the converted network of the Airport.

11. It is the PLB contractor responsibility to provide a full solution including the VM server configuration and coordination with the ICT contractor.

E. DEVICES AND COMPONENTS

1. PLB CMS shall be consisting of the following equipment:
   a. Two (2) workstations with monitor minimum 27", one workstation (operator workstation) will be located in the TOCC room in the MTB and one workstation (maintenance workstation) will be located in the PLB/VDGS maintenance room.
   b. Two (2) redundant Servers (one server located in the Administration

Building and one server located in the Datacentre building),
c. Two (2) industrial tablets
d. One laser printer
e. All needed items for the proper operation of the system

2. The workstations/servers shall be selected according to the PLB CMS performances requirements and considering the specifications listed herein. Configuration and brand shall be submitted to the Project Manager's approval. They shall be selected according to the printers used for the project.
3. Industrial Tablet: two(2) wireless Industrial Tablets, with the following characteristics, not limited to Latest compatible operating system, 10.4" mini anti-reflective, scratch proof display, Minimum 2GB RAM, Must weigh less than 1.5 kg (Including battery), Support IEEE 802.11 b/g/n/ac, Support EAP/LEAP network authentication and WPA2 security, Weatherproof, rugged and robust (IP 64 standard minimum, IP67 preferred), withstand vibration levels of 10-100Hz with 2g for 1 hour, Withstand repeated drops of at least 1.6m onto concrete, Operating temperature should be between -0 C and +50 C, The Supplier should deliver the mobile terminals with appropriate accessories such as a holster & strap, protective covers and recharging devices
4. Printer: One Laser Printer, HP or equivalent. Printer to be selected according to the printers used for the Project in coordination with the relevant Contractor

F. PLB CMS Operations Workstation

1. Summary
   a. This workstation shall be used by the Operator(s) in charge of the PLB CMS.
   b. The PLB CMS Operator shall have the possibility to:
      1) Monitor all the operations made on any of the PLB and associated stands equipment
      2) Monitor all operational alarms
      3) Monitor all critical alarms affecting the availability of the aircraft stand
      4) Monitor stand availability
      5) Specify type of equipment failure or type of work carried out on the stand
      6) Specify duration of unavailability or restriction of an aircraft stand
   c. The Operator shall be able to manually input information to the system concerning the aircraft stand availability:
      1) PLB cleaning in progress
      2) Apron cleaning in progress
      3) Preventive maintenance in progress
      4) Repair work in progress
      5) Use of equipment forbidden
      6) Estimated duration of unavailability or restriction
      7) Free text to enter the reason of stand unavailability
   d. The stand availability shall be defined according to the type of equipment failure.
      1) Aircraft stand is available
      2) Aircraft stand is available with restriction: at least one equipment of the aircraft stand is failed, but the stand can still be used (the PLB CMS operator shall be able to type a free text to provide additional information on equipment unavailability)
      3) Aircraft stand is not available
   e. The PLB CMS shall have an interface with:
      1) The MIS, to automatically display stand allocation information and details on a flight expected at an aircraft stand.

2) The RMS, to report stand's availability, PLB availability and block ON / OFF information in real time, so that the RMS can update the stand allocation system. PLB mode is also reported to the RMS.
3) The Billing System, to report operating information on ground equipment necessary for invoices.

f. The PLB CMS Operations Workstation location shall be coordinated between PLB CMS Contractor and End Users.

2. Functions
   a. The PLB CMS Operations workstation shall have the following screen views:
      1) Overall stands view
      2) Aircraft stand views
      3) Stand availability view
      4) Alarm page
   b. A menu bar shall be displayed on all views that allows the users to switch from one view to another, at any time. Date and time, as well as the name of the currently displayed view, shall also be displayed on all views.

3. Main view
   a. An overall view shows all the aircraft stands**.** This view shall be automatically displayed on startup of the system.
   b. The view shall include:
      1) An overall view showing stand's availability. A colour coding shall be used to indicate the status of the stand:
         - Green to indicate the stand is available
         - Red to indicate the stand is currently not available: equipment failure / repair / use forbidden
         - Orange to indicate a minor problem on the stand: at least one equipment on the stand is not available but the aircraft stand can still be used
         - An indication shall be available to show if an aircraft is docked at the stand (aircraft shown at the relevant aircraft stands).
      2) An alarm band showing the last alarms of the system.
      3) A selection to enter the aircraft stand number to display on screen.

4. Aircraft Stand Views
   a. One view shall be available for each aircraft stand, showing aircraft stand equipment availability.
   b. A color code shall be used to indicate the status of the equipment:
      1) Green to indicate the equipment is available
      2) Red to indicate the equipment is currently not available: failure / repair / maintenance in progress
      3) Orange to indicate a minor problem on the equipment
   c. The aircraft stand view shall allow access to equipment views, one for each type:
      1) One view for each PLB, with access to more detailed views showing information on the rotating system, levelling system, the lighting, the sensors, the safety shoe, etc.
      2) One view for the 400Hz, including the information concerning the pits (open / closed).
      3) One view for the PCA and the Water Supply Equipment, including the information concerning the pits (open / closed).
      4) One view for the bridge AHU as applicable.

   d. Each view shall display, on pop-up windows if necessary, all relevant

information concerning the various equipment of the aircraft stand.

5. Alarm View
   a. Only operational alarms and critical equipment failures shall be reported to the Operations unit. The associated equipment shall be displayed in color on the detailed view of the relevant stand. All active alarms shall be listed on the alarm page in chronological order, with the oldest alarm at the top of the page. Each alarm shall have a date and time stamp and have a brief description. The alarm text shall be clear for easy understanding by the Operator.

6. Stand Availability View
   a. The PLB CMS Operator is in charge of informing the RMS of the status of aircraft stand equipment.
   b. In case of equipment failure or when maintenance or clean-up work is required, the PLB CMS shall be able to input this information in the system, to indicate scheduled work on a stand.
   c. The PLB CMS Operator shall manually input data in the system, such as:
      1) Scheduled repair on a stand or the apron area associated to a stand
      2) Scheduled clean-up work on a stand or the apron area associated to a stand
      3) Estimated duration of unavailability
   d. The type of unavailability shall be chosen by the Operator in a pre-defined list. A more detailed explanation on the cause of unavailability can be typed if necessary.

B. PLB CMS Maintenance Workstation

1. Summary
   a. The maintenance workstation of the PLB CMS shall be used for the maintenance of the aircraft stand equipment. Special consideration should be made to make use of an industrial wireless terminal tablet to provide access to any stand.
   b. This unit shall consist of a workstation and a printer.
   c. The maintenance crew shall have the possibility to monitor information regarding all the aircraft stands:
      1) All the operations made on any of the PLB (and associated equipment, such as PCA, PLB air conditioning, water supply and 400Hz)
      2) All operational alarms
      3) All critical alarms affecting the availability of the aircraft stand
      4) All alarm and information regarding the equipment
      5) Communication failures
      6) Specify type of work carried out on the stand
      7) Specify duration of unavailability or restriction of an aircraft stand
   d. To this effect, the system shall communicate with every PLB, PCA, PLB AHU, 400Hz and water supply systems.
   e. The maintenance Operator shall be able to enter information to the system concerning the maintenance task carried out on the aircraft stands:
      1) Preventive maintenance in progress
      2) Repair work in progress
      3) Estimated duration of unavailability or restriction
      4) Free text to enter reason of stand unavailability
      5) PLB availability status, etc.
   f. The Maintenance workstation location shall be coordinated between PLB CMS Contractor and End Users.

2. Functions
   a. The PLB CMS Maintenance workstation shall have the following views:

1) Overall view, as described for the Operations Workstation
2) Aircraft stand views, as described for the Operations Workstation
3) Alarm page, as described for the Operations Workstation

4) Network view
5) Aircraft database update view
6) Maintenance schedule view
7) PLB data storage
8) PLB users login and password management.

b. A menu bar shall be displayed on all views to switch from one view to another without navigating to a main view at any time. Date and time, as well as the name of the currently displayed view, shall also be displayed on all views.

3. Network View
   a. The network view shall display the status of the communication between the various components of the PLB CMS System.
   b. Interfaces with external systems shall be displayed as well.
   c. A faulty link shall be displayed in a different color.

4. Aircraft Database Update View
   a. One view shall be available to allow the Maintenance Operator to update the aircraft database contained in the PLB.
   b. In case a new type of aircraft has to be added to the system, it shall be possible to update the database update remotely from the Maintenance workstation. In the same way, a type of aircraft may be deleted from the database.

5. Maintenance Schedule View
   a. The Maintenance Schedule View shall allow the maintenance Operator to print scheduled maintenance to be carried out on aircraft stands on a weekly basis.

6. PLB User login Management
   a. Login and passwords shall be used to authorize a dispatcher or a Maintenance Operator on a PLB.
   b. Login and password shall be entered on the PLB touch screen and sent to the PLB CMS server for validation.
   c. It shall be possible to modify the Login and Password database from the server or using the Maintenance Workstation.

7. PLB Long term Data storage
   a. Data storage of the events logged in the PLBs shall be stored in the PLBs for short term then transferred to the PLB CMS server for long term storage.
   b. Data storage shall be able to be filtered and exported to the PLB Maintenance laptop using the Maintenance Workstation.

8. Printer
   a. The local printer shall be used to print:
      1) Sorted alarm list
      2) Preventive maintenance schedule
      3) Reports
      4) Status of an aircraft stand
   b. Alarm printing shall only be implemented from the Maintenance Workstation.

C. PLB CMS Servers

1. Summary
   a. The PLB CMS shall use a redundant server cluster that collects and stores data from the various aircraft stands, and provides monitoring units with relevant information on aircrafts stand status. PLB CMS servers shall be based on virtual machine (VM) type of environment and shall be located in two (2) separate locations.
   b. The main functions of the servers shall be the following:
      1) Interface with:
         - The GOS and Airport Operational Systems (RMS, MIS) through the MSI
         - The Billing System
         - The Airport Master Clock System.
      2) Supervision server
      3) Time synchronization
      4) Password management
      5) PLBs Users login and password management
      6) PLB long term data storage
      7) Alarm log
      8) Manage alarms for database capacity
      9) Data saving on external support

2. Functions
   a. Monitoring Server Function
      1) The monitoring of the PLB CMS workstations shall be managed from the Supervision server. The application data as well as the views and the real time database of the application shall be stored.
   b. Historical Data Save Function
      1) System data such as technical failures, operational failures and other data reported from the various components shall be logged in the server, with a date and time stamp.
      2) The event log files shall be saved on external support to avoid system overload (hard disk full).
   c. Data Save Function
      1) Shall allow data save on removable external support of selected files, in a format that can be used with MS Excel or Access.
      2) Shall allow removal of those files from the server after being saved. This action can only be done after Operator validation.
      3) These functions shall be activated manually by the maintenance Operator on the database server.
   d. Recovery Function
      1) In case of system failure, data might need to be reloaded in the system. Loaded data during the recovery process shall have the same configuration and same format as initially.
   e. Time Management
      1) In order to synchronize all the clocks of the system, the server shall be in charge of setting all equipment clocks with the Airport Master Clock's time.
      2) All the equipment of the PLB CMS shall be automatically synchronized to the same time and date by means MSI interface with the NTP server.
      3) Setting other equipment time shall be done at least once a day, and shall be done upon recovery from a communication failure.
   f. Password Management
      1) Passwords shall be used to access some functions of the system
      2) It shall be possible to modify passwords from the server; but this function shall be password protected.

g. Database Capacity Alarm
   1) Alarms shall be generated when the server capacity (hard disk) reaches a given level.
   2) Two levels can be set and modified. At implementation on site, they shall be set at:
      - Warning level: 85% used,
      - Alarm level: 95% used.
   3) These alarms shall be logged on the server.

h. PLB User login Management
   1) Login and passwords shall be used to authorize a dispatcher or a Maintenance operator on a PLB.
   2) Login and password shall be entered on the PLB touch screen and sent to the PLB CMS server for validation.

   3) It shall be possible to modify Login and Password database from the server or using the Maintenance workstation.

i. PLB Long term Data storage
   1) Data storage of the events logged in the PLBs shall be stored in the PLBs for short term then transferred to the PLB CMS server for long term storage.
   2) It shall be possible to filter data storage and export it to the PLB Maintenance laptop using the Maintenance Workstation.

D. PLB CMS APPLICATION

1. The PLB CMS Application will be installed in the Airport as an independent system.
1. The components of the PLB CMS Application shall comply with the requirements issued by the Contractor in charge of the Airport VM System in order to ensure that the Performances are met,
2. The supply includes all licenses, compatible software and hardware required to integrate the PLB CMS Application in the Airport VM,
3. Long term Storage shall be stored in an external data storage (NAS or SAN) supplied by the PLB CMS supplier,
4. System recovery will be achieving by the Airport VM, however the PLB CMS supplier shall manage the recovery of the data stored in external storage,
5. PLB CMS contractor shall coordinate with all related contractor for the Racks, switches, data sockets, SCN and CNE components

2.4 PLB CMS INTERFACE WITH THE PASSENGER LOADING BRIDGES

A. The PLB CMS shall have an interface with the PLBs at each stand.

B. Connections shall be established with the PLC of each bridge. The interface shall use MODBUS over TCP/IP with an RJ45 plug.

C. The Operator shall be able to access the following information on the PLB CMS control panel display:

1. Position of the PLBs
2. Aircraft type.

D. When the PLBs are correctly pre-positioned, the PLB CMS is informed and aircraft docking procedure can start.

E. The PLB CMS shall send the expected flight information to the PLB, as well as locking of any PLB for maintenance purposes (if one of the PLB components failed).

F. This interface shall allow reporting of all actions made at the PLB level, as well as reporting all operational and technical failures. In addition, it shall be possible to update the PLB aircraft database remotely, using this link.

G. Data reported from the PLB to the PLB CMS shall be listed by the Contractor and shall as a minimum include the following:

- PLB operating mode
- PLB position (angle and length)
- PLB external lights status
- PLB pre-positioning
- PLB height
- PLB internal lights status

- Anti-collision siren status
status
- Rotating system status
- Range of motor intensity measurement
- Excess of nominal current
- Over current
- Phase failure
- Temperature rise
- Oil level, if any
any
- Sensors status
- Operating time
- Control console failure
- Communication failure
- Emergency stop
- PLB positioned for expected aircraft
- Anti-collision flashing lights
- Range of control loop
- Breaks status
- Short circuit
- Voltage drop
- Phase sequence order
- Levelling system failure
- Hydraulic reservoir level, if
- Safety shoe status
- Emergency lowering
- PLC or computer failure
- Movement travel limit
- Hour meter
- Validation for PLB locking

H. The above list shall be validated during final design.

I. The beginning of the aircraft docking procedure shall stop all the PLB's movements for safety reasons. Once the procedure is finished (aircraft parked), PLB's movements are allowed after a safety time of about 10 seconds.

J. Cables running inside the PLB shall form part of the PLB Contractor’s Scope of work.

K. The PLB CMS Contractor shall be in charge of interconnecting the PLB CMS and the PLB through an Interface Box located in the stand Technical room (IT room located in the Building Rotunda).

L. The PLB CMS Contractor shall be in charge of connecting the PLB CMS to the network switch located in the stand Technical room (IT room located in the Building Rotunda).

2.5 PLB CMS INTERFACE WITH THE PCA, 400HZ AND WATER SUPPLY

A. The PLB CMS system shall interface with the PCA, 400 Hz and Water Supply systems of a PLB. The interface shall use MODBUS over Ethernet (TCP/IP) type, with a RJ45 plug.

B. The PLB CMS shall display the pit open status and shall prevent aircraft docking while the PCA pits are open.

C. Coordinate with PCA, 400Hz and Water Supply Contractors for details of interface with the PLB CMS.

D. The interface shall allow reporting of all actions made at the PCA and Water Supply level, as well as reporting all operational and technical failures. In addition, information on the status of the pit (open / closed) shall be reported to the PLB CMS.

E. Data reported from the PCA and the Water Supply to the PLB CMS shall be listed by the Contractor and shall include as a minimum the following:

- Water pumping stations status/Fault
- Water tanks levels
- Hour meter contact
- PCA general fault
- ON / OFF power status
- Coil condition
- Fan power variator fault
- Air valves position
- Manholes position
- Lifting pump working auxiliary contact
- Emergency stop
- Potable water flow meter
- Watt meter
- PCA working auxiliary
- PCA filter fault
- Control valves
- Blown air pressure probe
- PCA electrical fault
- Air valve position fault
- 400Hz cable extracted
- Lifting pump fault
- PLC or computer failure

F. The interface shall allow reporting of all actions made at the 400Hz system level, as well as reporting all operational and technical failures. In addition, information on the status of the pit (open / closed) shall be reported to the PLB CMS.

G. Data reported from the 400Hz system to the PLB CMS shall be listed by the Contractor and shall include as a minimum the following:

- 400Hz converter operating mode
- Emergency stop
- Auxiliary 48V voltage
- Power consumption meter
- Load Ampere in each phase
- Voltage across each phase
- Circuit breaker status for various 400Hz converter power supply

- Frequency

- Cable hoist
- Converter status
- Hour meter
- Pit position
- PLC or computer failure
- PLC or computer failure

2.6 PLB CMS INTERFACE WITH THE GATE OPERATING SYSTEM (GOS)

A. The PLB CMS shall have an interface with the GOS through the MSI.

B. Data reported from the PLB CMS to the GOS shall be listed by the Contractor and shall include as a minimum the following:

- VDGS operating mode
- Block ON / block OFF
- Control box status
- Communication failure
- Emergency stop
- Aircraft identity failure
- PLC or computer failure
- Stand status
- Display status
- Scanning unit status
- Main computer unit failure
- Hour meter
- VDGS low visibility mode status

2.7 PLB CMS INTERFACE WITH THE MASTER SYSTEM INTEGRATION (MSI)

A. Through the MSI, the PLB CMS server shall communicate with:

1. The RMS: to report the unavailability of the stand, with a beginning and end time, as well as a free text to indicate the cause of the unavailability. When an aircraft stand is unavailable, a preset time of unavailability is reported to the RMS.
2. The information about aircraft presence on stands (block ON, block OFF) is also reported. In the same way, the VDGS also informs the RMS about PLB unavailability and its mode (OFF, Manual, Auto levelling).
3. The MIS: to get flight information with the flight number, aircraft type, aircraft series, stand allocation for the flight, estimated arrival time and estimated departure time.
4. The billing unit: to report information on ground services such as the PLB, the 400Hz, the PCA and the water supply (for billing purposes). The information will be used for invoices to airlines.

    a. The block ON/OFF information needed by the billing system will be received from the MIS.

B. The interface with these systems shall be done through the Master System Integration (MSI) that centralizes all the data necessary to the various systems.

C. The interface between the PLB CMS server and the MSI shall be through Ethernet TCP/IP, via the redundant Airport data network backbone.

D. The full list of information exchanged with these systems shall be prepared and confirmed during the design phase.

E. The list of foreseen data exchanges is detailed in Annex A of Division 25 Section "Master System Integration (MSI)". The list is not intended to be exhaustive but is a foreseen list of information that should be exchanged between all interfaced systems.

PART 3 - **EXECUTION**

3.1 FACTORY TESTING

A. Inspect and test each functional assembly at the factory prior to shipment. Employer or his representative maintain the right to witness these tests. Provide a 10-day notification prior to performance.

3.2 INSPECTION

A. General: Examine the areas and conditions under which the work is to be installed or performed, and remedy any conditions detrimental to the proper and timely completion of the work. Do not proceed until unsatisfactory conditions have been corrected.

B. Cutting and Patching: Inspect existing conditions of the work including elements subject to damage or to movement during cutting and patching. After uncovering work, inspect the conditions affecting installation of products, or performance of work.

C. The Contractor shall perform basic tests to ensure that the system and its components are functional. The results of these tests will be recorded and submitted to the Project Manager.

D. Prior to the inspection the Contractor is responsible to ensure a work area is ready and all requirements and pre-requisites have been met such as: health and safety, operation of mechanical and electrical systems, removal of construction equipment affecting the works, cleanliness of the area, etc.

E. The Contractor shall verify that the installed System is working and shall notify the Project Manager by letter. The Project Manager will inspect the installation and respond by letter indicating any issues or authority to proceed to next step

F. The Contractor shall record all inspection observations including the name(s) of personnel conducting the inspection, a brief description of the inspection and the observations. These records shall be available for review at any time and submitted before final acceptance.

G. Inspections

1. Pre-Installation Inspection: Inspection of all equipment and material to be used prior to installation. Compliance of all items shall be verified against the specifications and all other applicable standards. All equipment, cable, and associated hardware identified for installation shall be inspected for damage and completeness utilizing standard practices to determine integrity and acceptability.
2. In-Progress Inspection: At the Project Manager's discretion in-progress inspections shall be performed covering visual inspections of equipment, wiring practices, cabling, placement of equipment, marking of cables and adherence to safety procedures.
3. Final Inspection: The Contractor shall conduct a final inspection that encompasses all portions of the installation. This inspection shall be performed to ensure that all aspects of the installation have been performed in accordance with these Specifications, standard industry practices and the publications referenced herein. All non-compliance items shall be noted by the Contractor during this inspection.

4. Corrective Action and Verification Inspection: The Contractor shall perform corrective actions to ensure that all non-compliance items identified during the final inspection have been corrected.
5. Contractor shall ensure that all work performed under these Specifications (Sections) is in accordance with the requirements and standards defined and referenced therein. Any work performed in deviation of these Specifications (Sections), the referenced material, or any applicable standards or requirements, shall immediately be corrected by the Contractor without additional charges, regardless of the stage of work.

3.3 INSTALLATION

A. General: Install all work, meeting the requirements of the Contract Documents and in accordance with product manufacturer's instructions and recommendations, NFPA requirements, and requirements as specified herein and on Drawings. Meet requirements of final, reviewed submittals for the work.

B. Workmanship: Install all equipment, materials, specialties, etc., in accordance with the best engineering practice and standards for this type of work. Follow the recommendations and instructions of the product manufacturer, unless otherwise specified or shown in the Contract Documents.

C. Surface Finishes: Ensure all surfaces and edges of miscellaneous steel, etc., are smooth and free of marks, burrs, roughness, and other defects. Make finish welds match parent material. Where possible, grind welds smooth; remove flux, oxide, splatter or any other residue from the weld and adjacent areas of exterior and interior surfaces. Do not use synthetic type filler putty as metal filler.

D. Painting and Coatings:

1. Construct or finish all external components and PLB surfaces with inherently rust / defect / corrosion-resistant materials (i.e., stainless steel, glass, or plastic) or factory coat to ensure that the materials will be rust / defect / corrosion resistant to the tropical environmental conditions as specified.

E. Identification and Labeling:

1. Provide nameplate labels and signs as called for herein. Provide a nameplate for each PLB, each PLB control console panel, each electrical junction box, and each major equipment item (e.g., each motor).
2. Permanently attach each nameplate to each item and show at least the following in English:
   a. Equipment Number (to be provided by Project Manager /Employer)
   b. Manufacturer’s name and address.
   c. Date of manufacture.
   d. Manufacturer’s serial number.
   e. Motor rating (voltage and kW or HP) and Motor speed (rpm); for motors.
   f. Equipment ratings, where appropriate.
3. Furnish nameplates of engraved stainless steel, permanently attached with stainless steel screws.
4. Tag all electrical power and control cables which interface with terminal contractor- furnished cables to clearly identify the function and rating of each cable. Similarly, identify all terminations in junction boxes by tag, and cross-reference to

a tabulation to clearly identify each service contained.

F. Inspections and Tests:

1. General: Test all of the equipment installed under this Specification and demonstrate its proper operation to the Employer. Furnish all required labour, testing, instruments and devices required for tests and pay for all expenses involved in conducting such tests. Give 48 hours written notice to the Employer of all tests and demonstrations.

2. Inspection: Inspection includes but is not limited to:
   a. Rotation: Check drive shaft rotation direction and speed.
   b. Blocking: Remove blocks and other similar devices used to block shafts during shipment to the field or during alignment work.
   c. Alignment: Check whether equipment has been aligned.
   d. Lubrication: Check lubricant types and levels.
   e. Tightening: Tighten bolts, capscrews and other fasteners.

G. Install electrical connections for power, controls, and devices in accordance with the recommendations / requirements of the IEC and IET wiring regulations or equivalent international standards, subject to Project Manager's acceptance. Electrical power and control wiring and connections are specified in the Electrical Sections. Install and adjust motors in accordance with manufacturer's published instructions.

H. Perform the following equipment pre-operational checking activities, where appropriate or if not already performed and accepted at FAT. Coordinate these activities with the startup and testing work.

1. Lubricate oil lubricated type bearings, as appropriate. Fill with new lubricant according to manufacturer's recommendations.
2. Disconnect equipment drive couplings and check motors for proper rotation. Ensure rotation matches direction of rotation marked on equipment casing.
3. Check that all rotating equipment is free to rotate by hand.
4. Check that controls are correct for required application.
5. Check for fluids leakage from any mechanical or electrical devices

I. Field Testing and Final Checking: After the equipment has been installed and the various units have been inspected, adjusted, and placed in correct operating condition, field test the equipment in accordance with manufacturer's written testing procedures as accepted by the Project Manager. Demonstrate that the equipment functions in compliance with the specifications over the entire range of operation. Report any unusual conditions. Correct deficiencies of any of the field installed units.

J. Docking Tests: Conduct docking tests to demonstrate simulated docking. Use metal plate located by forklift at the aircraft door locations.

K. Install a new fire extinguisher, UL Listed, ABC Rated 3A:40B:C.

L. Hardware/Device/Component Installation

1. Provide an Installation Methodology Document,
2. Provide an Inspection and Test Plan (ITP),
3. Provide all required licenses.
4. All items, components, cables, etc. will be labelled as per the agreed labelling

scheme,

5. Allow for protecting, moving and stacking existing materials, equipment, etc.
6. Provide covering with tarpaulins, dust sheets or other materials as appropriate and remove them when no longer needed,
7. Properly ground each piece of electrical equipment prior to providing power in accordance with electrical guidelines and standards,
8. Perform all hardware tests at the equipment and subsystem levels to verify that the requirements of these equipment and subsystems have been met,
9. Include Power-On Self-Test reports (POST),
10. Perform the required System initialization and configuration and record the optimal settings for all devices and equipment to be included in the Operation and Maintenance Manual,
11. Perform tests and adjustments to assure satisfactory quality and performance of the system under operational conditions.

M. Racks Installations

1. All items, components, cables, etc. will be labelled as per the agreed labelling scheme
2. Contractor shall follow the rack installation guidelines to be coordinated with the "Structured Cabling Network" Contractor
3. Power cables, control cables, and high-level cables shall be run on left side of an equipment rack as viewed from the rear
4. Other cables shall be on the right side of an equipment rack, as viewed from the rear
5. Equipment mounted in drawers or on slides shall be provided with cables long enough to allow full extension of the drawer or slide. Include a service loop of at least 915 mm.

N. Network interfaces

1. For testing and commissioning of the overall network interfaces related to PLB CMS, to comply with Section 27 05 01 Common Clauses for IT and Security Systems

O. PLB CMS Test Environment

1. The Contractor shall define and deliver a "test platform".
2. The Contractor shall describe and deliver all simulators required for integration purposes.
3. The Contractor shall deliver all database scripts used to update the operational database from the test database and vice-versa.
4. The Contractor shall install any required automated test management tools from vendors who are acceptable to the Employer.
5. The Contractor shall describe the limitations of the test platform in order to allow the Employer's IT team to phase the testing:
    a. Tests that can be totally implemented on the "test platform".
    b. Tests that can be partially achieved on the test platform and that should be completely run on the "operational platform".

c. Tests that cannot be achieved on the “test platform” and that should be run on the “operational platform”.

6. Before the system becomes operational, all tests shall be performed on the “operational platform”.

7. Phased Testing:

   a. A phased acceptance test and performance demonstration program shall be developed and documented by the Contractor.
   b. This testing shall apply to all system components including, but not limited to, servers, gateways, bridges and cabling, the systems workstations including all PCs, monitors, keyboards, printers, and Network Interface Cards, and all software including configuration data.
   c. The Contractor shall provide a test plan for each phase with a description of exercise/test designs, operational scenarios used to simulate operational procedures, specific scripts and data sets.
   d. The Contractor shall provide the complete set of results at the end of each phase.
   e. The problems identified in each phase shall be corrected and demonstrated before any subsequent testing phase is performed.

8. Partial roll-out:

   a. If required, the Contractor shall carry out the tests sequentially according to the development planning: for instance, the core product may be tested and deployed before the complete version of the system is deployed.

   b. The Contractor shall incorporate this phasing in the overall project planning.

9. Initial Field Acceptance Tests (IFAT):

   a. This testing phase shall be required to verify that the systems are performing properly after installation.

   b. This phase shall consist of :
      I. On-site inspection.
      II. Testing of individual components and,
      III. Simulation of actual operations.

   c. The IFAT shall test all software, including, but not limited to, operating software, applications software, batch processing software, terminal emulators, as well as any database software of the systems. These tests shall be supervised by the Project Manager and Employer.

10. Systems Integration Tests (SIT):

    a. These tests shall include testing of the entire system, including all active components and connections to any external system. The test plan shall identify correct protocol communications and data message communications.

11. Final Acceptance Tests (FAT):

    a. Once the SIT phase is successfully completed, final acceptance testing shall be carried out to verify that each of the components is fully operational under actual conditions of operations.

    b. The FAT shall include, but not limited to, testing connections to physical

devices.

c. This phase shall include a system availability test.

d. Reports of all component tests shall be provided on a regular basis.

12. User Acceptance Tests (UAT):

a. Once the FAT is completed, the Contractor shall begin the handover to the assigned users of the system. The users may run the same tests as the FAT tests, but the focus shall be given to the coherency of the system, as far as work methods are concerned. The user-friendliness of the system shall also be thoroughly checked.

13. Initial Proving Period (IPP) (Experimental Period):

a. Once the UAT is completed, an Initial Proving Period of [three] months shall start in operational conditions: the software shall fulfill all requirements on a day-to-day basis.

b. If any major discrepancy is found in this IPP, the Contractor should be able to identify and fix it and to deliver a new version of the system. Each new delivery will reset the IPP for [three] more months.

c. Refer to Division 27 Section "Common Clauses for IT, Security & Special Airport Systems", Article "WARRANTY", Paragraph "Experimental Period".

14. Retesting: Correct deficiencies and retest until total system meets requirements of the Specifications and complies with applicable standards. Prepare written records of tests.

3.4 TAKING OVER CERTIFICATE

A. Prerequisites for the Taking Over Certificate (TOC)

1. Testing and commissioning has been successfully performed,

2. All closeout documents have been approved,

3. A Snag List with schedule for de-snagging has been agreed between the Contractor and the Project Manager,

B. Defect Liability Period (DLP)

1. DLP will commence from the time of TOC issuance and will run for a period of twenty-four

2. (24) months.

3. Correction of all defective materials (de-snagging) and workmanship in the installation will be carried out as scheduled within this period.

4. Operation, maintenance and expansion of the system by the operator shall not impact DLP.

5. During DLP any extensions of the system into other areas, or buildings outside the original scope of the Contract shall not relieve the Contractor of Contractual obligations.

C. Site Assistance and Adjustments

1. Appoint a manufacturer certified service representative as contact person for the DLP,
2. In case of system malfunctions, detected anomalies, unusual ageing of the components, performance degradation, workmanship issues, etc. the service representative will provide a rapid site intervention to ensure continuity of operation,
3. Provide on-site assistance and adjustments to the operator during DLP, provide for two site visits for this purpose at no additional cost,

3.5 MANUALS

A. Final manuals shall be provided by the Contractor upon completion

B. The Project Manager reserves the right to determine whether the above specified information as furnished by the Contractor is adequate and complete. The Project Manager may require additional submission by the Contractor to ensure that the documentation is complete and satisfactory

C. The O&M manuals shall contain adequate documentation of operating instructions for the System to be used by administrators, operators and technical personnel. The manual contains:

1. All settings, configuration scripts and configuration files
2. All command sets and the procedures/response in connection with each command
3. Operation, housekeeping and maintenance procedures
4. Initializing, reset, restart, reboot and other emergency procedures

3.6 ONSITE ASSISTANCE, TRAINING, AND MAINTENANCE

A. General: Provide onsite instructions / demonstrations to designated operating personnel covering operation, adjustments, and maintenance of PLB's.

B. Training: Provide on-site training of Employer's personnel in trouble shooting and problem solving. Include theory and hands-on training. On completion of training, issue each participant with a certificate of competency. Provide a minimum of 40 hours training for all the equipment, segregated into maintenance and operational trainings.

C. Maintenance: Beginning at initial acceptance, provide 400 days of full maintenance service by competent employees skilled in PLB operation. Use parts and supplies as used in the manufacturer of original equipment.

D. Warranty: The bridge Manufacturer shall provide an unconditional warranty for a minimum of 24 months (after successful finishing of the OMP) for the total of PLB installation. Full detail of the extended warrantied shall be provided for review and approval. In addition, a ten-year warranty is required for all exterior metal paint finishes.

Note :- PBB contractor to ensure that the final docking simulations reflect the final apron slopes as per the final grading scheme

PART 1 – GENERAL

1.1 Summary

This section outlines the requirements for IoT-based air quality sensors to be deployed across Jomo Kenyatta International Airport (JKIA) as part of the smart airport ecosystem. The sensors support monitoring of indoor environmental conditions and integration with smart airport applications and systems.

The system is designed to:

A. Enable real-time monitoring of air quality parameters
B. Support data-driven environmental control strategies

1.2 Scope of Work

The scope includes supply, installation, integration, testing, and commissioning of IoT air quality sensors, including:

A. Sensor devices and associated hardware
B. Integration with IoT platforms and building management systems
C. Testing, commissioning, and handover documentation

1.3 Standards & Compliance

All systems shall comply with relevant international standards for:

A. Indoor air quality and environmental monitoring
B. IoT communication protocols and interoperability
C. Cybersecurity and data protection

1.4 System Requirements

A. Sensors shall support continuous monitoring and data transmission
B. Systems shall allow for scalability and future expansion
C. Data shall be securely transmitted and accessible via centralized platforms
D. Integration with other airport systems (e.g., BMS, IoT platforms) shall be ensured

PART 2 – PRODUCTS

2.1 Air Quality Sensors

Sensors shall provide continuous monitoring of key environmental parameters, including:

A. CO_2
B. Particulate Matter (PM2.5 / PM10)
C. Total Volatile Organic Compounds (TVOC)
D. Temperature
E. Relative Humidity

Sensors shall:

A. Provide accurate, real-time measurements
B. Support remote calibration and monitoring
C. Be suitable for indoor airport environments

2.2 Connectivity & Integration

Sensors shall support:

A. Wireless communication (e.g., Wi-Fi or equivalent)
B. Optional wired connectivity (e.g., Ethernet / PoE)
C. Standard communication protocols (e.g., MQTT, HTTP/HTTPS)

All devices shall integrate with:

A. Building Management Systems (BMS)
B. Data analytics and monitoring systems

2.3 General Requirements

A. Equipment shall be robust, scalable, and suitable for continuous operation
B. Products shall be from approved manufacturers and meet performance requirements
C. Systems shall allow interoperability with other smart airport systems

PART 3 – EXECUTION

3.1 Installation

A. Sensors shall be installed in accordance with manufacturer recommendations
B. Locations shall be coordinated with architectural and MEP layouts
C. Installation shall ensure optimal coverage and performance

3.2 Testing & Commissioning

A. All sensors shall be tested prior to and after installation
B. System integration and communication shall be verified
C. Performance shall be validated against specified requirements

3.3 Operation & Maintenance

A. Systems shall include provisions for monitoring, maintenance, and updates
B. Training shall be provided to relevant operational staff
C. Documentation shall be provided, including manuals and system configurations

AQ SENSOR

PART 1 – GENERAL

1.1 Summary

This section outlines the requirements for IoT-based air quality sensors to be deployed across Jomo Kenyatta International Airport (JKIA) as part of the smart airport ecosystem. The sensors support monitoring of indoor environmental conditions and integration with smart airport applications and systems.

The system is designed to:

A. Enable real-time monitoring of air quality parameters
B. Support data-driven environmental control strategies

1.2 Scope of Work

The scope includes supply, installation, integration, testing, and commissioning of IoT air quality sensors, including:

A. Sensor devices and associated hardware
B. Integration with IoT platforms and building management systems
C. Testing, commissioning, and handover documentation

1.3 Standards & Compliance

All systems shall comply with relevant international standards for:

A. Indoor air quality and environmental monitoring
B. IoT communication protocols and interoperability
C. Cybersecurity and data protection

1.4 System Requirements

A. Sensors shall support continuous monitoring and data transmission
B. Systems shall allow for scalability and future expansion
C. Data shall be securely transmitted and accessible via centralized platforms
D. Integration with other airport systems (e.g., BMS, IoT platforms) shall be ensured

PART 2 – PRODUCTS

2.1 Air Quality Sensors

Sensors shall provide continuous monitoring of key environmental parameters, including:

A. CO_2
B. Particulate Matter (PM2.5 / PM10)
C. Total Volatile Organic Compounds (TVOC)
D. Temperature
E. Relative Humidity

Sensors shall:

A. Provide accurate, real-time measurements
B. Support remote calibration and monitoring
C. Be suitable for indoor airport environments

2.2 Connectivity & Integration

Sensors shall support:

A. Wireless communication (e.g., Wi-Fi or equivalent)
B. Optional wired connectivity (e.g., Ethernet / PoE)
C. Standard communication protocols (e.g., MQTT, HTTP/HTTPS)

All devices shall integrate with:

A. Building Management Systems (BMS)
B. Data analytics and monitoring systems

2.3 General Requirements

A. Equipment shall be robust, scalable, and suitable for continuous operation
B. Products shall be from approved manufacturers and meet performance requirements
C. Systems shall allow interoperability with other smart airport systems

PART 3 – EXECUTION

3.1 Installation

A. Sensors shall be installed in accordance with manufacturer recommendations
B. Locations shall be coordinated with architectural and MEP layouts
C. Installation shall ensure optimal coverage and performance

3.2 Testing & Commissioning

A. All sensors shall be tested prior to and after installation
B. System integration and communication shall be verified
C. Performance shall be validated against specified requirements

3.3 Operation & Maintenance

A. Systems shall include provisions for monitoring, maintenance, and updates
B. Training shall be provided to relevant operational staff
C. Documentation shall be provided, including manuals and system configurations

PART 1 – GENERAL

1.1 Summary

This section outlines the requirements for a Fault Detection and Diagnostics (FDD) module to be implemented as part of the Jomo Kenyatta International Airport (JKIA) smart airport ecosystem.
The FDD module enables continuous monitoring and analysis of building systems to identify faults, inefficiencies, and performance gaps, supporting data-driven operations and maintenance.

1.2 Scope of Work

The scope includes the provision and implementation of the FDD module, including:

A. Configuration of the FDD module within the overall digital ecosystem
B. Integration with BMS, IoT systems, and other data sources
C. Setup of analytics, dashboards, and reporting functions
D. Testing, commissioning, and handover

1.3 System Requirements

A. Continuous analysis of system performance using operational data
B. Integration within the overall smart airport ecosystem
C. Secure data exchange and interoperability with connected systems
D. Scalable configuration to support future expansion

PART 2 – PRODUCTS

2.1 FDD Module

The FDD module shall include:

A. A data analytics engine processing time-series data from connected systems
B. A user interface with dashboards and visualization tools
C. Deployment within the airport's digital infrastructure (cloud or on-premise)

2.2 Data Integration

The module shall integrate with:

A. Building Management Systems (BMS)
B. IoT sensors and devices
C. Metering System
D. Other airport operational and digital systems

Integration shall be achieved through standard protocols and open APIs, ensuring reliable and secure data exchange.

2.3 Analytics & Functionality

The FDD module shall provide:

A. Rule-based and AI-driven fault detection
B. Identification of anomalies, inefficiencies, and system faults
C. Monitoring of energy, environmental, and operational performance
D. Prioritization of issues with actionable insights for operations teams

PART 3 – EXECUTION

3.1 Installation & Integration

A. Configuration and integration of the FDD module within the existing systems
B. Coordination with all relevant stakeholders and system providers
C. Alignment with the overall smart airport architecture

3.2 Testing & Commissioning

A. Verification of system integration and data flow
B. Validation of analytics and fault detection outputs
C. Completion of system testing and acceptance

3.3 Operation & Training

A. Training for operational and maintenance teams
B. Provision of user documentation and system guidelines
C. Support for ongoing operation and optimization

FDD
